Cognitive science studies on the category of time in daily communication of Vietnamese people (the case of conceptualmetaphor TIME IS A CONTAINER)

Phạm Thị Hương Quỳnh

Vietnam Institute of Linguistics, Applied Linguistics, Hanoi, Vietnam.

hqp2000@gmail.com

Abstract

Cognitive science studies the relationship between language and thought. in which culture and personal experience play an important role in shaping people's conceptual thinking. Conceptual metaphor is a way of thinking based on experience. The conceptual metaphor is universal. However, it has a typical color in a certain nation because of specific cultural contexts such as the characteristics of the times, ideological ideology, tradition, cultural exchange and adaption. This article focuses on the metaphorical analysis of the notion that time is a container, this is how people perceive time in Vietnamese language. Time is an idea that always exists in the mind of man because we experience time through the transformation of ourselves and of everything around us. Therefore, this is a fairly common conceptual metaphor in Vietnamese thinking. Survey material of the article is the conversations in daily life, it truly reflects Vietnamese people's feelings and ways of thinking about the world around them.

Keywords: conceptual metaphor, cognitive linguistics, time is a container, time

INTRODUCTION

Cognitive Linguistics believe that every nation and every culture has a unique thought framework that affects the way people think, speak and communicate. This article focuses on the metaphorical analysis of the notion that TIME IS A CONTAINER, this is how people perceive time in Vietnamese language. Time is an idea that always exists in the mind of man because we experience time through the transformation of ourselves and of everything around us. Therefore, this is a fairly common conceptual metaphor in Vietnamese thinking. Survey material of the article is the conversations in daily life, it truly reflects Vietnamese people's feelings and ways of thinking about the world around them.

MATERIALS AND METHODS

Overview of conceptual metaphor

Conceptual metaphor considers conceptuality as the basic unit of the spirit. The cognitive semantics languist Crue said that "The idea is the key factor to help the human cognitive activities effectively. They are organized into potential blocks of knowledge, describing the connection of things, phenomena, situations according to our experience "[quoted by Ly Toan Thang, 2009, p 279.]. The main concept is the result of the process of creating mental symbols - an element made up of three aspects: intelligence, emotion, and will. Currently, scientists put concepts in two relationships to study, one is conceptual in the relationship between language and culture; The second is the notion in the relationship between language and perception. In any relationship, the idea is always systematic. It means there will be a concept as a basis to develop all the remaining concepts into an interconnected system.

Conceptual metaphor has the structure "A is B", where A is the targetconcept and B is the source idea. Source domain irradiation to target region sheds light on the target domain. For example, LOVE IS THE JOURNEY, with LOVE is tatget domain, and JOURNEY as the source domain. The source of the JOURNEY will irradiate its characteristics such as destination, transportation, participants in the journey, etc. For example: You go your way, I go my way => parting, in which the idea of the path belongs to the journey.

The conceptual metaphor is thus universal, just as Lakoff once said, "We live by metaphor."

2.2. The empirical basis of the conceptual metaphor of TIME AS CONTAINER

Time is an abstract concept but is a unit that can be measured through changes in phenomena. For example, from a biological perspective, human birth, growth, maturity, and aging can be identified through physical transformation. For example, from black hair to gray hair, from shiny skin to wrinkles, etc. For plants, time is also measured in a closed development cycle, flowering plants. , fruiting, ripe fruit; green leaves and yellow leaves; ... are the marks of the time left. Therefore, human perception of time as well as human experiences of time is often very clear. People are often placed in three dimensions of time as present, past and future. The human experience of time can be illustrated with the following diagram:

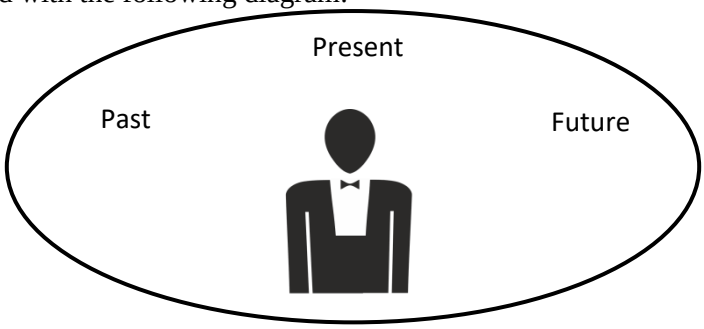

Figure 8. The Human Diagram in the three-dimensional space of time

People always live in the three-dimensional space of the past, present and future. The circle of time always continues between the three spatial regions, today is the present and today will become the past of tomorrow, tomorrow is the embodiment of the future. Therefore, people and things of the objective world are always in the movement of three dimensions of time. Looking at the diagram above, we see that people are aware of time through daily life, through years, through their own changes. That is why time is perceived as a container to contain everything. Perceptions of Vietnamese time are often divided into three basic directions. The first direction the person is at the destination and the movement time towards us are standing, for example *the beautiful future will come to you,...* The second direction the man moves through the time for example*I am confident to go to the future*, ... The third direction of time is an asset that people can use, for example, *Human life is only a span/ Who sleeps in the day, the remaining part is only half a span, time is gold, ...*

Structure of CONTAIN concept

CONCEPT IS THE SOURCE IDEA OF MANY CONCEPTUAL METAPHORS. SUCH AS:
THE BODY IS A CONTAINER FOR EMOTIONS
ANGER IS THE PRESSURE IN A CONTAINER.
ANGER IS THE HEAT OF FLUID IN A CONTAINER.
MIND IS A CONTAINER
NATION IS A NATION (CONTAINER)
AFFECTION IS PRESSURE IN A CONTAINER

The source domain of CONTAINER is usually the source domain of ontological metaphors. If the structure metaphor has a specific source domain and a more abstract target domain, then in the metaphor ontology both domains are abstract concepts. Therefore, the source domain in the structure metaphor often carries its specific characteristics to clarify the meaning of the target domain. For example, the itinerary source region will have characteristics such as destination, itinerary, people participating in the JOURNEY, etc. in order to irradiate to clarify the meaning for the destination domain LOVE, LIFE. The source domain in ontological metaphor has the function of demarcating space, perceiving abstract conceptual domains through concrete objects such as things, materials or containers. At present, cognitive science has gone very far, showing that most cognitive models, the radiating models of concepts, have been elaborately studied. Within the scope of this topic, when studying the radiating model of the CONTAIN concept, we also use this recorded research result. The commenters have put forward the conceptual diagram of the CONTAINER source domain as follows:

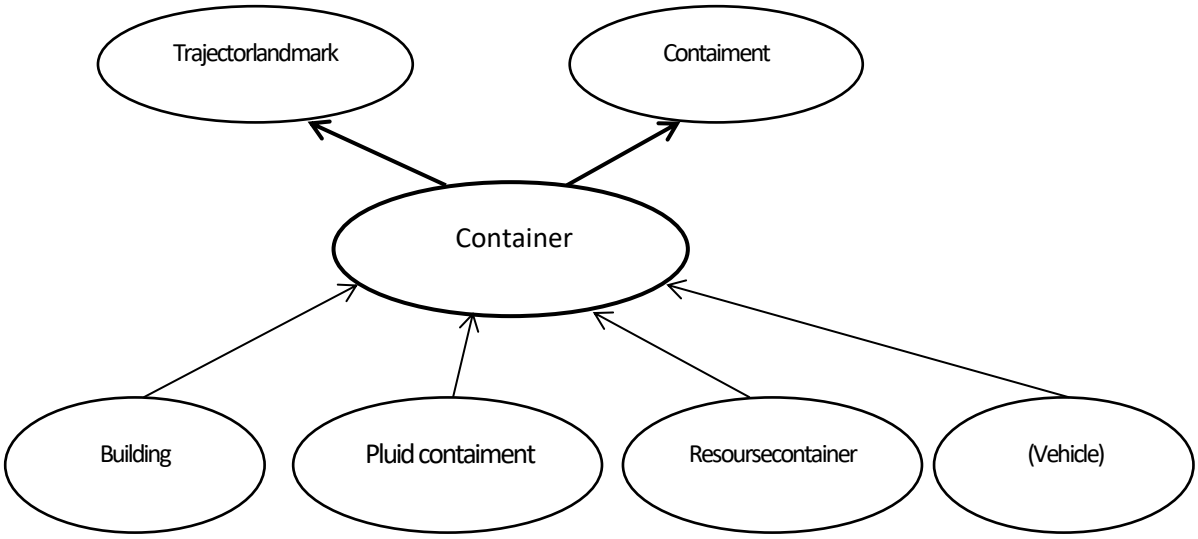

Figure 9. Conceptual diagram of the CONTAINER source domain [14]

Looking at the diagram, we see that there are two directions of the arrow, one direction from the CONTAINER concept to the other ideas and one direction from the arrow towards the central idea. This is explained as the arrows pointing to CONTAINER as secondary concepts, showing each feature of the main idea and it belongs to that main idea. The direction of the arrow from the center towards the outside means that the CONTAINER concept is the basic concept for other ideas. This is a manifestation of the network and the connection of ideas in the human spiritual world.

The CONTAINER conceptdomain with the above attributes that belong to the common humanity, but with each country, the attributes will have a different center-periphery due to the influence of culture. Depending on the ethnicity, this attribute is superior to the others. Culture includes two categories: material culture and spiritual culture. Among cultural values, there are national culture, regional culture and individual culture that will influence the thinking process of people.

RESULTS ("RESULTS and DISCUSSION" may be combined in a single title.)

Expression of metaphor TIME AS CONTAIN in language

Irradiation scheme of conceptual metaphor of TIME AS CONTAINER

The irradiation scheme of the conceptual metaphor of TIME AS CONTAINER is meant to illustrate the reference from the source domain to the destination domain. Based on the properties of the CONTAINER source domain, we formulate a mapping scheme as follows:

TIME target	CONTAIN source
The circulation of the past, present, future	Circle of container
Event occurred	Phenomenon of container
Time landmark	Signs of container
Change over time	Things of container
Time movement	Change of the object is contained within

Figure 10. Irradiation diagram of conceptual metaphor TIME AS CONTAINED

The irradiation scheme shows the correspondence between the source domain and the target domain. It is also the basis for finding and surveying in lexical expressions.

3.2. The linguistic expression of the conceptual metaphor of TIME AS CONTAINER

The characteristics of the CONTAINER source domain irradiate to the target time domain to concretize this abstract concept. First of all, time is coded as a container containing everything. Consider the following examples:

G: What kind of school did Mai Anh study there in the past?

M: He studied finance and banking in Taiwan

In the above language expression, *In the past*, it is a unit of the past time and the event "Mai Anh studied banking and finance in Taiwan" belongs to that past time. Thus, in the past, it is understood as a container for Mai's schooling event.

Ta: hey, you worked here in the second half of September?

T: Yes, I worked from ... well in September, until now

Ta: No but before, before

T: Before I only worked from 2008 until now, until September now I have come out, in Vinh, I have been working in Vinh always

Similarly, around the half of September, until now is also a container for the *working event*. *Before*, that is also a concept of time belonging to the past. In this conversation there is also the movement of time from the past to the present. It is a recollection in a closed cycle of three spatial regions. Within that period of time, events are objects.

- Only three years have I seen him back home.

- The last period, like the last period when the crisis of land occurred, many real estate giants got bankrupt.

- Friend's child nearmy room, she/he been studying for 3 years, but she/he dances everywhere she/he has money.

In the above linguistic expression, *the past three years*, it is a unit of the past time, it functions as a vote for the fact that the character in the speech did not return to the homeland and now the return to the homeland is an event taking place at a certain time that the subject is referring to. In another statement, *the past three-year* unit contains a baby's dance learning activity. Similarly, the *last period* is a unit of time that functions as *a land crisis event*.

1 month and 30 days he saw me give 30 bombs to get uranium, and if 1 day he saw 10 bombs, one day he saw 30 bombs and then stopped working then pay off 1 billion 29 days later just go to eat and play .

1 month and 30 days is the current time unit, the fact that *you saw me 30 bombs* contained in that period. This way of thinking shows that time is understood as a circular circumference, in which things happen and are limited to that circumference. Therefore, in a sentence, the unit of *1 day* is also the container for the number of 10 bombs, 30 bombs and the *next 29 days* are also the time category to contain eating and playing events.

But Ms. Nhung said that, in the past, she raised baby Trang ina too stunted manner.

Here, *in the past* is also a unit of the past time, in that unit is*Trang-named child raising*. Time passed is the repository of events. All events are in human memory encapsulated in time.

D: Well, there were hard old days, maybe people overcame the subsidy period

K: Subsidy is supposed to eat for decades

The unit of time in this statement is the *old days*, the old days signify the subsidy period. The era has passed as a cover of the hardships that the communicating characters want to talk to each other.

- During the time when I went to work, I only needed to go to work, but very rarely, I did not do execercise, I could only do exercise after retiring to take care of exercise.

Now, *the time when I went to work, after retirement*, is the concept of time. In the space of the time when *I was working*, I was very busy, so I came to the space after *retirement* to include physical activity.

- The day before I said I will change shifts so that I can go out in this afternoon.

The time in this statement is a point in the past, a point in the present. The past time is the *day before* and the present time is *this afternoon*. The story has a movement in the length of time and at each time it contains events of *shifting and going out*.

I have worked at that agency for 30 years.

30-year time is the container for the "*I have worked*" event

When I heard the news that my grandmother passed away, *in a moment* I really collapsed, so unexpected.

In a moment is a moment of time filled with painful, depressed emotions. So moment is a container.

My mother *struggled throughouther life*. My hometown is poor!

Throughout her life is a time filled with time of hardship.

After 87 years of schooling, he stayed at home for 2 years before continuing to study.

Two-year time is the container for *home stay*.

The above linguistic expressions show that the unit of time perceived as the container can be a moment, a period of a few years, a few decades to a lifetime. Obviously, this is a common way of thinking in the daily life of Vietnamese people.

DISCUSSION

This study has shown that Vietnamese people think about time at different ages. The reason for the difference is that due to age, old people often have more experiences in life than young people, conversely, young people have more ambitions and dreams than old people. That's why old people tend to think about the past time, don't attach too much importance to money, and young people often think about money, love, etc.

CONCLUSION

By analyzing the typical linguistic expressions in the conceptual metaphor of TIME AS CONTAINER, we find that the sense of time of Vietnamese people is mostly concentrated in the basic attribute of time as a container of things and time are felt more in the past, the present more. In particular, for the elderly, the sense of the past is very clear. The past is the place where memories, events and events have passed in life. For young people, the sense of time is often more present. This is also consistent with the psychological characteristics of Vietnamese people. Because Vietnamese people often tend to 'review the old situation', or take stories of family, children from private life, ... to tell each other. Ie individual ego is mingled in ourself. This is the exact opposite of the West, because Westerners value the self, the privacy.

ACKNOWLEDGEMENTS

Cognitive linguistics is not a mere theory of language but a research direction that synthesizes many scientific disciplines such as computer science, neuroscience, linguistics, etc. Cognitive learning aims to answer the question of how is the thought process formed? What psychological processes are involved in the formation of ideas in the human mind? Conceptual metaphor is a human way of thinking that helps us perceive the world through our own experiences. The conceptual metaphor of time is an example of how we think metaphorically.

Abstract

Bolted joint is one of the most commonly used separable joint types utilised for gas turbine engines. It brings modularity for assembly and disassembly operations of gas turbine engines during on-site maintenance actions as well as giving chance to partial change of damaged parts instead of a complete replacement. Also, integrity of connection is another critical design criteria particularly under some excessive and combined operational conditions like ultimate loads with thermal effects. During the design process, optimized joint design should be achieved by considering all operating conditions including cold assembly to most demanding loads. Applying torque on the bolts during assembly creates a preload on the bolt and this pre-load enables keeping the joint at intended condition without loosening. Based on the literature, torque values vary for different applications and are specified based on the experiences even for the similar thread types.
Preload has a great role in the function of threaded connections. Unless sufficient amount of preload is provided, strength and durability of the joint aren't ensured properly.
This study is conducted to investigate and analyse the effect of assembly parameters on bolt life used for gas turbine engines. Calculations and analyses are carried out for 6 different assembly conditions with various level of torque, nut factor and lubrication methods.

Keywords: Preload, Bolt, Joints, Life.

INTRODUCTION

Bolted joints play an important role in the integrity and durability of a reliable engineering design. Their performance is critical in several industries such as aeronautical, oil, drilling, and nuclear. Working principle of bolted joints is mainly based on force interaction. Preload produced by applied torque on bolt or nut gives a clamping force on the fasteners.
In order for bolted joints not to be damaged during operation and for them to perform their duties fully, function and strain of the connection must be determined carefully. Selection of materials suitable for the working conditions, determination of the safety factor and selection of the assembly method and its control are also conditions to be considered when calculating the joint strength. Strength of a bolted joint is primarily determined by the stiffness of each fasteners and connected parts.

MATERIALS AND METHODS

Effect of the preloading force on the life and strength of the bolts is investigated by using different assembly variables (torque, nut factor, lubricationtype) for 6 different cases of the joints indicated in Figure.

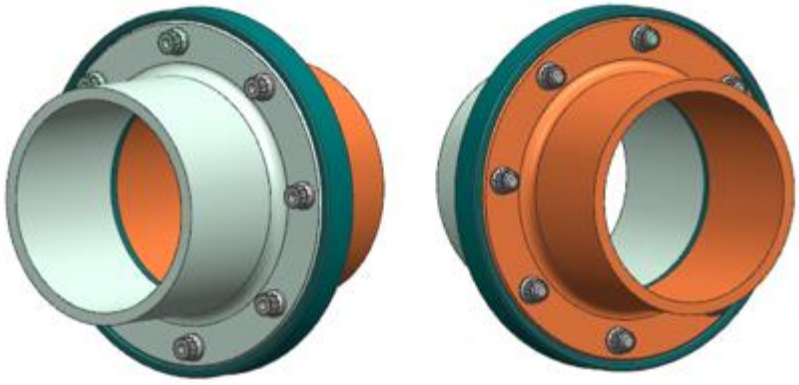

Figure 1. Bolted Joint

Bolts selected for the current system concept are double hexagon type of "AS48500-599" series bolts, which are frequently used in the aviation industry. Standard thread size of this bolt series is "0.250-28 UNJF-3A" and material is Inconel 718. Cross-sectional view and material information of the system are shown in Figure.

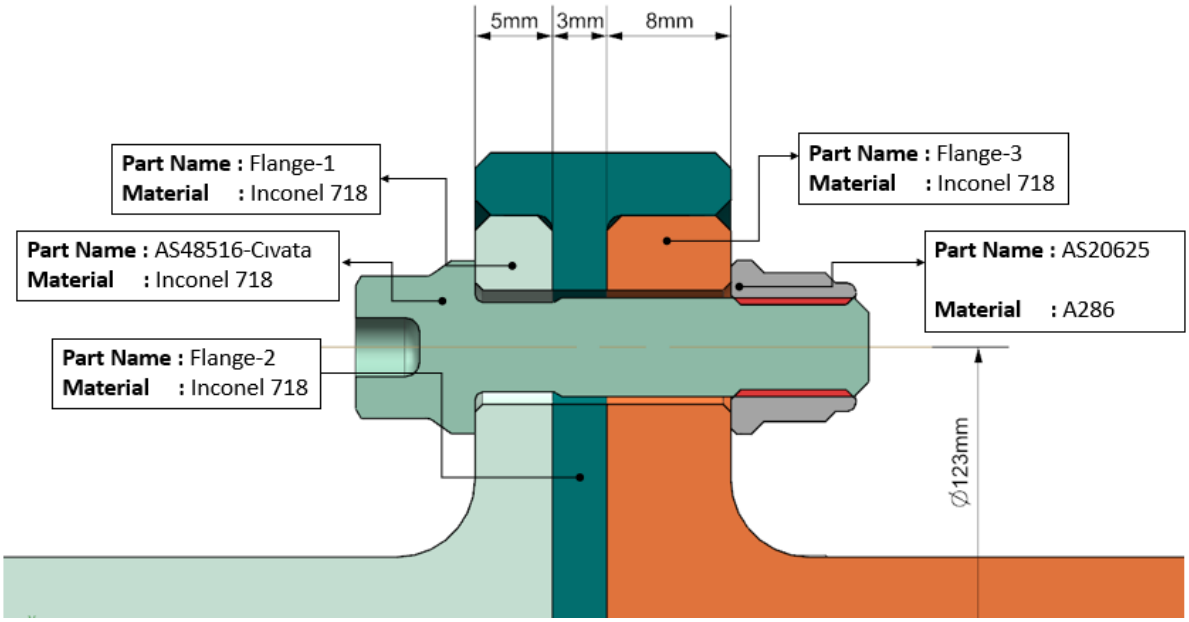

Figure 2. Section of Joint

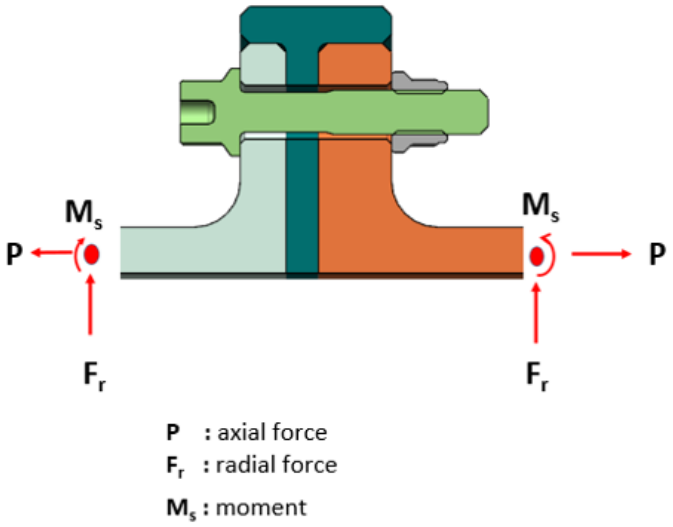
System is exposed to external loads during operation, which are carried by pre-loading force. The external loads are indicated in Figure and assumed to be constant for all cases.



Loads	Unit	Value
P	N	13000
F_r	N	8500
M_s	Nmm	1600

Figure 3. External Loads on the Flange

Main parameters affecting preload are torque value, nut factor and lubrication factor during assembly process. Preloads are calculated for 6 different cases according to Equation 1.

$$F_{pre} = \frac{T}{K * D_h * (1 - \%torque\ reduction)} \quad (1)$$

D_h : Head Diamater of Bolt

F_{pre} : Preload

K : Nut Factor

T : Assembly Torque

Table 1. Preload Calculations

Cases	T (Nm)	Nut Factor (K)	Oil Type	Torque Reduction Constant for Oil	D_h (mm)	F_{pre} (N)
Case 1	2.9	0.18	SAE 40	0.35	11.13	2261
Case 2	3.9	0.18	SAE 40	0.35	11.13	3026
Case 3	4.9	0.18	SAE 40	0.35	11.13	3785
Case 4	6.1	0.2	SAE 0	0.4	11.13	4554
Case 5	7.1	0.2	SAE 30	0.4	11.13	5338
Case 6	8.2	0.2	SAE 30	0.4	11.13	6112

Finite element method is used for the assessments and details of analysis are explained. Hexagon elements are used in the finite element method. Bolt head of the flange is fixed and external loads are applied from the nut of flange interface. Any stress on the bolt were calculated under the preload and external loads. Forces are applied to the flange as a remote force from a distance of 8 mm.

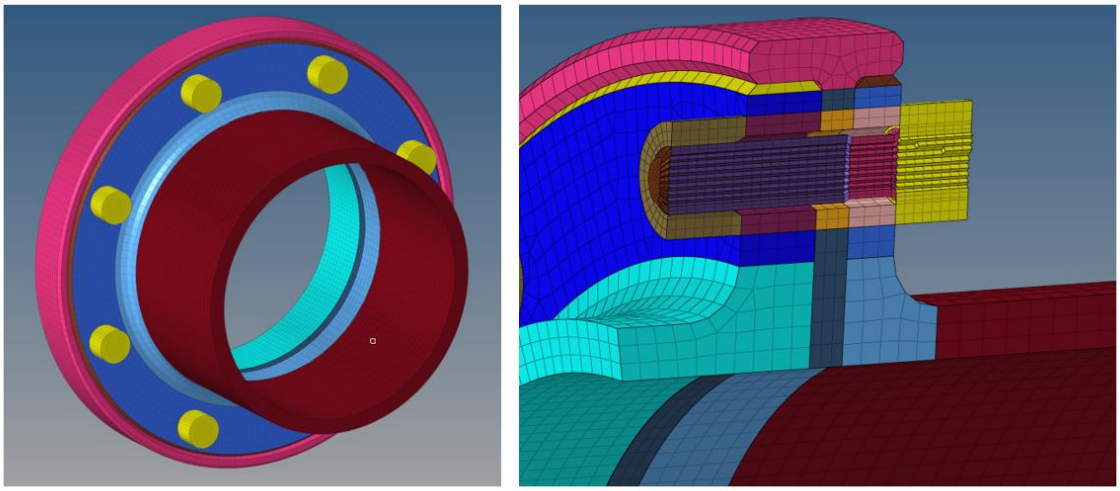


Figure 4. Mesh Type of Model

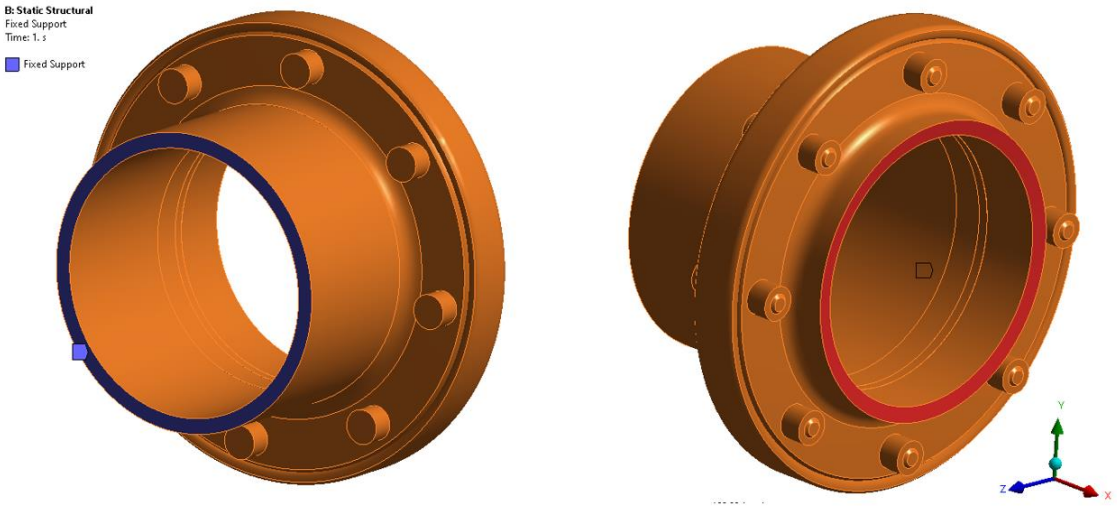

Figure 5. Boundary Conditions

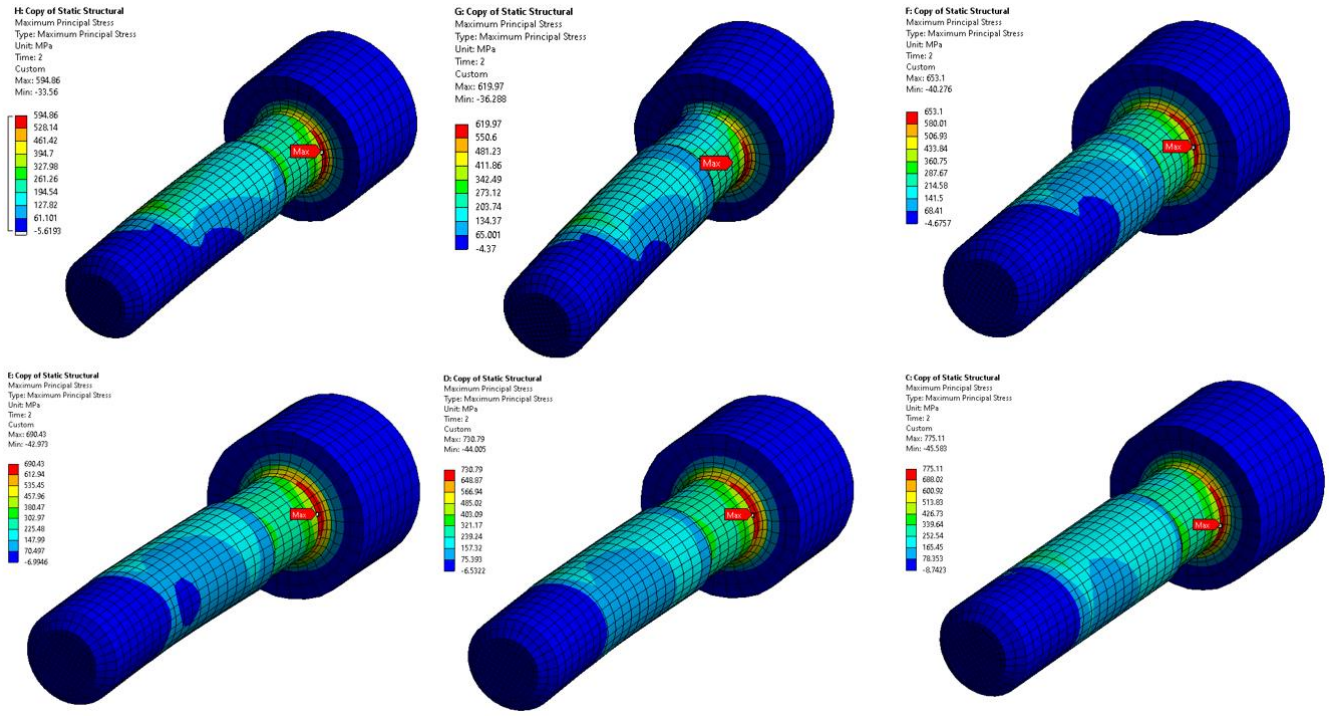
Maximum stresses on the bolt resulting from preload and external loads occurred at the radius under the bolt head and are given in the

Table for 6 different conditions.



RESULTS and DISCUSSION

Calculations and analysis prove that alternating stress decreases as the preload force acting on the bolt increases.. Alternating stress depends on the difference between minimum and maximum stress, in other words, it depends on the amplitude. Assumptions are made and determined values used in the calculations are R'=-1 and A3=0.5 by considering material data of Inconel 718.

$$S_{max} = \frac{\left(S_{alt} * \frac{2}{(1-R)}\right) * (1-R)^{A3}}{(1-R\prime)^{A3}} \qquad (2)$$

Smax : Maximum Stress (Walker Coefficient)
Salt : Alternating Stress
R : Ratio Min Stress of Max Stress
A3 : Proportional Factor for Metals and Alloys

Table 2. Maximum Stress and Alternating Stress

Cases	Preload(N)	min Stress (MPa)	max Stress (MPa)	R	S_{alt} (MPa)	Smax (Walker)
Case 1	2261	207	594	0.348485	193.5	339.0265
Case 2	3026	275	619	0.444265	172	326.2943
Case 3	3785	344	653	0.526799	154.5	317.6295
Case 4	4554	414	690	0.6	138	308.5774
Case 5	5338	484	730	0.663014	123	299.6498
Case 6	6112	552	775	0.712258	111.5	293.96

The number of life cycles remaining in the material limits increases as the alternating stress decreases in the S-N curve of material, which means extended durability of the part

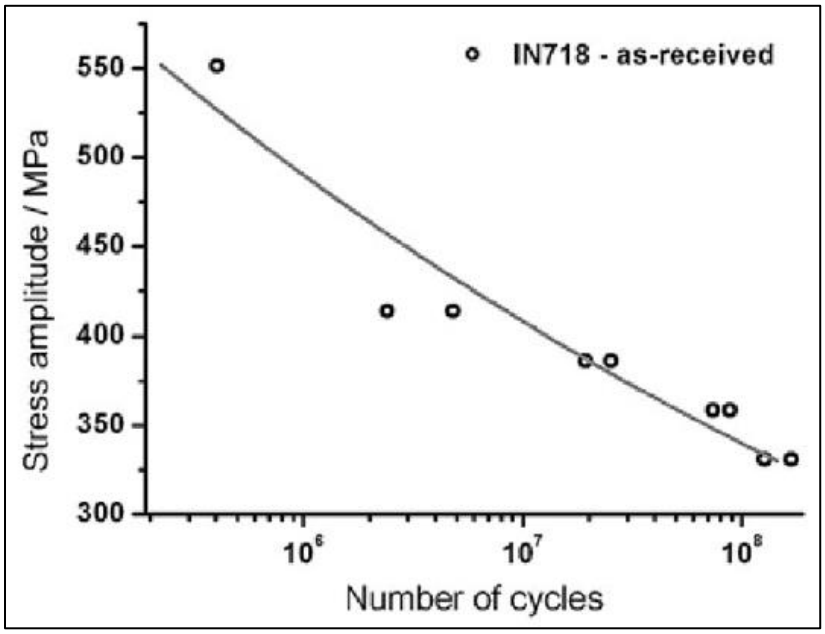


Figure 6. S-N Curve for Inconel 718

CONCLUSION

In this study, relationship between preload and its effect on endurance limit are investigated. Following conclusions can be derived:

- With the increase of bolt preload force under constant external loads, alternating stress decreases and bolt life increases. However, excessive preloading may cause plastic deformation with external loads, so the optimum preloading force should be determined by tests.
- The maximum stress occured at head to shank radius of bolt.
- The bolt threads were not fully modeled in the analysis. In further studies, thread modelling should be included and verification by testing should be accomplished.

ACKNOWLEDGEMENTS

First, the author wants to thank Tusaş Engine Industries (TEI) for providing opportunity and supporting to the study at Eskisehir Technical University.

The author would like to express his sincere and deep appreciation to Prof. Dr.Dilek Turan and Asst. Prof. Seyid Fehmi Diltemiz, their supervisor, for the professional supports and encouragement throughout the study.

The author also wants to thank his friends in TEI. Many thanks are given to Şevket Özcan for his help in analysis.

Finally, the author would like to dedicate this work to the members of his family who always stood behind him with great patience and encouragement.

Özet

Gerek gelişen teknolojiye ayak uydurmak için gerekse yakıt tasarrufu sağlayarak sürdürülebilirlik için taşımalı araç sektöründe önemli değişikliklere gidilmektedir. Avrupa Birliği (AB) 2050 yılına kadar karbon nötrlüğü elde edebilmesi için 2030 yılına kadar sera gazı emisyonlarını araçlarda yüzde 50 azaltmayı hedefleyen iklim paketi sunmuştur. Avrupa'ya ihracat yapan bütün ülkeler de bu kapsamda sayılacaktır. Araçlarda hafifletme çalışmaları bu konuda ilk akıllara gelen inovasyonlar arasındadır. Her şeyden daha da önemlisi geleceğimize bir yaşam borcumuz bulunmaktadır. Bu hedefler doğrultusunda, araç üretiminde fayda, performans veya güvenlikten taviz vermeden toplam kütlenin ve maliyetin azaltılması amaçlanmaktadır. Araçlarda toplam ağırlık olarak bakıldığında, toplu taşımada ağırlık oranı fazla olan ve ergonomi bakımından en önemli ekipmanlardan biri olarak kabul edilen yolcu koltukları akıllara gelmektedir. Bu çalışmada, yolcu taşıma araçları sınıfına giren minibüslerin (M2 sınıfında) yolcu koltuğu iyileştirme çalışması faaliyetleri yürütülmüştür. Hafifleştirmenin yanı sıra dayanımı yüksek koltuk tasarımının geliştirilmesi ve yapılan fizibilite çalışması ile işçilik ve malzemeden %5 oranında maliyet iyileştirilmesi planlanmıştır. Yapılan iyileştirmeler sonucunda, olumsuz şartlarda yolcunun negatif yönde minimum etkilenmesi için hayati önem taşıyan ECE Avrupa Regülasyonlarına uygun emniyet kemerlerinin bağlantı noktalarının dayanım testi (UN ECE R14) uygulanmıştır. Üst piston çekme yükü 743 kg ve alt piston çekme yükü 906 kg olarak belirlenmiştir. Bunun yanı sıra prototipi üretilen koltuk üzerinde arkalık dayanım testi ve yanal sacın dayanım testi ve sıcaklık dayanım testi gibi validasyon testleri ve yanmazlık testi uygulanmıştır. Tasarım değişikliği ile mevcut ürünlerden daha hafif, testlerde regülasyon beklentilerinin üzerinde reaksiyonlar veren ve maliyetli azaltılmış koltuk geliştirilmiştir.

Anahtar Kelimeler: Araçlarda hafifletme, Maliyet kazancı, UN ECE R14, Yolcu koltuğu tasarımı

Development of Lightweight and Cost-Reduced New System Passenger Seats

Abstract

Fundamental changes have been made in the transportation vehicle sector, both in order to keep up with the developing technology and for sustainability by saving fuel. The European Union (EU) has presented a climate package that aims to reduce greenhouse gas emissions by 50 percent in vehicles by 2030 in order to achieve carbon neutrality by 2050. All countries exporting to Europe will also be counted within this scope. Lightening studies in vehicles are among the first innovations that come to mind. More importantly, we owe our future a life debt. In line with these targets, it is aimed to reduce the total mass and cost of vehicle production without compromising performance and safety. Considering the total weight of vehicles, the passenger seats, which are considered to be one of the most important equipment in terms of ergonomics and the weight ratio in public transportation, come to mind. In this study, passenger seat improvement activities were carried out for minibuses (in the M2 class) that are in the passenger transport class. In addition to lightening, it is planned to improve the design of the seat with high strength and to improve the cost of labor and materials by 5% with the feasibility study. As a result of the improvements made, the strength test of the attachment points of the seat belts, which is vital for the passenger to be minimally affected in adverse conditions, has been applied in accordance with the ECE European Regulations.

The upper piston tensile load is 743 kg and the lower piston tensile load is 906 kg. In addition, validation tests such as the backrest strength test, the strength test of the lateral sheet metal and the temperature resistance test, and the non-flammability test were applied on the seat whose prototype was produced. With the design and material changes, seats that are lighter than existing products, that react above the regulation expectations in the tests, and that are low cost, have been produced.

Keywords: Lightening in vehicles, Cost savings, UN ECE R14, Passenger seat design

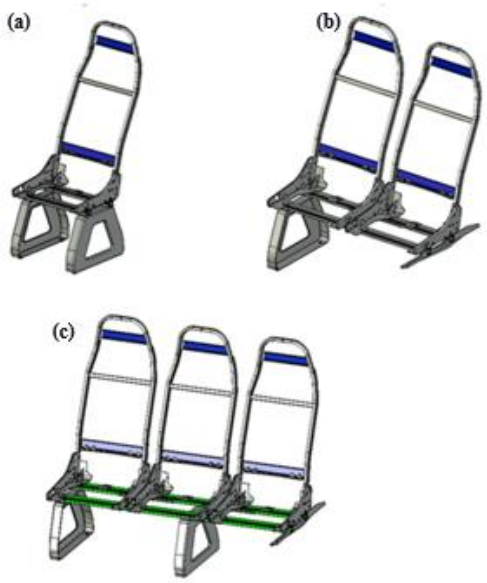
GİRİŞ

Gündelik hayatımızı kolaylaştıran ve yaşamda artık temel ihtiyaçlarımızdan biri olan ulaşım faaliyeti doğrudan sürdürülebilir çevre kavramı ile ilişkilendirilmektedir. Avrupa Birliği'nde 11 Aralık 2019 tarihinde Avrupa Komisyonu tarafından görüşülen "Avrupa Yeşil Mutabakatı" 2050 yılına kadar sera gazı salınımının sıfırlanacağını hedeflemişlerdir. 2021 yılı Çalışma Programı çerçevesinde Avrupa Komisyonu'nun, "sera gazı salınımlarını 1991 seviyelerine kıyasla 2030 yılına kadar en az %55 oranında azaltmak" hedefini belirlemişlerdir. Komisyon tarafından "Fit for 55" paketi 2021 tarihinde açıklanmıştır. "Fit for 55" paketi, AB'nin iklim, enerji, ulaşım, arazi kullanımı ve vergilendirme politikalarını belirlenen hedefe uygun hale getirmek üzere kabul edilmiştir (Avrupa Komisyonu, 2021c). IPCC (Uluslararası İklim Değişikliği Paneli) tarafından 2018 yılında yayımlanan bir raporda, önümüzdeki yıllarda iklim krizinden kaynaklanan dünya sıcaklığının artışının nasıl 1,5 ºC ile sınırlanacağı üzerine tartışılmıştır. Avrupa ve Dünya 2050 hedeflerini hızlı bir şekilde belirleyip aksiyonlar almak için yaptıkları çalışmalarına Türkiye'de 2053 yılında net sıfır taahhüdü vermiştir. Mirici ve Berberoğlu (2022) Türkiye için Avrupa Yeşil Mutabakatın bir fırsat mı yoksa tehdit mi olduğu üzerine değerlendirme yapmış ve Türkiye ekonomisi açısından ilk bakışta bu durumu tehdit olarak görseler de ekosistem kaynaklarının sürdürülebilirliği açısından umut verici bir fırsat olarak değerlendirmişlerdir. Avrupa Birliği'nde sera gazı salınımlarında enerji sektörü başı çekerken, ikinci sırada ulaşım sektörü almaktadır. TÜİK raporlarında toplamda sera gazı salınımının %22.3'lük payını oluşturan ulaşım sektörünün çok büyük bir kısmının kara ulaşımından kaynaklandığını özellikle de yolcu araçlarından meydana geldiği açıklanmıştır (TÜİK 2021). TÜİK raporu göz önüne alındığında yolcu araçlarında CO_2 salınımı azalmak için yapılabilecek çalışmaların başında yakıt tüketimini azaltmak gelmektedir. Hem maliyet açısından hem de sera gazı salınımı azaltıp enerji verimliliğini arttırmak için araçlar üzerinde iyileştirme çalışmaları yapılmaktadır. Yapılan araştırmalar sonucunda, yeni çıkan birçok teknolojinin araç sınıfına da bağlı olarak yakıt tüketimine ve enerji verimliliğine etki sağlayacağı görülmüştür. Tahmini katkı oranı en fazla %10-15 oranla motor turbo sistemlerinden sonra %10 oranı ile araç ağırlık hafifletme çalışmaları gelmektedir (King, 2007). Araç sınıfına bağlı olarak yakıt tüketiminde potansiyel yapılabilecek yenilikler incelenmiştir. Hafif ve orta ağırlıktaki taşıtlar (M2) ve otobüsler (M3) için hibrit elektrik teknolojileri %40 yakıt ekonomisini etkilemektedir. Motor sistemlerindeki iyileştirme %20 etki ederken, sürtünmelerin azaltılması ve hafifletme çalışmaları %17 yakıt ekonomisine katkı sağlamaktadır (Vyas ve ark., 2002). Bu durum göz önüne alındığında araçlarda hibrit sisteme geçilmesi motor sistemlerindeki değişimler yatırım maliyeti yüksektir. Araçlarda hafifletme çalışmaları ilk akıllara gelen uzun ömürlü yeniliklerdendir. Toplu taşıma araçlarında ağırlık azaltma hedefi doğrultusunda sayı itibari ile de fazla yer kaplayan taşıt koltukları ilk akla gelen ekipmanlar arasındadır. Yüce, (2013) yaptığı araştırmalarda koltukların son yıllarda otomotiv sektöründeki hafifletme çalışmalarında önemli bir yer kapladığını öne sürmüştür. Malzeme değişikliğinin hafifleme de en etkili yöntemlerden biri olduğunu ve otobüs, minibüs üreticileri de tedarikçilerinden konfor ve güvenlik şartlarını da göz önünde bulundurarak hafif koltuk üretmesi beklediğini dile getirmiştir. Bu çalışmayı gerçekleştirmedeki amaç yolcu taşımada kullanılan minibüsler için koltuk hafifletme ve maliyeti düşürme çalışmaları kapsamında koltuk güvenlik ve konfor standardını sağlayarak yenilikçi koltukların geliştirilmesidir. Koltuk iskeletini oluşturan arkalık, duvar bağlantı braketi ve yanal sacı ekipmanlarında malzeme türü ve et kalınlığı değerlerinde iyileştirmeler yapılarak ağırlık hafifletme çalışmaları yürütülmüştür. Güvenlik ve konfor standartları açısından uygunluğu da ECE Avrupa regülasyonlarına uygun R14 emniyet kemeri bağlantı noktaları dayanım testi ve validasyon testleri ile doğrulanmıştır. Çalışmanın olumlu sonuçlanması durumunda diğer önemli parçalarında da malzeme değişikliğine gidilmesi ve alternatif yeni malzemelerin kullanımı için de çalışmalar başlatılmasının önü açılmış olacaktır.

MATERYAL VE METOD

Tasarım

Koltukların içerisinde bulunan tüm aparatlar ve parçalar belirlenmiştir, hafifletme için uygun sac parçaları kullanım yerine göre işlem fonksiyonunu kaybetmeden alternatif malzemeler belirlenmiş ve tasarımsal değişiklikler gerçekleşmiştir. Şekil 1'de gösterilmiş olan yolcu koltuklarının iskelet yapısı tekli iki ayaklı koltuk (a), ikili cam bağlantılı (b) ve üçlü cam bağlantılı (c) olacak şekilde tasarlanmıştır. CAD çizimleri bilgisayar ortamında gerçekleştirilmiştir. CAD çizimleri üzerinden malzeme seçimleri değiştirilerek ve tasarımda eskiye göre iyileştirmeler yapılarak koltuğun toplam ağırlığı bakımından hafifleştirme yapılmıştır. Tasarımı gerçekleşen koltukların prototip üretiminin gerçekleştirebilmek için kalıp tasarımı, kalıp imalatı ve ekipman aparat tasarımı da gerçekleştirilmiştir.



Şekil 1. Tasarımı gerçekleşen hafifleştirilmiş (a) Tekli iki ayaklı koltuk, (b) İkili cam bağlantılı koltuk, (c) Üçlü cam bağlantılı koltuk

Tasarıma Etki Eden Etmenler

Malzeme - Kesit Kalınlığı

Koltuk arkalık ve duvar bağlantı ekipmanı için yüksek mukavemet yapısı ve iyi kaynaklanabilir özelliğinden dolayı S420MC (DIN 1.0980) yapısal çeliği kullanılmaktadır. Yapısal çeliğin kimyasal bileşimi Tablo 1'de verilmiştir. Tablo 2'de de çeliğin mekanik özelliği verilmiştir.

Yanal saclar S420MC çeliğinden 3 mm kalınlığında üretilirken S500MC çeliği ile 2,5 mm kalınlığına düşürülmüştür. Tasarım olarak da değişiklik gerçekleştirmiştir. Duvar bağlantı braketi S420MC sacı ile 4 mm kalınlığında üretilirken, S500MC sacı ile kalınlık 2,5 mm'ye düşürülmüştür.

Tablo 1. S420MC Çeliğinin kimyasal bileşimi (%Ağ.) (Steel Number, 2022)

3mm'den sonra uzama (%)	19

Ağırlık olarak hafifletme yaparken parçaların mukavemetini de arttırarak hafifletme yapılması planlanarak aynı tür yapısal çelik olan S500MC (DIN 1.0984) alternatif kullanılarak koltuk arkalığı ve duvar bağlantı ekipmanının üretimi gerçekleştirilmiştir. S500MC çeliğinin kimyasal bileşimi Tablo 3'de verilmiştir. Ağırlığı fazla olan ekipmanlar belirlenerek ağırlık düşürme yapabilmek için kalınlıklarında değişiklikler yapılmıştır.

Tasarım Doğrulama

Tasarımı gerçekleşip kalıp tasarımı ve üretimi gerçekleştirdikten sonra ekipmanlarının toplanması ile prototip koltuk üretimi gerçekleşmiştir. Avrupa'ya bir aracın ticarileştirebilmek için koltuklarının, Avrupa Regülasyonlarına göre emniyet kemeri bağlantı noktaları dayanımı testi standardı olan UN ECE-R14 regülasyon sertifikasına sahip olması gerekmektedir. Test sırasında koltuktaki emniyet kemeri düğüm noktalarının test kuvvetlerini karşılaması gerekmektedir. Bu regülasyona göre ölçüleri belirli alt ve üst çekme aparatları ile statik yükler koltuğa uygulanmaktadır (Öztürk ve Şendeniz, 2014). Koltuktaki emniyet kemeri bağlantı noktaları çekme testi kuvvetlerini ve test sırasında koltuktaki emniyet kemeri düğüm noktalarının test kuvvetlerini karşılaması gerekmektedir. Alt ve üst çekme aparatları ile statik yükler koltuğa uygulanmaktadır. Alt ve üst piston kuvvetleri araç sınıfına göre değişmektedir.

M2 sınıfı araçlar için üst piston : 675 kg

M2 sınıfı araçlar için alt piston: 675 kg + (10 x kA)

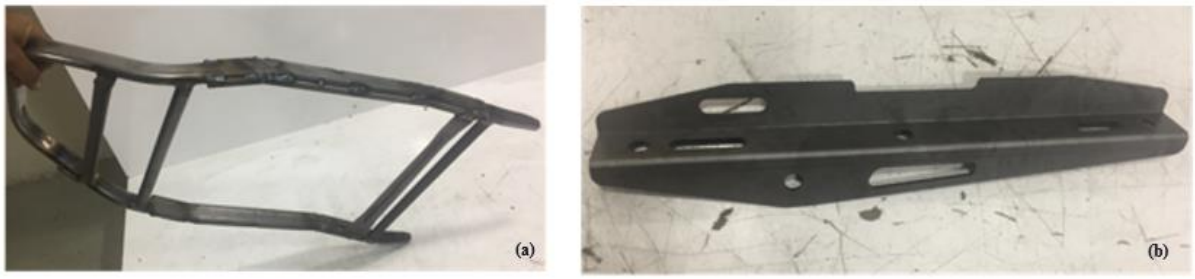
Minibüs koltuğu için tasarlanan yolcu koltuğu R14 testi, Pilot Taşıt Koltukları Ar-Ge Merkezi test laboratuvarında, üst piston çekme yükleri standart yüklerin yaklaşık %10 fazla olacak şekilde 743 kg ve alt piston 906 kg olarak belirlenip gerçekleştirilmiştir.

Validasyon testlerini gerçekleştirmek için pnömatik test cihazına ölçüm yapılacak koltuk test cihazına bağlanmıştır. Arkalığın dayanımını ölçmek için 150.000 tekrar olacak şekilde 300N yük koltuğun arka kısmına gelecek şekilde uygulanmıştır. Bu test ile koltuk arkalığında oluşabilecek kalıcı deformasyon tespit edilecektir. Oturak yanal sac dayanımı testi için de 120 kg yük altında 300.000 tekrar altında gerçekleştirilmiştir. Test için hazırlanan koltuk, belirli çevresel koşullarına göre sıcaklık ayarı yapılarak sıcaklığın ekipman üzerindeki etkisini görmek için iklim odası içerisinde sıcaklık dayanım testi yapılmıştır. Koltuk +40 ºC'de 17 saat sonrasında +70 ºC'de 7 saat %95 nem olan ortamda bekletilmiştir. Bu süreç 4 defa tekrarlanmıştır. Koltuk üzerinde sıcaklığa bağlı oluşabilecek deformasyonlar incelenmek istenmiştir.

Motorlu araçların içyapılarında birçok tekstil ürünü kullanılmaktadır. Bu malzemelerin tutuşabilme, yatay veya dikey yanma hızı ve erime davranışları gibi çeşitli yanma davranışları Avrupa regülasyonlarına göre ECE 118 düzenlemelerine uygun olmak zorundadır. Koltuk süngerine ECE R118.02 standardına uygun Annex 7 yanma testi, Annex 6 yatay yanma ve Annex 8 dikey yanma testi uygulanmıştır.

BULGULAR VE TARTIŞMA

Tasarımı gerçekleştirilen yolcu koltuğunun prototip üretimi gerçekleştirilmiştir. S420MC çeliği ile MS500MC çeliği karşılaştırıldığında, kimyasal bileşimlerinde bir farklılık olmadığı halde (Mn değerinde %0.1'lik artış) mekanik özelliklerinde iyileşmeler gözlenmiştir. Arkalık sacı S420MC ile üretildiğinde sacın ağırlığı 4,46 kg gelirken, S500MC ile üretildiğinde 3,95 kg olarak ölçülmüştür. Duvar bağlantı braketi S420MC sacı ile 4 mm kalınlığında üretilirken, S500MC sacı ile kalınlık 2,5 mm'ye düşürülmüştür.



Şekil 2. (a) Hafifletilmiş arkalık, (b) Hafifletilmiş duvar bağlantı braketi

Oturak yanal sacı S420MC çeliğinden 3 mm kalınlığında üretilirken S500MC çeliği ile 2,5 mm kalınlığına düşürülmüştür. Tasarım olarak da değişiklik gerçekleştirmiştir (Şekil 3). Toplam ağırlığı 2,42 kg olarak ölçülmüştür.

Şekil 3. Yeni tasarlanan oturak yanal sacı görüntüsü

Aracın toplam ağırlığının düşürülmesi ve kazançların sağlanmasıyla birlikte olumsuz şartlarda yolcunun negatif yönde minimum etkilenmesi için hayati önem taşıyan emniyet kemerleri bağlantı noktalarının dayanımı testi (UN ECE R14) yapılmıştır. Koltuğun testi başarı ile geçebilmesi için deney sırasında; koltuk parçalarının, bağlantılarının veya aksesuarlarının hiçbirinin tamamen ayrılmamalıdır. Birkaç bağlantı kısmen kopsa ve bütün kilitleme sistemleri kilitli kalsa bile, koltuk platforma bağlandığı haliyle kalmalıdır. Ayrıca koltuğun üzerinde bulunan aksesuarların veya parçaların herhangi birinde yaralanmaya sebep olabilecek keskin, sivri kenar oluşmamalıdır. Test sonucunda koltukta oturan yolcunun yönetmelikçe belirlenen kriterlere göre ciddi olarak yaralanmaması gerekmektedir. Şekil 4'deki gibi koltuk test cihazına bağlanmıştır. UN ECE R14 standardına uygun çekme testi için üst piston çekme yükü 743 kg ve alt piston 906 kg olarak belirlenmiştir. Koltuk hareketinde belirlenen standart deplasman mesafesinden daha az yer değiştirme görülmüştür. Tasarım çekme testini başarı ile geçmiştir.

Şekil 4. Emniyet kemeri çekme dayanımı testi ECE R14'ün uygulama görüntüsü

Validasyon testlerini gerçekleştirmek için pnömatik test cihazında ölçüm yapılmak üzere uygun şekilde koltuk test cihazına bağlanmıştır (Şekil 5). Arkalığın dayanımını ölçmek için 150.000 tekrar olacak şekilde 300N yük koltuğun arka kısmına gelecek şekilde uygulanmıştır. Test öncesi arkalığın yerleştirildiği platformda kolona uzaklığı 19 cm ölçülmüş test sonrası arkalığın kolona olan uzaklığın 19,1 cm civarında olduğu görülmüştür. Kuvvetin uygulandığı noktada kalıcı deformasyonun 20 mm veya altı olması gerektiğinde ve koltuk test sonrası işlevselliğini kaybetmemesinden dolayı test başarılı sonuçlanmıştır.

Şekil 5. (a) Arkalık dayanım testi öncesi, (b)Arkalık dayanım testi sonrası koltuk görüntüsü

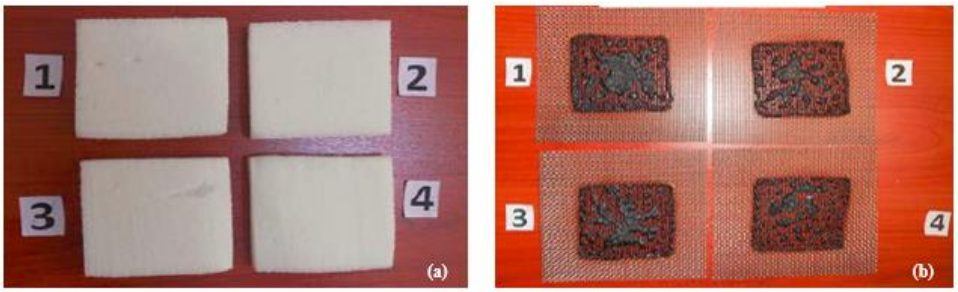
Oturak yanal sac tutucunun dayanım testi için 120 kg yük altında 300.000 tekrar altında gerçekleştirilmiştir. Test sonucunda yapılan incelemelerde oturak tutucu sac yüzeyinde herhangi bir deformasyon oluşumu gözlenmemiştir.

Şekil 6. Oturak tutucu saç dayanım testi

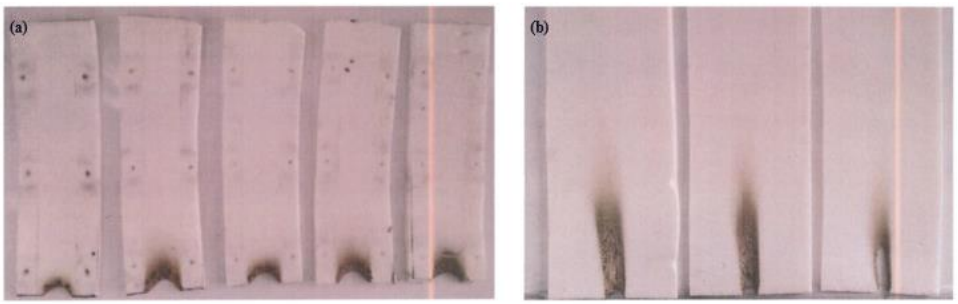
İklimlendirme odası içerisinde sıcaklık dayanım testinde koltuk +40 ºC'de 17 saat sonrasında +70 ºC'de 7 saat %95 nem olan ortamda bekletilmiştir. Bu süreç 4 defa tekrarlanmıştır. Test tamamlandığında koltukta herhangi bir renk değişimi, yırtık ve yanma davranışı görülmemiştir. Koltukta deformasyona rastlanmamıştır.

Şekil 7. İklimlendirme odasında (a) Sıcaklık dayanım testi öncesi koltuk görüntüsü, (b)Sıcaklık dayanım testi sonrası koltuk görüntüsü

Koltuğun süngerinin tutuşabilme, yatay veya dikey yanma hızı ve erime davranışları gibi çeşitli yanma davranışları ECE R118.02 Annex 7 yanma testi Şekil 8'de erime testi öncesi ve erime testi sonrası görüntüleri verilmiştir. ISO 3795 standardına uygun, 13mm kalınlığına sahip beş adet 356 x 100 x 12.5mm'lik numune, U şeklindeki bir tutucuya monte edilmiştir ve bir yanma odasında 15 saniye boyunca iyi tanımlanmış ve düşük enerjili aleve maruz bırakılır. Alev numunelerin serbest ucuna uygulanmaktadır. Çıkan sonuçlar doğrultusunda yanmazlık testini başarı ile geçmiştir. Annex 6 yatay yanma ve Annex 8 dikey yanma testi test öncesi ve sonrası görüntüleri Şekil 9'da verilmiştir. Yanma görüntülerinde ve sonuçlarında herhangi bir uygunsuzluk bulunamamıştır.



Şekil 8. ECE R-118.02 Annex 7 erime davranışı (a) erime testi öncesi, (b) erime testi sonrası



Şekil 9. Sünger yanmazlık testi ECE R-118.02 (a) Annex 6 yatay yanma testi, (b) Annex 8 dikey yanma testi

SONUÇ

Yolcu taşımada kullanılan minibüsler için koltuk hafifletme ve maliyeti düşürme çalışmaları kapsamında ekipman malzemelerini ve et kalınlıklarını revize ederek koltuk güvenlik ve konfor standardını sağlayarak yenilikçi koltuklar geliştirilmiştir. Tasarımı başarı ile gerçekleşen koltukların prototip üretimi gerçekleşmiştir. ECE Avrupa Regülasyonlarına göre R14 standardındaki emniyet kemeri bağlantı noktaları dayanım testi başarı ile sonuçlanmış ve standarda uygunluğu belgelenmiştir. Validasyon testlerinden arkalık dayanım testinde kalıcı deformasyonun 20 mm sınırı sağlanmıştır. Koltuk üzerine uygulandığında herhangi bir çatlak, kırık veya deformasyon gözlenmemiştir. Aynı zamanda koltuk, toplamda 96 saat 40 ºC ve 70 ºC'de bekletildiğinde koltuk yüzeyinde renk değiştirme veya deformasyon gözlememiştir. Koltuğun süngerinin yanma davranışı testleri sonucunda koltuk süngeri başarı ile testten geçmiştir. Bunun sonucunda ekipmanların S420MC çeliği yerine ekipman et kalınlığının düşürülmesine karşın alternatif olarak S500MC çeliği kullanılabilirliği onaylanmıştır.

TEŞEKKÜR

Projemiz Pilot Taşıt Koltukları Ar-Ge ve Tasarım Merkezi kapsamında yürütülen ve başarı ile tamamlanan bir projedir. Bu doğrultuda projede emeği geçen tüm personellere ve prototip-test merkezinin kullanım imkanı sağlayan Pilot Taşıt Koltukları A.Ş. ailesine teşekkür ederiz.

Abstract

In this study; it is intended to encapsulate peppermint oil by molecular encapsulation for use in aromatherapy. For this purpose, inclusion complexes of peppermint essential oil with beta cyclodextrin were formed. Characterization studies of the obtained complexes were carried out with Scanning Electron Microscopy (SEM), Differential Scanning Calorimeter (DSC) Analysis and Gas chromatography (GC-MS) analyzes. The complexes in powder form were applied to 100% cotton fabric with impregnation method and the resistance of the fabrics to 5 washings was examined. According to the analyses made, it has been seen that complexes containing peppermint oil can be used especially in areas where it is desired to give a pleasant smell and relaxing effect.

Keywords: Peppermint oil, cyclodextrin, cotton, essential oil, fragrant textiles

INTRODUCTION

Mint is a well-known natural herb that grows in most countries with different climates. The peppermint plant contains more than 40 different chemical compounds (including menthol, menthone, and menthyl acetate), and its consumption safety has been proven by studies. Members of the mint genus are characterized by essential oils of great economic importance, used by the flavor, fragrance and pharmaceutical industries. This herb is used in folk remedies and traditional medicine for its antitumor and antimicrobial properties, chemopreventive potential, kidney movements, antiallergenic effects, as well as for reducing cramping, digestive complaints, nausea, for the treatment of digestive disorders, diarrhea and nervous system actions. widely used. Mint preparations include leaves, leaf extracts and water, although the plant is mainly grown for its essential oil, which is distilled from freshly picked leaves (Meamarbashi, 2014; Loolaie et al., 2017; McKay and Blumberg, 2006; Grigoleit and Grigoleit, 2005). Peppermint oil has found wide application in the pharmaceutical, food and cosmetic industries. Peppermint oil contains a rich amount of pulegon. Pulegon is a monoterpene, hepatotoxic and pneumotoxic (Özgüven and Kırıcı, 1999; Chan, 2001).

The stability of essential oils can be increased using molecular encapsulation technology. Since essential oils are adversely affected by external factors under normal conditions, the effects of the properties they contain are limited. For this reason, oils should be stored in a cavity in order to reduce their volatile properties and increase their long-term use. For this purpose, cyclodextrins appear as one of the methods used. Supramolecules are complexes formed by the combination of two or more molecules, ions or coordination compounds with different properties through intramolecular interactions. Most of these interactions are of the host and guest type. In supramolecular chemistry, host molecules are lattice compounds such as cryptands, crown ethers, calixerenes, cyclophans and cyclodextrins (CD). The most important of these host molecules are cyclodexrins (Avcı, 2010). Cyclodextrins are produced industrially as a result of the degradation of starch by the enzyme transglycosylase produced by many micro-organisms (eg, Bacillus macerans). Cyclodextrins are annular and the annular structure resembles a truncated cone (Dodziuk, 2006; Douhal, 2006; Türkoğlu et al., 2022; Szejtli, 1988).

Cyclodextrins can form inclusion complexes with different molecules thanks to their special chemical molecular structures. The most distinctive features of cyclodextrins are their ability to form inclusion complexes (host-guest) with many different types of solid, liquid or gaseous compounds. In these complexes, the guest molecule is held by the cyclodextrin (host) cavity (Akçakoca, 2006).

In this study, peppermint oil is intended to be encapsulated in b-cyclodextrin. B-CD: mint structure inclusion complexes were formed at 3 different concentrations and SEM images were taken. As a result of the images obtained, the optimum inclusion complex was transferred to the cotton fabrics by the impregnation method. In order to examine the washing resistance of the transferred complex, it was subjected to 5 washings. SEM and GC analyzes were performed before and after washing. Also, the whiteness values of the fabrics before and after the application were calculated.

MATERIALS AND METHODS

In this study, 100% cotton fabric (200 g/m^2 and warp/weft yarn density of 25/22 yarns/cm) was used. Within the scope of the study, commercial peppermint oil was used as the internal phase. Peppermint oil was obtained from Ephesus Spice and Essential Oil. β -CD (1134.98 g/ mol) was supplied by Sigma-Aldrich, USA as a host molecule. The organic solvent ethanol was supplied from Merck, Darmstadt, Germany. The formaldehyde-free and acrylic based cross-linking agent was acquired from Maiturk, Bursa, Turkey. All other auxiliary chemicals used in the study were of laboratory-reagent grade.

Kneading method was used for molecular encapsulation of peppermint oil. Porcelain pestle was added to β-CD in powder form, which was weighed at the rates determined for the preparation of the product. After adding the active ingredient solution prepared with ethyl alcohol to β-CD, it was mixed until the solvent evaporated. The resulting paste was kept at room temperature until it dried. The inclusion complex was prepared in three molar ratios 1:1, 1:2 and 1:3 host–guest molar ratio, respectively.

The morphologic properties of the inclusion complexes were evaluated using scanning electron microscopy (SEM-Quanta 250 FEG). Samples were gold-coated (15 mA, 2 min) to assure electrical conductivity. The images were taken at 250×magnifcation.

DSC was performed using a Perkin-Elmer diamond differential scanning calorimeter for the purpose of distinguishing the complex formation from the simple physical mixture with the help of characteristic endothermic or exothermic peaks. The analyses were conducted in nitrogen medium between 0 and 300oC. The scanning rate was stated as 5°C per minute. The phase change enthalpies and uncomplexed active substance ratios of the samples obtained in molecular encapsulation studies were calculated in the DSC device (Taneri 2004).

$$\text{Uncomplexed Active Ingredient (\%)} = \left(\frac{\Delta Hi}{\Delta Ho.c}\right).10^4 \quad (1)$$

In the equation, ΔHi represents the normalized integral data of the product, and ΔHo represents the normalized integral data of the active substance. The percentage of active ingredient in cyclodextrin is given by c. The percentage of complexation of the capsules was calculated based on the ratio of uncomplexed active substance.

The application of the selected ideal formulation to the fabric was carried out according to the table given below (Table 1).

Table 1. Recipe for transferring inclusion complex to fabric

Inclusion complex (g/l)	Binder (g/l)	AF (%)	Drying and Fixation	
			Temperature (°C)	Time (min)
40	50	85	120	7

After inclusion complex application, the fabrics were washed washed for 5 cycles with 4 g/l ECE nonphosphate reference detergent (A) at 40°C for 30 minutes according to ISO 105-C06:2010.32 The fabrics were rinsed then dried in laboratory conditions.

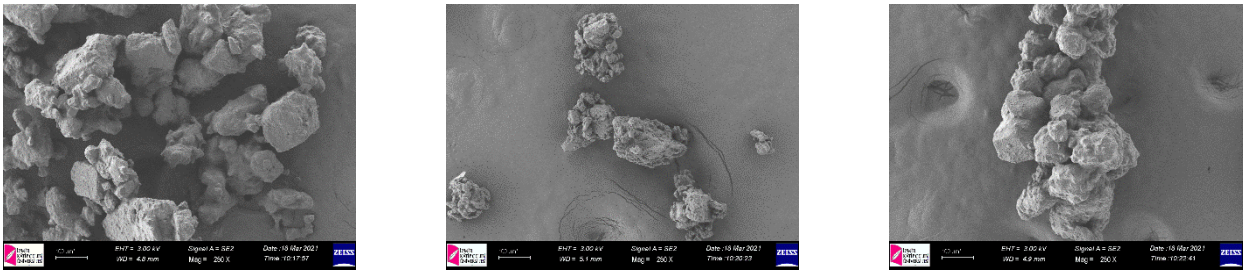
SEM images were taken to obtain the existence of capsules on the textile surface from both washed and unwashed samples. The images were taken at 250×magnifcation. Gas chromatography (GC) is a common type of chromatography used in analytical chemistry for separating and analyzing compounds that can be vaporized without decomposition. The fabrics were extracted to analyze the contents of the capsules containing peppermint oil transferred to the fabrics. For GC analysis, Algient brand GC / MS + head space device was used. The

temperature is set from 100 to 325°C at a rate of 5 °C/min. Helium was used as the carrier gas with a flow rate of 20 ml/min, split ratio of 1:50.

The whiteness values of the fabrics before and after the application were calculated with a Minolta CM-3600d brand spectrophotometer according to the Stensby formula.

RESULTS and DISCUSSION

In this study, inclusion complex were successfully prepared by kneading method. SEM images for microparticles produced by using chosen formulas which were 1:1, 1:2 and 1:3, are given in Figure 1. These particles are compact, do not show observable fractures, cracks or pores and have nonspherical random shapes.



1:1 **1:2** **1:3**

Figure 1. SEM images of inclusion complexes

The SEM of 1:3 showed a more uniform particle size distribution and there was bigger gaps between the particles than the other ratios, thus suggesting good redispersibility. The sizes of particles which is 1:3 are determined to be between 5 and 35 µm, whereas the particles of 1:1 and 1:2 are between 50 and 135 µm, approximately.

DSC phase change enthalpies were calculated according to the given equation in Table 2.

Table 2. Complexing amounts of samples containing peppermint oil

Inclusion complex	Complexing amount (%)
1:1 β-CD: peppermint oil	90.48
1:2 β-CD: peppermint oil	93.55
1:3 β-CD: peppermint oil	98.35

When the complexation rates of the capsules containing peppermint oil were examined, it was determined that the active substance was successfully encapsulated for all ratios. According to the calculations in Table 2, it was determined that the highest complexing rate was between 98.35% and 1:3 in capsules containing β-CD: peppermint oil. It was determined that the capsules produced at 1:1 and 1:2 ratio were also complexed at a high rate of 90.48% and 93.55%, respectively.

From all the data acquired, the optimum complex concentration was determined, which are 1:3 for β-CD: peppermint oil and the inclusion complex was transferred to cotton fabrics by impregnation method.

SEM images of cotton fabrics which were obtained β-CD: peppermint oil inclusion complex, were indicated at Figure 2.

	Inclusion Complex Transferred	After 5 washing
250x		
Figure 2. SEM photomicrographs of cotton fabrics treated with peppermint oil complex with no wash and after 5 washing

These images showed that β-CD application were succeeded with impregnation method. It was observed that complexes were fixed onto the textile surface. Also, the effect of repeated washings on capsules was evaluated. Capsules on the textile surface and also embedded in the binder were observed even after 5 washes.

The GC analysis results of fabrics transferred to inclusion complex containing peppermint oil and the same samples after 5 washes were shown in Figure 3.

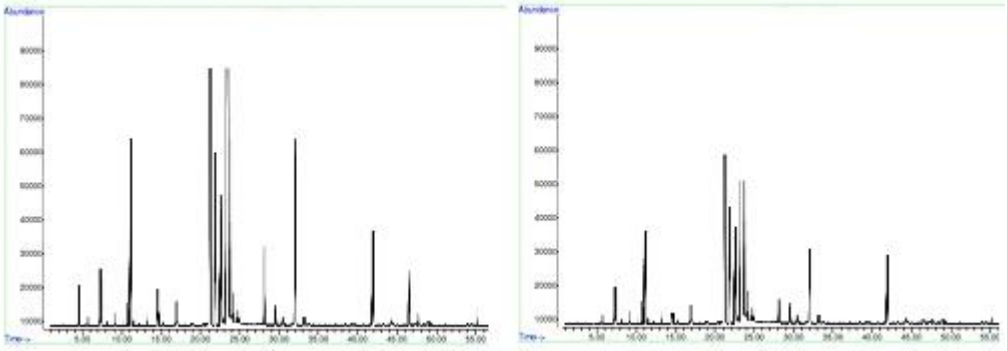


Figure 3. GC diagrams of peppermint inclusion complex transferred fabrics and after 5 wash

The constituents of peppermint oil were inspected using GC–MS. As a result of GC analysis, the analysis revealed more than 23 constituents representing 90.35% of the total oil and menthol, menthone and eucalyptol are its major constituents. When compared with the literature, it is seen that specific peaks of peppermint oil are determined at GC diagrams (Hawryl et al., 2015). It was found that some of these peaks were decreased after 5 washes, but significant peaks were remained. It is observed that the oils transferred on the fabric in capsule form protect their existence after washing.

Table 3. Yellowness-whiteness values of complex transferred fabrics by spectrophotometer

Fabrics	**Yellowness (ASTM D 1925)**	**Whitness (Stensby), (D-65°)**
Raw Fabric	8.535	85.485
Peppermint:β-CD	4.483	84.485
Peppermint:β-CD (after 5 washing)	5.935	84.350

The yellowness-whiteness values of the unwashed and 5 washed samples of the fabrics on which peppermint oil-β-CD inclusion complexes were transferred were calculated with a Minolta CM-3600d brand spectrophotometer according to the Stensby formula. When Table 3.3 is examined, no big difference is observed in the yellowness-whiteness values of the complex transferred fabrics.

CONCLUSION

Within the scope of this study, cotton fabric was developed by molecular encapsulation of peppermint oil with different ratios as 1:1, 1:2 and 1:3. After SEM and DSC analysis, 1:3 ratio were selected as optimum formulation for inclusion complex and then transferred to the cotton fabirc with impregnation method. The capsules remained on the fabric and have been able to maintain the fragrant effect at a certain rate after 5 washes. The yellowing degrees of the complex transferred fabrics were examined and it was observed that the application process did not cause a significant yellowing in the textile material. It was concluded that the application of inclusion complexes prepared with β-CD on textile surfaces will not cause yellowing on the fabric surface. According to the analyzes made, it has been seen that complexes containing peppermint oil can be used especially in areas where it is desired to give a pleasant smell and relaxing effect. It is expected that the service life of the textile material to be transferred will increase thanks to the long-term pleasant smelling effect in the products that can be used.

Özet

Çiftlik hayvanlarında topallık hareket esnasında ağrı duyulmasına neden olan sağlık problemidir. Topallık enfeksiyöz ve enfeksiyöz olmayan ajanlar, yanlış besleme uygulamaları, zayıf konformasyon, büyüme hızı, altlık kalitesi veya yaralanma gibi çeşitli faktörlerden kaynaklanabilir. Çiftlik hayvanları yetiştiriciliğinde ciddi bir refah problemi olarak kabul edilen topallık, hareket zorluğuna, ağrı ve acı duyulmasına, yem ve su tüketiminin azalmasına, oyun ve dinlenme gibi temel davranışlarını gerçekleştirememesine neden olarak yaşam kalitesinin düşmesine yol açmaktadır. Topallık, hayvancılık endüstrisine maliyeti açısından mastitisten sonra ikinci sıradadır. Kanatlı yetiştiriciliğinde ise, Avrupa'daki etlik piliç sürülerinin yaklaşık %10-30'luk kısmının çeşitli kemik ve eklem problemlerine bağlı olarak topallığa bağlı acı çektiği tahminlenmektedir. Performans ve refah üzerine olumsuz etkilerinden dolayı, topallık hayvancılık endüstrisinde en önemli hayvan refahı problemleri arasında yer almakta ve ciddi ekonomik kayıplara neden olmaktadır. Ekonomik kayıplar hem tedavi maliyetlerindeki hem de üretim kayıplarındaki artıştan kaynaklanmaktadır. Gerekli önlemler alınmadığı veya tedavi uygulanmadığı durumlarda, topallık hayvanların itlaf edilmesine veya ölümüne yol açabilmektedir. Dolayısıyla gerekli önlemlerin alınması ve topallık belirtileri gösteren hayvanlara zamanında müdahale edilmesi kuşkusuz hayvan refahı ile ilgili yasal yükümlülüğün bir parçasıdır. Bu noktada, topallığa zemin hazırlayan predispozan faktörlerin bilinmesi, kayıpları en aza indirmek ve refah üzerindeki olumsuz etkileri azaltmak için yetiştiriciye fırsat sağlar. Bu amaçla rutin olarak toplanan sürü sağlığı izleme verileri topal olma riski yüksek olan hayvanları belirlemek ve topallık kontrol stratejileri uygulamak için kullanılabilir. Bununla birlikte sürüde topallık puanlama sistemlerinin kullanılması ve sürekli takibi, topal hayvanların yüzdesinin kademeli olarak artmasını önleyecektir. Topallığın azaltılması yetiştiricilere azalan süt üretimi, potansiyel kısalan üretkenlik ömrü ve tedavi maliyetleri açısından önemli ölçüde ekonomik olarak fayda sağlayacaktır. Etlik piliç yetiştiriciliğinde ise alternatif besleme programları ve yönetimsel uygulamalar ile muhtemel bacak problemlerine bağlı topallığın en aza indirilmesi büyük önem taşımaktadır.

Welfare and Lameness in Farmed Animals

Abstract

Lameness is a health problem causes pain during movement in farm animals. This problem could be caused by many factors, including infectious and non-infectious agents, improper feeding practices, poor conformation, growth rate, litter quality, or injury. Lameness, that is considered as a serious welfare problem, leads to decrease life quality of animals' by causing difficulty in movement, pain, and suffering, decline in feed and water consumption, and inability to exhibit basic behaviors such as playing, resting. It ranks at second after mastitis in terms of cost to the livestock industry. In poultry production, it is estimated that approximately of 10-30% of broiler flocks raised in Europe suffer from lameness induced by bone and joint problems. Due to its negative effects on performance and welfare, lameness is one of the most important welfare problems and causes serious economic losses. Economic losses are derived from increment both treatment costs and production losses. In the absence of necessary precautions or treatment applications, lameness could result in culling of animals or death. Therefore, taking effective precautions and timely responding to animals showing signs of lameness is undoubtedly a part of the legal obligation regarding animal welfare. At this point, knowing the predisposing factors for lameness provides an opportunity to producers to minimize the losses and the negative effects on welfare. For this, routinely collected flock health monitoring data could be used to identify the animals with high risk and apply

the lameness control strategies. However, the usage of lameness scoring systems and continuous monitoring of animals will prevent to gradual increase of the percentage of lame animals. Reducing of lameness will provide to producers with significant economic benefits in terms of milk production reduction, potentially shortened productive life, and treatment costs. In broiler production, minimizing the lameness due to possible leg problems with alternative feeding systems, and management practices have crucial importance.
Keywords: lameness, welfare, productivity, broiler, cattle, small ruminant

GİRİŞ

Ruminant hayvanlarda ayak hastalıkları %20'nin üzerinde prevalans göstermekte ve bu hastalıklar hayvanlarda hem et ve süt verimi hem de üreme performansını olumsuz etkileyerek ciddi ekonomik kayıplara yol açmaktadır (Eze, 2002; Clarkson ve ark., 1996). Bunun nedeni esas olarak, hayvanın hareketini etkileyen ayak sorunlarının neden olduğu ağrıdır (Flower ve Weary, 2009). Topallık prevalans oranlarındaki farklılıklar da barınak ve yönetim koşulları, topallık skorlama yöntemleri ve kullanılan eşik skorları ile ırkların topallığa duyarlılığındaki farklılıklardan kaynaklanır (Sarjokari ve ark., 2013). Ekonomik ve refah sonuçları üzerindeki etkisinden dolayı topallık, hayvancılık endüstrisi için en önemli hayvan refahı ve ekonomik kaygı sebeplerinden biri olarak kabul edilmektedir. Topallık, hayvancılık endüstrisine maliyeti açısından mastitisten sonra ikinci sıradadır (Huxley, 2012). Ekonomik kayıplar hem tedavi maliyetlerinden hem de azalan üretimden kaynaklanmaktadır (Winter ve Green, 2017). Ruminantlarda görülen topallıkların %90'ının sebebi ayak ve tırnak deformasyonlarıdır (Clarkson ve ark., 19996). Özellikle meradan uzun süre uzak kaldıklarında tırnaklarda aşırı ve düzensiz uzamalar görülmektedir. Bununla birlikte hatalı tırnak kesimi de hayvanlarda ağırlığın tırnaklara dengesiz dağılımına neden olarak tırnak deformasyonlarına yol açmaktadır. Bu nedenle düzenli tırnak bakımı ve yılda iki kez yapılması gereken ayak banyosu ayak hastalıklarının önlenmesinde çok önemli bir yer tutar (Ermutlu ve Kaya, 2016). Aşırı büyümüş tırnakların kıvrılarak ayaklara batmasında, ayak altı lezyonlarının tedavisinde formalin, çinko sülfat veya çinko sülfat gibi antiseptik solüsyonlarda ayak banyosu yapılması tedavi ve kontrol için yaygın olarak kullanılan yöntemlerdir (Marshall ve ark., 1991). Dinlenme alanlarında gübre ve idrar birikmesinden kaynaklı kötü hijyen, tırnakları topallığa yol açan çeşitli lezyonlara yatkın hale getirdiğinden hayvanların bulunduğu zeminin temiz ve kuru olması da hayati öneme sahiptir (Greenough ve ark., 1997). Ayrıca besleme hataları, enfeksiyonlar, gebelik, hayvanın yaşı ve ağırlığı ile mevsimsel değişiklikler de ayak hastalıklarının oluşumunda büyük önem arz etmektedir (Yurdakul, 2018; Polat, 2022). Modern etlik piliç üretiminde topallık neden olduğu ağrı ve acı hissinden dolayı ciddi bir refah problemi olarak kabul edilmektedir (Kapell ve ark., 2012). Sürüde topal olan piliçler kümes içerisinde hareket zorluğuna bağlı olarak yem ve suya erişimde kısıtlama yaşamaktadır (Weeks ve ark., 2000). Bununla beraber, topallık toz banyosu, eşelenme, yürüme gibi diğer doğal davranışları da olumsuz yönde etkilemektedir (Weeks ve ark., 2000). Etlik piliçlerde refah üzerine olumsuz etkilerinin yanı sıra, topallık aynı zamanda dönem sonu canlı ağırlıkta düşüşe (Gocsik ve ark., 2014), mortalite artışına (Wideman ve ark., 2012), dolayısıyla da üretici kazancında kayıplara neden olan ciddi bir problemdir. Yapılan bir araştırmanın sonucunda, 2010 yılı için ABD'de etlik piliç üretiminde topallığa bağlı kayıpların 80 milyon ile 120 milyon dolar arasında olduğu tahmin edilmiştir (Yousaf ve ark., 2021). Topallık tedavi edilmezse, hayvan sağlığını ve refahını tehlikeye atmanın yanı sıra hayvanların itlaf edilmesine veya ölümüne yol açabilen tehlikeli bir hastalıktır. Bu nedenle hem ruminant hem de kanatlı sürülerinde refah değerlendirme protokollerinde hayvan temelli ölçütlerden biri olarak topallık en önemli kriterlerden biridir. Hayvanlarda çiftlikte hareketlilik puanlaması uygulaması, sürüdeki hayvanların durumunu değerlendirmede yararlı bir araçtır (Archer ve ark., 2010). Puanlamanın sonuçları, eylem planlarını formüle etmek, tedavi listeleri oluşturmak ve sürü düzeyinde topallığı izlemek için kullanılabilir. Böylece rutin olarak toplanan sürü sağlığı izleme verilerinden topal olma riski yüksek olan hayvanların belirlenmesinde ve topallık kontrol stratejilerinin oluşturulmasında yararlanılabilir.

Bu derlemede ruminantlarda ve etlik piliç yetiştiriciliğinde topallığın önemi, sebepleri, puanlama yöntemleri ve refah ile ilişkisi ele alınmıştır.

Sığırlarda Topallık

İneklerin yaklaşık %50'sinin üretken yaşamları boyunca topallıktan etkileneceği tahmin edilmektedir. İneklerde topallık ile ilişkili risk faktörleri arasında yatma davranışı, diz lezyonları, yetersiz durak boyutları, yetersiz veya düşük kaliteli yataklar, kaygan yürüme yüzeyleri ve ayakların çamura maruz kalması sayılabilir (Dembele ve ark.,

2006; Sadiq ve ark., 2017). Ayrıca yüksek verimli ineklerin topallık geliştirmeye daha yatkın olduğu (Alawneh ve ark., 2014), buzağılamada düşük vücut kondisyon skorunun ve buzağılamadan sonra aşırı vücut kondisyon kaybının daha yüksek topallık riski taşıdığı, ineğin yaşının ve laktasyon sayısının artmasının topallığa yatkınlığını artırdığı bilinmektedir (Rutherford ve ark., 2009; Green ve ark., 2016). Bununla birlikte ineklerde topallık açısından genellikle sürü düzeyindeki risk faktörleri olarak durak yüzeyi ve yataklık derinliği de dikkate alınmaktadır (Cook ve Nordlund, 2009). Derin yataklıklı bölmelerde barındırılan ineklerde topallık prevalansının, kauçuk yataklı bölmelerde barındırılan ineklere kıyasla daha düşük olduğu bildirilmiştir (Cook ve ark., 2004). Dışkı kontaminasyonu olan bölmelerin artması topallık riskini artırmaktadır. Büyük sürülerde ahırlarda derin yataklık kullanılması ve sağımhaneye giden yollar ile meraya erişim arasındaki yollarda kauçuk kaplı zeminler topallığa karşı koruyucu bir etki yapmaktadır (Chapinal ve ark., 2013). Meraya erişim, ineklerin hareket kabiliyeti üzerinde yararlı bir etkiye sahiptir. Genel olarak, merada tutulan ineklerde topallık sorunu gelişme olasılığı daha düşüktür (Onyiro ve ark., 2008). Normalde bölmelerde barındırılan inekler için mera otlatma dönemi, özellikle klinik olarak topal sığırlarda, hareket skorlarında iyileşmelerle sonuçlanır (Haskell ve ark., 2006). Diğer yandan mera koşullarında yetiştirilen süt sığırlarının katettikleri mesafenin çok uzun olması ve hareket etmeye zorlandıkları yol ve hız topallık risk faktörüdür. Bununla birlikte merada bulundukları dönemin yağışlı olması tırnakları daha yumuşak ve yaralanmaya karşı daha duyarlı hale getirmektedir. (Ranjbar ve ark., 2016). Topallık kaynaklı ağrı; hareketin azalmasına ve potansiyel olarak daha az yem ve su tüketimine neden olarak ineklerin vücut kondisyonunun azalmasına yol açar (Juarez ve ark., 2003). Ağrı ayrıca ineğin duygusal durumunu doğrudan olumsuz etkileyerek beslenmenin yanı sıra dinlenme ve serbestçe hareket etme gibi türe özgü davranış özelliklerini göstermesini engeller. Dolayısıyla ayak rahatsızlıklarından kaynaklanan işlev bozukluğu düşük süt verimi ve düşük doğurganlıkla sonuçlanır (Algers ve ark., 2009). Sürüde topal ineklerin saptanmasıyla ayak hastalıklarının şiddeti ve yaygınlığı saptanabilir. Topal ineklerin saptanmasında farklı yöntemler kullanılmaktadır. Bununla birlikte ayak bozuklukları ile ilişkili ağrıyı değerlendirmek için hareket skorlaması en sık kullanılan araçtır (Flower ve ark., 2008). Sprecher ve ark. (1997)'nın geliştirdiği skorlama yöntemi topallığın şiddetini hızlı, kolay ve doğru olarak saptamadaki kullanışlılığı nedeniyle oldukça kabul görmüştür. Bu skorlama sırasında; ineğin yürüme şekline, yürürken ayak üzerine ağırlığını verme durumuna ve ayakta dururken sırtının şekline göre değerlendirme yapılmakta ve ineklere 1'den (normal yürüyüş) 5'e kadar (çok topal: hareket etmeye isteksiz) bir topallık puanı verilmektedir. Yürümesi normal olan fakat ayakta dururken sırtı düz yürürken kamburlaşan hayvan hafif topal (2 puan), hem ayakta dururken hem de yürürken sırtı kamburlaşan ve yürürken kısa adım atan hayvanlar orta topal (3 puan), hem ayakta dururken hem de yürürken sırtı kamburlaşan ve yürürken bir veya daha çok ayak üzerine basamayan hayvan topal (4 puan) olarak nitelendirilir. İneklerde bu 5 ölçütlük puanlama sistemi, "normal yürüyüş"ten hafif farklılıkların ayırt edilmesine olanak sağlayan ve bu nedenle gelişmekte olan topallığın daha erken tespit edilmesini kolaylaştırabilen bir "düzensiz yürüyüş" kategorisi içermektedir. Juarez ve ark. (2003) topallık puanının 1'in üzerinde olmasının topallığın bir göstergesi olarak değil bireysel veya grup düzeyinde topallığın nedenlerinin saptanması ve tedavi yapılması için bir fırsat olarak değerlendirilmesi gerektiğini bildirmişlerdir.

Koyun ve Keçilerde Topallık

Topallık, ergin koyun ve keçilerin yanı sıra genç ve büyümekte olan kuzu ve oğlakları da etkileyen dünya çapında önemli bir sorundur. Topallığın varlığı veya yokluğundan herhangi bir üretim grubu etkilenebileceğinden hayvan refahı protokolüne dahil edilecek iyi bir gösterge olarak kabul görmüştür. Topallık hayvan refahını tehlikeye attığından topal hayvanların hızlı bir şekilde tespit edilmesini ve tedavi edilmesini kolaylaştırmak için hayvanların topallık durumunun hızlı ve güvenilir bir şekilde tespit edilebilmesi önemlidir. Topallığın sürüde ≤ %5 ve ≤ %2 olması hedeflenir (FAWC, 2011).

Küçükbaş hayvanlarda topallığın en yaygın nedeni ayak çürüklüğüdür (Conington ve ark., 2010). Hastalık, havasız ortamda hızlıca çoğalan *Dichelobacter nodosus* tarafından oluşturulur. Sürülerin >%90'ında bulunur ve topallığın yaklaşık %70'ine neden olur (Winter ve ark., 2015). Ayak çürüklüğü yaşayan koyun ve keçilerde lezyonlar dört ayakta birden görülebilir. Eğer hastalık tek ayakta mevcutsa hayvan o ayağını yere basmamaya çalışır, her iki ön ayakta ise ön dizleri ile yürümeye çalışır, dört ayakta ise hayvanların hareket etmek istemedikleri ve ayağa kalkamadıkları gözlenir. Ayak çürüklüğü bulaşıcı olabileceğinden, yaygınlığı azaltmak için en iyi strateji, erken teşhis ve müteakip tedavidir (Kaler ve Green, 2008). Koyun ve keçileri ayak çürüklüğüne karşı düzenli aşılama ve yeni koyunları 3 haftadan fazla karantinaya alma daha düşük topallık prevalansı ile sonuçlanmaktadır (Winter ve

ark., 2015). Bulaşıcı koyun dijital dermatiti (CODD), sürülerin %35-60'ında bulunan bir başka enfeksiyöz topallık nedenidir ve sürülerdeki topallığın yaklaşık %30'undan sorumludur (Dickins ve ark., 2016). Bununla birlikte sürünün diğer sürüdeki hayvanlarla karışması da ayak mantarı ve interdigital dermatitis gibi topallığın iki enfeksiyöz nedenine ortam hazırlamaktadır (Winter ve ark., 2015). Koyun sürülerinde topallığın bir diğer sebebi de rutin tırnak kesimi uygulamalarında tırnakların aşırı derinden kesilerek kanamasına neden olunmasıdır (Grant ve ark., 2018). Tırnakların aşırı uzaması, ayak ve alt bacaktaki kemiklerde hasara neden olarak hareketlerin engellenmesine ve düzensiz yürüyüşe neden olabilir. Aşırı uzayan tırnaklar genellikle tırnakların düzenli aşınmaması veya yetersiz tırnak bakımının bir sonucudur. Aşırı tırnak uzamasının ağıllarda tespit edilmesi daha kolaydır ancak hafif ve orta derecede tırnak uzaması ancak altlıksız düz bir zeminde örneğin sağım sırasında değerlendirilebilir (Munoz ve ark., 2018). Küçükbaş hayvan barınaklarında hijyene dikkat edilmemesi, altlıkların nemli ve kirli bırakılması da enfeksiyöz ayak hastalıklarına zemin hazırlayan bir diğer faktördür. Özellikle küçükbaş hayvan yetiştiriciliğinin geleneksel yöntemlerle yapılması nedeniyle çok sayıda hayvanın birlikte barındırılması, düzenli ayak ve tırnak bakımının yapılmaması ayak hastalıkları için hazırlayıcı faktörlerdir. Hayvanların otladıkları çayır-meraların taşlı ve nemli olması da tırnakların yumuşamasına ve kırılmasına neden olarak enfeksiyöz etkenlerin canlı dokulara girişini kolaylaştırır. Bununla birlikte sağlıklı bir ayak yapısı ve tırnak gelişimi için kalsiyum, fosfor, çinko, bakır, demir, selenyum ve magnezyum gibi iz minerallere ihtiyaç vardır. Hayvanlar bu ihtiyaçlarını genellikle günlük rasyonlarından veya meralardan karşılarlar. Eğer meralar veya rasyonlar bu iz minerallerce yetersizse ayak sağlığı olumsuz etkilenir (Alkan ve ark., 2021). Koyun sürülerinde tırnak lezyonlarının rutin tespitinde altın standart her bir hayvanın fiziksel olarak ters çevrilmesi ve görsel olarak her tırnağın değerlendirilmesini içerir. Koyun ve keçilerin ayak hastalıklarında klinik semptomlar her yaşta ve birden çok sayıda hayvanda aynı anda birden çok ayakta ortaya çıkan şiddetli ve sürekli topallıktır (Angel ve ark., 2015). Sürüde topallığın erken ve doğru tanısı koyun ve keçi refahının sağlanması bakımından önemlidir. Bu açıdan sürü rutin olarak topallık yönünden kontrol edilmeli ve sürü topallık takip programları düzenli olarak uygulanmalıdır. Bu amaçla koyun ve keçilerde refah değerlendirme protokollerinin de önemli bir parametresi olarak topallığın yaygınlığını ve derecesini saptamak için çeşitli yürüyüş puanlama sistemleri kullanılmaktadır (Hill ve ark., 1997; Anzuino ve ark., 2010; AWIN, 2015; Munoz ve ark., 2018). Genellikle bu skorlama sırasında; koyun ve keçinin yürüme şekline ve yürürken ayak üzerine ağırlığını verme durumuna göre değerlendirme yapılmakta, normal yürüyen hayvana 0, şiddetli topal (hareket etmeye isteksiz) hayvana 3 puan verilmektedir. Etkilenen uzuv yere değdiğinde adımları net bir şekilde kısalan hayvan hafif topal (1 puan), yürürken etkilenen uzuvda ağırlık taşıyamayan hayvan orta topal (2 puan) olarak nitelendirilir. Küçükbaş hayvanlarda kullanılan skorlama sistemi, bir hayvanı topal olarak sınıflandırmak için kesin bir topallamanın gözlemlenmesini gerektirir. Çünkü kullanılan bu 4 kategorili sistemde ineklerde kullanılan skorlama sistemlerindeki "düzensiz yürüyüş" kategorisi dahil edilmediğinden hayvanlarda normal bir yürüyüşten hafif bir sapma "normal" olarak puanlanmaktadır. Bu nedenle hayvanlar, yalnızca kesin bir topallama geliştiğinde tespit edilebilmektedir. Bununla birlikte düzensiz bir yürüyüş mutlaka topallığın göstergesi değildir. Örneğin hayvanın şekli, duruşu ve meme dolgusu yürüyüşünü etkileyebilir (Flower ve Weary, 2009). Ancak, bu kategoriyi içeren bir yürüyüş puanlama sistemi kullanmak, eşitsizliğin nedenini araştırmak için bir fırsat sağlar. Ardından, gerekli görüldüğü takdirde, iyileştirici müdahaleler uygulanabilir ve potansiyel olarak durumun kötüleşmesi önlenebilir (Leach ve ark., 2012). Diğer yandan kategori sayısının azaltılması yürüyüş puanlama sistemini basitleştirerek gözlemciler arası güvenilirliği ve tekrarlanabilirliği artırabilir (Schlageter-Tello ve ark., 2014). Bu durum koyun ve keçilerde kullanılan yürüyüş puanlama sistemlerinin neden 5'ten az kategoriye sahip olduğunu ve genellikle şiddetli topallığı belirlemeye odaklandığını açıklayabilir. Aslında bir yürüyüş puanlama sistemi gözlemciler ve onların eğitim ve deneyim düzeyleri tarafından belirlenmektedir. Bununla birlikte, gerekli eğitim düzeyi ve çiftlikler arasındaki yönetim ve kaynaklardaki farklılıklar nedeniyle, hayvanların tek tek yürüyüş skorlaması zor olabilir; bu nedenle tüm puanlama sistemleri güvenilirlik açısından kabul görmüşse de hayvanları “sağlıklı” veya “topal” olarak değerlendiren bir ikili puanlama ölçeğinin koyunlar veya kuzular için çiftlikte en güvenilir ve pratik yöntem olduğu bildirilmiştir. Hatta çiftlikte grup değerlendirmesi yaparak topallık saptama yüzdesinin kullanılmasının daha uygun ve pratik olacağı belirtilmiştir (Zufferey ve ark., 2021).

Etlik Piliçlerde Topallık

Büyüme hızının artırılması için yapılan genetik seleksiyon sonucu günümüzde kullanılan etlik piliç genotipleri geçmişe göre birim zaman içerisinde daha hızlı büyümektedir (Zuidhof ve ark., 2014). Etlik piliçlerde kemik gelişimi kas ve yağ doku gelişiminden yavaş olduğundan, bacaklarda çarpıklık ve tibial diskondroplazi gibi

bozukluklar görülmektedir. Yapılan bir çalışmada incelenen etlik piliçlerin %30 ile %49'unun tibial diskondroplaziden dolayı acı çektiği sonucuna varılmıştır (SCAHAW, 2000). Bacak problemlerinin etkisi yürüme anormallikleri şeklinde görülmektedir. Etlik piliçlerde yüksek canlı ağırlık artışı olmak üzere, yetiştiricilik koşullarında barındırma yoğunluğu, beslenme yetersizlikleri, hava kalitesi, aydınlatma, yaş, genetik, bakteriyel veya kaynaklı bacak problemleri olmak üzere çok sayıda faktör topallığın ortaya çıkmasında etkili faktörlerdir (Kittelsen ve ark., 2015). Yüksek verim özelliklerine sahip modern etlik piliç genotiplerinde iskelet sisteminin gelişimi ve sağlığı için besleme büyük önem taşımaktadır (Pender, 2020). Beslemeye bağlı çok sayıda yetersizlik durumu genellikle topallık ile karakterize edilen muskulo-skeletal sistem hastalıklarına neden olmaktadır. Kanatlı sürülerinde topallığın önlenmesi ya da en aza indirilebilmesi için bu faktörlerin bilinmesi büyük önem taşımaktadır. Bu kapsamda kanatlı yetiştiriciliğinde topallığa neden olan beslenme yetersizliğine bağlı gözlenebilen bazı problemler (Pender, 2020); rasyonda vitamin D3 yetersizliği ya da Ca/P dengesizliğine bağlı olarak ortaya çıkan raşitizm, rasyonda manganez eksikliğine bağlı olarak gelişen perosis ve kondrodistrofi, rasyonda biyotin yetersizliği ve beraberinde ıslak altlıkla insidansı ve şiddeti artan ayak taban yangısı, rasyonda Ca/P dengesizliği ve yemdeki yüksek klorid içeriğine bağlı ortaya çıkan tibia diskondroplazisi olarak gruplandırılabilir (Yousaf ve ark., 2019). Kanatlılarda çevresel ve yönetimsel faktörlerin hayvan sağlığı, verimi ve refahı üzerine önemli bir etkisi bulunmaktadır. Altlık yönetimi, havalandırma, ısıtma, aydınlatma, barındırma yoğunluğu gibi birçok faktör yönetimsel konular arasında yer almaktadır. Piliçlerin altlıkla sürekli temas halinde olmalarından dolayı altlık materyali ve altlık kalitesi önemli bir konudur (Hartung ve Spindler, 2012). Kullanılan altlık materyali, piliçlerin rahat hareket edebilmesini sağlamalı ve ayak sağlığı için uygun özelliklere sahip ve kaliteli olmalıdır. Altlık materyalinin su tutma kapasitesinin düşük olması durumunda, altlıkta ıslanma meydana gelmekte, altlık pH'sında değişim ve amonyak miktarında artış görülmektedir. Bu değişimler piliçlerde ayak tabanı, göğüs ve dizde deri yangılarına sebep olmaktadır (Fairchild ve Ritz, 2006). Ayrıca, kümes içerisinde yüksek barındırma yoğunlukları ayak sağlığı açısından risk oluşturan önemli bir konudur. Yetiştirme döneminde ideal barındırma yoğunluğunun 2007/43/AB Direktifi kapsamında 33kg/m^2 olarak, ancak çevresel kontrolün sağlanabildiği kümeslerde 39 kg/m^2'ye çıkabileceği bildirilmiştir (2007/43/EC). Topallığın değerlendirilmesi için sürüdeki piliçler tek tek kontrol edilmeli ve değerlendirilmelidir. Bu amaçla, 6 puanlık değerlendirme skalası kullanılmakta olup, bu skalada 0 puan normal ve sağlıklı durumu, 5 puan ise yürüyememe durumunu temsil etmektedir (Kestin ve ark., 1992). Saha koşullarında yapılan bir çalışmada etlik piliçlerin %14-50'lik kısmında topallığın gözlendiği, yürüme skoruna göre yüksek puanlar (3-5 arasında) aldığı ortaya konmuştur (Kittelsen ve ark., 2017). Topallığın gözlendiği etlik piliçlerin (yürüme skoru>3) analjezik ilavesi yapılan yemleri tercih ettiği ve bu şekilde analjezik alan etlik piliçlerde aktivitenin arttığı gözlenmiştir (Hothersall ve ark., 2016). Topallığın değerlendirilmesi için, geleneksel yöntem olarak bilinen yürüyüş skorlamasına ek olarak, son zamanlarda tam otomatik görüntüleme sistemlerinin kullanımı gündeme gelmiştir. Video görüntüleme tekniği ile etlik piliçlerde topallığın değerlendirilmesi popüler olan yöntemlerden birisidir. Bu yöntemde hayvanla temas edilmemesi, kümes içerisinde dönem sonuna kadar gözlem yapılabilmesi ve bu ekipmanların giderek ekonomik hale gelmesi sistemin önemli avantajlarındandır (Yousaf ve ark., 2021). Ayrıca, geleneksel yöntemde olduğu gibi farklı çiftliklerde yürüyüşü değerlendiren teknik personelin kümese gelmesini engellediğinden, biyogüvenlik açısından riskli durumları da ortadan kaldırmaktadır (Hussain ve ark., 2018). Son zamanlarda topallığın değerlendirilmesi için kullanılan diğer yöntemlerden birisi ise pedobarometrik değerlendirme yöntemi olup, bu yöntemde piliçlerin ayak taban basınçları hassas üç boyutlu pedobarografi cihazı ile ölçülmektedir (Yousaf ve ark., 2021).

SONUÇ

Topallık kontrolü ve yönetimi, ideal olarak sürü/çiftlik veya bölgesel düzeyde hedeflenmelidir. Bakım-yönetim şartlarının iyileştirilmesi, vücut kondisyonunu korumak için iyi bir besleme yönetimi, barınak zemininin düzgün ve hijyenik olması, rutin tırnak kontrolü, düzenli tırnak bakımı ve banyosu gibi koruyucu önlemlerin alınması ile ayak hastalıklarının engellenerek hayvan refahının korunması mümkündür. Bunların yanı sıra iyileştirilmiş karantina ve biyogüvenlik önlemleri ile birlikte sürülerde topallık prevalansının çok daha düşük seviyelere ulaşması sağlanacaktır. Yetiştiricilerin tırnak kesimi ve kanamaya neden olmama konusundaki becerilerini geliştirmeleri ve tırnak kesimi sırasında kanayan tırnak yüzdesinin düşürülmesi küçükbaş hayvanlarda ayak hastalıklarının ortaya çıkmasını azaltma noktasında kritik öneme sahiptir. Ayrıca yetiştiricilerin bilinçlendirilmesi ile rutin bir sürü sağlığı programının parçası olarak çiftlik içi topallık yönetimindeki eksiklikleri belirlemek için topallık kayıtları ile birlikte toplanan verilerin analiz edilmesi, topallık dinamiklerinin daha iyi anlaşılmasını,

ilişkili risk faktörlerinin belirlenmesini ve insidansını azaltmak için stratejilerin formüle edilmesini kolaylaştıracaktır.

Abstract

In many engineering systems, vibrations can occur in many structures, sometimes due to external environmental factors and sometimes due to reasons that cannot be determined. These vibrations can create critical effects that can cause damage to the system. The important dynamic parameters of the structure that should be examined in determining these vibrations are 'natural frequency', 'period' and 'mode shapes'. Therefore, modal analysis of the structure is considered an important step in the design process to predict the vibration characteristics of the designed structure. Most studies on overhead crane systems have been on the crane system beams and their behaviour. The aim of this study is to determine the effect of the use of overhead crane system in a steel industrial structure on the dynamic behaviour of the structure. For this purpose, a model steel industrial structure with a span of 10 m and a length of 20 m was created with SAP2000. An overhead crane system moving on rail beams at a height of 6m from the ground in a model steel structure was designed. In the model steel industry structure, an overhead crane system traveling on rail beams has been analyzed with the SAP2000 finite element analysis program.
As a result of the analysis, it is seen that the effect of using overhead crane system on the dynamic parameters of the steel test structure provides a 27.9% increase in the dominant period of the model steel structure and a 21.79% decrease in the dominant frequency were obtained.

Keywords: Overhead Crane, Finite Element Method, Dynamic Parameters, Steel Structure, Modal Analysis, Period

INTRODUCTION

Cranes are the best way to provide a heavy lift facility that covers almost the entire area of a building. The overhead crane is the most important material handling system for heavy goods. The primary task of the overhead crane is to move and transfer heavy loads from one location to another (Alkin et al. 2005).Steel Building Systems can support several different types of crane systems when required.The typical crane types are top running, under hung (overhead) and jib cranes and are usually electric powered. Cranes can be provided in several styles based on the required capacity span and service class. Overhead cranes are supported by using a suspension type support which is connected to the bottom of a frame.The crane wheels are supported from the bottom flange of the crane beams which act as a crane rail and usually only span a portion of the column to column span of the structure.They are usually a small capacity of crane (C.S.Steel,B.Inst.,Cambridge, 2010).Overhead crane beamed cranes are the most economically used cranes in the industry among all cranes. The crane bridge moves on the crane rails located at a height. The bridge also forms the movement path of the moving carrier vehicle part overhead crane usually work in closed volumes inside the factory as well as outdoors. Cranes working outdoors differ in terms of concealed drive systems and drive systems that are stronger than those operating inside the factory so that they can overcome wind resistance. The main advantage of overhead cranes is the freeness of the floor of the factory due to the fact that the crane path is located at the feet of the roof construction. We can group the cranes with overhead bridges into single and two beams (Kemal, 2008). Vibrations may occur in most engineering structures sometimes due to external environmental factors and sometimes due to undetermined reasons.These vibrations can create critical effects that can damage the system. The important dynamic parameters of the structure to be examined in determining these vibrations are 'natural frequency', 'period' and 'mode shapes'. Therefore, the modal analysis of

the structure is considered as an important step in the design process to predict the vibration characteristics of the designed structure. The aim of the study is to examine the changes in the dynamic parameters of a model steel industrial structure due to moving overhead crane systems. The study is concerned with the response of a overhead crane supported by a steel frame structure that exhibits linear elastic material behavior and is modeled using a three-dimensional finite element network in the dynamic parameters of the structure. The new earthquake regulation TBDY 2018 includes significant changes in the calculation of earthquake loads and calculation approaches to be used in all kinds of building design (steel, reinforced concrete, masonry, etc.) compared to the previous regulations (Öztürk,2018). In this study, the author used the data of the TBDY2018 regulation in the calculation of earthquake loads in the analysis of the model steel industry structure. Samsun province conditions were used in the design. The steel industry structure model is located at Latitude: 41.278308 and Longitude: 36.303740. Local Soil Class: ZD, Earthquake Ground Motion Level: DD-2, Turkey Earthquake Hazard Map was taken from Interactive web application (AFAD). In recent years, many earthquakes have occurred in the world and as a result, heavy losses have been given. By looking at the results, it has been understood that this situation creates various problems for the countries that have suffered heavy losses and how important it is for the structure to be informed about the current status of the structures (Aydın,2022).Many researchers have focused on gaining knowledge of overhead crane movements and have presented different approaches and technologies to achieve this goal (Zhang et al.,2008; Azeloğlu et al.,2015; Yıldırım and Esim,2019; Kemal,2008; Lu et al.,2022). It is understood from the researches that earthquakes can have devastating effects on all kinds of structures forms (Aydın,2022; Wei et al.,2004; Tuhta et al.,2020; Hsiao et al.,2012; Kasımzade et al.,2021; Günday et al.,2018; Tuhta and Günday,2020; Sertaç Tuhta et al.,2020). In addition to the different factors affecting the structure the harmful effects of environmental vibration should not be ignored. By environmental factors, the environmental loads that the buildings are exposed to almost every day come to mind. (Vehicle, wind, etc.) and it is known that it causes rapid changes and developments in steel structure designs (Günday,2022; Aydın,2022) There are various studies and practices to minimize the effects that will affect the structure (Kocabaş, 2005). It is known that steel industry structures are adversely affected by these environmental movements due to both large spans and height (Günday,2022; Naimi and Peker,2022; Girges N.W.,2018; Tuhta and Günday,2020, Aydın,2022). Knowing the dynamic parameters of the structures provides us with information about the situation that may occur before or after the structure. Experimental behavior of structures is investigated with experimental studies in structures vibrating with various factors. In these studies, primarily analytical models of the structures are created. The dynamic behavior of buildings, bridges and other structural systems when exposed to earthquakes is generally studied with analytical and experimental models. Investigation of the dynamic behavior of any structure can be investigated theoretically by constructing a finite element model and experimentally by using modal analysis methods. In the literature review related to this publication, many studies using the finite element method have been reached. In some studies, such as some of the publications using the finite element method and guiding the author's work are as follows on the use of the finite element method were used (Oden and Reddy,1976; Tekkaya and Soyarslan,2019; Sewell,1985; Bathe,2008). With all this knowledge, this new study has been carried out. Researchers have conducted many studies using the Finite Element Method (FEM) on steel structures (Kemal,2008; Lu et al.,2022; Andrea G.,et al.,2014; Alkin et al,2005, Aydın,2022; Günday, 2022; Tuhta et al.,2020, Kasımzade et al.,2021). The author also refers to these studies about the steel structures made. Looking at the literature studies, the researchers carried out a different number of studies using the finite element method (Girges N.W.,2018; Azeloğlu et al.,2015; Yıldırım and Esim,2019; Kemal,2008; Lu et al.,2022; Andrea G. et al.,2014; Alkin et al,2005; Crane Supporting SS,2009).

With this study, the author aimed to reveal the effects of the use of overhead crane in the system in steel industry structures on the dynamic behavior of the structures (period, frequency, mode shapes). The steel industry structure model created with the SAP2000 program was used. Analysis results are given comparatively at the end of the study. As a result, the design of the steel structure was carried out. In this research, which was analyzed according to the TBDY 2018 regulation data, it was evaluated as an original study in terms of being a resource for researchers related to this subject, since the design was made according to the SAMSUN conditions required by the regulation.

MATERIALS AND METHODS

In this study, a model steel industry structure was created and modal analysis was carried out with the finite element method. In the application of the finite element method, the SAP2000 package program, which is used in the field of academic and engineering applications all over the world was used.

A) Description of Model Steel Industry Structure

In the study, a model steel industry structure with a length of 20 m, an opening of 10 m and a height of 9,36 m was used. The structure modeled as a industry structure geometry. Steel structure is modelled as a single storey. The steel industry structure consists of equal length spans in the range of 5 meters. The roof strut is designed as 2,06 meters. In the designed steel industry structure, the pre-sizing was made with the SAP2000 program without making the pre-analysis design. Preferred profiles are respectively: IPE in the columns, UPN steel profile in the purlins and cross connection elements, a 0,018m circular. Bar element in the steel tension connections, and UPN80 profiles in the 2L Cornier Wind tension rod in the roof trusses. After the analysis, optimum profile thicknesses were obtained in the program without any problems and the structure was designed with appropriate profiles. The model steel structure finite element model was created using the SAP 2000 program. The finite element model of the steel industry structure with overhead crane system is given in (Fig.1)

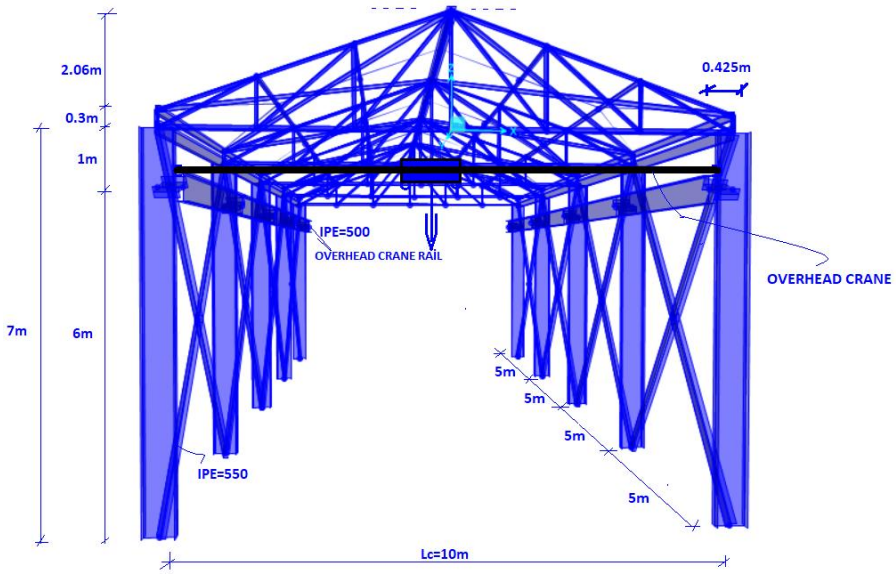

Figure 1. Finite element model of the steel industry structure with Overhead Crane with Sap2000

B) Description of Overhead Crane Systems

In the design of the Overhead Crane Systems; the beam's own weight, the rail, all accessories, loads from the crane, and the design of the crane rail beams will include the impact factor. In this study the design of the single girder overhead crane was investigated and the dynamic effects of the 10 tons capacity and 10 m span overhead crane on a model steel structure were investigated. The overhead crane was designed to move on a steel rail made of IPE500 profile.

The overhead crane is shown in Figure 1.

Handling Capacity: 10 ton; Bridge Length: L_c =10 m; Distance between wheels of trolley: LK=1,22m

Wheel Loads (KN); Crane R_{max}=52,5 KN; Crane R_{min}=10,6KN; Crane Velocity: 0.167 m/sec

Load Patterns of Overhead Crane System with SAP2000 (FEM) (Fig.3); Crane Speed: (10/60=0,167m/sn); Crane Span=20m; Discretize Load Every Steps=4 Sec.; Duration of Loading is=120 Sec. in Fig.3 Multi Step Vehicle Live Load Pattern Generation of Overhead Crane Systems with Sap2000 was shown.

The overhead crane consists of one girders, one saddles to connect them, and a trolley moving in the longitudinal direction of the overhead crane and wheels. The configuration of the overhead crane is shown in Fig. 2. A 10-ton-capacity overhead crane of overall length 10 m and total weight 12.5 tons was selected as a study object. The driving unit is installed in one of the two girders. The overhead crane is supported by two rails and the runway girders installed in the steel structure as seen figüre 1.

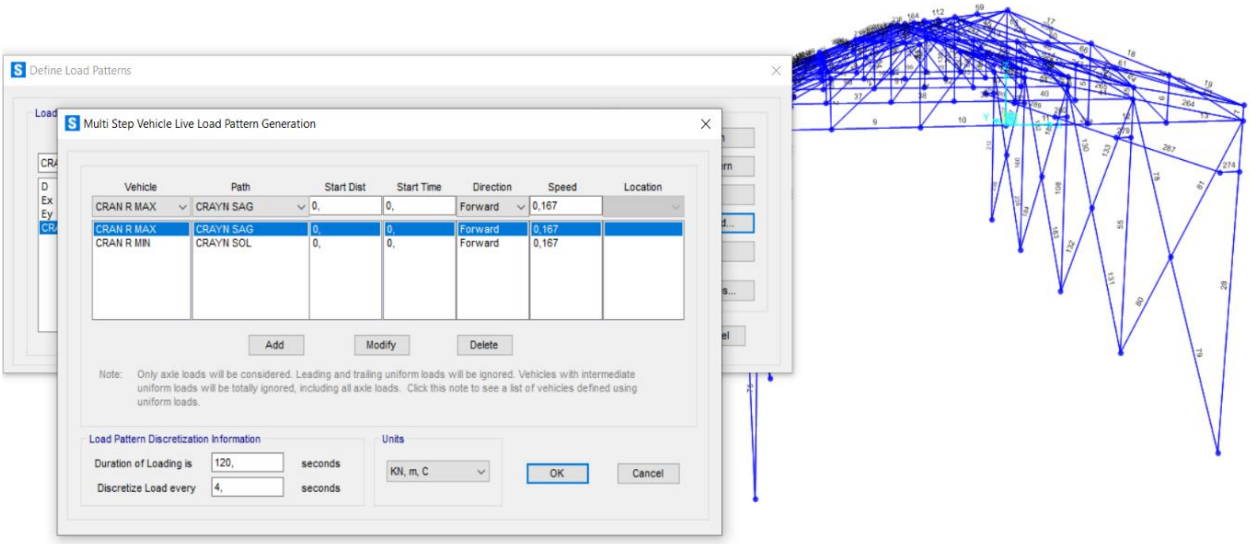

Figure 3. Multi Step Vehicle Live Load Pattern Generation of Overhead Crane Systems with Sap2000

RESULTS and DISCUSSION

The model steel industry structure was first analysed with the finite element method using SAP2000 (V24) then overhead crane systems were added to the system and the same analyses were repeated and the results were compared. In the study, the following were taken as material properties in the analysis; Material grade: S235 steel; the modulus of elasticity as E = 2.0x105MPa, material density ρ = 7.85kg / m3 and Poisson ratio υ = 0.3.

C) Results of the Model Steel Structure with Overhead Crane Systems

The steel industry structure was analysed with overhead Crane systems. The first 5 modes were taken into account in the analysis. Obtained results are presented in figures 4,5,6,7,8 as periods and mode shapes (Table 1)

Table 1. Modal period and frequencies of steel industry structures with Overhead Crane

TABLE: Modal Periods and Frequencies

D) Results of the Model Steel Structure without Overhead Crane Systems

In this analysis overhead crane systems were not included in the analysis. The following were taken as material properties in the analysis; Material grade: S235 steel material, the modulus of elasticity as E = 2.0x105MPa, material density ρ = 7.85kg / m3 and Poisson ratio υ = 0.3. As a result of the analysis, although the analyses of the steel model structure were made for 12 different modes, the author has taken into account the first 5 modes of the structure. The results are presented for 5 modes at Table 2.

Table 2. Modal period and frequencies of steel industry structures without Overhead Crane

TABLE: Modal Periods and Frequencies without Overhead Crane				
Output Case	**StepType**	**StepNum**	**Period**	**Frequency**
Text	Text	Unitless	Sec	Cyc/sec
MODAL	Mode	1	0,2296	4,3552
MODAL	Mode	2	0,2094	4,7746
MODAL	Mode	3	0,2047	4,8844
MODAL	Mode	4	0,2028	4,9290
MODAL	Mode	5	0,2013	4,9668

The comparison of model steel industry structure with overhead crane system and without overhead crane system of the model is given in Table 3. The first 5 mode shapes of the model steel industry structure were used in this study.

Table 3. Comparison of period value between overhead crane and without overhead crane systems

	With Overhead Crane		Without Overhead Crane			
MOD	**FREQUENCY**	**PERIOD**	**FREQUENCY**	**PERIOD**	**DIFFERENCE**	**PERIOD % DIFFERENCE**
1	3.4064	0.2936	4.3553	0.2296	0.0640	27.9
2	4,6209	0.2164	4,7747	0.2094	0.0070	3,34
3	4,6385	0.2156	4,8844	0.2047	0.0109	5,32
4	4,6410	0.2155	4,9290	0.2028	0.0127	6,26
5	4,6421	0.2154	4,9669	0.2013	0.0141	7,00

The difference between overhead crane and without overhead crane systems in the dominant period is **27.09 %.**

The Modal Mass Participation Ratios Table 4 shows the mass participation ratios in the (UX), (UY), (UZ), (RX), (RY) and (RZ) directions for each mode. In Table 4 the direction in which the mass participation of the relevant mode is high is accepted as the dominant direction for that mode. In this case, for the above table, it can be interpreted that the 1st mode is dominant in the (UX) direction, the 2nd and 3rd Modes are dominant in the (RY), (RZ) direction, in other words, it is dominant in the torsion direction.

CONCLUSION

As a result of the Analytical Analysis, the following results have been reached;

Modal analysis of model steel industry structure with overhead Crane system is performed and results are revealed. Finite element method is used as a method for modal analysis. As a result of the analysis, the first 5 mode shapes and period values of the model steel industry structure with overhead Crane were obtained. The dominant period of the model steel industry structure with overhead crane system was determined as **0.2936** seconds. This study is an example of obtaining period and mode shapes by modeling an overhead crane systems with the finite element method and modal analysis.

A total of 5 natural frequencies ranging from **3.4** to **4.66 Hz**. were obtained analytically from the finite element model of the model steel industry structure with overhead crane systems.

From the finite element model of the model steel structure analytically, a total of 5 periods ranging from 0.29 sec to 0.21 sec. have been obtained. Translational and torsional mode shapes are observed in the mode shapes in the model steel structure with overhead crane systems.

In mode 1, the frequency was measured as 3.4064 Hz. This frequency is the dominant frequency of the model steel structure with overhead crane systems.

In mode 2, the frequency was measured as 4.6209 Hz.; In mode 3, the frequency was measured as 4.6385 Hz.

In mode 4, the frequency was measured as 4.6410 Hz.; In mode 5, the frequency was measured as 4.6421 Hz.

In mode 1, the period was evaluated as 0.2936 Sec. This period is the dominant period of the model steel steel structure with overhead crane systems.

In mode 2, the period was evaluated as 0.2164 Sec.; In mode 3, the period was evaluated as 0.2156 Sec.

In mode 4, the period was evaluated as 0.2155 Sec.; In mode 5, the period was evaluated as 0.2154 Sec.

- The dominant frequency of the structure is **3.4064** Hz. Furthermore, the dominant period of the model steel structure is **0.2936** sec.
- Translation in X, direction in mode 1; Torsion in Y, Z direction in mode 2, mode3, mode4, mode 5
- The maximum tension moment on the rail on which the overhead crane moves was obtained as =70,755 KN.m on the IPE500 rail with element number [290-1] at a distance of 2.91708m.

Considering the mode shapes and the dominant period value of the model steel structure, it is clearly concluded that dynamic loads are of great importance in with overhead crane systems where this design against dynamic effects is successful.

Abstract

Geopolymers are inorganic polymeric compounds created by synthesizing raw materials rich in silicate and alumina. A complex aluminosilicate gel develops when these raw ingredients are incorporated with an alkaline solution during the polymerization process. However, there are many factors affecting the geopolymerization process. In this research, factors affecting the mechanical properties of fly ash-based geopolymer mortars in the presence of silica fume were investigated. These factors are the binder/aggregate ratio, the presence of silica fume in the binder materials, different molarity of sodium hydroxide, and different ratios of sodium silicate to sodium hydroxide. It has been observed that increasing both binder (Fly ash + Silica Fume) to aggregate ratio (10%, 15%, 20% and 25%) and molarity of NaOH (6M, 8M, and 10M) has resulted in a continuous increase in compressive and flexural strength of geopolymer samples. Increasing the ratio of Silica Fume (10%, 20%, 30%, and 40%) to total binder dosage in the mixture up to 20% has caused an increase of compressive and flexural strength geopolymers. After that, the strength obtained decreased with a further increase of silica fume dosage beyond 20%. On the other hand, increasing the Na_2SiO_3 to NaOH ratio resulted in a decrease in the compressive and flexural strength of fly ash-based geopolymer mortars. This could be related to the presence of excess silicates in the geopolymer mixture, which could obstruct the geopolymeric structure formation and decrease the strength of geopolymer mortars.

Keywords: geopolymer, fly ash, silica fume, sodium hydroxide, sodium silicate.

INTRODUCTION

Portland cement (PC), as one of the most critical and fundamental construction materials, turned into the most used man-made material with a global production of 4.16 Gt/year (Cembureau, 2021). PC consumes a great deal of energy and contributes 5-8% of Global CO_2 emissions, as the production of a ton of concrete emits approximately a ton of CO_2 (Boden et al., 2008). Thus, many studies have been conducted regarding finding substitute material for cement (partially or fully) with other eco-friendly binding materials with low CO_2 emission. Victor Glukhovsky produced the first alkali-activated geopolymer by combining clays and an alkaline solution to create low- or calcium-free cementitious materials. He introduced the term "soil cement" and conducted a study into these alkali-activated materials in 1957 (Krivenko, 2017). Davidovits proposed cement-less concrete, commonly known as geopolymer concrete and defined geopolymers as three-dimensional alumina-silicate-based binders (Davidovits, 1991). Geopolymers are one of the most common cement alternative materials employed nowadays (Hao et al., 2015). Due to their minimal CO_2 emissions and utilization of hazardous and non-hazardous waste sources as binder materials, geopolymers are environmentally beneficial (Komnitsas and Zaharaki, 2007). Theoretically, any industrial waste containing sufficient silica and alumina can be utilized in the production of geopolymer (Yang, 2014). Generally, all the studies carried out in the last couple of decades verified that geopolymers are formed by the reaction of binder materials containing alumina-silicate activated with aqueous alkali hydroxide or silicate solution. Some of the binder materials that have been utilized for the production of geopolymers are fly ash (FA) (Xie and Xi, 2001; Bakharev, 2005), metakaolin (Duxson et al., 2007), blast furnace

slag (Martinez et al., 2006), calcined clays (Zhang et al., 2004), and other pozzolans (Martinez et al., 2006; Alcantara et al., 2000).

Alkali-activated materials usually form two main gel systems based on their source of aluminosilicates (Provis and Deventer, 2013; Provis et al., 2015). The activation of products containing low-calcium binder sources like fly ash and metakaolin form a gel dominated by amorphous three-dimensional alkaline aluminosilicate hydrate (N-A-S-H) (Fernández-Jiménez and Palomo, 2005). On the other hand, high-calcium sources like alkali-activated powdered ground granulated blast-furnace slag (GGBS) have a reaction dominated by alkali resulting in the formation of (C-A-S-H) gels. Additionally, it is also possible to witness the coexistence of (N-A-S-H) and (C-A-S-H) gels or forming one hybrid (C,N-A-S-H) by activating FA/GGBS in an alkaline environment, while FA/GGBS ratio having a significant impact on the dominating gel (Ismail et al., 2014; Marjanovic et al., 2015).
Geopolymers have many beneficial properties, such as rapid compressive and flexural strength development, acid and fire resistance, rapid setting time, and sufficient freeze-thaw resistance (Buchwald et al., 2011). Numerous studies have been carried out on the factors that influence the strength and durability of alkaline-activated mortars. These factors are listed as follows.

- **Water content:** Water content plays a significant role in the geopolimerization process. However, using an excess amount of water during the preparation of geopolymer samples results in a decrease in compressive and flexural strength due to the high water loss during curing, which results in the formation of porous microstructure (Hadjito et al., 2004, Narbosa et al., 2000 and Fernandez and Jimenez, 2010).
- **Alkali content:** Alkali content is a crucial factor affecting geopolymer production. The concentration of silicate ions is critical for the formation of geopolymerization. Studies have shown that the compressive and flexural of geopolymer increases with the increase of liquid alkali content to an optimum value and then tends to decrease (Sukmak and Sui-Long, 2013, Thakur and Ghosh, 2009).
- **Silica Content:** Presence of higher silica causes the quicker conversion of aluminosilicate sources to form a geopolymer gel, resulting in shorter initial and final setting times of geopolymers. It also increases the strength and decreases the flowability of geopolymer mortars (Lee and Deventer 2002, Rees et al., 2007, Thakur and Ghosh 2009, Dehghani et al., 2021).
- **Curing condition and time:** Curing condition has a significant effect on the mechanical properties of geopolymer. Numerous studies have demonstrated that oven-cured geopolymers obtain higher compressive and flexural than ambient-cured ones. In general, heating changes the formation of geopolymer gel crystals, which increases the mechanical properties of geopolymers (Shihab et al., 2018). Furthermore, heat curing time has a substantial effect on the mechanical properties of geopolymers as increasing heat curing time increases the compressive and flexural strengths (Thakur and Ghosh, 2009).

As previously mentioned, the method of curing has a significant impact on the micro-structural and strength development of fly ash geopolymers. In contrast to oven-cured specimens, the Class C fly ash geopolymer mixture hardens gradually at ambient temperature and shows little strength gain at the beginning of the ageing process. Therefore, the curing method is determining factor in the geopolymerization process. The geopolymerization process occurs more quickly at higher temperatures between 60 and 90 °C. However, only precast geopolymer concrete buildings can be applied to oven curing. These characteristics restrict the use of fly ash-based geopolymer to precast concrete structures exclusively and are thought to be difficult if not impossible for on-site concrete applications (Duxson et al., 2007). In this research, silica fume was used to obtain higher compressive and flexural strength of fly ash-based geopolymer mortars at an early stage by applying the ambient curing method.

This study deals with investigating the influence of some of the factors mentioned above by varying the following parameters.

(a) The ratio of binder (Fly ash + Silica Fume) to aggregate content (10%, 15%, 20% and 25%),
(b) The ratio of Silica Fume (10%, 20%, 30%, and 40%) to the total binder,
(c) The molarity of NaOH (4M, 6M, 8M, and 10M), and
(d) The Na_2SiO_3 to NaOH solution ratios of (1.5, 1.75, 2, and 2.25) on the synthesis of mechanical properties of fly ash-based geopolymer mortar in the presence of silica fume.

MATERIAL AND METHOD:

Materials

C-type fly ash and silica fume were used as binder material to produce Fly ash and Silica fume-based geopolymer mortars. The Class C fly ash used in this study was obtained from Sivas Kangal Thermal Power Plant Electricity Production Inc. while the Silica fume (SF) was obtained from Antalya Etibank Electrometallurgy Plant. Table 1 shows the chemical compositions of FA and SF. SF's very fine-grained nature and high SiO_2 content cause pozzolanic reactions to begin at a very early age. The combination of Na_2SO_3 and NaOH was used to activate the binder materials and geopolymer mortars.

Table 1. Chemical composition of Class FA and SF

Component		SiO_2	Al_2O_3	CaO	Fe_2O_3	MgO	K_2O	ZrO_2	TiO_2	MnO	SO_3	Loss on ignition	Total
FA	Mass (%)	33.1	10.4	18.9	7.48	2.94	1.5	0.4	0.84	0/05	7.58	14.4	100
SF	Mass (%)	89.0	0.47	0.89	1.53	1.60	1.11	-	-	-	0.43	4.97	100

In the experimental study, clean and dry sand passing through a 2 mm sieve was used as aggregate. The particle sizes and granulometry curves of the natural sand used are shown in Table 2 and Figure 1.

Table 2. Distribution of particle dimensions of the aggregate used in the study

Sieve size (mm)	31.5	20	16	11.2	8	4.75	2	1	0.5	0.3	0.15	0.063
Percent Passing (%)	100	100	100	100	99.7	96.14	61.03	38.78	24.13	12.13	2	0.27

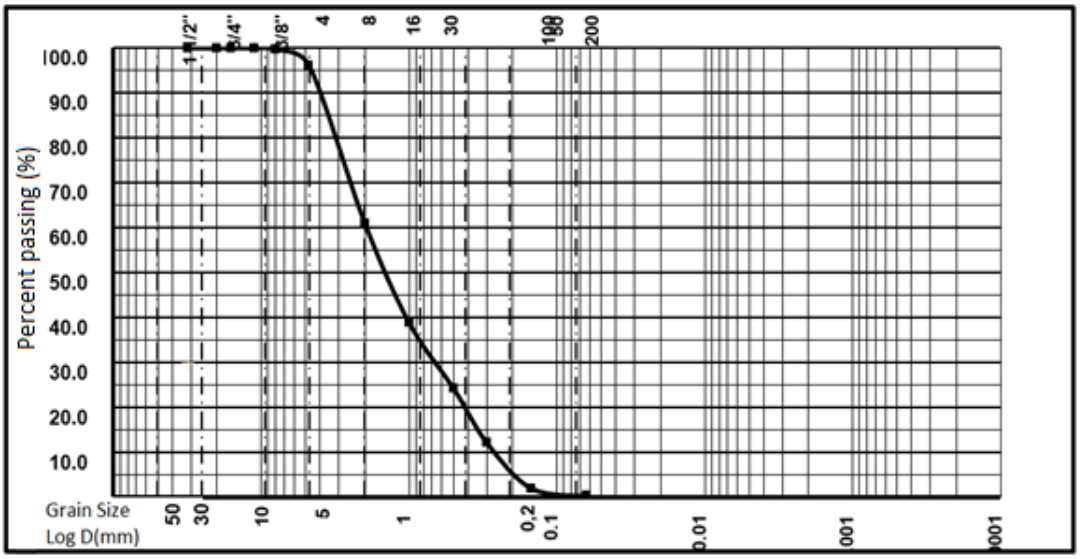

Figure 1. Granulometry curve of the aggregate used in the study

Na_2SO_3 and NaOH were used as alkali activators for activating geopolymer mortars. NaOH was in granulated form and had a purity of 98%. According to the data obtained from the supplying company, the specific gravity of Na_2SO_3 was 1.35 g/cm^3 and its alkaline modulus was 2 (Na_2O_3 = 13%, SiO_3 = 27% and water = 60%).

Mix design and curing condition

In this study, experimental optimization studies were carried out using the Taguchi method. In order to determine the optimal mixture that maximizes the compressive and flexural strength of fly ash and silica fume-based geopolymer mortars, an experimental design with 4 parameters and 4 levels was established utilizing the Taguchi

method's L16 orthogonal design. The parameters examined were: ratio of binder (FA+SF) to aggregate (10%, 15%, 20% and 25%), SF (SF/binder ratio 10%, 20%, 30% and 40%), Molarity of NaOH (4M, 6M, 8M and 10M), Na_2SiO_3 / NaOH ratio (1.5, 1.75, 2 and 2.25). The aforementioned natural sand was used as an aggregate, and a constant amount (1200 gr) was used in all the samples and not evaluated as a variable parameter. Tables 3 and 4 show that a total of 16 mixtures were prepared using the L16 (4^4) orthogonal sequence established.

Table 3. Parameters and levels of L16 used in the experiments

Level	FA+SF (%) (binder/Aggregate ratio)	SF (%) (SF/binder ratio)	NaOH (M)	Na_2SiO_3 / NaOH ratio
1	10	10	4	1.5
2	15	20	6	1.75
3	20	30	8	2
4	25	40	10	2.25

During the mixing process, sand, FA and SF were first added to the mixer pan and mixed for 2 minutes in a dry condition till they formed a homogenous mixture. After that, a solution containing water was added to sodium hydroxide to obtain the desired molarity and rested for 24 hours for chemical reaction completion. Then, a solution of Sodium Silicate was added to the mixture and mixed for 3 minutes.

Geopolymer mortars were cast into the molds of sizes 40x40x160 mm^3 after the mixing phase and applied 72 seconds of compaction using a vibrating table to remove the air entrapped air bubbles. Subsequently, geopolymer mortar samples were cured at an ambient temperature of 20-25ºC and relative humidity in the range of 48-59%. Samples were removed from the molds after 24 hours and cured in the same condition for 28 days.

RESULTS AND DISCUSSIONS:

The compressive and flexural strength results obtained from the geopolymer mortar samples after 7 and 28 days showed that the compressive and flexural strength of geopolymer samples increased with age and are given in Table 5 and Figures 3 to 6. Compressive and flexural strength tests have been carried out in accordance with ASTM C109 and ASTM C293 standards, respectively. Based on the results obtained from the experiments (7 and 28-day strengths), S/N values were computed by employing Equation1 to obtain the S/N ratio of "Larger is better" result.

$$S/N_L = -10Log\left[\frac{1}{n}\sum_1^n \frac{1}{Y_i{}^2}\right] \quad (1)$$

The S/N values calculated in the evaluation of the test results are given in Table 4.

Table 4. Material used in the mixtures and the compressive strength results of 7 and 28-day and their S/N values

Level	FA+SF (%) (binder/Aggregate ratio)	SF (%) (SF/binder ratio)	NaOH (M)	Na_2SiO_3 / NaOH ratio	7-day Compressive strength (MPa)	28-day Compressive strength (MPa)	7-day Flexural strength (MPa)	28-day Flexural strength (MPa)
1	120	12	4	1.5	3.2	4.6	1.0	1.4
2	120	24	6	1.75	6.7	9.1	2.2	3.0
3	120	36	8	2	9.0	12.1	3.2	4.2
4	120	48	10	2.25	6.6	9.4	2.0	2.9
5	180	18	6	2	6.1	8.4	2.0	2.8
6	180	36	4	2.25	5.6	7.8	2.0	2.7
7	180	54	10	1.5	10.9	15.8	3.4	4.9
8	180	72	8	1.75	7.7	11.0	2.5	3.6
9	240	24	8	2.25	10.8	15.1	3.7	5.2
10	240	48	10	2	12.6	18.5	3.9	5.7
11	240	72	4	1.75	5.9	8.1	2.0	2.7
12	240	96	6	1.5	11.3	15.9	4.0	5.6
13	300	30	10	1.75	14.7	21.5	4.8	7.1
14	300	60	8	1.5	13.0	19.4	4.3	6.4
15	300	90	6	2.25	9.5	13.7	3.1	4.5
16	300	120	4	2	6.2	8.8	1.9	2.7

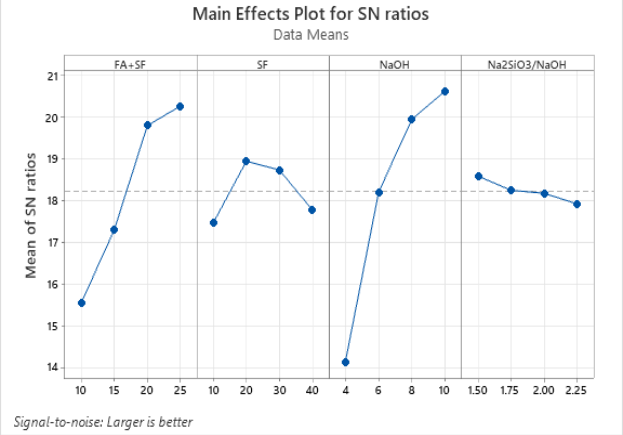

Figure 3. S/N values of compressive strength (7-day)

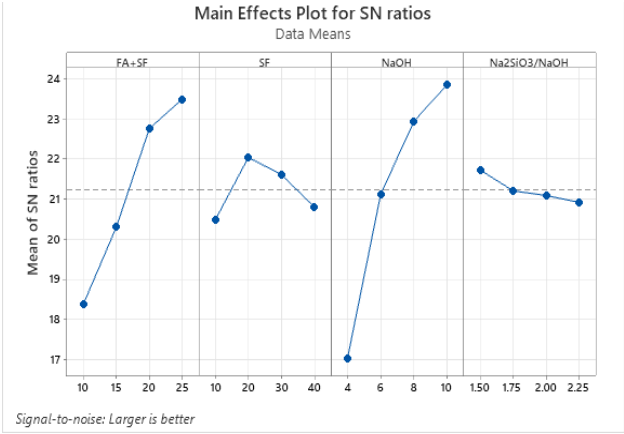

Figure 4. S/N values of compressive strength (28-day)

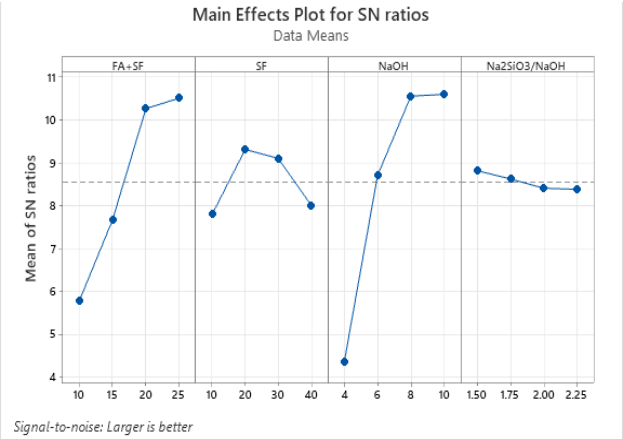

Figure 5. S/N values of flexural strength (7-day)

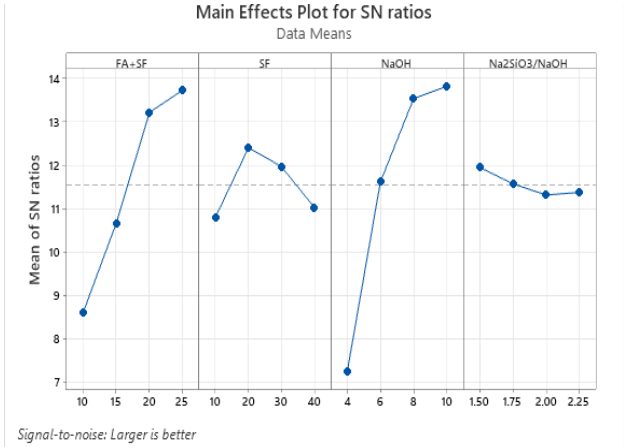

Figure 6. S/N values of flexural strength (28-day)

After the evaluation of the obtained S/N values, the parameter levels that generated the highest S/N values were regarded as the optimal parameter levels after considering both compressive and flexural strength test results. Thus, the analysis of the evaluated S/N values of the 7 and 28-day compressive and flexural strength results depicted that;

- the 4th level of binder content parameter (FA + SF);
- the 2nd level of SF content parameter;
- the 4th level of molarity of NaOH parameter;
- and the 1st level of Na_2SiO_3/NaOH ratio parameter produced the optimum mixture design, and their impact factor is shown in Table 5.

Table 5. Optimal mixture obtained from 7- and 28-day compressive strength results

	FA+SF (binder/Aggregate ratio)	SF (SF/binder ratio)	NaOH (M)	Na_2SiO_3 / NaOH ratio
Optimal level	25%	20 %	10	1.5
Impact Ranking	2	3	1	4

As shown in Figures 3-6, the ratio of binder (FA+SF) to aggregate content in the geopolymer mortar caused the increase of compressive and flexural strength due to the formation of strong bonding between geopolymer gel and aggregate. It is observed that increasing the binder/aggregate ratio from 10 to 25% resulted in a continuous increase in compressive and flexural strength of geopolymers without peaking since it was planned to use less binder dosage for the production of geopolymer mortars.

The addition of SF into the mixture resulted in an increase in the compressive strength of geopolymers, but adding beyond 20% of binder content led to a continuous decrease in compressive and flexural strength. In general, blending SF into FA is expected to decrease porosity and improve the mechanical properties of geopolymers (Thokchom et al., 2011). However, Blash and Lakshmi (2018) proposed adding excess SF into geopolymer mixture may decrease the workability and strength of geopolymers.

The compressive and flexural strength increased with an increase in NaOH molarity, as confirmed by most of the studies available in the literature. It's observed that increasing molarity from 4M to 10M resulted in continuous increase in compressive and flexural strength of geopolymers without peaking since it was intended to use less dosage of NaOH.

It can also be observed that the compressive and flexural strength decreased continuously with the increase in Na_2SiO_3 to NaOH solution ratio. Generally, the presence of soluble silicates in the geopolymer mortar helps the polycondensation of geopolymeric systems (Gao et al. 2014). However, the presence of excess silicates in the geopolymer mixture which obstructs the geopolymeric structure formation resulting in the presence of insoluble silicates in the geopolymer mixture that could cause a decrease in the strength of geopolymer mortar (Cheng et al. 2003).

4. Conclusion:

In the present study, some of the factors affecting the mechanical properties of FA and SF-based geopolymer were investigated. From the study, it has been observed that:

- The strength of geopolymer increases with the increase of the dosage of binder material
- Silica fume presence decreased porosity and increased compressive strength, but adding more than 20% of binder content led to a continuous decrease in compressive strength.
- Molarity of NaOH plays a vital role in the geopolymerization process, and the increase of molarity from 4M to 10M led to a compressive strength increase.
- Increasing the ratio of Na_2SiO_3 to NaOH resulted in a decrease in the compressive and flexural strength of fly ash-based geopolymer mortars. That could be related to the presence of excess silicates in the geopolymer mixture which could obstruct the geopolymeric structure formation and cause a decrease in the strength of geopolymer mortars.

Studies related to addition of SF into high calcium Fly ash-based geopolymers are very limited. Thus, studying the effects of excess silica content on ambient cured geopolymer mortars is beneficial for further understanding

the production of ambient cured geopolymer concrete since oven curing of geopolymer concrete to obtain high strength is only limited to pre-casted geopolymer concrete.

Abstract

With the proliferation of digital banking, many banks are now processing transactions through internet banking and mobile branches. Digital banking allows anyone to make payments and transfers from anywhere. Money transfer is one of the most used digital banking transactions today. Money transfer methods offered by banks are used for workplace payments, rent payments, and payments for goods and services. Since money transfers are not possible on weekdays and holidays, business owners schedule their money transfers according to specific days and hours. In this study, Sentry Transfer was developed to enable uninterrupted money transfers. Sentry Transfer is a platform that enables fast, reliable, and easy money transfers between banks anytime. It has been developed to eliminate the obligation to have an account at the same bank for transfers, the time restrictions imposed by the Electronic Funds Transfer (EFT) system, and the high commissions and limit problems that the Instant and Continuous Money Transfer (ICFT) system entails. With this platform, it is possible to transfer money at any time of the day and without time restrictions.

Keywords: Money Transfer, Electronic Funds Transfer, Instant Funds Transfer, Wire Transfer

INTRODUCTION

Digital banking is an advanced form of online banking. Banking services are provided online here. Digital banking includes a high level of process automation, mobile applications, and web-based services for providing banking products and conducting transactions. Digital banking enables anyone to make payments and transfers from anywhere.

Money transfer is one of the most used digital banking transactions today. Due to globalization, the acceleration of life, and inevitable technological development, the phenomenon of money transfer has also changed over time. Domestic money transfers by hand, with intermediary companies, or with the help of public transportation have evolved and given way to effortless transactions from bank accounts. There are several ways to send money domestically. The first of these is the wire transfer. The system that allows the sending account to transfer money from the same bank to another account or an account at the same bank is called a wire transfer. While this system, like any money transfer system, requires a fee, it can conduct transactions around the clock because the transfer is made from the same bank accounts. However, only the receiver and the sender can send from the same bank account. If the sender's account and the receiver's account have accounts at different banks, the money can be transferred through EFT via the bank account. However, since EFT is a transfer between different banks, it cannot be done 24/7. Each bank has EFT hours that vary during working hours. These hours are usually between 09:00 - 17:00. However, EFT cannot be performed outside working hours, on weekends and holidays. Transactions made during the specified hours will be executed on the next business day. The ICFT transaction, which allows money transfers between different banks 24 hours a day, 7 days a week and without time limits, is similar to EFT. For all these reasons, the objective of this study was to develop a platform for uninterrupted money transfers called Sentry Transfer.

This paper is organized as follows: Section 2 presents related literature. Details of study are given in Section 3. Section 4 concludes the paper.

LITERATURE REVIEW

In recent years, various methods have been used to transfer money. For this reason, it is important to analyze the measures that can effectively prevent the uncertainty that can cause EFT. Despite the importance of these systems, many financial institutions are not aware of the potential risks and fraud associated with Automated Clearing House (ACH). Therefore, (Sheema and Subala, 2022) addressed the risks of EFT and attempted to propose measures to reduce exposure to such risks. (Christodorescu et al., 2020) developed a system to enable the secure issuance and transmission of a new Central Bank Digital Currency (CBDC). In this design, public-key cryptography was used with the central bank and other financial institutions as the certification authority to create digital signatures. CBDC was intended to create a flexible payment system that allows consumers and businesses to conduct offline digital transactions in any situation. An Offline Payment System (OPS) had been proposed that allows one user to make a digital payment to another user while both users were temporarily offline and unable to connect to payment agents (including the Internet). (Islam et al., 2020) proposed a money transfer system to automate and improve the security of the payment process for Small and Medium Enterprises (SMEs) in Bangladesh. To achieve this goal, a conceptual framework was proposed from the perspective of Industry 4.0, along with the necessary algorithm. The proposed system incorporated the technique of iris verification to uniquely and permanently verify the identity of a user. Customers with multiple bank accounts used multiple applications to manage those accounts. And so many applications mean a huge amount of data. The real problem was that when big data was integrated, the volume, variety, and accuracy of the data become too large for traditional data processing to handle. (Srividhya et al., 2017) proposed a system for the systematic processing of such big data. The system combined multiple accounts of the customer into a common layer that fulfills all their transactional needs. (Sawaikar, 2015) proposed Yes Money, a remittance system for migrant workers. The proposed system involved the development and implementation of an information and communication-based solution for financial participation. It was found that this system is a product that can benefit other products in the market. (Mulwa and Ndati, 2013) investigated the Integrated Marketing Communication (IMC) strategies used in M-PESA money transfer services in Kenya, which were necessitated by the fact that similar mobile money transfer services exist in Kenya but are not as successful in uptake and usage as M-PESA. The case study method was used, which allows for both qualitative and quantitative analysis and interpretation of the data. The population was selected through both purposive and non-objective sampling methods. The results confirmed that Safaricom employs IMC strategies to disseminate information about the innovation M-PESA that was appropriate for the target markets compared to its competitors, so the success of the launch could be attributed to unique IMC strategies. (Merritt, 2011) analyzed developments in mobile money transfers, the emerging ecosystem, its participants, and business models. It also examined the impact of roaming payment systems across relevant legal and regulatory jurisdictions and geographic boundaries, and the emergence of mobile airtime as an alternative currency. (Wijesundera, 2011) proposed a fast and low-cost money transfer method to solve the high cost of money transfers in Sri Lanka. This method demonstrates the usefulness of such a system for Sri Lanka and implements a prototype for person-to-person mobile money transfer and specifically for managing cashless payments using mobile devices to purchase goods. This system includes an SMS send/receive module, a client-server module, a web module, etc. It contains the most important modules. (Hesse, 2010) introduced an interbank money transfer system for personel computer and mobile devices. In addition, it has been noted that the advent of cell phones with Internet access has led to the emergence of websites built by mobile characteristics such as screen size, page size, image size, and processing power, as well as applications developed solely for the mobile platform. (Badran, 2009) conducted research on money transfer services among different users in Northern Cyprus. The users were students, workers, and some businessmen. It was found that the choice of money transfer service is influenced by factors such as cost, speed, and security. Research had shown that customers use different remittance channels depending on their own needs.

DETAILS OF SENTRY TRANSFER

For companies to run their operations constantly, they may need to transfer money continuously on weekends, special days, and during non-working hours. For this reason, Sentry Transfer provides payment mediation services through the Internet and mobile bank branches so that United Payment customers can transfer money to their bank accounts within the framework of Law No. 5441. Sentry Transfer, whose working principle is shown in Figure 1, consists of the roles and structures listed below.

Sender Bank: the bank to which the remittance is made.
Sender Account/ IBAN: the account information of the customer sending money to the sending bank.
Intermediary account (sending bank): the United Payment Services account information in the sending bank's system.
Receiver's bank: the bank of the receiver in the money transaction.
Receiver's account/ IBAN: the receiver's account number with the receiving bank in the money transfer transaction.
Intermediary account (receiver bank): the United Payment Services account details in the receiving bank's system.

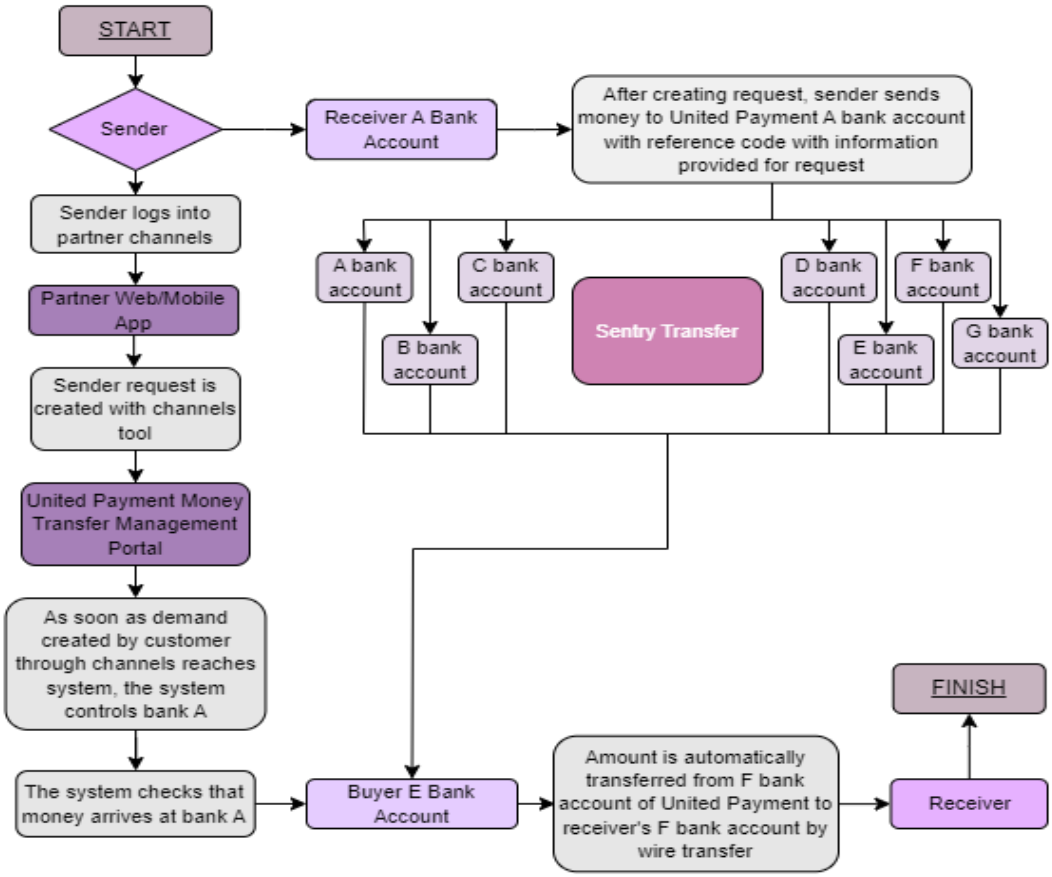

Figure 1. Working Principle of Sentry Transfer

The sender first selects the account at the bank to which the transfer is to be made via Sentry Transfer, enters the receiver's details and the amount he or she wishes to send, and transfers the transfer to United Payment's intermediary account at the sending bank. When United Payment verifies and intercepts this transaction received on the intermediary account, the receiver sends the money via wire transfer from the intermediary account at the bank to which the money is to be sent.

In the development of Sentry Transfer, the front-end was developed using Vue JS and the back-end was developed using Go. Using Go for the back-end resulted in small binaries that did not contain dependencies such as a runtime engine when compiled. The small size of the application resulted in increased network traffic and time savings in the deployment pipeline. Because Go applications did not have extensive framework initialization processes, the applications were able to respond to incoming Web requests within a very short time after deployment. The GRPC protocol was supported over HTTP 2.0. The microservice architecture integrated the sub-applications belonging to the study and ensured their communication with smaller packet sizes and lower network load. Protocol buffers were used to define the message structures of our web applications in a centralised system. Integration began with the creation of server and client code with a single command using the definitions in these proto files. Thanks to the GRPC gateway, the remaining service ends were also offered to partners supporting only HTTP 1.1 communication without writing any additional code. Sentry Transfer was run as a Docker container in a microservice architecture. Hashicorp Nomad was used as

a tool for containerized application management (orchestration). To complement this, Consul was used for service discovery to communicate between our applications and Fabio for routing and load balancing.

CONCLUSION

For financial processes to be orderly, money transfers must occur without interruption. Current money transfer methods are fraught with problems, such as requiring the same bank, the ability to transfer at specific times, commission fees, and transaction limits. For this reason, this study developed the Sentry Transfer application, which enables money transfers around the clock. With this application, customers can send money uninterrupted, whether on weekends, special days, or outside working hours, and they can continue their operational processes efficiently.

Abstract

In this study, the effect of seed coat presence on germination of bean genotypes with differentseed coat color were investigated. The study was established under laboratory conditionsin a randomized experimental design with 4 replications. In the study, 12 bean genotypes were used and the seeds were divided into two groups after being kept in water in a darkenvironment for 24 hours. In the first group, the seeds were peeled (without damaging the embryo), while the seeds in the second group were left to germinate directly. Germination and seedling growth characteristics were investigated. As a result of the study, germination rate of bean genotypes with different testa colors varied between 80.0 - 88.75%; vigor index 1802.63 - 1158.50; shoot length 6.69 - 10.54 cm; root length 5.17 -10.30 cm; fresh weight 1.23 - 3.41 g and dry weight 0.25 - 0.58 g. As a result of the correlation analysis, statistically positive and significant correlations were determined between the other traits except germination. As a result of the study, removing the seed coat resulted in statistically significant positive increases in all traits examined. It was determined that different testa colour was not effective on seed germination in beans. The highest values were obtained in the other traits except root length in the large white colored bean genotype (G2) with high thousand grain weight.

Keywords: Bean (*Phaseolus vulgaris* L.), testa colour, testa presence, germination properties, correlation analysis

Introduction

Beans (*Phaseolus vulgaris* L.) are one of the most important edible grain legumes worldwide. The gene center of beans is Central America and South America (Kwak and Gepts, 2009), and beans are cultivated in five regions including South and East Africa, South Eastern and Western Europe, North, Central and South America and East Asia (Demircan, 2018). In the world, approximately 29 million tons of dry beans are produced on approximately 34.5 million hectares of bean cultivation area and the average yield per hectare is 880 kg (FAO, 2020). In our country, the cultivation area is 890 thousand da, production is 225,000 tons and the average yield per decare is 268 kg (TUIK, 2020). Nutritionally, beans have a good protein source, 2-3 times that of cereal grains (Siddiq et al., 2010). In addition, it is considered one of the most important legumes for human consumption in the world due to the protein, carbohydrates, vitamins and minerals it contains. Furthermore, beans have rich phytochemicals, antioxidant activity and a wide array of flavonoids such as anthocyanins, flavonoids, proanthocyanidins, flavonols, phenolic acids and isoflavones (Beninger and Hosfield, 2003; Choung et al., 2003; Aparicio-Fernandez et al., 2005b; Granito et al., 2008; Lin et al., 2008).

As the main modulator of interactions between the internal structures of the seed and the external environment, the seed coat (testa) not only maintains the integrity of seed parts,but also protects the embryo from mechanical injury, disease and pests. The seed coat also improves seed survival in soil, especially under adverse environmental conditions, and helps to prevent species extinction in the wild (Souza and Marcos-Filho, 2001; Tiryaki et al., 2014). In addition, during periods of rapid water uptake, the seed coat is the primary barrier to water penetration (Zhang et al., 2008). The fact that germination- limiting activities are often less permeable to water and/or oxygen is an indication of its mechanical resistance to radicle emergence (Mohamed-Yasseen et al., 1994).

The seed coat acquires its distinctive colour at physiological maturity. Furthermore, seed coat pigmentation plays an important role in seed dormancy and germination (Powell, 1989; Debeaujon et al., 2000;

Ochuodho et al., 2008). Many sources have stated that seed colour is one of the important characteristics of absorption damage in many crops. In legumes, white seeds germinate earlier than coloured seeds because they have the ability to take up water faster than colored seeds. However, fast germinating seeds are subjectedto more water uptake damage and submergence tolerance (Duran and Retamal, 1989), higher leaching and lower vigor and vigor (Hou and Thseng 1991; Kantar et al., 1996).

Germination and emergence of bean seeds are under the influence of factors such as temperature, humidity, oxygen, coat colour, coat strength and water uptake rate (Demir, 1995). It has been reported that white grain bean varieties have lower seed quality than coloured grain varieties and these white grain varieties show poorer germination, emergence and development, lower yield and less resistance to unfavorable environmental conditions (Powell et al., 1986). In many field crops such as *Phaseolus vulgaris* L. (Hacısalihoğlu et al., 2013; Possobom et al., 2015), soybean (Marwanto, 2004), rapeseed (Zhang et al., 2008), flax (Dana et al., 2008) and *Arabidopsis* (Debeaujonet al., 2000), pod and seed coat colour has been used to develop a simple method to improveseed quality. In this study, it was aimed to determine the effects of seed coat (testa) on germination and seedling traits in bean genotypes with different seed coat colour.

MATERIALS AND METHODS

This research was conducted in the laboratories of Isparta University of Applied Sciences, Faculty of Agriculture, Department of Field Crops in 2021. In the study, 12 bean genotypes with different seed colours were used. The characteristics of the bean genotypes are given in Table 1 and the images of the seeds are given in Figure 1. In the study, registered variety (Yunus 90, G1), Bombay white (G2), black spotted white (G3), red bean (G4), black (G7), dark purple (G8) and yellow (G9) bean genotypes were obtained from seed stocks of Isparta University of Applied Sciences, Faculty of Agriculture, Department of Field Crops, powdery (G5), powdery with burgundy spots (G6), light brown (G10), brown with small cream spots (G11) and brown with large cream spots (G12) bean genotypes were obtained from the seed company.

Figure 1. Images of the bean genotypes used in the study

The study was established in a completely randomized experimental design with 4 replications. In the study, each bean genotype was divided into two groups as with and without seed coat. 200 seeds from each genotype were used. These seeds were separated as 25 seeds in each replicate and placed in 250 ml glass jars with lids. Then, distilled water was added to these jars and they were kept in a dark environment (20-25^0 C) for 24 hours. At the end of 24 hours, the seeds in the jars were removed from the water with the help of a strainerand the seed coats (testa) of 100 seeds out of 200 seeds were peeled without damaging the embryos and cotyledons. Then, 25 with seed coat and coat peeled seeds of different coloured bean genotypes were placed in petri dishes (9 cm diameter). Whatman (No:3) filter paperwas placed 2 under the seeds and 1 on top of the seeds in the petri dishes and the seeds were left to germinate at a temperature of 22-24°C according to the principles specified in ISTA (1996). After the seeds were placed in the germination medium, they were checked every day to determine the number of germinated seeds and the experiment wasterminated at the end of the 9th day. Water was added to the germination media when

necessary. The characteristics examined in the experiment are given below.

Germination rate (%) was calculated by dividing the number of germinated seeds by the number of seeds placed in the germination medium and multiplying by 100. Root and seedling length (cm) was determined at the end of the germination period by cutting the roots and seedlings of the seed from their joints with a razor blade and measuring their lengths with the help of a millimeter ruler (Karaman and Kaya, 2017). Vigor index (VI) was calculated according to the formula VI = [Germination percentage x (root length + seedling length)] using the obtained root and seedling lengths (Hu et al., 2005). Fresh and dry weights (g) were determined by weighing the fresh weights of 10 selected seedlings on a 0.01 precision balance and then the seedlings were dried in an oven at 65˚C for one day and weighed on a precision balance and their dry weights were determined.

The data obtained for the traits examined in the experiment were subjected to analysis ofvariance with TOTEMSTAT statistical package program according to the random plots experimental design and difference groupings were made according to Duncan test. In addition, correlation analysis was performed in Minitab statistical package program to determine the relationships between the traits examined.

Results

In the study, germination and seedling characteristics of bean genotypes with different seed colours were examined with and without seed coats. As a result of the study, genotype and seed coat inclusion status were found to be statistically significant on germination rate (P≤0.01). On the other hand, bean genotypes, presence of seed coat and bean genotypes x seed coat interactions were found statistically significant on vigor index, seedling and root length, fresh and dry weight (P≤0.01; Table 2).

In the study, germination rate of bean genotypes varied between 80.0 - 88.75%. The highest germination rate was determined in red bean genotype (G4) and the lowest in light brown bean genotype (G10). It was observed that there was no statistical difference between the red bean (G4) genotype with the highest germination rate and white (G1), large white (G2), white with black spots (G3), powdery (G5), dark purple (G8), yellow (G9), small (G11) and large (G12) spotted brown bean genotypes. When the germination rates of the genotypes were compared according to the seed coat content, it was determined that the germination rate (90.83%) of the bean genotypes without seed coat (without test) was higher (Table 3).

The vigor index of bean genotypes with different seed color varied between 1033.88 - 1802.63. The highest vigor index was determined in white bean (G3) genotype and white(G1) and large white (G2) bean genotypes were in the same group with G3 genotype. The lowest vigor index was determined in genotype G11 (brown) (587.13). According to theseed coat condition, bean genotypes with seeds without seed coat had higher vigor index(1882.02). The highest vigor index of the bean genotypes with seeds containing seed coatwas determined in white bean genotype (G3) (1271.50) and the lowest was determined inblack bean genotype (G7) (701.00). In bean genotypes without seed coats, the highest vigor index was determined in the large white bean (G2) genotype (2457.25) and in the registered (white) bean variety (G1). Again, the lowest vigor index in bean genotypes without seed coat was determined in dark purple bean (G11) genotype (1535.00) and redbean (G4) genotype (1538.50) (Table 3).

In the study, the average seedling lengths of bean genotypes with different seed coat colours varied between 6.69 - 10.54 cm. The highest seedling length was determined in large whitebean genotype (G2) and the lowest seedling length was determined in dark purple bean genotype (G8). When the seed coat content was analyzed, the average seedling length of bean genotypes without seed coat was higher (11.20 cm). In the genotypes containing seed coat, the highest seedling length was determined in large white bean genotypes (G2) and white with black speckles bean genotypes (G3) and the lowest seedling length was determined in light brown bean genotype (G10). In genotypes without seed coats, the highest seedling length was determined in the large white bean genotype (G2) and the lowest in the dark purple bean genotype (G8) (Table 4).

The average root length of different colored bean genotypes was highest in white bean genotype (G3) (10.30 cm) and lowest in dark purple bean genotype (G8) (5.17 cm). On the other hand, root length averages (9.52 cm) were higher in bean genotypes without seed coats as in seedling length. In bean genotypes containing seed coats, the highest root length was determined in white with black spots bean genotype (G3) and the lowest rootlength was determined in brown bean genotype (G12) with small cream spots. In the bean genotypes without seed coats, root length was highest in the large white (G2) and black speckled white (G3) genotypes and lowest in the small cream speckled brown bean (G11)genotype (Table 4).

Fresh and Dry Weight

The average fresh weight of the bean genotypes varied between 1.23 - 3.41 g. The highest fresh weight was determined in the large white coloured bean genotype (G2) and the lowest fresh weight was determined in the small cream spotted brown bean genotype (G11). When the seed coat inclusion status was analyzed, the average fresh weight of the seeds whose seed coats were removed was higher (2.20 g). On the other hand, the highest fresh weightwas determined in genotype G2 (2.85 and 3.97 g, respectively) among the seeds with and without seed coat. Among the bean genotypes with seed coat, the lowest fresh weight was determined in the genotype G11 (brown bean with small cream spots), while the lowest fresh weights were determined in the genotypes G11, G10 and G12 (1.58, 1.59 and 1.61 g,respectively) without seed coat (Table 5).

The highest average dry weight of different colored bean genotypes was determined in the large white bean (G2) genotype (0.58 g) and the lowest in the light brown bean (G10)genotype (0.25 g). According to seed coat condition, the highest average dry weight wasdetermined in the treatment without seed coat (0.45 g). Among the bean genotypes containing seed coat, the highest dry weight was determined in the large white bean (G2)genotype and the lowest dry weight was determined in the small cream speckled brown bean (G11) genotype. In bean seeds without seed coat, dry weight was highest in large white (G2) and white bean with black spots (G3) genotypes and lowest in light brown bean (G10) genotype (Table 5).

Correlation Analysis

The correlation values of the traits examined in the study are given in Table 6. It was determined that there were statistically positive and significant correlations among the other traits except germination rate ($P \leq 0.01$). The highest positive and significant correlation was determined between vigor index and seedling and root length in the groupwithout seed coat. Although there was a significant correlation (r=0.29*)

between germination rate and vigor index in samples without seed coat, this correlation was positive but insignificant when the seed coat was removed. The relationship between germination rate and other traits was found to be insignificant (Table 1).

Discussion

In this study, the effects of the presence of seed coat on germination and seedling characteristics of bean genotypes with different seed coat colour (with and without seed coat removed) were investigated. In the study, germination (germination rate and vigor index) and seedling (seedling length, root length, fresh and dry weight) traits showed significant variation according to bean genotypes and presence of seed coat (Table 2; 3; 4; 5). As a result of the correlation analysis, statistically positive and significant correlations were determined between the other traits except germination (Table 6). Although the highest germination rate was determined in the red colored bean genotype (G4), high germination rates were also determined in bean genotypes with different seed coat colours [white (G1),large white (G2), white with black spots (G3), powdery (G5), dark purple (G8), yellow (G9), small (G11) and brown with large spots (G12)] (Table 3). This shows that seed coat colour is not effective on germination rate. However, in different studies, it was determined that seed coat color can affect germination. As a matter of fact, Abdullah et al. (1991) reported that germination rate of colored cowpea genotypes varied between 0-83%, and the germination rate of brown and black testa genotypes (41-83%) was higher than that of white and partially white genotypes (0-21%). Torada and Amano (2002) also reported that seed coat color negatively affected germination and the seed coat weight of yellow seedswas higher than that of light or dark brown seeds. Powell et al. (1986) determined the field emergence of 30 *Phaseolus vulgaris* L. with different testa colors and found that black and brown testa beans (91%) had higher emergence rates than white testa beans (67%). Powell (1989) found that when the expression of the A gene in coloured pea lines was suppressed by a recessive pollen gene, the resulting white seeds (palpal AA) absorbed water faster. They also reported that there is a close relationship between pigmentation inthe seed coat and slow water uptake and that the slow water uptake in coloured pea seeds is related to the restriction of water entry by the seed coat. In our study, it can be said that when the seed coat was removed, high germination rate occurred (white with large white,white with black spots, red, powdery, dark purple, yellow, brown with small and large spots) due to the increase in water uptake rate and it can be said that the seed coat slows down the permeability to water.

In edible grain legume species, heterogeneous maturation can lead to significant differences among seeds in shape, size, weight and color (Fenner, 1993; Coste et al., 2001; 2005). These differences can affect the subsequent physiological characteristics of the seeds (e.g. germination and dormancy) (Kahn et al., 1996). Powell et al. (1986) reportedthat beans with colored testas adhered more firmly to the testa cotyledons than beans withwhite testas, and that this was the main factor affecting the faster water uptake of coloredseeds. It has been suggested that cowpea cultivars with fully or partially cream/beige testahave faster water uptake than cultivars with coloured testa, and that colored seed coats arethicker than light-colored seeds (Morris et al., 1968). It has also been reported that dark seed coats form a physical barrier with a larger number of cells,

differences in cell densityor some chemical reactions (phenolic oxidation) specific to colored seeds can reduce water permeability (Khan et al., 1997). Furthermore, lignin content in Lima bean testa was found to affect both testa thickness and water absorption rate (Kannenberg and Allard, 1964). In a study on cowpea, it was determined that water was absorbed faster in cowpea varieties with fully or partially cream/beige testa than in varieties with colored testa (Pekşen et al., 2004). As a matter of fact, the variation in germination and seedling characteristics of bean genotypes with different seed coat colours in our study may be dueto physical, technological and quality characteristics of the seeds as well as genetic characteristics. In addition, it can be said that the seed coat reduces water absorption andcreates a barrier in germination.

The vigor index, which is obtained by multiplying the germination percentage by the seedling + root length, was higher in the genotypes with white testa (G1, G2 and G3). The lowest was found in dark purple (G7) and black (G8) genotypes with high pigmentation. Tong et al. (2021) found that the vigor index and root length of the yellow seed coat clover were 13% and 18% higher than the brown clover, respectively. On the otherhand, since germination, i.e. growth, started earlier in the samples with the seed coat removed, the vigor index was found to be 2-3 times higher than those containing the seedcoat (Table 3).

In the study, variation was determined in seedling traits (seedling length, root length, freshand dry weight) of bean genotypes with different seed coat colour. The increase in growthrate in seed coat color also increased the seedling traits. On the other hand, seedling length,root length, fresh and dry weight values of the seeds decreased as seed color changed fromlight to dark (Table 3; 4). Anuradha et al. (2009) classified chickpea according to differentseed coat colours (light and dark brown) and found that light coloured seeds had higher germination and potential, seedling length, dry matter production, vigor index. Atak et al. (2008) determined that seedling characteristics (seedling length, root length, fresh and dry weight) of pea genotypes with light, medium and dark green seed colors were highest indark green pea genotypes and lowest in light green pea genotypes. However, besides seedcoat color, genetic factors potentially affect both seed germination and seedling growth (Souza and Marcos-Filho, 2001). The differences observed between the traits examined in the study may vary according to the genetic structure of the seeds as well as cultural and environmental conditions during cultivation.

Conclusion

In the study, it was determined that the presence of seed coat in bean genotypes with differentseed coat color had significant effects on germination and seedling traits. As a result of the correlation analysis, a statistically positive and significant relationship was determined between the other traits except germination trait. As a result of the study, among the bean genotypes with different seed coat color, the highest values were determinedin all traits examined except root length in the large white bean genotype (G2) with highhundred grain weight. It was revealed that the seed coat can inhibit germination and growth, and the traits examined were generally superior in those with the seed coat removed. In general, it can be said that vigor and seedling characteristics of light coloredseeds are better than dark coloured bean seeds. However, it should be kept in mind that notonly seed color but also seed size, genetic structure and many other factors are effective in the formation of these differences.

Özet
Bu çalışma, Bitlis masifi aplit dayklarının mineralojik, yapısal ve jeokimyasal özelliklerinin oluşum koşullarından ne derece etkilendiğini tespit etmek amacıyla hazırlanmıştır. Granit/granodiyorit kökenli aplitlerin mineralojik bileşimi magnezyum hornblend, plajiyoklaz, alkali feldispat, kuvars ve biyotit'dir. Jeokimyasal diyagramlar, toleyitik ve kalkalkalen bileşimi işareteder. Aplit daykları, bölümsel ergime sonrasında gelişen fraksiyonel kristallenmeye uğramış üst kıtasal kabuğun ürünleri olduğunu göstermektedir. Elde edilen tüm veriler, masife ait kayaçların petrolojik gelişiminde metamorfizma ve bölge jeodinamiğinin önemli olduğunu rol oynadığını göstermektedir.

Anahtar Kelimeler: Fraksiyonel kristaleşme, parajenez, masif, metamorfizma

Metamorphism pressure factor evidence on aplite petrogenesis

Abstract
This study was prepared to determine to what extent mineralogical, structural and geochemical properties of aplite dykes of the Bitlis massif are affected by the formation conditions. Mineralogical composition of granite/granodiorite-origin aplites are magnesium hornblende, plagioclase, alkali feldspar, quartz and biotite. Geochemical diagrams indicate the tholeiitic and calc-alkaline composition. Aplit dykes show that they are products of upper continental crust which underwent fractional crystallization after partial melting. All the data obtained show that metamorphism and geodynamics of region play an important role in petrological development of rocks of the massif.

Keywords: Fractional crystallization, paragenesis, massive, metamorphism

GİRİŞ

Bitlis Masifi bölgesel metamorfizma sonucu oluşmuş geniş yayılım alanı ve kayaç çeşitliliğine sahip bir masiftir (Şengün, 1993; Tolluoğlu, 1981; Genç, 1990; Susam, 2018). Alt ve Üst Birlik kayaçlarından oluşan bu masifin Alt Birlik kayaçlarını amfibolit, paragnays/şist, eklojit ve bunları kesen granit ve holo-lökokratik granitik kayaçlar, Üst Birlik kayaçlarını ise meta-pelitler ve meta-karbonatlar oluşturur. Metamorfizmaya nap ağırlığından kaynaklanan yüksek basınç önemli mineral reaksiyonlarının gelişmesine ve mineral oluşumlarına sebep olmuştur (Oberhansli ve ark., 2012). Glokofan, disten gibi minerallerin varlığı bunun delilidir.

Çalışma alanı içerisinde yeralan Bitlis masifine ait Yolcular grubu amfibolit, biyotit-muskovit gnays, mikaşistler, gözlü gnays, biyotitli meta-granit, kuvarso-feldispatik gnays ve melapegmatit gibi Gondwana temel kayaçlarını kapsar (Oyan ve Tolluoğlu, 2005). Kaledoniyen metamorfizması hem Yastıktaş gözlü ganysını hemde Doğruyol gnaysı ve Karakuş amfibolitini etkilemiştir. Van Gölü'nün güneydoğusunda ve Bitlis iline bağlı Hizan ilçesinin güneyini kapsayan inceleme alanında, Yolcular grubunun Yastıktaş gözlü gnaysı ve Karakuş amfiboliti yeralır. Migmatitleşmenin masif içerisinde önemli bir yeri vardır. Masifin yerleşimi sırasında geliştiği ifade edilen migmatitleşme (Kılıç ve Ateş, 2014;Kılıç ve Kaya, 2018), ayrı bir çalışma konusudur. Bu çalışmada Kaledoniyen orojenezi sırasında gelişen nap ağırlığının sebep olduğu metamorfizma ve bunu en iyi yansıtan pegmatoid damar kayaçlarının petrografisi ve petrolojisi incelenecektir.

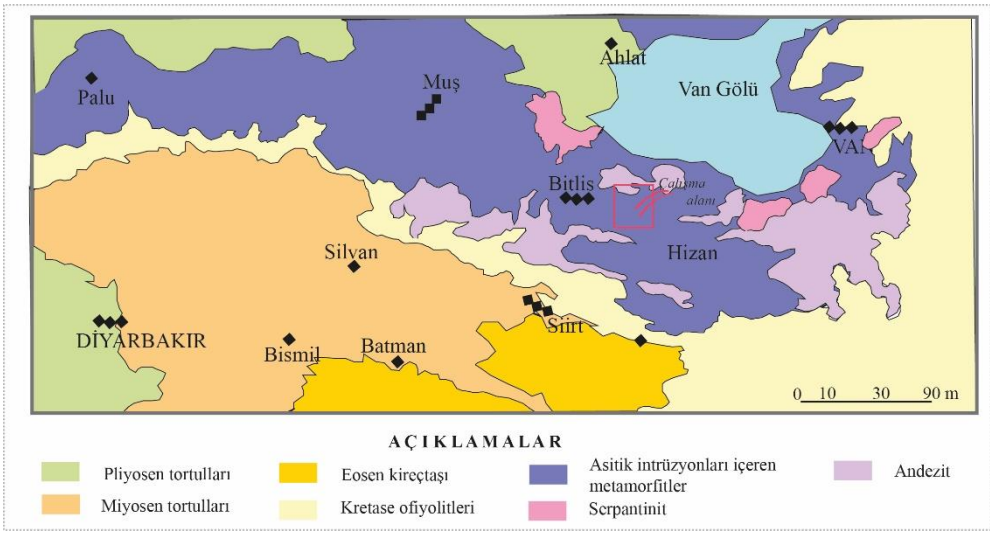
MATERYAL VE METOD

Çalışma arazi ön incelemeleri ile seçilen örneklerin mikroskop çalışmalarını ve kimyasal analizlerini kapsamaktadır. İnce kesitlerin hazırlanması ve örneklerin mikroskop incelemeleri Fırat Üniversitesi Jeoloji Mühendisliği bölüm laboratuvarlarında yaklaşık 150-200 örnek üzerinde gerçekleştirilmiştir. Kimyasal analizler ise 20 örnekte LA-ICP-MS analiz metodu uygulanarak "Acme Analitik Laboratuvarı"nda yapılmıştır. Petrografik adlama ve kimyasal analiz sonuçları hazır paket programlarında (Grapher 9, Microsoft Office Excel 2010) değerlendirilerek makale amacına uygun formatta hazırlanmıştır.

BULGULAR

Stratigrafik olarak birden çok karmaşığın bir seri içerisinde ilksel ilişkileri korunmuş ve devamlılık gösteren seriler (magmatik, metamorfik) halinde bulunması ile oluşan birkaç kilometre genişliğe sahip birimlere masif adı verilir. Masif orojenek kuşak içerisinde topografik ve yapısal olarak diğer kayaçlara nazaran daha yüksek bir topografya sunan farklı kökenli kayaç topluluğudur. Istranca masifi, Uludağ, Menderes, Kazdağ, Sultandağ, Ilgaz, Tokat, Anamur, Akdağmadeni, Kırşehir, Niğde, Malatya ve Bitlis masife örnek olarak verilebilir. Yüksek dereceli metamorfizma (Ilgaz masifi), orta dereceli metamorfizma (Pütürge-Bitlis masifi), düşük ve çok düşük dereceli metamorfizma gibi, kayaç çeşitliliği ve farklı metamorfizma dereceleri gösterebilirler. Farklı metamorfizma derecelerine en iyi örneklerden biri Bitlis masifidir. Bitlis masifi yüksek dereceli metamorfizmayı işaret eden gnays, migmatit, amfibolitler iç/çekirdek bölümünü oluşturur. Düşük dereceli metamorfizma ürünü şist, mermer, fillit gibi kayaçlar ise örtü/kılıf bölümünde bulunmaktadır.

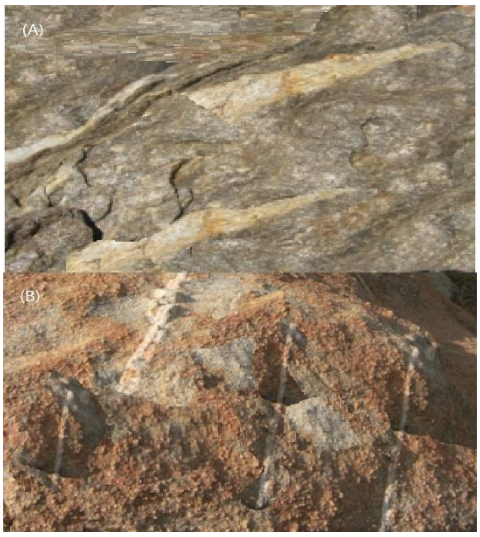
Yaklaşık 1-1.2 km^2'lik bir alanda amfibolit kütleleri içerisinde metamorfizmadan oldukça etkilenmiş paragnayslar ve asitik magmatikler bulunur (Şekil 1). Koyu yeşil ve yeşilimsi mavi renge sahip masif yoğun şistozite yapısı kazanmış amfibolşistler ile devam etmektedir. Almandin amfibolit fasiyesini karakterize eden, granatlı amfibolitlerin bir diğer özelliği biyotit mineralenin varlığıdır (Şekil 2).



Şekil 1. İnceleme alanının yer bulduru ve jeoloji haritası

Şekil 2. Yolcular grubuna ait kayaç örnekleri

Pegmatoid damarlarından aplitler, masifin çekirdek bölümünde baskındır. Ancak, örtü birimlerinide çalışma alanının bazı kesimlerinde kesmiş olduğu görülmüştür. Basınç etkisiyle aplit damarları mercek, göz ve budin yapısı şeklinde izlenmektedir. Budin yapıları birkaç santimetreden bir metreye kadar değişen boyutlarda izlenmekteir. Aplit daykları, metamorfizma etkisiyle yaygın olarak mercekler şeklinde gnayslar içerisinde bulunmaktadır. Aplit sil ve mercekleri alterasyon etkisiyle kırmızımsı bir görünüm sergilemektedir. (Şekil 3).

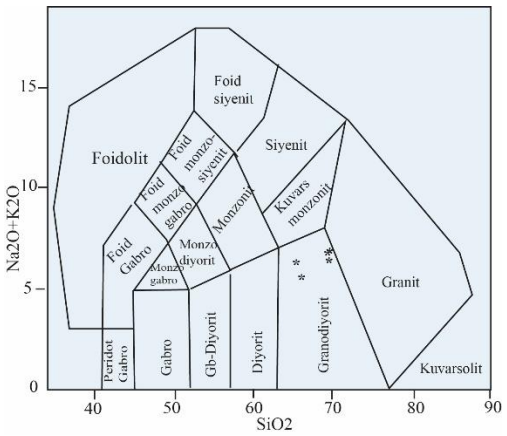


Şekil 3. Aplit sil ve mercekleri

Aplitlerin ana mineral parajenezi; Kuvars (%50-55), plajiyoklaz (%5-10), ortoklaz (%30-35), biyotit (%0-5) ve sfen'dir. Aplitik (mozaik) dokuya sahiptirler. Holokristalin bir hamura içinde plajiyoklaz ve kuvars fenokristalleri izlenir. Feldispatlar içinde ortoklazların plajiyoklazlara oranla daha baskındır. Küçük taneli ve özşekilsiz olan kuvars kristalleri çoğunlukla hamurda, daha az fenokristal olarak kristal şeklinde, dinamik metamorfizma etkisi ile dalgalı sönme özelliği sergilerler. İkincil olarak epidot ve klorit kristalleri izlenir.

Bitlis metamorfiti içerisinde bulunan Yolcular metamorfitine ait aplit sil ve damarlarından alınan 6 adet örneğin analiz sonuçları değerlendirilmiştir. Yapılan analizlerde, SiO_2 miktarı %69.55-%73.72, Al_2O_3 %14.07-16.30, TiO_2 %0.33-0.53, FeO 0.29-0.73, MnO %0.01-0.11, MgO %0.38-0.80, CaO %0.15-0.82 arasında değiştiği belirlenmiştir. Yüksek SiO_2 değeri aplitin kökeniyle uyumludur. Jeokimyasal analiz verilerinin değerlendirilirmesinde bazı elementlerin hareketliliği sebebiyle, alterasyon ve metamorfizma süreçlerinde hareketsiz olan kalıcılığı yüksek elementler kullanılmasına çalışılmıştır (Jenner, 1996; Pearce, 1996;Kılıç ve Kaya, 2014). Silika eriyiklerinin vizkozitesi SiO_2 içeriği (yüksek SiO_2 içeriği yüksek vizkozitedir), çözünmüş uçucuların miktarı ve türü (yüksek H_2O içeriği ise düşük vizkozitedir) tarafından ve

ilave olarak sıcaklık ile kristal şekli viskoziteyi kontrol eden diğer faktörlerdir. CO_2'in aşırı fraksiyonu ise eriyiğin vizkozitesini artırmaktadır (Pikerton and Stevenson, 1992). Granitik magma vizkozitesi soğuma sırasında kristalleşmeyle artma eğilimine sahipken, magma vizkozitesi sulu granitik magmaların kristalleşmesi sırasında, H_2O içeriğinin ergiyikte çoğalmasına bağlı olarak azalacaktır. Jeokimyasal analiz verileri, aplitik kayaçların bileşimini belirlemek amacıyla SiO_2'ye karşı Na_2O+K_2O diyagramları hazırlanmıştır (Michard, 1989) (Şekil 4). Bu diyagramlarda, aplit dayklarının granit, granodiyorit bileşiminde olduğu görülmektedir. Elde edilen sonuçlar petrografik verilerle uyumludur.



Şekil 4. İnceleme alanındaki magmatik kayaçların diyagramındaki konumu (Michard, 1989)

Jeokimyasal veriler kıtasal kabuk kısmi ergimeye uğrayan ana kaynak olduğunu göstermektedir. Aplit magmasının evriminde fraksiyonel kristallenmenin önemli rol oynadığı yüksek Rb/Sr ile LaN/YbN ve düşük K/Rb, Sm/Nd, Sr/Ba oranlarından izlenebilmektedir. Bu element oranları bölümsel ergime sonrasında gelişen fraksiyonel kristallenmeye uğramış üst kıtasal kabuğu işaret etmektedir.

TARTIŞMA

Bitlis masifi içerisinde yeralan aplit dayklarının mineral bileşimleri, makroskobik yapısı ve değişimleri değerlendirilerek masifinin yerleşimi incelenmiştir. Fraksiyonel kristallenme ve ağırlık basıncı aplitlerin oluşumunda etkendir. Mineralojik ve jeokimyasal veriler arazi verileriyle uyumludur.

SONUÇ

Yolcular Metamorfiti' ni kesen aplit daykları magmatik faaliyetlere ve tektonik etkilere bağlı olarak kataklazma, migmatitleşme ve retrograd metamorfizma gelişmiştir. Aplit örnekleri alkali feldispat, plajiyoklaz, biyotit, kuvars ve hornblend minerallerinden oluşmuştur. Petrografik ve jeokimyasal analiz verileri granit-granodiyorit bileşiminde olduğunu işaret etmektedir. Bu kayaçlar magmatik diferansiyasyonla aplitin oluşmasına neen olmuşlardır. Major oksitlerdeki değişim kalkalkalen özellikli granitik magmadaki fraksiyonel kristallenmeye bağlanmıştır. Aplit örneklerinden hazırlanan ince kesitlerinde asimetrik yapıdaki porfiloblastlar ve feldispat alterasyonunun geliştiği belirlenmiştir.

TEŞEKKÜR

Bu çalışma FÜBAP MF.22.07 projesi kapsamında hazırlanmıştır. FÜBAP birimine sağlamış olduğu mali destek ve katkılardan dolayı teşekkür ederiz.

Bankacılık sektöründe derin öğrenme yöntemleri ile müşteri kayıp analizi

Büşra Yavuz

İstanbul Okan Üniversitesi, Mühendislik ve Doğa Bilimleri Fakültesi,
Bilgisayar Mühendisliği, İstanbul, Türkiye

busryavuz@stu.okan.edu.tr

Özet

Bankacılık sektöründe her geçen gün rekabet ortamının artması sebebiyle bankaların yeni müşteri ediniminin yanı sıra var olan mevcut müşterini elde tutmaları için çeşitli yöntemlerle müşteri kayıp analizi yapmaları kaçınılmaz hale gelmiştir. Yapılan çalışmalar bankaların yeni müşteri edinim maliyetlerinin mevcut müşteri bağlılığını sağlamaktan çok daha maliyetli olduğunu göstermektedir. Bu durum bankaların müşteri kayıp analizi yapmalarının, mevcut müşteri bağlılıklarını arttımak için verecekleri stratejik kararlarda, yapacakları planlamalarda ve geliştirecekleri fırsat ve kampanyalarda büyük öneme sahip olduğunu ortaya koymaktadır. Gelişen teknoloji ile veri madenciliği ve yapay zeka yöntemleri hemen her alanda kullanıldığı gibi bankacılık sektöründe de oldukça etkin bir şekilde kullanılmaya başlanmıştır.

Bu çalışma, derin öğrenme yöntemleri ile Naive Bayes (NB), Destek Vektör Analizi (DVM), Lojistik Regresyon (LR) gibi farklı veri madenciliği sınıflandırma yöntemlerinden oluşan farklı analizlerden oluşmaktadır. Yapılan analizlerde açık erişime sahip kaggle.com web sitesinden alınan, 10000 banka müşteri kaydından oluşan bir veri seti kullanılmıştır. Veri seti her bir banka müşterisine ait bankacılık ve profil bilgileri ile müşterilerin bankadan ayrılma durumunu gösteren sınıf bilgisinden oluşmaktadır.

Veri seti ile yapılan müşteri kayıp analizleri sonucunda, ortalama %80 başarı oranıyla derin öğrenme yöntemlerinin diğer yöntemlere göre daha başarılı olduğu görülmüştür.

Anahtar Kelimeler : Bankacılık, Derin Öğrenme, Müşteri Kaybı, Yapay Zeka

Customer churn analysis with deep learning methods in the banking sector

Abstract

Due to the increasing competitive environment in the banking sector, it has become inevitable for banks to conduct customer churn analysis with various methods in order to retain their existing customers as well as to acquire new customers. Studies show that new customer acquisition costs of banks are much more costly than maintaining existing customer loyalty. This situation reveals that banks' customer loss analysis is of great importance in their strategic decisions, plans and opportunities and campaigns they will develop in order to increase their existing customer loyalty. With the developing technology, data mining and artificial intelligence methods are used in almost every field, as well as in the banking sector, they have started to be used very effectively.

This study consists of different analyzes consisting of deep learning methods and different data mining classification methods such as Naive Bayes (NB), Support Vector Analysis (DVM), Logistic Regression (LR). In the analysis, a data set consisting of 10000 bank customer records taken from the open access website kaggle.com was used. The data set consists of banking and profile information of each bank customer and the class information that shows the status of customers leaving the bank.

As a result of customer churn analysis with the data set, it has been seen that deep learning methods are more successful than other methods with an average success rate of 80%.

Keywords : Banking, Deep Learning, Customer Churn, Artificial Intelligence

GİRİŞ

Gelişen teknoloji ile birlikte bankacılık sektöründe müşteriyi elde tutma banka kârı açısından olağanüstü bir etkiye sahip olmuştur. Günümüzde bu etki rekabet avantajı faktörleri arasında sayılabilecek pazar payı, ölçek, birim maliyet faktörlerinin neden olduğu etkiyi aşmıştır (Zhao Jing ve Xing-Hua Dang,2008). Her geçen gün

değişen müşteri ihtiyaç ve talepleri doğrultusunda bir banka için yeni müşteri edinimi, mevcut müşterisini elde tutmaktan çok daha maliyetli olmaktadır (Sümeyye Aydın,2021). Bu nedenle kayıp oranını azatabilmek için yapılan tahminler çerçevesinde müşteriler sınıflandırılarak farklı pazarlama stratejileri uygulanabilir (Zhao Jing ve Xing-Hua Dang,2008). Bankacılık veritabanlarında sürekli artan çok büyük kapasitedeki ham veri miktarı kurumlara tek başına bilgi sağlamamaktadır. Veri madenciliği teknikleri, iş karar süreçlerinin iyileştirmek ve doğru analizler yapabilmek adına verilerdeki kalıpları ve ilişkileri keşfetmek için kullanılmaktadır (Alisa Bilal Zoric, 2016). Bu çalışmanın amacı, geleneksel makine öğrenmesi yöntemlerinin ve derin öğrenme yöntemlerinin kullanılarak bankadaki müşteri kaybının tahmin edilmesi ve buna göre en uygun yöntem ve modelin belirlenmesidir. Bu sayede bankalar müşteri kaybı öncesi kayıp oranı yüksek müşteri grupları için farklı stratejik çalışmalar yürütebilir.

Literatür Özeti

Müşteri kaybı tahminleme analizleri ile ilgili birçok çalışma bulunmaktadır. Bu çalışmalar arasında daha çok telekom ve bankacılık sektörleri ön plana çıkmaktadır.

Jing ve Dang, ticari bir bankanın VIP müşterileri için müşteri kayıp tahmini çalışması yürütmüştür. Çalışmalarında yapay sinir ağları, destek vektör makine, karar ağacı, lojistik regresyon ve Naive Bayes sınıflandırma yöntemlerini kullanmışlardır. Çalışma sonrasında yapmış oldukları karşılaştırmalarda müşteri kaybını tahmin etmek için en iyi modelin %59 başarı oranıyla destek vektör makinesi modeli olduğunu ortaya koymuşlardır aşmıştır (Zhao Jing ve Xing-Hua Dang,2008).

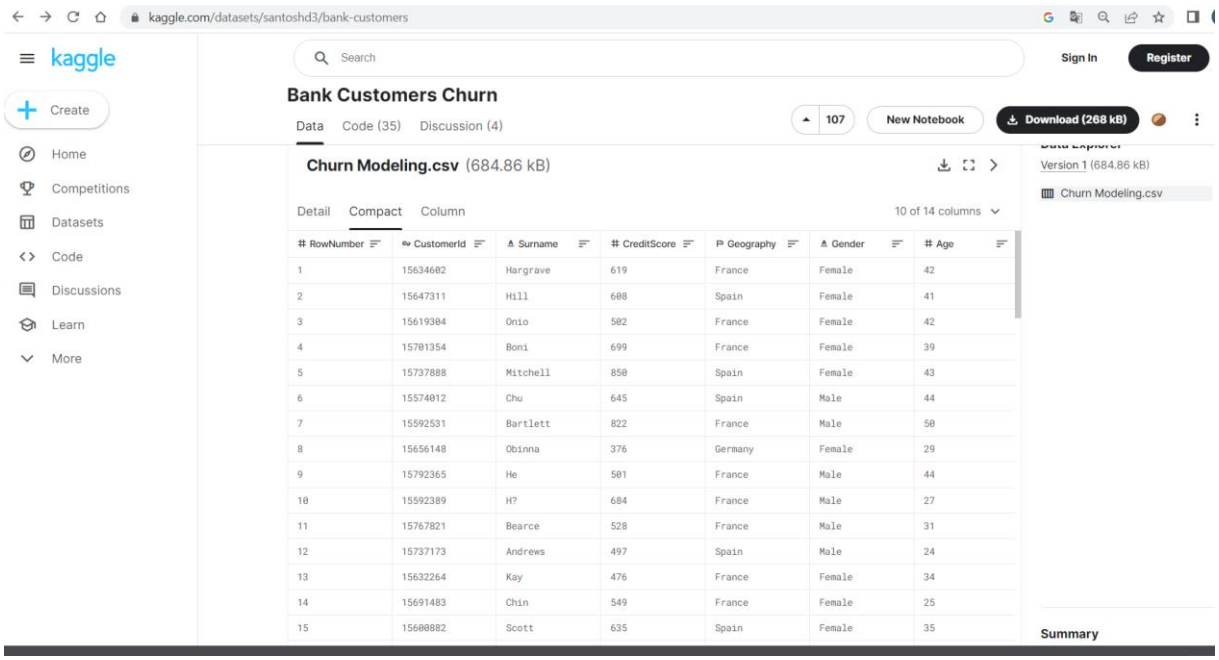
Nie ve diğerleri, bir Çin bankasından alınan gerçek müşteri kredi kartı bilgilerini kullanarak bir müşteri kayıp tahminleme modeli oluşturmak için iki farklı veri madenciliği algoritmasını kullanmışlardır. Kullanılan algortimalar lojistik regresyon ve karar ağacı algortimalarını içermektedir. Çalışmada müşteri bilgileri, kart bilgileri, işlem faaliyetleri ve risk bilgilerinden oluşan 4 değişkenin katkısı incelenmiştir. Test sonuçlarında lojistik regresyon modelinin karar ağacından daha iyi performansa sahip olduğunu göstermiştir (Guangli Nie ve ark.,2011).

Xie ve diğerleri, gerçek bir banka müşteri verisi üzerinde veri madenciliği yöntemlerinden dengeli rastgele orman algoritmasını kullanarak en iyi müşteri kayıp tahmini yapmayı planlamışlardır. Çalışmada dengeli rastgele orman algoritması sonuçlarını, yapay sinir ağları, karar ağaçları ve destek vektör makineleri algoritmaları ile karşılaştırarak , test sonuçlarında en iyi tahmin modelinin rastgele orman algoritmasına ait olduğunu göstermişlerdir (Yaya Xie ve ark.,2009).

METARYAL VE METHOD

Veri Kaynağı

Veri seti, sunmuş olduğu veri setleri ile veri madenciliği, yapay zeka, veri analizi, istatistik gibi bilimsel çalışmaların yapılmasını sağlayan bir oluşum olan Kaggle.com sitesinden alınmıştır. Veri seti müşteri bilgileri ve müşteri kayıp durumunu gösteren 14 farklı değişkenin bulunduğu 10000 müşteri kaydından oluşmaktadır. Resim 1. Veri setinin bulunduğu ilgili web sitesi gösterilmiştir.

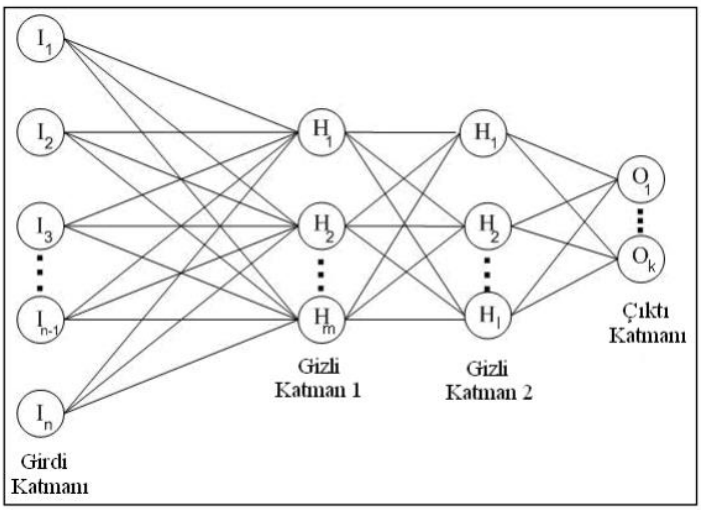


Resim 1. Kaggle.com veri kaynağı

Derin Öğrenme

Derin öğrenme, insan beyni yapısına dayanan ve yapay sinir ağları olarak adlandırılan makine öğrenme algoritmalarının bir alt kümesidir (Sanket Agrawal ve ark.,2018). Yapay sinir ağını kullanarak bilgiyi öğrenmede insan beyninin yapısını simüle eder (Anouar Dalli,2022). Sistemlerin örneklerle eğitilmesine olanak sağlar ve insanların bu örnekler karşısında nasıl davranacağını öğretir. Derin öğrenmede sistem, sınıflandırma görevlerini doğrudan görüntü, metin, ses veya videolardan gerçekleştirmeyi öğrenir. Modeller, çok sayıda etiketli veri kümesi üzerinde birçok katman içeren sinir ağı mimarileri kullanılarak eğitilir (Sanket Agrawal ve ark.,2018). Her ardışık katman, önceki katmandaki çıktıyı girdi olarak alır (Abdulkadir Şeker ve ark.,2017). "Derin" terimi, sinir ağındaki gizli katmanların büyüklüğünü ifade eder (Sanket Agrawal ve ark.,2018). Şekil 1. de genel hatlarıyla derin öğrenme mimarisi gösterilmiştir.

Derin öğrenme, özellik çıkarma ve dönüştürme için çok katmanlı doğrusal olmayan işlem birimlerini kullanır. Veri girişine yakın alt katmanlar basit özellikleri öğrenirken, üst katmanlar alt katman özelliklerinden türetilen daha karmaşık özellikleri öğrenir. Mimari, hiyerarşik ve güçlü bir özellik temsili oluşturur. Bu, derin öğrenmenin hem büyük miktardaki verilerden hem de farklı kaynaklardan toplanan verilerden yararlı bilgileri analiz etmek ve çıkarmak için uygun olduğu anlamına gelir (Pramila P. Shinde ve ark.,2018).



Şekil 1. Derin öğrenme mimarisi

Farklı görevler için geliştirilmiş birkaç derin öğrenme tekniği bulunmaktadır.

Derin Sinir Ağları (Deep Neural Network –DNN) genel olarak birkaç gizli katmana sahip herhangi bir sinir ağını ifade etmektedir. Tipik olarak, verilerin giriş katmanından çıkış katmanına geriye gitmeden aktığı ve katmanlar arasındaki bağlantıların ileri yönde tek yönlü olduğu ve hiçbir zaman bir düğüme dokunmadığı bir yapay sinir ağıdır (Sprh Labs, 2019).
Konvolüsyonel Sinir Ağları (Convolution Neural Network-CNN) çok katmanlı algılayıcıların (Multi Layer Perceptron-MLP) bir türüdür (Abdulkadir Şeker ve ark.,2017). LeNet mimarisi ilk olarak LeCunet arkadaşları tarafından tanıtılmıştır (Pramila P. Shinde ve ark.,2018). İlk olarak hayvanların görme mekanizmasından yola çıkılarak oluşturulmuştur. CNN algoritmalarının yaygın uygulama alanları olarak ses ve görüntü işleme, belge tarama ve doğal dil işleme sayılabilir (Abdulkadir Şeker ve ark.,2017).
Tekrarlayan Sinir Ağları (The Recurrent Neural Networks-RNN), bozuk bir sürümden saklanan bir kalıbı kurtarmak için kullanışlıdır ve Boltzmann makinelerinin ve otomatik kodlayıcıların öncülleridir (Pramila P. Shinde ve ark.,2018). İlk olarak Basit Tekrarlayan Ağ (Simple Recurrent Network-SRN), Jeff Elman tarafından tasarlanmıştır. RNN mimarilerinde önceki bilgi kullanımına dayalı bir yaklaşım vardır (Abdulkadir Şeker ve ark.,2017).
Uzun Kısa Vadeli Hafıza Ağları (Long Short-Term Memory -LSTM), ilk olarak 1997 yılında Hochreiter ve Schmidhuber tarafından sunulmuştur (Pramila P. Shinde ve ark.,2018). Konuşma ve metin işleme alanlarında oldukça iyi sonuçlar elde edilmektedir (Abdulkadir Şeker ve ark.,2017).
Sınırlı Boltzmann makineleri (Restricted Boltzmann Machines-RBM), girdi kümesi üzerinden bir olasılık dağılımı öğrenebilen, üretken bir yapay sinir ağı uygulamasıdır. 2000 yılının ortalarında Geoffrey Hinton ve arkadaşları tarafından hızlı öğrenme algoritmaları geliştirdikten sonra popüler olmuştur (Pramila P. Shinde ve ark.,2018).
Derin İnanç Ağları (Deep Belief Networks- DBN), Geoffrey Hinton tarafından tanıtılmıştır. Sınıflandırma ve denetimsiz öğrenme için kümeleme yeteneğine sahiptir. Yaygın olarak görüntü tarama ve üretme uygulamalarında kullanılmaktadır (Abdulkadir Şeker ve ark.,2017).

Derin öğrenmede yaygın olarak kullanılan çeşitli kavramlar bulunmaktadır.

Aktivasyon Fonksiyonları, bir yapay sinir ağında girdiler ve buna karşılık gelen çıktılar arasındaki doğrusal olmayan ve karmaşık eşleşmelerin öğrenilmesini ve anlamlandırılmasına yardımcı olmaktadır. Aktivasyon foknsiyonları, bir giriş sinyalini sırayla yığındaki bir sonraki katmana girdi olarak beslenen bir çıkış sinyaline dönüştürmek için kullanılmaktadır (Pramila P. Shinde ve ark.,2018).
Kayıp Fonksiyonları, bir yapay sinir ağı modelinde eğitim örneklerinde oluşturulan tahmini hatayı hesaplamak için en son katman olan çıktı katmanında kullanılmaktadır. Bu hata, gerçek çıktı ile tahmin edilen çıktı arasındaki farkı ortaya koymaktadır. Ölçülen değer ile modelin tahmin edilen değere ne kadar yaklaştığı sonucu elde edilmektedir (Laith Alzubaidi ve ark., 2021)
Epoch (döngü) Sayısı, bir yapay sinir ağı modelinde eğitim verilerinin ağa gösterilme sayısdını ifade eden bir hiper parametredir (Jason Brownlee,2018)

Makine Öğrenmesi Yöntemleri

Lojistik Regresyon (LR), birkaç bağımsız öznitelik ile bağımlı öznitelikler arasındaki ilişkiyi ve ayrımı gösteren, geliştirilmiş bir denetimli sınıflandırma ve genelleştirilmiş doğrusal regresyon modelidir (Fatemeh Ehsani,2022)
K-En Yakın Komşu (KNN) Öğrenme Algoritması, regresyon ve sınıflandırma gibi denetimli öğrenme uygulamalarında kullanılır. Bu algoritma ile bir olayın sınıf etiketine, eğitim kümesindeki olayın komşularına ne kadar benzer olduğuna karar verilir (Anouar Dalli,2022).
Karar Ağacı Modeli (KA), sınıflandırma için kullanılan bir makine öğrenmesi algoritmasıdır. Diğer algoritmalar arasında hem basit kullanımı, anlaşılabilir olması hemde nitel ve nicel veriler ile çalışılabildiği için veri setindeki verileri sınıflandırmak için makine öğrenmesi çalışmalarında yaygın olarak kullanılan bir modeldir (Sümeyye Aydın,2021).
Destek Vektör Makineleri (DVM), sınıflandırma problemlerinde yaygın olarak kullanılan bir modeldir. Modelin yüksek oranda doğru sonuç vermesi tercih edilmesinde ön plana çıkmaktadır. Model, doğrusal ve

doğrusal olmayan verilerin modellenebilmesini ve birbirinden bağımsız bir çok değişkene sahip büyük verilerle çalışılabilmesini sağlamaktadır (Ayşegül Kaba,2019).
Naive Bayes (NB) sınıflandırıcısı, Bayes teoremini güçlü bağımsızlık varsayımlarıyla uygulamaya dayanan basit bir olasılıksal sınıflandırıcıdır. Basit bir ifadeyle, bir Naive Bayes (NB) sınıflandırıcısı, bir sınıfın belirli bir özelliğinin varlığının (veya yokluğunun), başka herhangi bir özelliğin varlığı (veya yokluğu) ile ilgili olmadığını varsayar (Thanasis Vafeiadis ve ark.,2015).
Rastgele Orman Algoritması (ROA), büyük veri setlerinde sınıflandırma ve tahminleme uygulamalarında kullanılan denetimli bir makine öğrenmesi algoritmasıdır. Bu modelde rastgele oluşturulan çok sayıda karar ağaçları probleme göre sınıf veya sayı tahmini yapmaktadır (Sümeyye Aydın,2021).

Veri Analizi

Bu çalışmada kullanılan veri seti kaggle.com sitesinden alınmıştır. Veri seti bir bankanın 10000 tekil müşterisinin 14 farklı özelliğinden oluşmaktadır. “Row Number” veri setinin ilk sütunu olup, veri setindeki her bir kayda bir numara tahsis etmektedir. “Customer Id”, müşteri kayıtlarında tekrarları önlemek için her müşteriye benzersiz bir kimlik değeri atamaktadır. “Surname” değişkeni ise her bir müşterinin banka kayıtlarında bulunan soyadını temsil etmektedir. Bahsedilen bu üç değişken sadece müşteri tanımlama için kullanılmakta olup, müşterilerin bankadan ayrılma kararlarını etkilemediğinden dolayı veri setinden kaldırılmıştır. Tablo 1. Sınıflandırma için kullanılan değişkenler ile ilgili özellikleri göstermektedir.

Tablo 1. Veri seti değişken özellikleri

Değişken	Veri Tipi	Veri Tanımı	Min. Değer	Max. Değer	Ortalama Değer	Standart Sapma
CustomerId	Nominal	Müşteri Kimlik Numarası

BULGULAR VE TARTIŞMA

Banka müşteri kaybının tahminlemesinin yapılabilmesi için veri setindeki 11 değişken kullanılmıştır. Sınıflandırma çalışmaları için veri setine DNN modeli uygulanmıştır.

Çalışma için Google Colaboraty yazılımı ve Phtyon yazılım dili kullanılmıştır. Modelin performansı, modele Grid Search tekniği uygulanarak ayarlanan hiper parametrelerden etkilenmiştir.
Epoch sayısı 10 ile 100 değeri arasında, parti boyutu ise 10 ile 100 arasında artan adımlarla yürütülmüştür.

SONUÇLAR

Müşteri kayıp analizi, bankacılık sektöründe artan rekabet ortamında bankaların mevcut müşterilerini elde tutabilmesi için bu yönde uygulayabilecekleri stratejik kararların belirlenebilmesi için en doğru kayıp tahmin çalışmasının yapılmasını amaçlamaktadır. Bankalar için yeni müşteri ediniminin mevcut müşteriyi elde tutmaktan daha maliyetli olmasından dolayı mevcut müşteri kaybının en az oranda olmasını sağlamak büyük önem taşımaktadır. Bu doğrultuda çalışmada kullanılan banka veri setinde müşterinin kredi skoru, sahip olunan banka ürün sayısı, kredi kartı sahipliği, bakiye bilgisi ve müşteri yaş bilgisi gibi müşteri özelliklerinden oluşan 11 farklı değişken arasındaki ilişki analiz edilmiştir. Bu analiz için derin öğrenme yaklaşımı uygulanmıştır. Derin öğrenme modelinin performansı, dönem ve parti boyutu için optimum parametrelerin bulunması ile gözlemlenmiştir. Modelin performans değerlendirmesinin yapılabilmesi için ise veri setine diğer sınıflandırma algoritmalarıda uygulanmıştır. Sonuçlara göre, derin öğrenme modelinin müşteri kayıp tahmininde diğer algoritmalara göre çok daha yüksek başarı oranına sahip olduğunu göstermektedir.

TEŞEKKÜR

Abstract
In this study, the variation of earthquake design displacements of lead-rubber isolators applied to unbalanced bridges with different pier column heights for different earthquake design parameters, pier column height, isolator diameter, lead core diameter and rubber thickness is numerically investigated. Long and short spectral acceleration coefficients and local soil class are considered as earthquake design parameters. Since this study requires a large number of structural analysis of isolated bridges, a code is developed to conduct these analyses automatically with the help of application programming interface feature of the bridge structural analysis program. The code provides data exchange between these two programs to model isolated bridge structure parametrically. As a result of numerous structural analyses, it can be concluded that all considered short period spectral acceleration coefficients significantly increase the isolator design displacement, but long period spectral acceleration coefficient is influential when it takes small values in the case of large short period acceleration coefficients. When the local soil classes are examined, it is seen that larger design displacement is obtained in weak soils and the effect of the soil increases with increasing short period spectral acceleration coefficient. Additionally, the design displacements of the isolators on the pier whose column height varies become almost zero as the height increases up to a certain value. As far as isolator geometrical properties are considered, it is observed that when the isolator diameter and lead core diameter are increased the design displacements decrease. On the contrary, as the isolator rubber thickness increases the design displacement increases.
Keywords: Lead-rubber isolator, Unbalanced bridge, Ground motion parameters.

INTRODUCTION

Some vital structures can be protected from severe earthquakes by applying seismic isolation to ensure uninterrupted use. Seismic isolation can be accomplished using various isolation devices and a range of isolation devices has been developed in aseismic design of structures since 1970 (Robinson, 1982). The fundamental concept of seismic isolation devices is to reduce earthquake-induced forces in a structure by lengthening its natural period and by adding damping to the structure. The most common isolators in use today fall into one of two categories: elastomeric- based (e.g., lead-rubber bearings (LRBs) and high-damping rubber bearings), and friction-based (e.g., Eradiquake bearings and friction pendulum bearings) (Lee et al., 2001). Among these devices, lead-rubber isolator is more widely used in bridges for uninterrupted use in order to provide emergency rescue and necessary recovery after strong earthquakes (Kunde and Jangid, 2003). For this reason, many studies have been carried out on such isolation devices. Especially, numerical modeling of such isolators and their effects on structures have been studied in detail. For example, Hwang and Chiou (1996) proposed an equivalent linear model for the seismic analysis of base isolated bridges with LRB through an identification method. Also, Simon and Vigh (2013) built a three dimensional numerical model in OpenSEES finite element modeling software to study three continuous girder bridges by multi-mode response spectrum analysis using effective stiffness values and by non-linear time-history analysis to check the applicability and validity of the effective stiffness method.

Hameed et al. (2008) conducted a parametric study to investigate the effect of lead rubber bearing isolators and ground motion characteristics on the response of seismically isolated bridges. Also, Edalati and Tahghighi (2019) investigated the influence of isolation systems on the seismic behavior of an urban reinforced concrete bridge using nonlinear time history analysis method. Similarly, various studies are available in the literature to examine the effects of elastomeric bearings on the seismic response of bridges ((Turkington, et al., 1989a), (Turkington, et al., 1989b), (Roy and Dash, 2018)).

This study focusses not on the responses of isolated bridges but on the isolator design displacements for varying unbalanced bridge substructure stiffness, earthquake spectral acceleration coefficients and isolator geometric properties by performing numerous structural analyses in CSiBridge program (CsiBridge, 2019) automatically with the help of a code developed in Matlab program (Matlab, 2021).

MATERIALS AND METHODS

The isolator design displacements are obtained for the case that the bridge is assumed to be unbalanced with unequal column heights as shown in Figure 1 to investigate unbalanced substructure stiffness. The short pier column height (H_1) is assumed to be 5 m and the long pier column height (H_2) is varied between 5m and 25m. The column diameters are kept constant for different pier column heights. The transverse typical layout of the isolated bridge is depicted in Figure 2. The elasticity modulus and unit weight of the column concrete are taken as 24821 MPa and 24 kN/m^3, respectively.

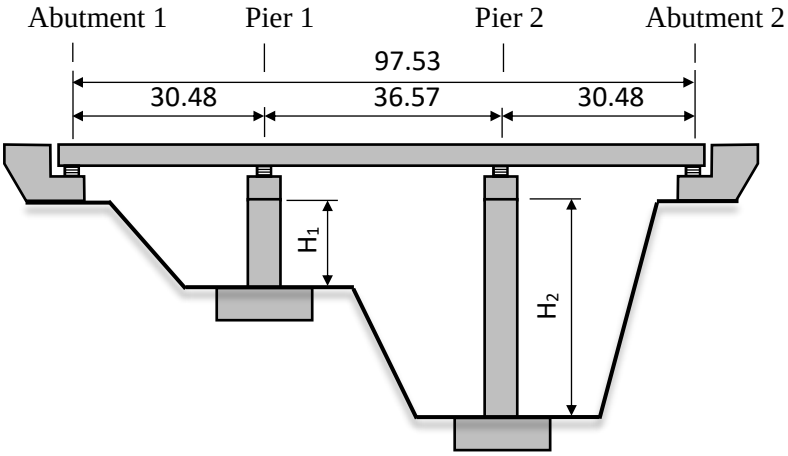

Figure 1. Elevation view of the unbalanced isolated bridge

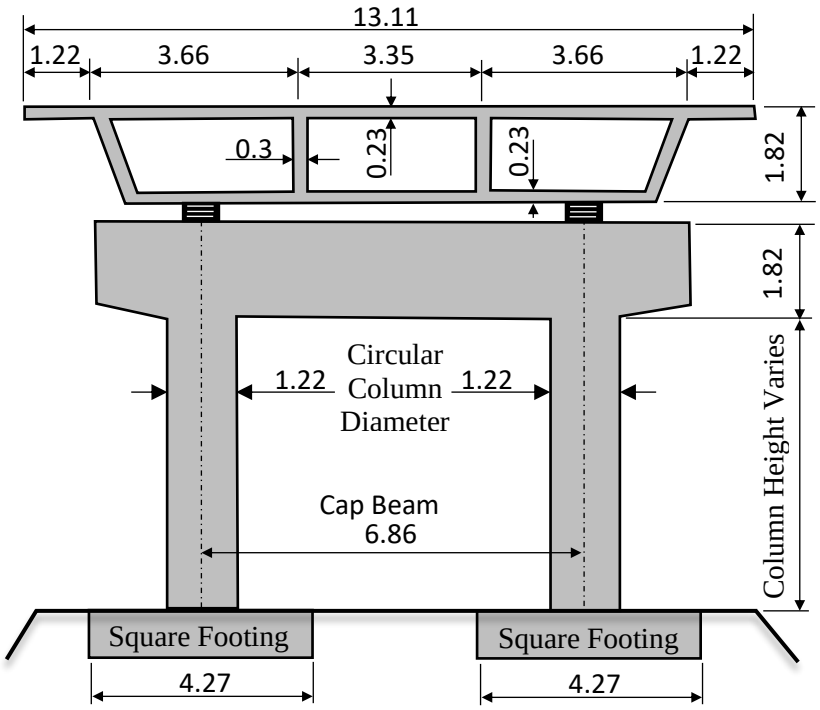

Figure 2. Typical section view of the isolated bridge

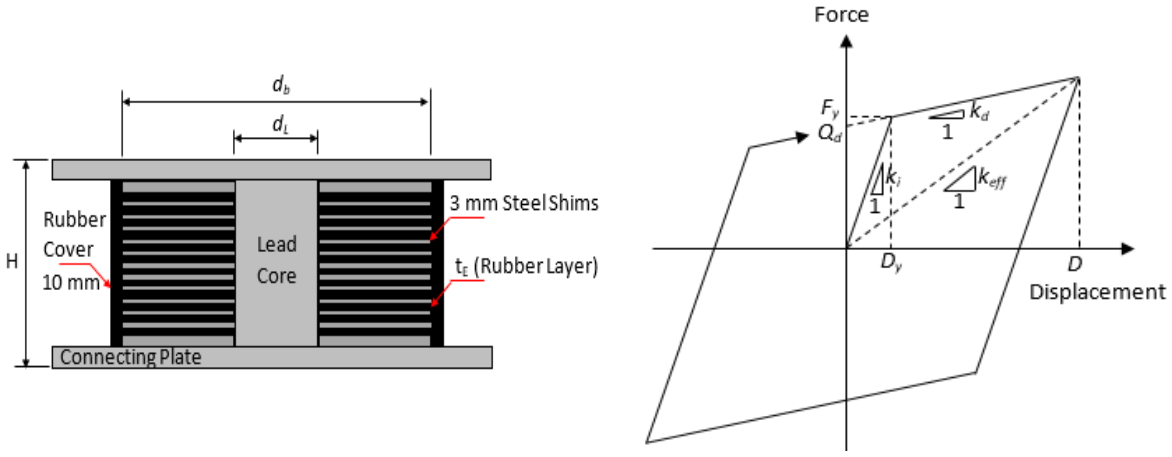

a) b)

Figure 3. a) Geometrical details and **b)** bilinear force-displacement behavior of a lead-rubber isolator

The notations of the lead-rubber isolator unit utilized between superstructure and cap beam as an isolation device is depicted in Figure 3-a. The effective stiffness of an isolator unit is the linearized property of the isolator in elastic analysis methods. It is gathered from the idealized bilinear force-displacement behavior of an isolator shown in Figure 3-b as (TBDS, 2019):

$$k_{eff} = \frac{Q_d}{D} + k_d \tag{1}$$

where Q_d is the characteristic strength, D is the design displacement and k_d is the post-elastic stiffness of the rubber. The characteristic strength and post elastic stiffness can be obtained as:

$$Q_d = F_y(1 - \frac{k_d}{k_i}) \quad \text{and} \quad k_d = \frac{GA_b}{T_r} \tag{2}$$

where $k_i = 10k_d$ is the assumed elastic stiffness of the isolator, $G = 0.62$ MPa is the shear modulus of the rubber and F_y is the yield strength calculated using Eq. (3) where $f_{yL} = 10.3$ MPa is the shear yield stress of the lead and d_L is the diameter of the lead core.

$$F_y = f_{yL}\frac{\pi {d_L}^2}{4} \tag{3}$$

In the post elastic stiffness equation A_b is the net bonded area and T_r is the total thickness of the rubber layers. The net bonded area is the gross area without the lead core area. Thus it is calculated as:

$$A_b = \frac{\pi({d_b}^2 - {d_L}^2)}{4} \tag{4}$$

where d_b is the diameter of the bonded rubber without rubber cover.

The superstructure displacement depends on both substructure stiffness and isolator effective stiffness. The substructure stiffness changes with changing column heights and so the superstructure displacement changes. As the superstructure displacement changes the isolator design displacement (D) alters. An iterative procedure is applied to obtain the value of superstructure displacement since the isolator effective stiffness depends on the isolator design displacement and vice versa.

Lateral (k_L), vertical (k_V) and torsional (k_T) stiffnesses of the lead-rubber isolator unit need to be calculated to be able to generate a 3-dimensional structural finite element model of the isolated bridge for multi-mode eigenvalue analysis. Lateral stiffness of the isolator is equal to effective stiffness of the isolator and other stiffness values are acquired using the following equations:

$$k_V = \frac{E_b.A_b}{T_r} \quad \text{and} \quad k_T = \frac{G.J_b}{T_r} \tag{5}$$

where E_b is the compressive elasticity modulus and J_b is the torsional moment of inertia of the isolator rubber. The compressive elasticity modulus can be calculated with the following equation:

$$E_b = \frac{1}{\left(\frac{1}{6GS^2} + \frac{4}{3K}\right)} \tag{6}$$

where $K = 2000$ MPa is the volumetric modulus of the rubber material, S is the shape coefficient and J_b is the torsional moment of inertia of the confined rubber layers obtained as:

$$S = \frac{{d_b}^2 - {d_L}^2}{4d_b t_E} \quad \text{and} \quad J_b = \frac{\pi {d_b}^4}{32} \tag{7}$$

where t_E is the thickness of each rubber layer.

A sample three dimensional finite element model of an isolated bridge is shown in Figure 4. In this model, the box-girder deck, cap beam and columns are represented by line (beam) elements, and isolators are represented by linear link (spring) elements. Foundation system is assumed to be fixed. The stiffness properties of the lead-rubber isolator are used as the stiffness coefficients of the spring elements representing the isolator units in the bridge structural model.

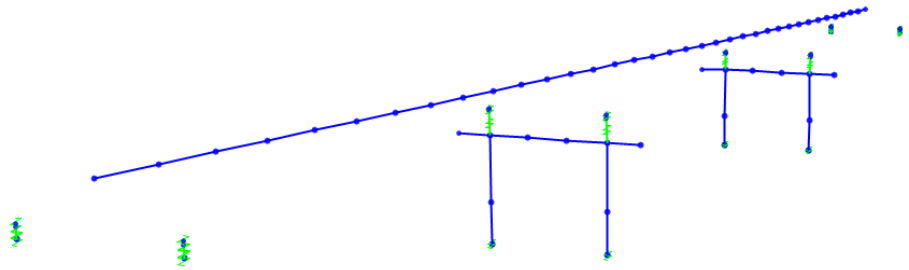

Figure 4. Finite element model of a sample bridge

Figure 5 illustrates a standard horizontal elastic design acceleration spectrum to be used in the analyses (TBDS, 2019). The ordinates of the spectrum are obtained in terms of gravity acceleration (g) with the help of short period (S_S) and T=1 s (S_1) spectral accelerations for 5% damping and a reference soil ground condition ($(V_S)_{30}$ =760 m/s). The spectral acceleration values without ground effects are obtained by taking maximum directivity effect amplification coefficients (δ_S = 1.2 and δ_1 = 1.3) into account as follows (TBDS, 2019):

$$S'_S = \delta_S S_S \quad \text{and} \quad S'_1 = \delta_1 S_1 \tag{8}$$

S'_S and S'_1 values are modified by coefficients F_S (Table 1) and F_1 (Table 2) in order to consider local soil conditions, respectively. In this way, S_{DS} and S_{D1} values are obtained as (TBDS, 2019):

$$S_{DS} = F_S S'_S \quad \text{and} \quad S_{D1} = F_1 S'_1 \tag{9}$$

RESULTS AND DISCUSSION

Figure 6 shows the earthquake design displacements of isolators on Pier 2 for changing short (S_S') and long (S_1') period spectral acceleration coefficients as well as varying Pier 2 column height (H_2). The local soil class considered for the figure is ZA. In Figure 6-a and 6-b, it can be seen that the S_1' value does not change the design displacements until short period value becomes S_S'=0.5. However, for short column bridges (H_2=5m and H_2=10m), it is observed that there are significant changes for S_1'=0.1 and S_1'=0.2 values after S_S'=0.75. But, for the large values of S_1'>0.2, there are no significant differences in the design displacements.

Figure 7 depicts the design displacements of isolators on Pier 1 in the case of H_2=10m and ZA local soil class for changing short and long period spectral accelerations. It can be seen that increasing S_1' value has almost no effect on the design displacement for S_S'=0.25 and S_S'=0.5 values, while for S_S'=0.75 and larger values, the changes for the case in which S_1'=0.1 is altered to S_1'=0.2 are approximately 15%, 75%, 145% and 225% increase, respectively. However, negligible decreases occur for values greater than S_1'=0.2.

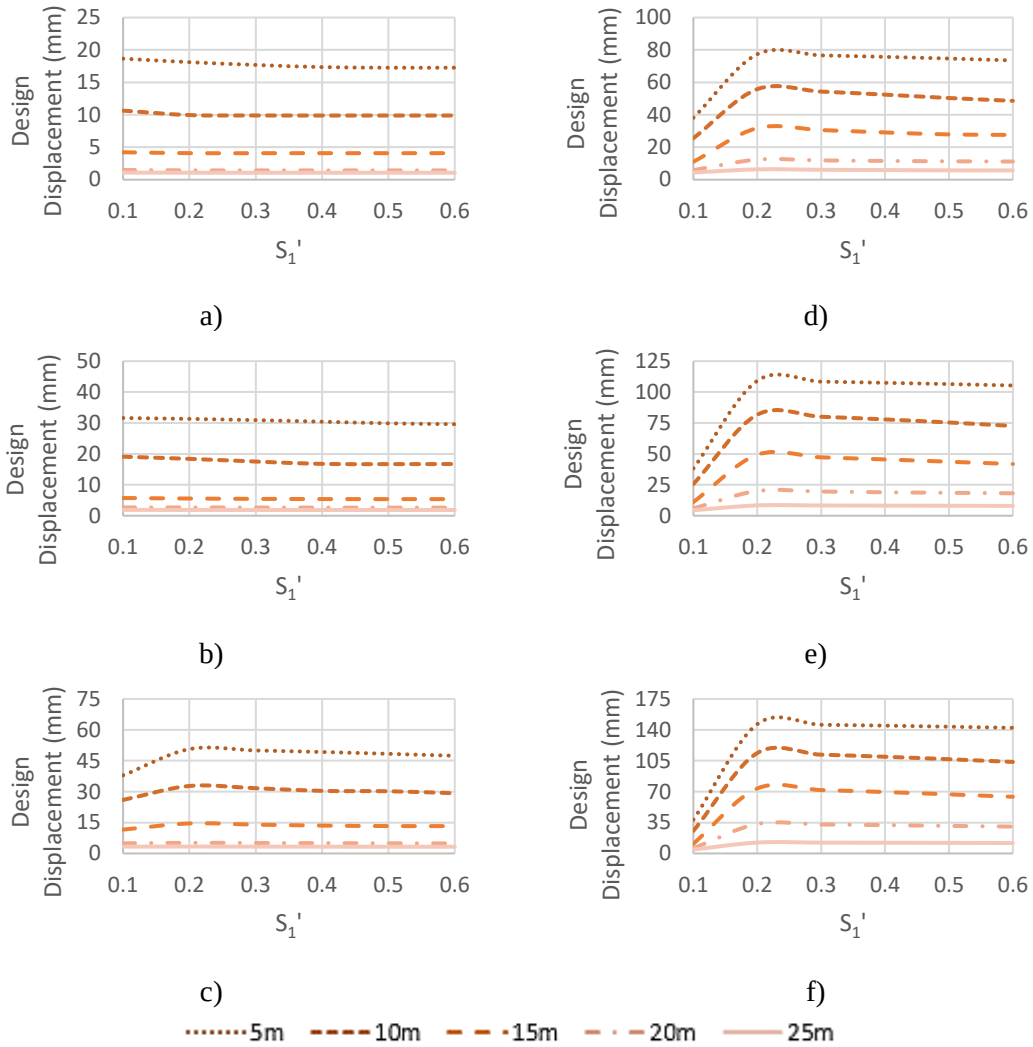

Figure 6. Design displacements of isolators on Pier 2 for **a)** S_S'=0.25 **b)** S_S'=0.5 **c)** S_S'=0.75 **d)** S_S'=1.00 **e)** S_S'=1.25 and **f)** S_S'=1.50

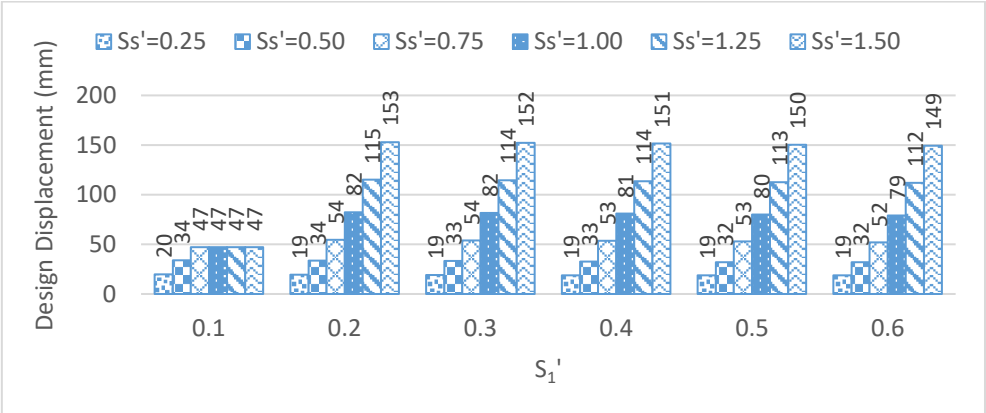

Figure 7. Design displacements of isolators on Pier 1 for H_2=10 m and soil class ZA

Figure 8 illustrates the variations in the design displacements of the isolators on Pier 1 for different S_S' values and local soil classes when S_1'=0.1. It can be realized from the figure that the displacement values increase from the soil class of ZA to ZE. That is, lower design displacements are obtained for strong soils. In addition, the effect of the soil on the design displacement increases as the S_S' value increases. For instance, the design displacement increases approximately 5 times from ZA to ZE for S_S'=0.25 while it increases approximately 13 times for S_S'=1.5.

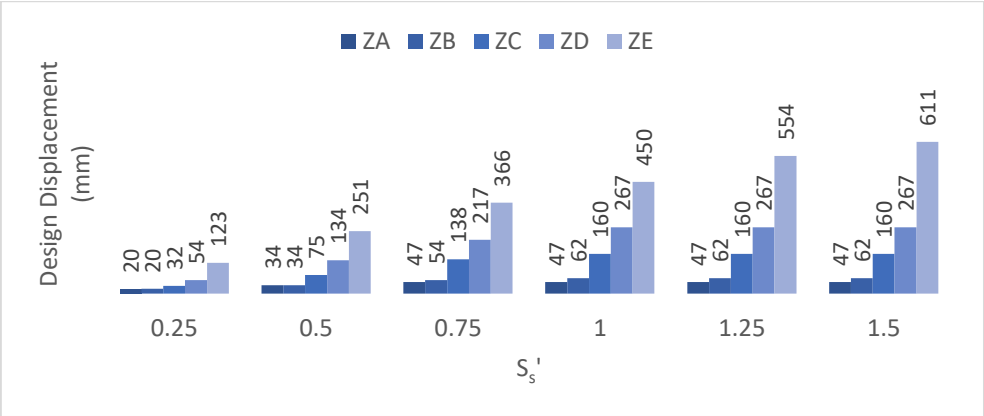

Figure 8. Design displacements of isolators on Pier 1 for S_1'=0.1

Figure 9 demonstrates the variations in the design displacement of isolators at different locations of the bridge for various Pier 2 column heights, bonded isolator diameters, lead core diameters and rubber thicknesses in the case of H_2=25m.

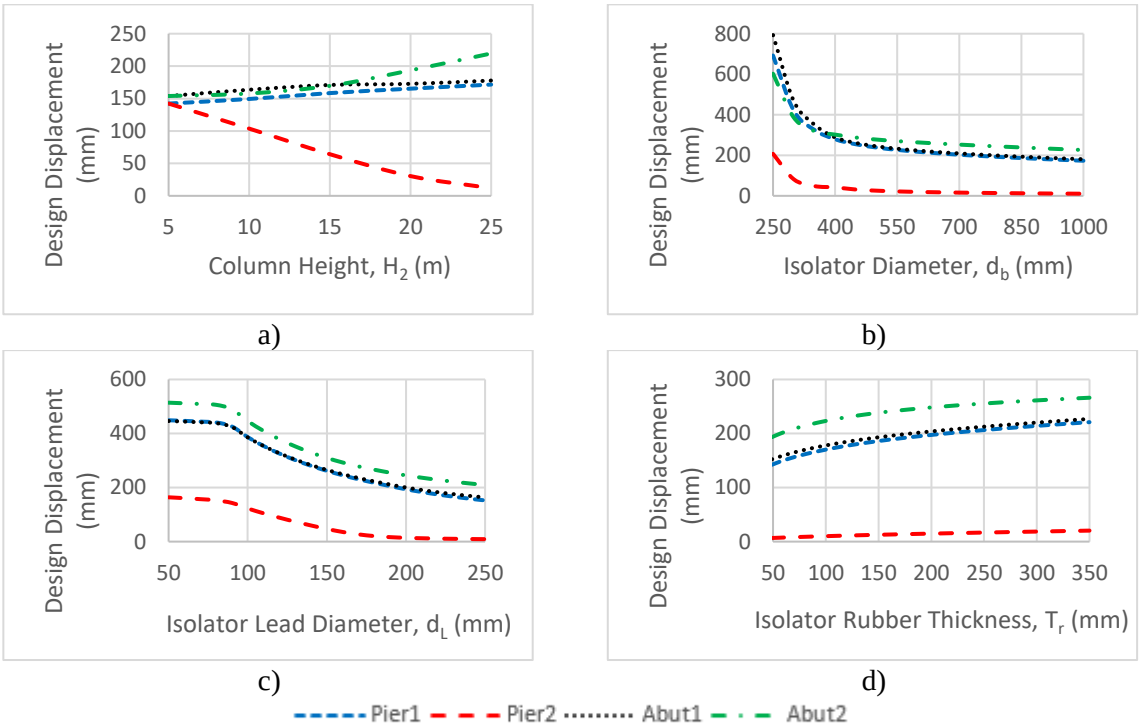

Figure 9. Design displacements of isolators for varying a) Pier 2 column height b) isolator diameter c) lead core diameter and d) rubber thickness

It can be seen from Figure 9-a that the design displacements of the isolators on Pier 2 decrease significantly as H_2 value increases while the design displacements of isolators at different locations such as abutments increase slightly. Moreover, it can be observed from Figure 9-b that when the isolator diameter is enlarged it significantly decreases the design displacement up to a certain value and remains almost constant after this value. For example, by increasing the isolator diameter at Pier 1 from 250 mm to 500 mm, the design displacement decreases by approximately 65%, while it decreases by approximately 27% when it is increased from 500 mm to 1000 mm. Additionally, according to Figure 9-c, the relatively small (between 50 mm and 100 mm) lead core diameter does not affect the design displacement, but after a certain value, it significantly reduces the design displacement. When the lead core diameters of isolators on Pier 1 are altered from 100 mm to 250 mm, the design displacements are reduced by approximately 60%. This reduction ratio varies with respect to the location of the isolator. For example, the reduction ratios are approximately 58% and 53% for Abutment 1 and Abutment 2, respectively, and 92% for Pier 2 isolators. Finally, it can be seen from Figure 9-d that the design displacement increases as the rubber thickness increases. As an example, the design displacement increases approximately 56% by increasing the rubber thickness of isolators on Pier 1 from 50

mm to 350 mm. This is because of the fact that larger rubber thickness reduces the horizontal stiffness of the isolators.

CONCLUSION

This study focuses on the variations of earthquake design displacements of bridge lead-rubber isolators for various ground motion parameters such as spectral acceleration coefficients and local soil classes, unbalanced pier heights, isolator diameters, lead core diameters and rubber thicknesses. A code is developed to be able conduct numerous bridge structural analyses automatically. As far as numerical results are considered, it can be stated that long period spectral acceleration coefficient has almost no effect on the design displacements for small short period acceleration coefficients (S_S'), while it has significant effects for 0.1 and 0.2 values in the case of large S_S' values. As the local soil classes are considered it can be realized that the design displacements increase from strong soil ZA to weak soil ZE.

As the column height of Pier 2 increases the design displacement of the isolator on this pier reduces and comes closer to zero at a certain height while it increases slightly for isolator at different locations of the bridge. Therefore, it can be stated that after a certain pier column height isolators become ineffective and desired displacement capacities are provided by the flexible substructures of the bridge.

As far as geometrical properties of isolators are investigated, it is observed that as the isolator diameter increases it significantly reduces the design displacement up to a certain value. Similarly, large lead core diameters reduce the displacements considerably when compared to the small lead core diameters. Finally, it can be noted that the isolator design displacement increases as the isolator rubber thickness enlarges due to the reduced horizontal stiffness of the isolator.

Özet

Son zamanlarda diferensiyel geometri konularının kinematik alanında yoğun bir şekilde tartışıldığı görülmektedir. Vida hareketlerinin geniş bir uygulaması, özellikle katı cisimlerin hareketlerinin Lie grubu ve Lie cebir yapısından yararlanılarak verilebilir. 3-boyutlu Öklid uzayında, bir lineer vektör alanının integral eğrileri, lineer vektör alanıyla ilişkili matrisin rankına bağlıdır. 1985 te Karger ve Novak lineer vektör alanlarını tanımladı. Sonrasında birçok araştırmacı bu alana odaklanmıştır. Bunlardan biri olan Acratalashian (1989), Öklid uzayında lineer vektör alanlarının integral eğrilerini inceledi. Ancak lineer vektör alanlarının integral eğrileri ile anlık hareketler arasındaki ilişkiyi dikkate almadı. Bu çalışmada öncelikle 3-boyutlu Lorentz uzayında (veya Minkowski 3-uzayında) 1-parametreli hareketler üzerinde durulacak, ardından 1-parametreli harekete karşılık gelen matrisin rankı ile integral eğrileri arasındaki ilişki verilecektir.

Anahtar Kelimeler: Helisel vektör alanı, Minkowski uzayı, İntegral eğrisi.

Integral Curves of Helicoidal Vector Fields in Minkowski Space

Abstract

Recently, it is seen that the subjects of differential geometry have been intensively discussed in the field of kinematics. A wide application of screw motions can be given, especially by utilizing the Lie group and Lie algebra structure of the motions of rigid bodies. In 3-dimensional Euclidean space, the integral curves of a linear vector field depend on the rank of the matrix which related to the linear vector field. In 1985, Karger and Novak introduced the linear vector fields. Many researcher have been focused on this area. One of them, Acratalashian (1989), have been studied integral curves of linear vector fields in Euclidean space. But he did not consider the relation between integral curves of linear vector fields and instantaneous motions. In this study, first of all we concentrate on 1-parameter motions in 3-dimensional Lorentzian space (or Minkowski 3-space), then we will give some definitions and the relation between the rank of the matrix which is related to the 1-parameter motion and the integral curves.

Keywords: Helicoidal vector field, Minkowski space, Integral curve.

GİRİŞ

Kinematik günümüzde birçok alanda kullanılmaktadır. Acratalashian (1989), çalışmasında Öklid uzayında lineer vektör alanlarının integral eğrilerini ele almış, fakat bu eğrilerle 1-parametreli hareketler arasındaki ilişkiye değinmemiştir.

Bu alana katkı sağlayanlardan biri de D.P. Chevallier dir. 1991 yılında yaptığı çalışmada, modül kavramını kullanarak dual kuaterniyonlar için yeni bir yaklaşım ortaya koymuş ve bunu katı hareketlere uygulamıştır.

Bu çalışmada, öncelikle konu için gerekli bazı tanımlar yapılacaktır. Konusu geçen çalışmalardan farklı olarak, Minkowski uzayında helisel vektör alanı ve integral eğrisi tanımı yapılmış ve helisel vektör alanına karşılık gelen matristen yararlanılarak integral eğrilerinin cinsleri belirlenmiştir.

MATERYAL VE METOD

$\mathbb{R}^3$ üzerinde

$$<,>_L : \mathbf{R}^3 \to \mathbf{R}^3$$
$$(\vec{u},\vec{w}) \to <\vec{u},\vec{w}>_L = -v_1w_1 + v_2w_2 + v_3w_3$$

şeklinde tanımlanan $<,>_L$ metrik tensörü ele alalım. Bu durumda $(\mathbf{R}^3, <,>_L)$ ikilisine 3-boyutlu Lorenz veya daha bilinen adıyla Minkowski uzayı denir ve $\mathbf{R}_1^3$ şeklinde gösterilir.

E_1^3 üzerinde

$$\begin{aligned} f: \quad E_1^3 &\to E_1^3 \\ x &\to f(x) = y(t) = g(t)x + c(t) \end{aligned} \tag{1}$$

1-parametreli hareketi göz önüne alalım. Burada, $g(t) \in SO(3,1)$ yani, $\varepsilon = \begin{bmatrix} -1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ olmak üzere, $g^T = \varepsilon g^{-1} \varepsilon$ olur. Bu dönüşümü matris şeklindeki ifadesi aşağıdaki gibidir:

$$\begin{bmatrix} y(t) \\ 1 \end{bmatrix} = \begin{bmatrix} g(t) & c(t) \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ 1 \end{bmatrix} \tag{2}$$
$$Y(t) = A(t)X$$

$A(t)$ formundaki 1-parametreli matrisler, matris çarpımına göre bir grup oluştururlar. Bu grup, $SE(3,1)$ ile gösterilir. Yani,

$$SE(3,1) = \left\{ A(t) : A(t) = \begin{bmatrix} g(t) & c(t) \\ 0 & 1 \end{bmatrix}, g(t) \in SO(3,1), c(t) \in E_1^3 \right\}$$

şeklindedir. (2) nin türevi alınırsa

$$\dot{Y}(t) = \dot{A}(t)X \tag{3}$$

bulunur ve (2) den X çekilerek, (3) te yerine yazılırsa,

$$\dot{Y}(t) = \dot{A}(t)A^{-1}(t)Y(t)$$

bulunur. $W = \dot{A}(t)A^{-1}(t)$ diyelim.

$$\begin{aligned} W &= \dot{A}(t)A^{-1}(t) \\ &= \begin{bmatrix} \dot{g} & \dot{c} \\ 0 & 0 \end{bmatrix} \begin{bmatrix} g^{-1} & -g^{-1}c \\ 0 & 1 \end{bmatrix} \\ &= \begin{bmatrix} \dot{g}g^{-1} & -\dot{g}g^{-1}c + \dot{c} \\ 0 & 0 \end{bmatrix} \end{aligned}$$

elde edilir. $w = \dot{g}g^{-1}$ dersek, w Lorenz anlamında ters simetriktir. Yani, $w^T = -\varepsilon w \varepsilon$ şartını sağlar. Ayrıca, $v = -\dot{g}g^{-1}c + \dot{c}$ vektörünün $\mathbf{R}_1^3$ e ait olması sebebiyle, $SO(3,1)$ Lie grubunun Lie cebiri

$$se(3,1) = \left\{ \begin{bmatrix} w & v \\ 0 & 0 \end{bmatrix} : w \in SO(3,1), v \in \mathbf{R}_1^3 \right\} \tag{4}$$

olarak elde edilir.

Bir $\vec{w}=(-c,-b,a)\in\mathbf{R}_1^3$ vektörüne $w=\begin{bmatrix}0 & a & b\\ a & 0 & c\\ b & -c & 0\end{bmatrix}$ Lorenz anlamında bir anti-simetrik matris karşılık gelir. $\vec{w}=(-c,-b,a),\vec{x}=(x,y,z)\in\mathbf{R}_1^3$ Minkowski uzayında keyfi iki vektör olmak üzere, Lorenz anlamında vektörel çarpım

$$\begin{aligned}\vec{w}\wedge_L\vec{x}&=\begin{vmatrix}\cdot & \cdot & \cdot\\ -c & -b & a\\ x & y & z\end{vmatrix}\\ &=(ay+bz,ax+cz,bx-cy)\\ &=wX\end{aligned}$$

şeklinde tanımlanır.

Şimdi Minkowski uzayında helisel vektör alanı ve integral eğrisini tanımlayalım.

Tanım 1. Plücker koordinat sisteminde $(\vec{a},\vec{a}^*)$ şeklinde ifade edilebilen bir vida hareketi

$$\begin{aligned}X:\ E_1^3 &\to \mathbf{R}_1^3\\ M &\to X(M)=\vec{a}^*+\vec{a}\wedge_L\overrightarrow{OM}\end{aligned}$$

Helisel vektör alanı ile birleşir. Burada $\vec{a}$ ya X vektör alanının ekseni denir ve w_X şeklinde gösterilir. Tüm helisel vektör alanlarının cümlesi

$$\begin{aligned}(X+Y)(M) &= X(M)+Y(M), M\in E_1^3\\ (\alpha X)(M) &= \alpha X(M),\alpha\in\mathbf{R}\end{aligned}$$

şeklinde tanımlanan işlemlerle bir reel vektör uzayı olur. Helisel vektör alanını matris formunda aşağıdaki gibi ifade edbiliriz:

$$\begin{bmatrix}X(M)\\ 0\end{bmatrix}=\begin{bmatrix}a & a^*\\ 0 & 0\end{bmatrix}\begin{bmatrix}M\\ 1\end{bmatrix}=\begin{bmatrix}\vec{a}\wedge_L\overrightarrow{OM}+\vec{a}^*\\ 0\end{bmatrix}.$$

Burada a ; 3x3 tipinde Lorenz anlamında anti-simetrik matris ve a^*; 3x1 tipinde bir matristir.

Tanım 2. X bir helisel vektör alanı ve $\alpha:I\to E_1^3, t\to\alpha(t)$ bir eğri olsun. Eğer her $t\in I$ için

$$\frac{d\alpha}{dt}=X(\alpha(t))$$

oluyorsa, α eğrisine X helisel vektör alanının integral eğrisi denir.

Helisel vektör alanları aynı zamanda lineer olduğundan bu dönüşüme bir matris karşılık gelir. Şimdi bu matrisin rankı ile X helisel vektör alanının integral eğrileri arasındaki ilişkiyi verelim.

Teorem 3. $X=(\vec{w},\vec{v})$ bir helisel vektör alanı olsun. Yani,

$$\begin{bmatrix} X(M) \\ 0 \end{bmatrix} = \begin{bmatrix} w & v \\ 0 & 0 \end{bmatrix} \begin{bmatrix} M \\ 1 \end{bmatrix} = \begin{bmatrix} \vec{w} \wedge_L \overrightarrow{OM} + \vec{v} \\ 0 \end{bmatrix}.$$

Bu durumda

1) $rank[w,v] = 3$ ise, X in integral eğrileri Lorenzian helislerdir.
2) $rank[w,v] = 2$ ise, X in integral eğrileri Lorenzian çemberlerdir.
3) $rank[w,v] = 1$ ise, X in integral eğrileri paralel doğrular olur.

İspat. $\alpha(t) = (x(t), y(t), z(t))$; X helisel vektör alanına karşılık gelen bir integral eğrisi olsun. Yani,

$$X\big|_{\alpha(t)} = \alpha'(t) \tag{5}$$

ve buradan

$$\begin{bmatrix} 0 & 1 & 0 & p \\ 1 & 0 & 0 & q \\ 0 & 0 & 0 & r \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} \tag{6}$$

yazılabilir.

1) $rank[w,v] = 3$ olsun. (6) dan

$$\frac{dx}{dt} = y + p$$
$$\frac{dy}{dt} = x + q$$
$$\frac{dz}{dt} = r$$

elde edilir. Üçüncü eşitlikten $z(t) = rt + s$ bulunur. İkinci eşitlikte türev alınır ve birinci eşitlik kullanılırsa,

$$\frac{d^2y}{dt^2} - y = p$$

denklemi elde edilir. Bu denkleme ait çözüm ise,

$$y(t) = c_1 \cosh t + c_2 \sinh t - p$$

şeklindedir. Buradan hareketle

$$x(t) = c_1 \sinh t + c_2 \cosh t - q$$

olur ki, bu durmda $\alpha(t)$ integral eğrisi,

$$\alpha(t) = (c_1 \sinh t + c_2 \cosh t - q, c_1 \cosh t + c_2 \sinh t - p, rt + s)$$

elde edilir.

$$\alpha'(t) = (c_1 \cosh t + c_2 \sinh t, c_1 \sinh t + c_2 \cosh t, r)$$

ve

$$<\alpha'(t),(0,0,1)>_L = r = \text{sabit}$$

olduğundan $\alpha(t)$ bir Lorenzian helistir.

2) $rank[w,v]=2$ olsun. Bu durumda (6) da $r=0$ olacaktır.

$$\frac{dx}{dt} = y+p$$
$$\frac{dy}{dt} = x+q$$
$$\frac{dz}{dt} = 0$$

denklem sistemi çözüldüğünde

$$\alpha(t) = (c_1\sinh t + c_2\cosh t - q, c_1\cosh t + c_2\sinh t - p, s)$$

elde edilir.

3) Son olarak, $rank[w,v]=1$ ise,

$$\frac{dx}{dt} = 0$$
$$\frac{dy}{dt} = 0$$
$$\frac{dz}{dt} = 0$$

denklem sistemini çözersek,

$$\alpha(t) = (pt+s_1, qt+s_2, rt+s_3)$$

paralel doğrular integral eğrisi olarak karşımıza çıkar.

SONUÇ

Bu çalışmada, Minkowski uzayında helisel vektör alanı ve integral eğrisi tanımları verilmiş ve bunlar arasındaki ilişki bir teorem yardımıyla belirtilmiştir.

Abstract

Innovation that gains importance with technology; makes it possible to integrate with machine learning techniques. At the same time, nanoengineering studies are in a multidisciplinary system; Which makes it possible to integrate machine learning and nanoengineering fields.
Here, the formation of experimentally studied data on a total of 1000 images consisting of 10 data classes of 100 images in each category consisting of Scanning Electron Microscopy (SEM) images; It was obtained by selecting according to the quality of nano-sized images within a set of 22,000 SEM images available as public access. The SEM data used are images obtained as a result of the work of 100 scientists for 5 years with the ZEISS SUPRA 40 resolution device in the TASC laboratory of CNR-IOM in Trieste. In the machine learning subcategory of the data trained in the experimental study; His training with CNN, one of the deep learning techniques, was completed. First, categories = ["Fibres10" , "Nanowires10" , "Patterned_surface10" , "Films_Coated_Surface10" , "Biological10" , "Porous_Sponge10" , "Powder10" , "Tips10" , "Particles10_de"'. The size was chosen as "128". "relusoftmax" and "" were applied as 'python code system activation'. With RMSprop, the training (epoch) values are in two different categories as 25 and 100 Daily. In the training of models, 800 data is training and 200 data is testing. The graphical results of this data are obtained with matplotlib. accuracy with the next confusion matrix values, a good result reached with the results obtained from the macro avg values. Finally, the selection of the best SEM image was completed and the results were obtained using machine learning techniques in the experimental part. The presented methodology can be effective in the advancement of future studies on convolutional neural networks (CNN), which is one of the deep learning approaches in the machine learning subcategory, which can be integrated into nanoengineering use cases in many fields.

Keywords: Machine learning, Convolutional Neural Networks(CNN), Scanning Electron Microscopy (SEM),Nanoengineering

INTRODUCTION

Artificial intelligence is called intelligent systems based on engineering and mathematics, and it shows itself, especially in the technological plan day by day. Machine learning, one of the sub-branches of artificial intelligence, is used in a multidisciplinary manner in many fields of use, just like nanoengineering. The training of SEM images with nanoengineering convolutional neural networks is part of the deep learning subcategory. CNN is a subcategory of deep neural networks most widely applied for image classification and recognition. Three types of layers are generally used to create the CNN architecture between the input and output. These layers are; the convolutional layer, repository layer, and fully connected layers. By providing SEM images to train with CNN, the best training parameters are compared; The values obtained with the obtained matrix values were formed. Finally, the coding part was created and image selection was provided by SEM image estimation[1-12].

Images used in image classification training in CNN, one of the deep learning techniques in the subcategory of machine learning, are SEM images. "Relu" and "softmax" activation functions were used to activate during the training phase. Then the training (epoch) was carried out at RMSprop.

A.The Place and Importance of 10 Datasets in the Experiment section in Nanoengineering

Scanning electron microscopy (SEM) is a very comprehensive material for investigating phenomena consisting of surfaces. In the figure, each image selected as an example from 1000 images is included[12].

Finally, there is the SEM image output of all stages.

Working with different functions in the training of SEM images and increasing the number of training are important in future studies where better and more realistic results can be created[12].

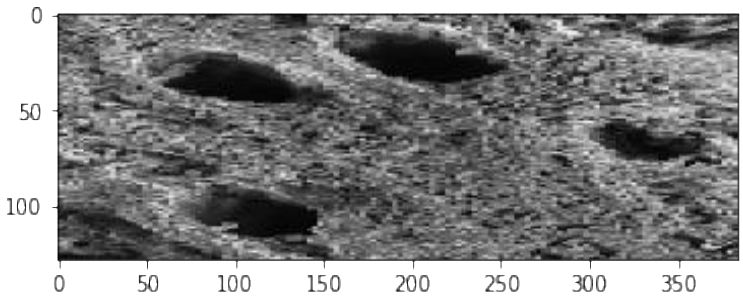

Figure-7 One of the best SEM images created at the end of the tutorial

DISCUSSION

Image classification technique (CNN) in machine learning of this study; Without observing the specific properties of the materials, only the general purpose SEM data is classified by image training. It may be important to develop more different applications by increasing the number and variety of images qualitatively. In addition, considering the different dimensional properties of images in macro, micro and nanoscale quantitatively can add a new dimension to scientific studies by presenting the necessary solution suggestions.

CONCLUSION

While performing model training in CNN, one of the sub-categories of machine learning; It is necessary as much as possible to evaluate the results by employing different parameters according to the data set. For this reason, observing the results obtained by changing the functions, parameters, and input values in model training is important for future findings.

Özet

Çelik kullanım alanının genişliği sebebiyle önemli bir malzemedir ve istenilen mekanik ve fiziksel özellikleri elde edilebilmek için birçok farklı proseste işlem uygulanmaktır. Bu işlemler sırasında çeliğin sıcaklığı artmakta ve sıcaklığı yüksek olan çelik bobinlerin başka bir hatta işleme alınabilmesi için soğumaları gerekmektedir. Soğuma süresinin önceden tahmin edilmesi ise planlama, zaman ve depolama alanı yeterliliği açısından oldukça önemlidir. Bu çalışmada soğuk haddeleme prosesinden çıkan bobinlerin sıcaklıklarına odaklanılmıştır. Bu işlem sonrasında çeliğin sıcaklığı 90 −150ºC aralığında değişmektedir ve bobinler yatay konumda doğal taşınımla soğumaya bırakılmaktadır. Bu hattan çıkan bobinlerin elektrolitik temizleme hattında işleme alınabilmesi için sıcaklıklarının 80ºC'den düşük olması gerekmektedir. Bobinlerin belirtilen sıcaklığa gelme süresi ortalama 0,5-2 gündür. Yapılan çalışmada çelik bobinlerin soğuma süresinin tahmini için sonlu elemanlar yöntemi kullanılarak zamana bağlı termal bir analiz oluşturulmuştur. Çalışmadaki nihai amaç soğuk haddelemeden çıkan bobinlerin sıcaklığının ne kadar sürede 80ºC'den düşük olacağını belirlemektir. Geliştirilen sonlu elemanlar modelinden elde edilen sonuçların doğrulanması için üretim alanında çelik bobinlerden ölçümler alınmıştır. Deney verileri ve termal analiz sonuçları karşılaştırıldığında çalışılan sıcaklık aralıkları için yaklaşımın uygulanabilir olduğu sonucuna varılmıştır.

Anahtar Kelimeler: ısıtılmış yatay bobin, doğal taşınım, sonlu elemanlar yöntemi, soğuma süresi

Abstract

Steel is an important material due to its wide area of use and many different heat treatment processes are applied in order to obtain the desired mechanical and physical properties. During these heat treatments, the temperature of the steel increases and the steel coils with high temperatures need to cool in order to be processed in another line. Predicting the cooling time is very important in terms of planning, time and storage space adequacy. In this study, the focus is on the temperatures of the coils coming out of the cold rolling process. After this process, the temperature of the steel changes in the range of 90 -150ºC, and the coils are left to cool by natural convection in the horizontal position. The temperature of the coils coming out of this line must be lower than 80ºC in order to be processed in the electrolytic cleaning line. The average time for the coils to reach the specified temperature is 0.5-2 days. In the study, a time dependent thermal model analysis was created by using the finite element method to estimate the cooling time of steel coils. The ultimate aim of the study is to determine how long the temperature of the coils coming out of cold rolling will be lower than 80ºC. In order to verify the results obtained from the developed thermal finite element model, measurements were taken from steel coils in the production area. model validation was carried out. When the experimental data and thermal analysis results were compared, it was concluded that the approach was applicable for the temperature ranges studied.

Key words: horizontal heated coil, natural convection, finite element method, cooling time

1.GİRİŞ

Dünyada ve ülkemizde çelik sektörü, kullanım alanının genişliği sebebiyle oldukça önemlidir. Çelik malzemede istenilen mekanik ve fiziksel özellikleri elde edilebilmek için çelik malzeme birçok farklı proseste işlem görmektedir. Bazı proseslerde malzeme üzerine termal etkiler bırakmaktadır. Örneğin bu proseslerden biri sıcak haddelemedir ve bu işlem sırasında bobin sıcaklığı 540-720ºC aralığında değişmektedir. Çeliğin

sonraki bir proseste işlem görebilmesi için oda sıcaklığında 3-5 gün soğumaya bırakılması gerekmektedir (Park ve ark., 1998). Soğuma işlemi ortam sıcaklığına, saç kalınlığına, bobin tonajına, soğuma işlem tipine (doğal taşınım, zorlanmış taşınım), bobinin uzaydaki konumuna göre değişmektedir. Soğuma süresinin önceden tahmin edilmesi ise planlama, zaman ve depolama alanı yeterliliği açısından oldukça önemlidir. Bu çalışmada ise soğuk haddeleme prosesine odaklanılmıştır. Soğuk haddeleme hatlarında, asitlenmiş sıcak haddelenmiş çelik 0,3-2 mm kalınlığı aralığında inceltilir. Bu proses sırasında çeliğin sıcaklığı 90 −150ºC aralığında yükselmektedir, bobinler yatay konumda doğal taşınımla soğumaya bırakılmaktadır. Bu hattan çıkan bobinlerin bir sonraki proses olan elektrolitik temizleme hattında işleme alınabilmesi için sıcaklıklarının 80ºC'nin altında olması gerekmektedir. Bobinlerin belirtilen sıcaklığa gelme süresi ortalama 0,5-2 gündür.

Silindirin yatay konumda soğumasıyla ilgili literatürde deneysel ve nümerik modeller bulunmaktadır. Deneysel çalışmalardan biri Churchill ve Chu (1975) yaptığı çalışmadır. Bu çalışmayla tüm Prandtl (Pr) ve Nusselt (Nu) sayısını kapsayan bir denklem elde etmişlerdir. Diğer bir deneysel çalışmada ise yatay ince bir silindirde zorlanmış ve doğal taşınım aynı anda etki ettiğinde akış hareketinin çeşitli durumlarda (zıt, paralel ve karşı) hangi taşınım türünün baskın geldiği incelenmiştir (Seiichi ve Takuro, 1975). Kuehn ve Goldstein, (1980) laminer akış rejiminde yatay izotermal bir silindirdeki doğal taşınımla ısı transferini incelemek için Navier-Stokes ve enerji denklemlerini eliptik sayısal bir yöntemle çözmüşlerdir. Büyük ve orta Rayleigh sayıları (Ra) için eğrilik etkilerden kaynaklı yaklaşımlarının yetersiz olduğunu görmüşlerdir. Wang ve ark., (1990), laminer bir akış rejimindeki doğal taşınımı incelemek için, çeşitli sınır koşulları altındaki yatay bir silindirde, eğri kesirli adım yöntemi kullanmışlardır. Oluşturulan sayısal modelin, geniş aralıklı problemlerde yeterli olduğu sonucuna varılmıştır. Chouikh ve ark., (2000), orta büyüklükteki Ra sayısında, dikey olarak aralarında uzaklık olan iki yatay silindirdeki doğal taşınımla ısı transferini deneysel olarak incelemişlerdir. Farklı uzaklıklar ile çeşitli Ra sayılarındaki sonuçlarla bilinen sayısal sonuçlar karşılaştırıldığında sonuçların tutarlı olduğu görülmüştür. Yamamoto ve ark., (2004), yatay bir silindirin çevresindeki doğal taşınımla olan ısı transferini ve ısı iletimini, ön şartlandırılmalı sayısal bir yöntemle incelemişlerdir. Reymond ve ark., (2008), yatay konumda olan iki silindirin aralarında boşluk kalacak şekilde yerleştirildiğinde, alttaki silindirin ısıtılıp ısıtılmamasına göre yukarda duran silindirin nasıl etkilendiğini araştırmışlardır. Alttaki silindir ısıtılmadığında üstteki silindirde doğal taşınımla olan ısı transferinde bir değişiklik görülmediği, ısıtıldığında ise büyük bir etkisinin olduğunu ve ortalama yüzey ısı transferini arttırdığını görülmüştür. Atayılmaz, (2011), izotermal, eş merkezli yatay bir silindirde, içteki silindirin sıcaklığı sabit tutularak doğal taşınımla olan ısı transferini deneysel ve nümerik olarak incelemiştir. İçteki silindirin çapı, halkanın çapından daha küçük hale geldiğinde, homojensizlik kaynaklı açısal yüzey sıcaklığının arttığı görülmüştür. Ashjaee ve ark., (2012), adyabatik bir yüzeyle arasında uzaklık olan yatay bir silindirdeki doğal ısı transferini, farklı uzaklıklar ve ortalama Ra sayılarında deneysel ve nümerik olarak incelemişlerdir. Lin ve ark., (2017) yaptıkları çalışmada ilk kez 3D HAD (Hesaplamalı Akışkanlar Dinamiği) yöntemi kullanarak suyun içinde ısıtılmış yatay bir silindirden olan ısı transferini ve akış özelliklerini incelemişlerdir. Dash ve Dash, (2019), yaptığı çalışmada kalın içi boş bir silindirin laminer akışta yerde doğal taşınımla soğumasını 3D HAD yöntemi kullanarak sayısal olarak Nu sayısını, soğuma süresini ve ısı transfer oranını hesaplamışlardır. Rath ve Dash, (2019), yaptıkları çalışmayla ilk kez birbiriyle temas eden farklı sayıdaki bobinlerdeki (3,6,10) doğal taşınımla olan ısı transferini laminer ($10^4 \leq Ra \leq 10^6$) ve türbülans ($10^{10} \leq Ra \leq 10^{13}$) akış için incelemişlerdir. Üç silindire sahip yığın sistemdeki ortalama Nusselt sayısı her iki rejimde 6 ve 10 silindire sahip yığından daha büyük olduğu sonucu görülmüştür.

Bu çalışmada çelik bobinlerin soğuma süresinin tahmini için sonlu elemanlar yöntemi kullanılarak zamana bağlı termal bir analiz oluşturulmuştur. Çalışmadaki nihai amaç soğuk haddelemeden çıkan bobinlerin en sıcak noktasının sıcaklığının ne kadar sürede 80ºC'nin altına ineceğini belirlemektir. Termal analize ek olarak, üretim alanında çelik bobinlerden ölçümler alınarak model doğrulama çalışması yapılmıştır.

2.MATERYAL VE METOD

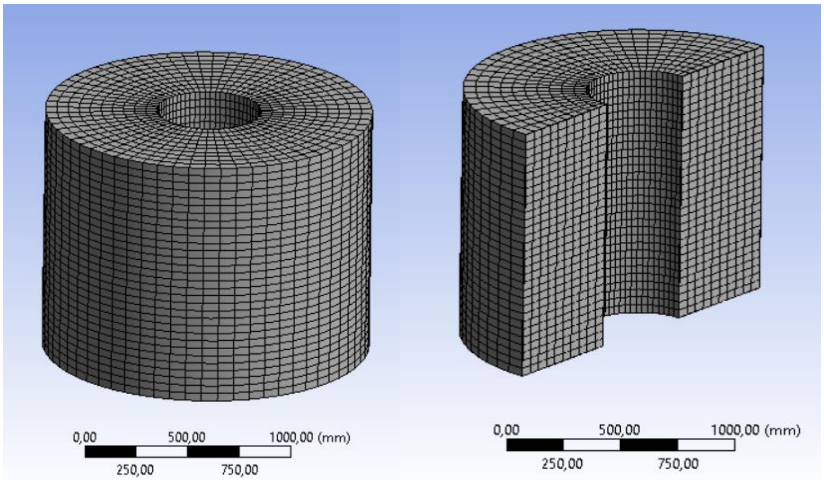
2.1 Sonlu Elemanlar Modeli

Bu çalışmada yatay bir silindirin doğal taşınımla soğumasını modellemek için, sonlu elemanlar yöntemi kullanılarak zamana bağlı termal bir analiz gerçekleştirilmiştir. Analiz için Ansys 2021 R2 programı kullanılmıştır. Malzeme olarak yapı çeliği tanımlaması yapılmıştır. Analizde, çelik malzeme için yoğunluk 7850 kg / m^3 alınmıştır. Sıcaklığa bağlı tanımlanan termal malzeme özellikleri ise Tablo 1'de gösterilmiştir.

Tablo 1. Çelik termal malzeme özellikleri (Park ve ark., 1998)

Sıcaklık (ºC)	Termal İletkenlik (W m^{-1}- C^{-1})	Özgül Isı (J $kg^{-1}C^{-1}$)
100	57,8	490,5
200	53,2	527,5
300	49,4	563,5
400	45,6	611,8
500	41	685
600	36,8	782,3
700	33,1	986

Ansys Designmodeler'da üç boyutlu geometri oluşturulmuştur. Oluşturulan sonlu elemanlar modelinde quadratic SOLID279 elemanlar kullanılmıştır. Eleman boyutu 35 mm'dir. Mesh yapısı Şekil 1'de gösterilmiştir.



Şekil 1. Mesh yapısı

Doğal taşınımda taşınım katsayısını (h) belirlemek için yatay bir silindirde Ra $\leq 10^{12}$ olduğunu dikkate alarak deneylerle bulunmuş denklem (5) kullanılmıştır (Churchill ve Chu, 1975). Silindirin yüzey sıcaklığı (T_s) $90ºC \sim 150°C$ aralığında ve hava sıcaklığı (T_∞) $0^0C \sim 40\ °C$ aralığında değiştiği kabulü yapılmıştır. Hava ideal gaz olarak kabul edilmiştir.

$$T_f = (T_s + T_\infty)/2 \quad (1)$$

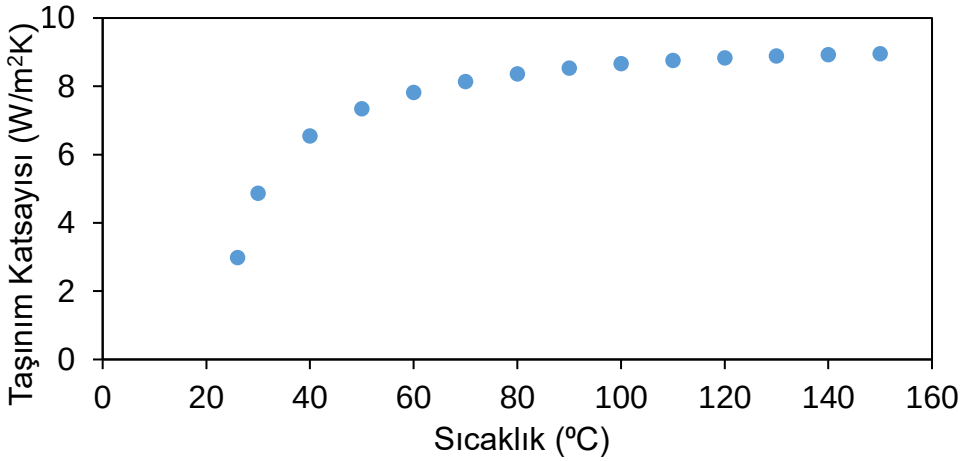
$$\beta = \frac{1}{T_f} \quad (2)$$

$$Ra = \frac{g\beta(T_s - T_\infty)L_c^3}{v^2} Pr \quad (3)$$

$$Nu = \left\{ 0.6 + \frac{0.387Ra^{1/6}}{\left[1 + \left(\frac{0.599}{Pr}\right)^{9/16}\right]^{8/27}} \right\}^2 \quad (4)$$

$$h = \frac{k}{L_c} Nu \quad (5)$$

Formüllerdeki ideal hava için, Prandtl sayısı (Pr), kinematik viskozite(v) ve iletim katsayısı (k) değerleri Tablo A-9'dan (Çengel ve ark., 2008) alınmıştır. Silindirdeki karakteristik uzunluk (L_c) silindirin dış çapıdır. Bu çalışmada literatürde yer alan yatay bir silindirin soğumasını incelemek için kullanılan sonlu elemanlar yöntemlerinden farklı olarak taşınım katsayısı denklem (5) kullanılarak hesaplanmış ve sıcaklığa bağlı bir parametre olarak tanımlanmıştır. Hesaplama yapılırken hava sıcaklığının sabit kaldığı kabulü yapılmıştır. Şekil 2'de 1 numaralı bobin için sıcaklığa bağlı hesaplanan taşınım katsayıları gösterilmektedir.



Şekil 2. 1.Bobin İçin Termal Analizde Kullanılan Sıcaklığa Bağlı Taşınım Katsayıları

Termal analizde sınır şartı olarak başlangıç sıcaklığı tanımlanmıştır. Tanımlanan sıcaklık değeri bobinin yan yüzeyindeki ölçülen sıcaklık değeridir. Bobinlerin bekleme sürelerine göre, analiz süresi tanımlanıp zamana bağlı termal bir analiz oluşturulmuştur.

2.2 Deney Kurulumu

Oluşturulan sonlu elemanlar modelinin validasyonu için deneyler yapılmıştır. Validasyon için üç farklı kalınlığa, genişliğe ve ağırlığa sahip bobinler seçilmiştir. Deneylerde kullanılan bobinlerin geometrik özellikleri Tablo 2'de gösterilmiştir. Ölçümler yapıldığında dış ortamın hava sıcaklığı 25ºC'dir. Şekil 3'te görüldüğü gibi bobinler yatay konumda soğumaya bırakılmıştır. Bobinler için 2 saat aralıklı ölçümler alınmıştır. Ölçümler alınması için ±5ºC sıcaklık toleransına sahip APPA 51 Thermometer termokupl (Şekil 4) ölçüm cihazı kullanılmıştır. Ölçüm yapılan bölge silindirin yan yüzeyidir (Şekil 5).

Tablo 2. Bobinlerin Geometrik Özellikleri

Bobin No	Genişlik (mm)	Kalınlık (mm)	Ağırlık (kg)	Dış Çap (mm)
1	1216	1,11	20375	1725
2	1250	0,7	22450	1780
3	1390	0,5	26640	1834

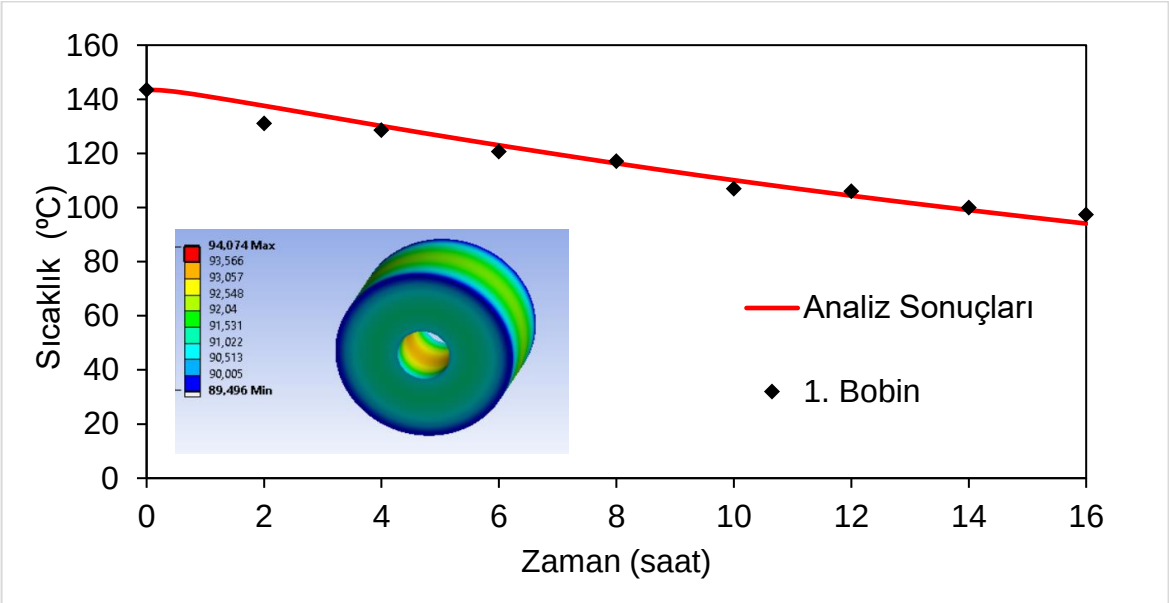
Şekil.3. Soğumaya Bırakılmış Bobinler

Şekil 4.Ölçüm Cihazı

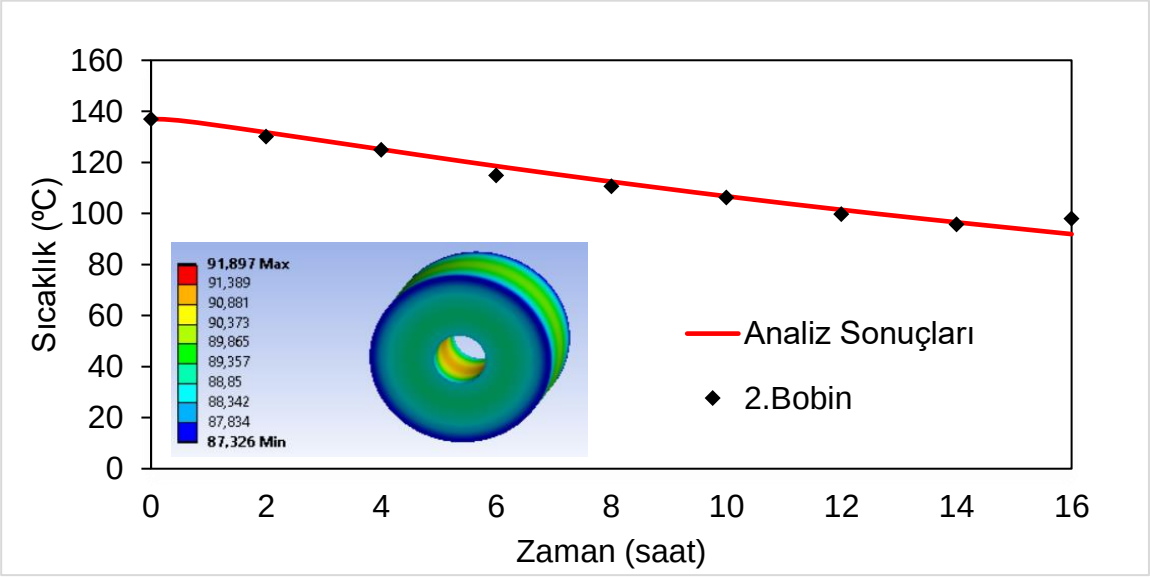
Şekil 5.Ölçüm yapılan yüzey

3. BULGULAR ve TARTIŞMA

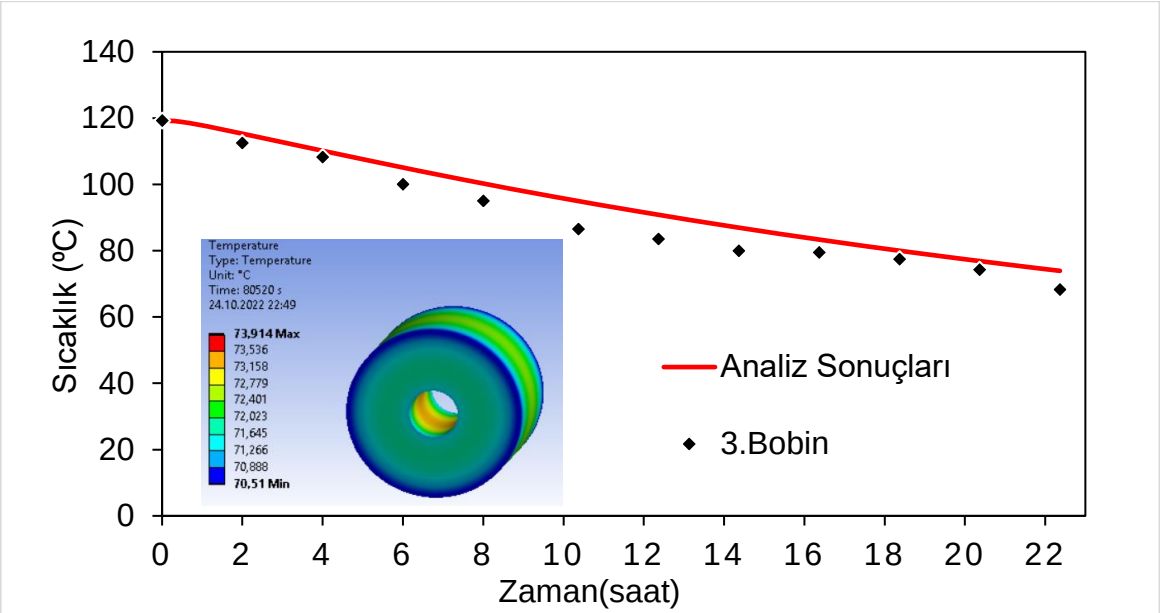
Her bir bobin için deney verileri ve termal analiz sonuçları karşılaştırılmıştır (Şekil 7, Şekil 8, Şekil 9). Bobin içindeki sıcaklık dağılımı gösterilmiştir (Şekil 10). Termal analiz yaparken yan yüzey sıcaklığının kullanılmasının sebebi, bobinin dış yüzeyinin yüzey alanının büyüklüğü sebebiyle daha çabuk soğuması ve yüzeyler arasındaki sıcaklık farklarının 40ºC'ye kadar çıkabilmesidir. Bu farktan dolayı uygulamada, soğuyan bobinin elektrolitik temizleme hattına alınabilmesi için yan yüzeydeki sıcaklık dikkate alınmaktadır. Termal analizin sonuçları ile deney verileri karşılaştırıldığında, 1.bobin ve 2.bobin için sonuçlarının uyumlu olduğu görülmüştür. Rath ve Dash, (2019), Ansys Fluent'de sonlu hacimler yöntemi kullanarak yatay bir silindirin soğumasını modellemişlerdir ve yaptıkları çalışmanın test validasyonu için Churchill ve Chu (1975)'nun deneylerle bulduğu denklemi kullanmışlar ve laminer akış rejiminde (104 □ Ra □108) yapılan analizlerle ölçümlerin iyi sonuç gösterdiğini belirtmişlerdir. Bobinin sıcaklık dağılımına bakıldığında (Şekil 10) ise merkezinden dış çapa doğru gidildiğinde sıcaklığın azaldığı görülmektedir.



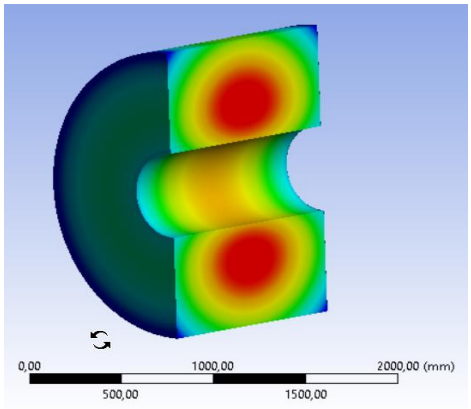
Şekil 7. 1.Bobin İçin Deney ve Termal Analiz Sonuçlarının Karşılaştırılması



Şekil 8. 2.Bobin İçin Deney ve Termal Analiz Sonuçlarının Karşılaştırılması



Şekil 9. 3.Bobin İçin Deney ve Termal Analiz Sonuçlarının Karşılaştırılması



Şekil 10.Sıcaklık Dağılımı

4. SONUÇ

Bu çalışmada soğuk haddelemeden çıkan bobinlerin doğal taşınımla soğumasını modellemek için sonlu elemanlar yöntemi kullanılarak zamana bağlı termal analiz oluşturulmuş, oluşturulan modelin validasyonu için de deneyler yapılmıştır. Üç bobin için deney ve termal analiz sonuçlarının uyumlu olduğu gözlemlenmiştir. Sonlu elemanlar yöntemi kullanıldığı için Fluent'de sonlu hacimler yöntemine göre oluşturulan modellerden daha kısa sürede sonuçlar elde edilmiştir. Bu çalışmadan yola çıkarak verilecek öneriler şunlardır:

- Farklı sıcaklık ve çevre sıcaklıkları için Churchill ve Chu (1975)'nun deneylerle bulduğu denklem kullanıldığında sonuçların uyumu karşılaştırılabilir.
- Aynı ağırlığa sahip farklı kalınlıktaki bobinlerin aynı çevre sıcaklığında doğal taşınımla soğuma sürelerinin kalınlığa bağlı olarak nasıl değiştiği araştırılabilir.

Abstract

Agricultural production is usually done to meet food and energy needs. Photosynthesis is a process in which green plants utilize the energy of sunlight to manufacture carbohydrates from carbon dioxide and water in the presence of chlorophyll. Because humans and animals cannot synthesize their own nutrients, photosynthesis is the most important chemical process that is a vital precaution. Today, there are serious problems in world food supply. Rapidly growing world population and rising biofuel consumption are fueling both food and biofuel demand. Biofuels, namely biodiesel and bioethanol, increase the use of food products to produce, nutrition and ethical concerns. The rational use of land, water and energy resources that are vital for humanity is becoming more and more important. Extensive use of vegetable oils in the biodiesel production may cause other significant problems such as starvation in developing countries. The aim of sustainable agriculture is to meet the food and textile needs of the society without compromising the ability of future generations to meet their own needs. Agriculture is the process of cultivating some plants and producing food, nutritional products, fiber and other desirable products through domestic breeding.

Keywords: Agricultural problems; Land use; Food; Organic farming materials; Natural sources; Environmental threats

INTRODUCTION

As the world population continues to grow geometrically, there is great pressure on arable land, water, energy and biological resources to ensure adequate nutrition while maintaining the integrity of the ecosystem.

Agriculture is one of the main components of the sustainability of human civilization. With today's advanced technology, agriculture's production is slowly shifting to producing safe commodities for society, the environment and the environment. Agricultural production is usually done to meet food and energy needs. More than 99% of the world food supply comes from the soil, less than 1% comes from the oceans and other water habitats (Pimentel D, et al., 1996; Pimentel D, et al., 2006)). In particular, about 87% of the world's fresh water is consumed or used by agriculture and is therefore not recovered (Pimentel D, 2006; Pimentel D et al., 2013).

Today, there are serious problems in world food supply. The rapidly increasing world population and rising fossil fuel consumption are increasing demands for both food and biofuels. This will exaggerate food and fuel problems. The human population is faced with severe food stress and malnutrition. Producing biofuels is necessary both for fossil energy and for food resources, which will intensify conflicts between these sources. The use of food products such as corn grain to produce ethanol increases nutritional and ethical concerns. Nearly 60% of the world's people are malnourished, so the need for grain and other basic foods is critical. The products grown for fuels derive land, water and energy resources that are vital for food production for humans (Wilson et al., 1974; Adsavakulchai et al., 2004; Lal, 2005; Pimentel et al., 2008; Kirtay, 2009).

Soil use as an impact category is an important parameter for biomass energy. This impact category defines the environmental impact of soil use for human activities. In particular, the category of land use sees natural land as a resource and assumes that the occupation of land and the management of it leads to the consumption of the resource. Natural land can now be defined as the addition of undisturbed soil by human activities and remaining natural soil fractions in use.

Agricultural issues

Agriculture is the process of cultivating some plants and producing food, nutritional products, fiber and other desirable products through domestic breeding. Agriculture is the cultivation and breeding of animal, plant and fungus for food, fiber, biofuels, medical plants and breeding for other products used to sustain and enhance human life.

Agricultural productivity is measured as the proportion of agricultural outputs of agricultural inputs. It can also be measured by a measure called total factor productivity. Agricultural production data refers to the crop and animal production available for human consumption and animal feed. The chemical basic of agricultural production depends on photosynthesis process.

Sustainable food production is a critical objective to meet the challenges facing agriculture worldwide. Advanced natural resource management policies, climate and energy policies, bio-security systems, property rights and innovations in collective action are a high-level focus.

Agricultural food production and water management have increasingly become global issues that cause debate on a number of fronts. The decline of soil and water resources, including the depletion of aquifers, has been observed in recent decades, and the effects of global warming on agriculture and agriculture are still not fully understood against global warming (Quinn et al., 2014; Talebi et al., 2014; Demirbas, 2009; Demirbas, 2007).

Photosynthesis as a source of life

Photosynthesis is an electrochemical event formed transformed into light energy into chemical energy. The origin of all carbon fuels or biomasses, which constitute the most important event in the formation of all foods and bio-fuels according to Eqs. (1 and 2).

$$CO_2 + H_2O \xrightarrow[\text{Micro-electrochemical cell}]{\text{Sunlight, chlorophyll}} CH_2O + O_2 \qquad (1)$$

$$6CH_2O \xrightarrow{\text{Polymerization}} C_6H_{12}O_6 \qquad (2)$$

Photosynthesis is an important biochemical process and some bacteria convert the energy of sunlight to to produce foods as chemical energy sources. Photosynthetic micro-organisms living in saline or freshwater environments convert sunlight water and carbon dioxide to algal biomass (Chisti, 2007; Quinn et al., 2014; Talebi et al., 2014). Photosynthesis is a process in which green plants utilize the energy of sunlight to manufacture carbohydrates from carbon dioxide and water in the presence of chlorophyll. Because humans and animals cannot synthesize their own nutrients, photosynthesis is the most important chemical process that is a vital precaution.

Land use, water use, environmental treats and ecosystem diversity

Land use is an indication of impact. The effects on land use are related to the land area used and physical land use. In particular, there are biodiversity, potential for biotic production, soil fertility and use value, and ecological soil function. Land use to produce food and bioenergy in a well-established infrastructure creates an environmentally friendly effect. Land use affects the causes of eco-products.

The use of food products such as vegetable oil and corn grain to produce biodiesel and ethanol increases nutritional and ethical concerns. Nearly 60% of the people in the world are in need of nutrition and the need for cereals and other basic foods is critical. The products grown for fuels derive soil, water and energy resources that are vital for food production for humans.

Between fuel and fuel, there is a dilemma in the production of liquid biofuels that damages food supply on a global scale, with the risk of changing direction of agricultural products or products. There is a disagreement about how important it is, what causes it, what the effect is, and what needs to be done or done. Biofuel production has increased in recent years. Some products such as corn, sugar cane and vegetable oil can be used

either as food, feed or biofuels. For example, vegetable oils have recently become more attractive as they are made from environmental benefits and renewable sources.

Vegetable oils are a renewable and potentially inexhaustible source of energy and the energy content is diesel fueled. The use of soybeans as a potential biofuel source is cropland competition with food production. On the other hand, extensive use of vegetable oils in the biodiesel production may cause other significant problems such as starvation in developing countries (Demirbas, 2009; Demirbas, 2007).

Many problems related to bioenergy have been ignored by scientists and policy makers. The environmental impact of corn ethanol is enormous: (1) corn production causes more soil erosion than other grown crops; (2) 1,700 gallons of water are required to produce 1 gallon of corn ethanol; (3) During production, during fermentation and when exposed to soil, exposing the organic matter of the soil and leaving it in large quantities, large amounts of carbon dioxide are produced in enormous quantities during the production of corn ethanol by fossil energy. In addition, conversion of cultivated areas for biofuel production contributes to the release of greenhouse gases. (4) All this accelerates global warming; (5) Using corn for ethanol increases the price of other foods linked to manufacturing or corn and animal nutrition (Pimentel et al., 2008; Demirbas, 2009; Demirbas, 2007).

The environmental effects of the irrigation are the effects on the natural and social conditions in the quantity and quality of soil and water resulting from the irrigation, and at the end and downstream of the irrigation scheme. Irrigated farming depends on the surface of the water or the materials taken from the ground water. Irrigation agriculture is an indispensable component of any strategy to increase global food supply. Improving the environmental performance of irrigated agriculture is important for long-term sustainability. Irrigation projects and irrigated farming practices can affect the environment in various ways. The environmental impact of irrigation systems depends on the quality of the water source, the quality of the water, and how the water is fed to the irrigated soil. The appropriateness of the management of water treatment systems and the relevant agricultural practices has a dramatic impact on the environmental impact of irrigated agriculture (Demirbas, 2007; Demirbas, 2011; Demirbas, 2011).

The ecosystem diversity of fuel applications provides many environmental, economic and consumer benefits. The use of plant residues for bio-energetic production should be critically assessed due to soil carbon sequestration, soil quality maintenance and positive effects on ecosystem functions (Lal, 2005; Demirbas, 2007; Demirbas et al., 2009; EER, 2007).

Energy plants include fast-growing trees such as hybrid poplars, black grasshoppers, willow and silver maple trees, such as corn, sweet sorghum and long-lasting grasses such as switchgrass. The biomass can be converted into modern energy carriers such as bioenergy, hydrogen, methanol, ethanol or electricity, both residues and energy plants.

The impact of energy efficiency on habitat and ecosystem diversity depends not only on previous land use and planting, but also on the quality of the energy plant. The role of energy depletion can play a role in the context of sustainable development, such as the use of bioethanol, and as a potential impact on biodiversity and more relevant research is needed (Adsavakulchai, 2004).

Conflicts exist today in the use of land, water, energy and other environmental resources needed for both food and biofuel production. Bioenergy resources can be divided into two broad categories: (1) organic municipal waste and residues from the food and materials sectors and (2) special energy plants.

Today, there are serious problems in world food supply. Rapidly growing world population and rising biofuel consumption are fueling both food and biofuel demand. This is exaggerating food and fuel problems. The use of food products such as corn grain to produce ethanol increases nutritional and ethical concerns. The products grown for fuels are draining land, water and energy resources that are vital for food production for human consumption. Using corn for ethanol increases the price of US beef, poultry, pork, eggs, bread, grains and milk by more than 10 to 30% (Pimentel et al., 2008; EPA, 2002; Demirbas, 2007; Demirbas et al., 2009; EER, 2007).

Today, there are serious problems in world food supply. Rapidly growing world population and rising biofuel consumption are fueling both food and biofuel demand. Biofuels, namely biodiesel and bioethanol, increase the use of food products to produce, nutrition and ethical concerns. The rational use of land, water and energy resources that are vital for humanity is becoming more and more important (Pimentel et al., 2008; EPA, 2002; Demirbas, 2007; Demirbas et al., 2009; EER, 2007; Chisti, 2007; Quinn et al., 2014; Talebi et al., 2014).

The aim of sustainable agriculture is to meet the food and textile needs of the society without compromising the ability of future generations to meet their own needs. Sustainable agriculture has three main objectives: a healthy environment, economic profitability and social equity. Food processors, distributors, retailers, consumers and waste managers play a role in ensuring a sustainable agricultural system in the food system. Main objectives of a sustainable agriculture system are given in Fig. 1.

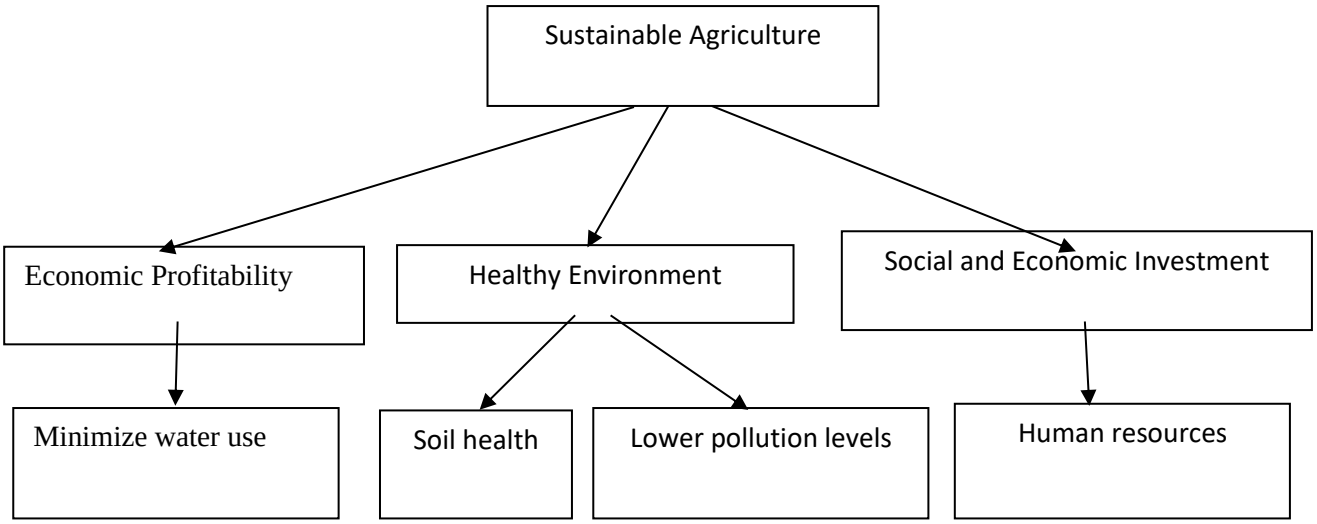

Fig. 1. Main objectives of a sustainable agriculture system.

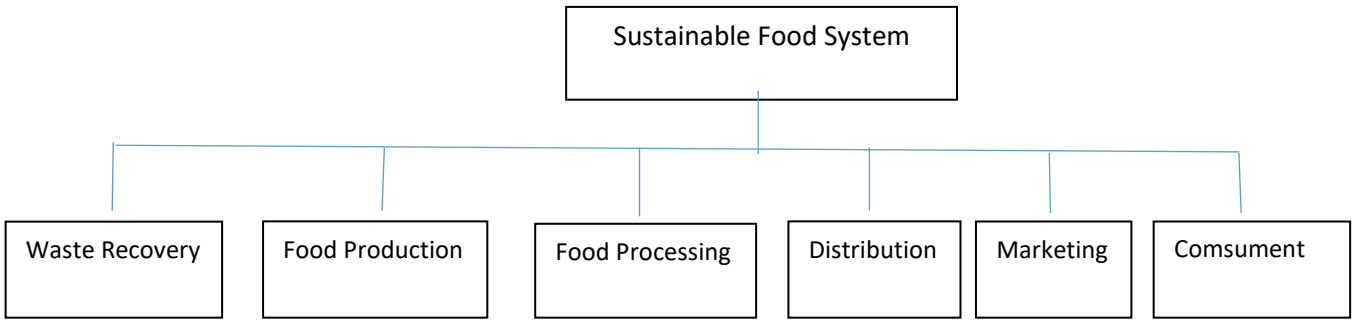

Fig. 2. Main elements of a sustainable food system.

Everyone plays a role in creating a sustainable food system. A sustainable food system contains six main elements:

1. Waste recovery from crude food materials.
2. Food Production
3. Food Processing
4. Food Distribution
5. Food Marketing
6. Food Comsumption

Fig. 2 shows six main elements of a sustainable food system. The world's agricultural system is opposed by a multi-purpose and balanced struggle. To meet different human needs, it should produce far more food for a population expected to reach 9.6 billion by 2050, provide economic opportunities for hundreds of millions of rural poor dependent on livelihoods for agriculture, and reduce negative environmental impacts. Ecosystem degradation and high greenhouse gas emissions should be reduced to the lowest possible level (Demirbas, 2004; Demirbas, 2006; Demirbas 2011).

CONCLUSION

Agricultural issues, natural resources and environmental threats are imported for human life. Food and agriculture is the heart of our civilizations. Many religions and cultures celebrate various aspects of food and agriculture due to the importance of our continuity. Natural resources, land and water use are vital precautions. The drought that is likely to happen in the future leads the people to take measures and find new remedies. The social, economic and political principles of an country should include the best possible solutions for the future. Humanity has to take the necessary precautions in terms of productive agriculture, rational land use, economic water and natural resources usage and negative environmental factors without losing time. It is urgent to organize international protocols and comply with common decisions in these areas.
The research will include analyzes that can help prevent and isolate future food and nutritional safety threats and ensure that scarce budgetary resources are directed to development priorities that provide the highest impact.

Abstract
The Wilson-Cowan system models excitatory and inhibitory sets of cortical cells in neural populations. As a result of a long evolution, it had many modifications, and a variety of applications. Especially productive this model became in the description of the hyper-synchronization in neural clusters, starting from the small-scale populations, comparable with the scale of the cortical mini-columns, up to the large regions of the epileptic seizures. In the proposed work we develop the Kolesnikov algorithm-based feedback for the simplified differential form of the Wilson-Cowan model to drive the dynamical functions of the excitatory or/and inhibitory cells. We derive the explicit equation for the tracking feedback control input, and discuss the pros and cons of our approach in comparison with alternative control algorithms. It helps to model the dynamics mechanism of many phenomena: focal seizures appearing in the cortical mini-columns, drug-resistant types of seizures, and others. The feedback control in the Wilson-Cowan model can serve for developing an efficient but simple approach to detect and suppress epileptiform behavior in artificial neural networks.

Keywords: Excitatory and inhibitory neurons, Wilson-Cowan differential model, tracking of neural population dynamics, Kolesnikov feedback algorithm.

INTRODUCTION

The Wilson-Cowan system for modeling excitatory and inhibitory sets of cortical cells in the neural populations had a long pre-history based on the progress in the development of neural field theory (Chow and Karimipanah, 2019). In its standard form, it has been formulated in (Wilson and Cowan, 1972; 1973), and the first of these publications became one of the most cited in the *Biological Cybernetics* (former *Kybernetik*) journal (Destexhe and Sejnowski, 2009).

As a result of a long evolution, the Wilson-Cowan system had many modifications, like graded potential models, spike response formalism, mean-field theory (Chow and Karimipanah, 2019), and a variety of applications, including modeling drug-induced visual hallucinations, mechanisms of long-time memory, binocular rivalry and many others (Wilson and Cowan, 2021).

Especially productive this model became in the description of the hyper-synchronization in neural clusters, starting from the small-scale populations, comparable with the scale of the cortical mini-columns (Wang et al, 2014), up to the large regions of the epileptic seizures (Shusterman and Troy, 2008).

Nevertheless, the theoretical progress in the description of hyper-synchronization still possesses great lack. Application to modeling epilepsy demands to invent methods for detecting and suppressing the seizure dynamics, and for that one need to develop efficient algorithms for control over the firing activity of excitatory and inhibitory neurons.

In this work, we develop the Kolesnikov algorithm-based feedback for the simplified differential form of the Wilson-Cowan model to drive (i.e., in the terms of control theory to *track*) the dynamical functions for the excitatory or/and inhibitory cells. We derive the explicit equation for the tracking feedback control input and discuss the pros and cons of our approach in comparison with alternative control algorithms.

MODEL AND CONTROL METHODS

The original model of Wilson-Cowan deals with a small homogeneous neural population where all cells receive the same number of excitatory and inhibitory afferents. The number of excitatory and inhibitory neurons firing at the time t are denoted as $E(t)$ and $I(t)$ correspondingly.

The Wilson-Cowan model has integral formulation, but if the time coarse-graining is assumed, it may be simplified to the differential form (Wilson and Cowan, 1972; 1973) which we use here.

Mathematical Model

The Wilson-Cowan simplified model consists of the system of two coupled ODEs (Wilson and Cowan, 1972):

$$\begin{aligned} \tau_E \frac{dE}{dt} &= -E + S\left(C_{EE}E + C_{IE}I + P + A(t)\right); \\ \tau_I \frac{dI}{dt} &= -I + S\left(C_{EI}E + C_{II}I + Q\right). \end{aligned} \tag{1}$$

Here τ_E and τ_I are the refractory time scales after the trigger, and the positive constant set C_{ij} ($i,j = E,I$) represents the coupling between the E and I sub-populations with the basic activity levels P and Q correspondingly. We added also the control input $A(t)$ to the excitatory population.

The sigmoid function $S(x)$ depends on the trigger threshold distribution. It can be chosen in a few alternative forms, for instance as a hyperbolic tangent. Here we use the most common version:

$$S(x) = \left[1 + \exp\{-a \cdot (x - \theta)\}\right]^{-1}. \tag{2}$$

The inverse function to (2) is:

$$S^{-1}(y) = \theta - \frac{1}{a}\ln\left(\frac{1}{y} - 1\right). \tag{3}$$

Following (Wang et al, 2014), we chose the steepness of the sigmoid (2) as $a = 1$, and its offset: $\theta = 4$.

Control Methods

The existence of the control input $A(t)$ in RHS(1) allows to the application of different control algorithms to track the populations of E and I neurons, i.e. to drive them as target functions versus time t. In some works one can find the elements of the open-loop control, see, for instance, (Korkmaz, 2022). On another side, we also experienced applying the feedback control algorithms to drive the dynamics of small populations for Hodgkin-Huxley neurons (Borisenok and Ünal, 2017; Borisenok, Çatmabacak, Ünal, 2018).

Here we follow the feedback approach and define at first the target function for the tracking. Let's take it as the target (T) population for the excitatory neurons as a given function of time: $E_T(t)$. We form the observing function:

$$\psi_E(t) = E(t) - E_T(t). \tag{4}$$

We emphasize that the control goal is namely *tracking*, such that the target population E_T is a time-dependent function! To lock the behavior of E in the neighborhood of E_T exponentially fast, i.e. to form the target attractor in the system, we use the Kolesnikov 'synergetic' feedback (Kolesnikov, 2012):

$$\frac{d\psi_E}{dt} = -\frac{\psi_E}{\tau}, \tag{5}$$

with some control time scale τ.

To find the control input A, we substitute (4) to (5) and express the derivative dE/dt as:

$$\tau_E \frac{dE}{dt} = \tau_E \frac{dE_T}{dt} - \frac{\tau_E}{\tau}\left(E - E_T\right). \tag{6}$$

Eq.(6) coincides with the LHS of the first equation in (1). By that, we can exclude the time derivative dE/dt in (1) and via the inverse function (3) find the explicit form of the control input:

$$A = \theta - \frac{1}{a}\ln\left(\left[\tau_E \frac{dE_T}{dt} - \frac{\tau_E}{\tau}\left(E - E_T\right) + E\right]^{-1} - 1\right) - C_{EE}E - C_{IE}I - P\,. \tag{7}$$

The control (7) making the tracking (4) has no memory: all time-dependent functions in its RHS are taken only for the present moment *t*.

Achievability of the Control Goal

Eq.(5) provides the exponential convergence of the function $E(t)$ to the control target $E_T(t)$. At the time scale τ the control input (7) virtually becomes:

$$A = \theta - \frac{1}{a}\ln\left(\left[\tau_E \frac{dE_T}{dt} + E_T\right]^{-1} - 1\right) - C_{EE}E_T - C_{IE}I - P\,. \tag{8}$$

That makes the second Eq.(1) for $I(t)$ to be in fact autonomic, and the target $E_T(t)$ plays a role of the control signal driving the inhibitory population function:

$$\tau_I \frac{dI}{dt} = -I + S\left(C_{EI}E_T + C_{II}I + Q\right). \tag{9}$$

In a similar manner to (4)-(5), we can define the target function ψ_I for the inhibitory tracking.

RESULTS AND DISCUSSION

Applying the Kolesnikov attractor feedback one can efficiently drive the dynamics of excitatory and inhibitory populations in small-scale neural clusters. Nevertheless, each control method has its pros and cons. The strong feature of the Kolesnikov feedback (Kolesnikov, 2012) is the exponentially fast convergence of the algorithm. From another hand, the explicit equation (7) for the control input is quite sophisticated and causes a certain computational cost.

An alternative approach can be based on the Fradkov speed gradient and similar gradient algorithm methods (Fradkov, 2007). Such type of algorithms works successfully for Hodgkin-Huxley neurons (Borisenok and Ünal, 2017). The Fradkov method provides a much more simple form for the control signals, but in the same time it may have a systematic error in the target tracking, such that the precision of the method is lower than it is in the Kolesnikov feedback.

Thus, the choice between control methods is actually the practical choice between the accuracy and simplicity of the numerical simulations. Particularly for the Wilson-Cowan model it will be investigated further.

CONCLUSION

The possibility of feedback control over the firing activity of the excitatory and inhibitory cells in small neural populations plays an important role in many practical applications of the Wilson-Cowan dynamical system (1). It helps to model the dynamics mechanism of focal seizures appearing in the cortical mini-columns (Wang et al, 2014). It can extend the opportunity of modeling drug-resistant types of seizures.

In other words, the feedback control in the Wilson-Cowan model can serve for developing an efficient but simple approach to detect and suppress the epileptiform behavior in the artificial neural networks, similar to what has been done for the small populations of Hodgkin-Huxley neurons (Borisenok, Çatmabacak, Ünal, 2018).

The dynamical system (1) is more simple (two variables versus four variables in the Hodgkin-Huxley approach) and, thus, it demands fewer computational sources to model the micro-epileptic dynamics.

Abstract

Due to the increasing population, the development of contaminated areas has become increasingly popular during the urbanization process. Pollutions in these regions are mainly caused by mining, metal industry, and oil extraction, which not only degrades the environmental quality of the soils but also changes the geotechnical properties of these soils. The sensitivity of clays to pollutants is affected by factors such as mineral structure, particle size, bond properties between particles, and ion exchange capacity. In this study, determination the effects of engineering designs made in kaolin areas contaminated with waste engine oil in geotechnical engineering were aimed. For this aim, the effects of contamination of kaolin clay with waste engine oil at different rates on the physical parameters (Atterberg limits, specific gravity, and compaction) and unconfined compression strength were investigated. The results showed that specific gravity and optimum moisture content values decreased as the waste engine oil ratio increased. Also, the plastic limit increased with an increase in the waste engine oil ratio. There is an increase in the liquid limit with the addition of waste engine oil, although not as much as the plastic limit. In this study, the UCS strength of pure kaolin had the highest value with a strength of 253.80 kPa, while it decreased by 50.16%, 42.42% and 34.33% in kaolin contaminated with 3%, 5%, and 9% engine oil, respectively. The effects of increased waste engine oil content on other parameters were investigated by Grey correlation analysis and according to the results, the peak value of unconfined compression strength (UCS_{max}) > specific gravity (Gs) > optimum moisture content (OMC) > plasticity index (PI) > liquid limit (LL) > maximum dry density (MDD) was obtained.

Keywords: Kaolin clay, Contamination with engine oil, Physical properties, Unconfined compression strength

INTRODUCTION

With the rapid development of the oil and automotive industry, environmental pollution has attracted a lot of attention in recent years. Petroleum and refining products (gasoline, diesel, motor oil, kerosene, etc.) are the main sources used for energy needs in the transportation and industrial sectors. For the lubrication needs of numerous automotive and other types of engines, engine oil is employed. During such use, engine oil receives a number of additional components (lead, chromium, naphthalene, chlorinated hydrocarbons, sulfur) resulting from engine wear. Oil changes become required as a result of the oil's changing viscosity over time. Such oils, which are unsuitable due to contamination after use and not suitable for their original purpose, must be disposed of properly. If collected securely and appropriately, used oils have the potential to be recovered and further refined. However, in most situations, they are disposed of in open drains or landfills, where they can contaminate groundwater. Such oils, when mixed with infrastructure soils, have a negative effect on many engineering properties such as saturation of soils with liquids characterized by physicochemical properties different from water, mechanical and filtration parameters, plasticity, swelling (Xia et al., 2019; Kererat, 2019; Xu et al., 2021). Spilling into the natural environment causes hydrocarbon contamination of air, soil and groundwater by toxic and mutagenic polycyclic aromatic hydrocarbons (Husaini et al., 2008; Du et al., 2013; Zhou and Liu, 2018; Fu et al., 2021). Re-development of areas contaminated with such genotoxic and carcinogenic products will bring along engineering problems on the grounds where infrastructure systems will be established, as well as deterioration of environmental quality and health, and will cause financial losses due to significant production losses and risky early mechanical failures.

The redevelopment of polluted areas in the rapid urbanization process brings along the use of weak soils with low strength and high deformation properties. It is frequently used as an impermeability element or protective

layer in many engineering structures such as clay soils, earth fill dams, road fillings, waste storage area mattresses, and nuclear power plants, which have a high-volume change feature. However, these soils can cause permanent damage to the building elements due to problems such as swelling, shrinkage, settlement, and swell due to changes in water content over time. The properties and thus behavior of infrastructure soils change due to the change in pore water properties and interaction with the soil particle (Nayak et al., 2007; Estabragh et al., 2014; Chen et al., 2015; Safehian et al., 2018).

Kaolin clay constitutes a large proportion of the clays found naturally in Türkiye. This type of clay is categorized as a soft clay type due to behavioral changes, including a decrease in strength when exposed to water (Ghosh and Bhattacharyya, 2002). Large quantities of kaolinite minerals in these soils result in high water absorption, low bearing capacity, and significant erosion (Salimi and Ghorbani, 2020). Due to its complex and unpredictable behavior, which has led to its reputation as troublesome soil in construction projects, studies on this type of clay have mostly been concentrated on. Due to the expansion of cities and the rising trend of development, land use rules have attempted to build on a variety of soils, including low-strength soils (such as kaolin clay), during the past several years.

For this context, the main purpose of this study is to investigate and reveal these effects in engineering designs made in areas contaminated with waste engine oil in geotechnical engineering. It is aimed to investigate the effect of contamination of kaolin clay with waste engine oil at different rates on the physical (Atterberg limits, specific gravity, and compaction parameters) and unconfined compression strength of kaolin clay.

MATERIALS AND METHODS

Kaolin is formed as a result of chemical weathering of granite or volcanic rocks. Their colour changes according to the minerals in them. However, it is usually found in nature in white colour. The kaolin clay used in the experiments was obtained from the Balıkesir region and the properties of this clay are given in Table 1.

Table 1. Summary of the properties of pure soil

Properties	Values
Whiteness	%89.38
Grain Size (µm)	D50 : 1.3 <10 µm : 97.1 <2 µm : 60.8
Chemical Content	SiO_2 = %58.40 Al_2O_3 = %37.74 Fe_2O_3 = %1.86 TiO_2 = %0.63
Humidity	% 0.37
pH	6.83
Specific Gravity	2.65 g/cm^3

Hydrometer analysis was performed to determine the grain size of the clay soil. The granulometry curve obtained as a result of the experiments is as seen in Figure 1.

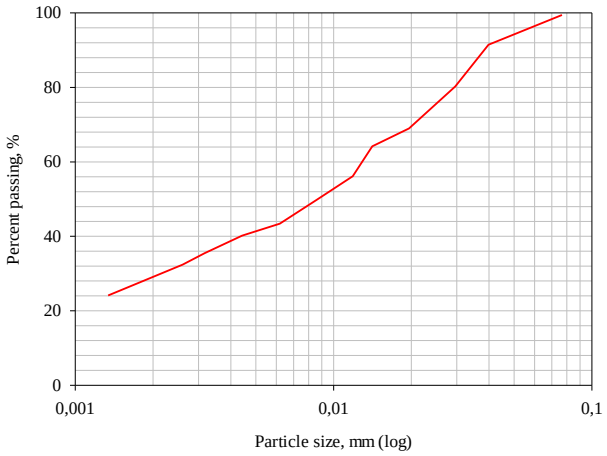

Figure 1. Granulometry curve of kaolin clay

As a result of the pycnometer tests, the specific gravity of the clay material was determined as 2.65 gr/cm³ (Table 1). Liquid and plastic limit (LL and PL, respectively) tests were carried out to determine the consistency limits of kaolin clay. The data obtained as a result of these experiments are shown in Table 2.

Table 2. Atterberg limits of the pure kaolin clay

Atterberg Limits	Value (%)
LL	26.15
PL	17.1
PI	9.05

Preparation of Specimens

The kaolin clays obtained from the Balıkesir region were mixed with waste motor oil in its pure form and at the determined increasing percentages and increasing contamination times after it was thoroughly mixed in order to show consistent results. It was exposed to contamination time of 0 day with 0%, 3%, 5% and 9% contamination percentages. First of all, kaolin clay mixed with motor oil by hand, then mixed more homogeneously with the help of a sieve (Figure 2).

Figure 2. Pure kaolin and different ratios of waste engine oil contamination

All of the soil specimens were prepared into 38 mm diameter, 76 mm high columns. The waste engine oil content was varied at different ratios by dry soil weight. The mixtures of soil-waste motor oil-water was compacted by three layers. The process of the preparation of the specimens was presented in Figure 3.

Figure 3. Preparation of the test specimens

The Unconfined Compression Strength (UCS) Test Process

In this study, the UCS test was carried out according to ASTM D2166 (2006). The unconfined compression strengths of the specimens were determined with a triaxial test machine (ELE brand) at the Firat University-Faculty of Technology-Civil Engineering Department-Soil Mechanics Laboratory. The same machine was also used for unconfined compression tests. A strain rate of 0.760 mm per minute was used to apply the load to the specimens. The loading procedure was repeated until either the specimen failed or the strain reached 20% (presented as Figure 4).

Figure 4. The UCS test process

RESULTS AND DISCUSSION

Liquid and plastic limit, pycnometer, compaction and UCS tests were carried out in accordance with the regulations for the classification and index properties of kaolin clay. The index properties obtained as a result of these experiments are as follows.

The results obtained as a result of Atterberg limit, pycnometer, compaction and unconfined compressive strength tests performed at different contamination percentages are given in Figures 5 to 9.

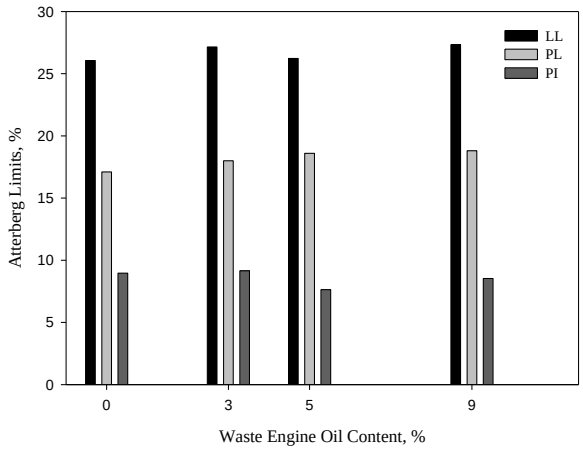

Figure 5. Atterberg limits according to waste oil content

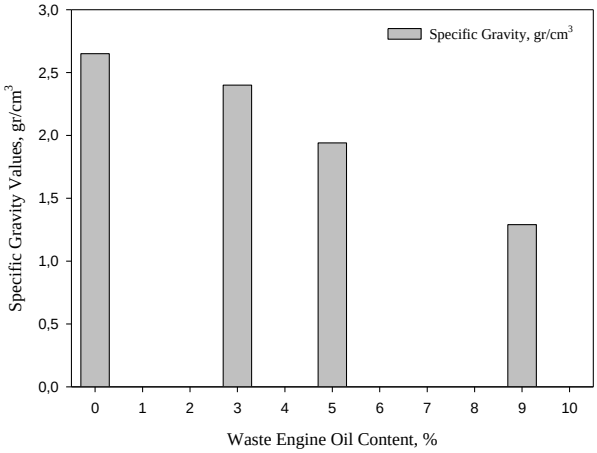

Figure 6. Specific gravity according to waste oil content

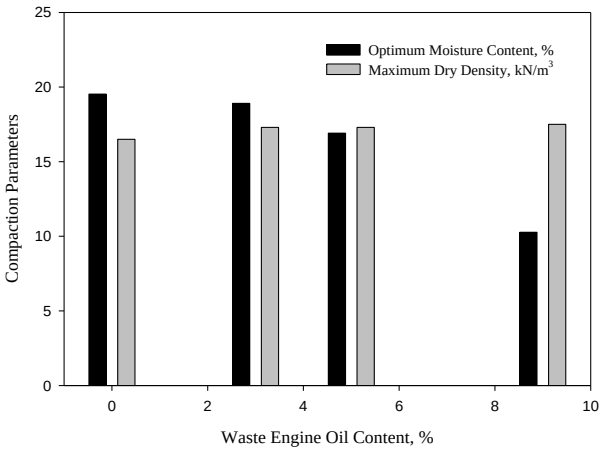

Figure 7. Compaction parameters according to waste oil content

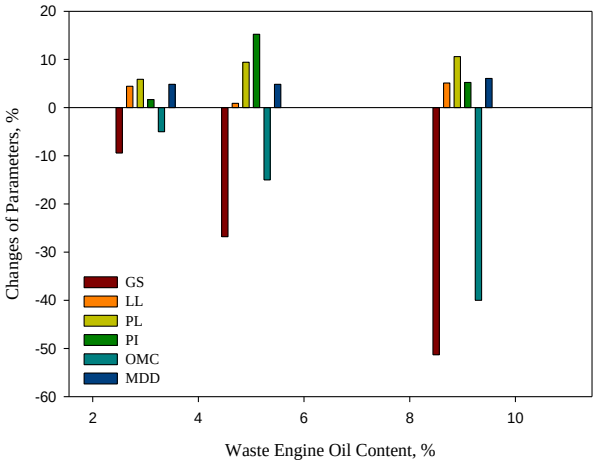

Figure 8. Changes of parameters according to waste oil content

The Effect of Contamination Degree on the Physical Properties

The specific gravity and optimum moisture content values decreased as the waste engine oil ratio increased. At maximum dry unit weight values, pure kaolin seems to be lower than when mixed with waste engine oil. While the maximum dry unit volume was found to be equal in 3% and 5% waste motor oil, a result close to other pollution rates was found in 9% waste motor oil. Liquid limit values vary between 26%-28% and plastic limit values vary between 17%-19%. Accordingly, the plasticity index is seen between 7%-10%. The plastic limit increases as the waste engine oil rate increases. For the liquid limit, the highest value is 9% waste engine oil, but the lowest value is 9% in the plasticity index. Liquid and plastic limit values of pure kaolin are at the lowest level when compared to contaminated soils with waste engine oil.

The Effect of Contamination Degree on the UCS

UCS tests were carried out on pure kaolin and 0-day contaminated soils with 3%, 5% and 9% engine oil. The results obtained depending on the contamination rate were reported by Li et al. (2022) show similar results to their study. One of the methods applied in their study is the same as the one used in this study, and the effects of engine oil on soils are seen to be close. Also, while the soil with the highest strength is pure soil, the lowest value is the soil with 3% engine oil addition. As presented by Li et al. (2022), while the pure state is the highest in the graphs showing fluctuating values, a decrease is observed in the values and then increases again. The

highest value in the engine oily soils, which do not exceed their pure state, is in the soils with 16% addition according to two different dry unit volume weight values. In this study, as engine oily soils were compared among themselves, kaolin clay with 9% engine oil added reached the highest value.

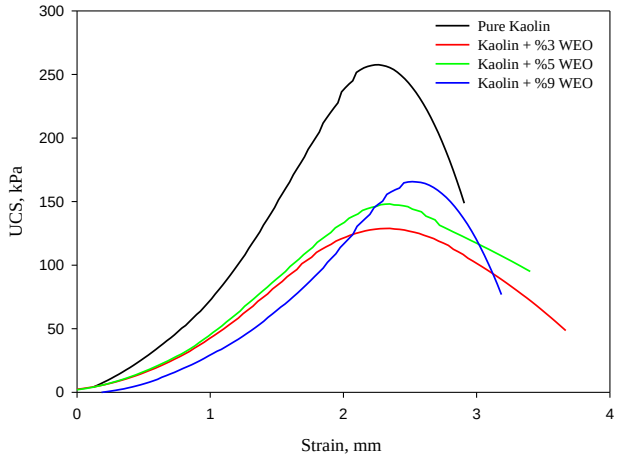

Figure 9. UCS results of different engine oil contamination

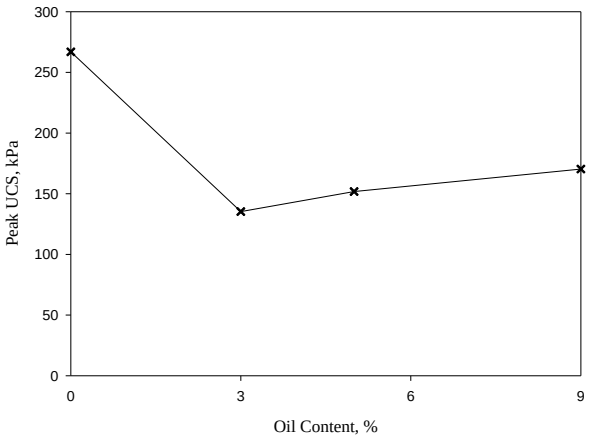

Figure 10. Peak UCS results of different engine oil contamination

Grey Correlation Analysis

Grey relational analysis is a technique for estimating grey relational degree and figuring out how much the system's primary behavior contributes to the total picture or how much the system factors impact one another (Kuo et al., 2018). To analyse the main parameters influencing the waste engine oil (WEO) content of kaolin clay, the relations between the specific gravity (Gs), peak UCS values, optimum moisture content (OMC), maximum dry density (MDD), liquid limit (LL) and plasticity index (PI) were determined by the grey correlation theory. The waste engine oil content was selected as the reference sequence and the other parameters (Gs, LL, PI, Peak UCS Value, DD, OMC) were taken as the comparison sequence. The following steps were used to obtain the Grey Relation Degree and the Grey Relation Order.

1. The reference sequence is defined as $x_0(k) = \{x_0(k_1), x_0(k_2), x_0(k_3), .., x_0(k_n)\}$ and the comparison sequence is defined as $x_i(k) = \{x_i(k_1), x_i(k_2), x_i(k_3), .., x_i(k_n)\}$.

2. To dedimensionalize the equations with different dimensions in the reference and comparison sequences, the reference and comparison sequences were computed using Eqs. (1) and (2).

$$x_0'(k) = x_0'(k) / x_0(k_1) = \left\{x_0'(k_1), x_0'(k_2), ..., x_0'(k_n)\right\} \quad (1)$$

$$x_i'(k) = x_i'(k) / x_i(k_1) = \left\{x_i'(k_1), x_i'(k_2), ..., x_i'(k_n)\right\} \quad (2)$$

where $x_0'(f_k)$ and $x_i'(f_k)$ normalized reference or comparison sequences.

3. Correlation coefficients are calculated according to Eq. (3).

$$\xi_i(k) = \frac{\min\limits_i \min\limits_k \left|x_0(k) - x_i(k)\right| + \rho \max\limits_i \max\limits_k \left|x_0(k) - x_i(k)\right|}{\left|x_0(k) - x_i(k)\right| + \rho \max\limits_i \max\limits_k \left|x_0(k) - x_i(k)\right|} \quad (3)$$

where ρ is the correlation coefficient, and taken equal to 0.50 in this study.

4. Grey Correlation (r_{0i}) can be obtained by Eq. (4):

$$r_i = \frac{1}{n} \sum_{k=1}^{n} \xi_{0i}(k) \quad (4)$$

Results of Grey Correlation Analysis

In this study, waste engine oil content and influence parameters (specific gravity, peak UCS values, optimum moisture content, maximum dry density, liquid limit and plasticity index) presented in Table 10 were utilized as the reference sequence and comparison sequences.

The results after dedimensionalized process calculated from Eqs. (1) and (2) are shown in Table 11.

Table 11. Data after dedimensionalized process

Peak UCS	LL	PI	W_{opt}	MDD	Gs	WEO
1	0.951336	0.983607	1	0.942857	1	0
0.498408	0.993414	1	0.95	0.988571	0.90566	0.333333
0.575841	0.959751	0.83388	0.85	0.988571	0.732075	0.555556
0.656758	1	0.93224	0.6	1	0.486792	1

Then, the approach degrees ($|x_0(k) - x_i(k)|$) between the reference and comparison sequences was computed from Eq. (3) and presented in Table 12. Also, as shown in Table 12, $\min_i \min_k |x_0(k) - x_i(k)| = 0.486792$, $\max_i \max_k |x_0(k) - x_i(k)| = 1$.

Table 12. Approach degree computation results

Peak UCS	LL	PI	W_{opt}	MDD	Gs
0.820126	0.831303	0.823809	0.820126	0.833327	0.820126
0.98759	0.821596	0.820126	0.83162	0.822685	0.842497
0.951545	0.829317	0.861639	0.857163	0.822685	0.892612
0.919035	0.820126	0.835896	0.941338	0.820126	0.993485

As a result, a formula is used to calculate the grey relation degree for the reference and comparison sequences. The results were announced as follows:

$\gamma_1 = 0{,}91957386$ $\gamma_2 = 0.825585231$ $\gamma_3 = 0.835367372$
$\gamma_4 = 0.862561639$ $\gamma_5 = 0.824705707$ $\gamma_6 = 0.887179825$

According to the results, the Grey correlation sequence of different parameters was obtained as Peak UCS > Gs > Wopt > PI > LL > MDD. The common interpretation of all waste motor oil contamination in the literature review is that the specific gravity and optimum water content decrease as the waste oil content increases (Akinwumi et al, 2014; Hewayde et al. 2019). Also, unconfined compression strength decreased with waste engine oil increased. It is therefore no unexpected that specific gravity, optimum water content and unconfined compression strength share the top three positions.

CONCLUSIONS

Due to the increasing population, the development of contaminated areas has become increasingly popular during the urbanization process. Pollutions in these regions are mainly caused by mining, metal industry, and oil extraction, which not only degrades the environmental quality of the soils but also changes the geotechnical properties of these soils. The sensitivity of clays to pollutants is affected by factors such as mineral structure, particle size, bond properties between particles, and ion exchange capacity.

The physical properties and unconfined compression strengths of the pure kaolin clay and soil polluted with waste engine oil at different ratios for 0 days were determined. According to this:

- The specific gravity and optimum moisture content values decreased as the waste engine oil ratio increased.
- At maximum dry unit weight values, pure kaolin seems to be lower than when mixed with waste engine oil.
- The plastic limit increases as the waste engine oil rate increases. For the liquid limit, the highest value is 9% waste engine oil, but the lowest value is 9% in the plasticity index. Liquid and plastic limit values of pure kaolin are at the lowest level when compared to waste motor oily soils.
- There is an increase in the liquid limit with the addition of waste motor oil, although not as much as the plastic limit.
- In this study, while the soil with the highest strength is pure soil, the lowest value is the soil with 3% engine oil contamination. As engine oily soils were compared among themselves, kaolin clay with 9% engine oil contaminated reached the highest value.

• When the effects of increased waste motor oil content on other parameters were examined by Grey correlation analysis, it was found that unconfined compression strength was the most affected parameter, while maximum dry density was the least affected parameter.

ACKNOWLEDGMENT

We would like to thank TÜBİTAK for its various contributions to science and scientists.

Abstract

Centaurea species are among the widely distributed plant species in Turkey. *Centaurea paphlagonica* is an endemic species. This species contains a high amount of phenolic compounds. The phenolic component analysis, which is generally found in plants, is made with HPLC-MS/MS devices. In this study, the extracts obtained from different parts of the *Centaurea paphlagonica* plant were first removed from the nonpolar parts, and then the polar parts were derivatized by esterification reaction with silylation reagents. The derived extract was analyzed by GC-MS instrument. The compounds were determined by comparison with the Wiley and NIST libraries.

Keywords: *Centaurea paphlagonica*, GC-MS, silylation method, polar compounds

INTRODUCTION

Centaurea species belong to the Asteraceae family and are widely distributed in Europe, northern Africa, North-South America and Asia. They are perennial herbaceous plants with more than 700 species in the world (Bouafia et al. 2020, . *Centaurea* genera are very diverse and widely distributed in Turkey. It has been reported to have 206 taxa in Turkey with the latest additions (Bona 2015, Şirin et al. 2019; Şirin et al. 2020). *Centaurea* species are widely used in traditional medicine since ancient times and more and more. *Centaurea cyanus* and *Centaurea scabiosa* are used in Scottish medicine as a diuretic and tonic (Bouafia et al. 2020, Aktumsek et al. 2011). *Centaurea pulchella*, *Centaurea drabifolia* and *Centaurea solstitialis* are used in traditional Turkish medicine for the treatment of abscesses, hemorrhoids, peptic ulcers and colds. In the literature, the biological activity of extracts and essential oils of different *Centaurea* species has been determined and it has been stated that they have antitumor, antidiabetic, anti-inflammatory, analgesic, antidepressant, enzymatic, antiplasmoid, antirheumatic, antioxidant, antimicrobial, antibacterial, antiproliferative properties (Arif et al. 2004; Bruno et al. 2018; Uysal et al. 2013, Ugur et al. 2009). The chemical content of *Centaurea* species varies greatly within the species and the characteristics of the ecosystem in which it spreads. The components that provide biological activity to the species are sesquiterpene lactones, flavonoids, lignans, alkaloids, phenolic compounds, steroids and terpenes (Krasnov et al. 2012, Grienke et al. 2018, Lockowandt et al. 2019). Phytochemical contents data and biological activity data of many species are still missing or not defined at all. *Centaurea paphlagonica* is an endemic plant species. There is only one publication on which phytochemical studies have been reported by another group, apart from the study we have done and reported on this plant species before. The study by another group was reported only on essential oil analysis.

Centaurea plant species are among very valuable plant species due to the rich and unique secondary components they contain. In order to bring these compounds to light, chemists and industry scientists focused their studies on the plant diversity in this species. It is difficult to determine individual phenolics in plant materials with a single analytical method. For this, it is necessary to find and develop alternative methods. These methods contribute to supporting each other in their studies or to make up for their deficiencies with existing methods. For this reason, it is aimed in this study to determine polar compounds of *Centaurea paphlagonica* by GC-MS technique, which is an alternative method for identifying compounds other than HPLC-MS. For this purpose, unlike the esterification method used for standard nonpolar molecules, polar compounds were identified using silylating reagents.

MATERIALS AND METHODS

Plant Material

The fresh plant materials were collected from Çankırı, Turkey (40°44'382"N-33°06'099"E) in July 2015. The plant identified and confirmed by expert Dr Selçuk Tugrul Koruklu, Department of Biology, Faculty of Sciences, Ankara University, where a voucher specimen (Herbarium number: 60501) was deposited.

Extraction of the *C. paphlagonica* (CPF1, CPF2, CPSL,CPR)

200 g of the part of the *C. paphlagonica* plant was crushed in liquid nitrogen. The completely powdered plant was extracted with methanol/chloroform (1:1) three times under room conditions (Demirtas et al., 2017). The extracts were filtered first through cheesecloth and then through ordinary filter paper. The solvents were evaporated to dryness at 30 ˚C and under reduced pressure (600 mm Hg). The crude extracts obtained at the end of the first, second and third extractions were combined.

GC/MS analysis (Gas Chromatography–Mass Spectrometry)

GC-MS analyses of extracts from obtained *C. paphlagonica* was analyzed with the Agilent Technologies 7890A GC System coupled to a 5975C inert MSD with Triple-Axis Detector. For column capillary HP-5-MS (60 m x 0.25 mm I.D. x 0.25 µm) column used. For GC-MS detection, electron ionisation system and ionisation energy of 70 eV was used. Helium was the transporter gas at a flow rate of 1 mL min. GC temperature program was set to 100 minutes. The program was as follow: As a result of the optimization, the starting temperature was determined as 100°C and the program was started from this temperature. It was kept at this temperature for 10 minutes. The temperature was then increased to 200 °C with an increase of 5°C per minute and held at this temperature for 20 minutes. The temperature was increased to 270 °C with an increase of 5°C per minute and kept at this temperature for 36 minutes. The structures of the analyzed compounds were determined by scanning the Famedb23, Famdbwax and NIST05a libraries loaded in the instrument.

Silylation procedure

Provided that each extract is in itself, as much extract as can be dissolved by 1 ml of methanol was added into 3 ml of eppendorf and a homogeneous solution was obtained. Then, 300 µl of chloroform was added to this volume and centrifuged at 12000 rpm for 10 minutes. Thus, apolar materials passed into the chloroform phase and formed a precipitate at the bottom of the tube, and this part was eliminated. After centrifugation, the remaining supernatant was taken to a new ependorf, 300 µl of chloroform was added, and centrifuged again for 10 minutes at 12000 rpm. 100 µl of the formed supernatant was taken and transferred to the new ependorph, and then the silylation process was started. First, a fast vacuum concentrator (SpeedVac, Savant DNA 120, ThermoScientific) was used to evaporate the solvents in the eppendorf tube. After removing the solvent in the tubes, 20 µl of methoxyamine hydrochloride solution dissolved in 30 mg/ml pyridine was added to each tube and incubated at 37 ºC for 2 hours. At the end of this period, 40 µl of MSTFA was added to each tube (N-methyl-N-[trimethylsilyl] trifluoroacetamide). Finally, the resulting 60 µl final volume was transferred to GC-MS vials containing capillary tubes and made ready for analysis.

.

RESULTS AND DISCUSSION

Analysis of polar compounds contained in extracts obtained from different parts of Centaurea paphlagonica plant (CPF, CPSL, CPR) with methanol/chloroform mixture was defined by GC-MS device. The results obtained were presented by scanning the current Famedb23, Famdbwax, WILEY and NIST libraries installed on the device (Table 1, Table 2, Table 3, Table 4, Table 5). As a result, quantitative analyzes of a number of compounds that could not be determined by HPLC-MS were identified as a result of derivatization with the GC-MS device, as well as preventing the decomposition of the substance at these temperatures. According to the percent area calculation, the glycoside compounds were found the most in the CPSL coded extract. While glyceraldehyde was determined as the main component in CPF1 (7.63%), CPF2 (2.60%) and CPSL (4.07%) extracts, galactopyranoside methyl 2,3-bis-O-(TMS)-cyclic methylboronate compound was determined as

glycoside compounds in the CPR extract. Maximum 9.79% Erythronic acid γ-lactone compound in CPF extract, 4.98% glycerol compound in CPF2 extract, 8.85% palmitic acid compound in CPSL extract and 6.01% Erythronic acid γ-lactone compound in CPR extract were found as main components.

Table 1. GC-MS analysis of glycosides in the *C. paphlagonica* extracts

CONCLUSION

The presence of phenolic compounds in plants has been proven using two different chemical analytical methods. these methods are HPLC and GC-MS. In both methods, there is a group of compounds that they cannot analyze. compounds with polar properties are compounds of this specified type. It does not require HPLC derivatization and analysis can be performed using standard compounds. However, GC-MS measurement is somewhat difficult and sensitive. This is due to the fact that silillation is a sensitive method. However, our study offers a very good alternative method for the determination of polar compounds by GC-MS. With this method, whether it is a plant extract or a food product, content analyzes with this method have shown that it will give clearer results. The results to be obtained from here will make important contributions to the medicinal value of the plant.

Özet

Hypericum salsugineum N. Robson & Hub.-Mor. (tuzkantaronu), *Hypericum* cinsinin tuzcul habitatları tercih eden tek türü olup Aksaray ve Konya illerinin Tuz Gölü çevresindeki tuzcul bataklık ve steplerinde yayılış gösteren endemik bir türdür. Çok yıllık otsu ve zehirli bir bitkidir. Deniz seviyesinden 900 m yükseklikteki tuzcul bataklık bölgelerinde yetişir. Ağustos ayında çiçeklenir. 10–20 cm kadar uzayıp boylanabilir. Önemli tıbbi aromatik türleri içeren bir familyanın türü olarak bu çalışmada, *Hypericum salsugineum*'un kök, gövde ve yaprak anatomik özelliklerinin araştırılması ile türün anatomik olarak ayırtedici karakterleri ve bu özelliklerin adaptasyon kabiliyetine katkısı tespit edildi. Kök anatomisinde öz bölgesinin tamamen ksilemden oluştuğu, salgı dokuya rastlanmadığı belirlendi. Gövde anatomisinde köke yakın bölgede öz bölgesinin kökten uzak gövdeye göre küçük ve dar olduğu ve salgı doku varlığı tespit edildi. Amfistomatik ve eşyüzlü olan yapraklarda anomositik stoma tipi gözlendi. Tuzcul ve kurak bir alanda yetişen türün yapraklarında tamamen palizat parankiması içerdiği görüldü. Stoma hücrelerinin boyutu fazla ışık ve sıcaklığa adaptasyondan dolayı küçük, stoma indeksi de su stresine bağlı olarak yüksek olarak belirlendi.

Anahtar Kelimeler: *Hypericum salsugineum*, *Hypericum*, halofit, anatomi, Tuz Gölü, Türkiye

Root, stem and leaf anatomical features of *Hypericum salsugineum* N. Robson & Hub.-Mor. (Tuzkantaronu - Hypericaceae)

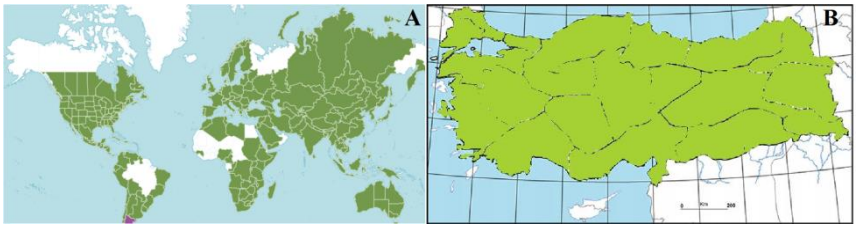
Abstract

Hypericum salsugineum N. Robson & Hub.-Mor. (tuzkantaronu) is the only species of *Hypericum* genus that prefers saline habitats and is an endemic species that spreads in salt marshes and steppes around Salt Lake in Aksaray and Konya provinces. It is a herbaceous perennial and poisonous plant. It grows in salt marshes at an altitude of 900 m above sea level. It blooms in August. It can grow up to 10-20 cm. In this study, the anatomical distinctive characters of *Hypericum salsugineum*, as a species of a family containing important medicinal aromatic species, and the contribution of these features to its adaptability were determined by investigating the root, stem and leaf anatomical features. In root anatomy, it was determined that the pith was completely composed of xylem and no secretory tissue was encountered. In the trunk anatomy, it was determined that the pith region near the root was smaller and narrower than the trunk away from the root and the presence of secretory tissue. Anomocytic stoma type was observed in the leaves that were amphistomatic and equilateral. It was observed that the leaves of the species grown in a saline and arid area completely contained palisade parenchyma. The size of the stomatal cells was determined to be small due to adaptation to high light and temperature, and the stomatal index was determined to be high due to water stress.

Keywords: *Hypericum salsugineum*, *Hypericum*, halophyte, anatomy, Tuz Lake, Türkiye

GİRİŞ

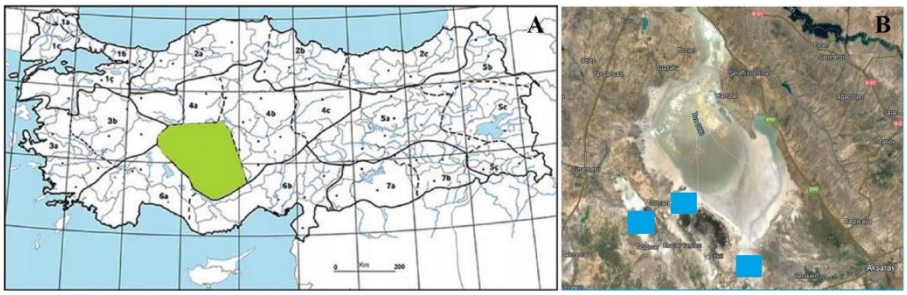
Hypericum L. (Hypericaceae), dünyada geniş yayılış alanlarında, çok farklı habitatlarda yetişir. Dünyada yaklaşık 480-510 kadar türe sahiptir (POWO, 2022). Kuzey ve güney yarıkürelerde geniş yayılışa sahiptir (Şekil 1) (POWO, 2022). Önemli gen merkezilerinden biri Türkiye'dir. Cinsin Türkiye'de 46'sı endemik olmak üzere 96 türü bulunmaktadır (Güner ve ark., 2012). Türkiye'de çok farklı ekolojik ortamlarda yetişebilmektedir (Şekil 1, URL-1).



Şekil 1. A- *Hypericum*'un dünya üzerindeki yayılış alanları, B- Türkiye'deki yayılış alanları

Önemli bir tıbbi aromatik bitki olan *Hypericum*'a ait türler dünyanın birçok yerinde ağrı kesici, parazit azaltma, yara iyileştirme, sinir hastalıkları tedavisinde, regl krampları, siyatik, eklem iltihabı tedavisinde, midevi rahatsızlıklardan kaynaklanan ağrıların giderilmesinde, bazı cilt hastalıklarının tedavisinde, idrar söktürmede, iltihap gidermede, bakterisit ve yatıştırıcı olarak yüzyıllardan beri tedavi amaçlı kullanılmaktadırlar (Baytop, 1999; Çırak ve Kevseroğlu, 2004; Kaçar ve Azkan, 2010).

H. salsugineum (tuzkantaronu) tuzcul habitatları tercih eden halofitik bir bitki olup cinsin tuzcul habitatları tercih eden tek türü olan *Hypericum salsugineum* IUCN (2019)'a göre EN kategorisinde değerlendirilmektedir. *H. salsugineum* Konya bölümünde Aksaray ve Konya illerinin Tuz Gölü çevresindeki tuzcul bataklık ve steplerinde yayılış gösterir (Robson, 1967; Güner ve ark., 2012) (Şekil 2, URL-2, Google Earth, 2022). Aksaray ili Eskil ilçesinin doğusu, Konya ili Cihanbeyli ilçesi Gölyazı'nın doğusu ve Tersakan Gölü güneyinde olmak üzere birkaç ana popülasyona sahiptir (Şekil 2).



Şekil 2. A- *Hypericum salsugineum*'un Türkiye'deki yayılış alanları, B- Aksaray ve Konya illerinin Tuz gölü çevresindeki yayılış alanları

Tuz Gölü çevresinde mevsime ve göle olan uzaklığa göre toprak özelliklerinin ve tuz tipinin birbirinden farklı olduğu ve bu özelliklerin bitkiye yansıdığı bilinmektedir. *H. salsugineum*'un yayılış gösterdiği alanlar olan Eskil çevresi lokalitesinde hem sodyum klorür hem de sodyum sülfat tuzluluğu görülmüştür. Türün yetiştiği alanda tür çeşitliliğinin yüksek olmasında en önemli faktör toprak çeşitliliğidir (Şekil 3) (Dengiz, 2007; Baysal Furtana, 2010; Baysal Furtana ve ark. 2013).

Şekil 3. A- *Hypericum salsugineum*, B- Habitatından bir görünüm

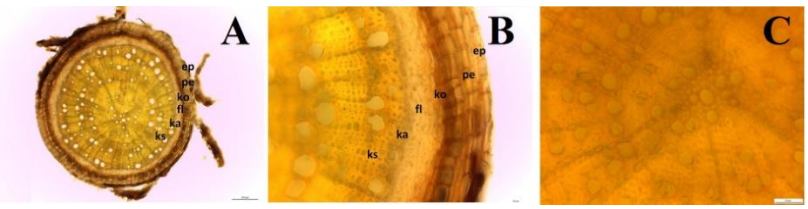
H. salsugineum üzerinde çok az sayıda çalışma bulunmaktadır. Türün ekofizyolojisinin çalışıldığı bir proje (Tıpırdamaz ve ark., 2010), polifenolik içeriğinin (Sakar, 1990), antiherpetik aktivitesinin (Duman, 2012), antioksidan ve antibakteriyel aktivitelerinin (Maltas ve ark., 2013), biyolojik potansiyeli ve kimyasal içeriklerinin (Bender ve ark., 2018) ve ağır metal içeriklerinin belirlendiği (Demir ve ark., 2021) çalışmalar bulunmaktadır. Türün üzerinde bu çalışmalar dışında karakterizasyonunun belirlenmesi amacıyla detaylı morfolojik, mikromorfolojik ve anatomik çalışmaların yapılmadığı tespit edilmiştir. Bu sebeple mevcut çalışmamızda kök, gövde ve yaprak anatomik özelliklerinin belirlenmesi, taksonomide kullanılabilirliği ve ekolojik adaptasyon kabiliyetinin belirlenmesi ve yorumlanabilmesi amaçlanmıştır.

MATERYAL VE METOD

H. salsugineum'un Aksaray ili Eskil ilçesinin doğusundaki lokalitesinden haziran ayında iki örnek alındı ve %70'lik alkol içinde tespit edilerek muhafaza edildi. Saha çalışması esnasında alınan bir örnek de AKSU herbaryumunda referans materyali (MT 6579) olarak koruma altına alındı. Çalışma esnasında iki bireyden kök, gövde, yaprak bölümlerinden enine ve yaprağın alt ile üst yüzey kısımlarından yüzeysel kesitler alındı. Sartur reaktifi ile boyanarak Leica marka ışık mikroskobu altında fotoğrafları LASEZ programı ile çekildi. 10 farklı yaprak alt ve üst yüzeyinden yüzeysel kesit alınarak stoma indeksi hesaplandı. Stoma sayısı (adet mm^2), bitkilerin en gelişmiş yapraklarında X40 objektifte 0.17 mm^2'ye denk gelen mikrometre alanına düşen stomalar sayılıp ortalaması alınarak; stoma boyu, stoma eni, stoma hücresi boyu, stoma hücresi eni, yan yana iki stoma arası uzaklık AlaMet programı ile ölçülüp belirlendi.

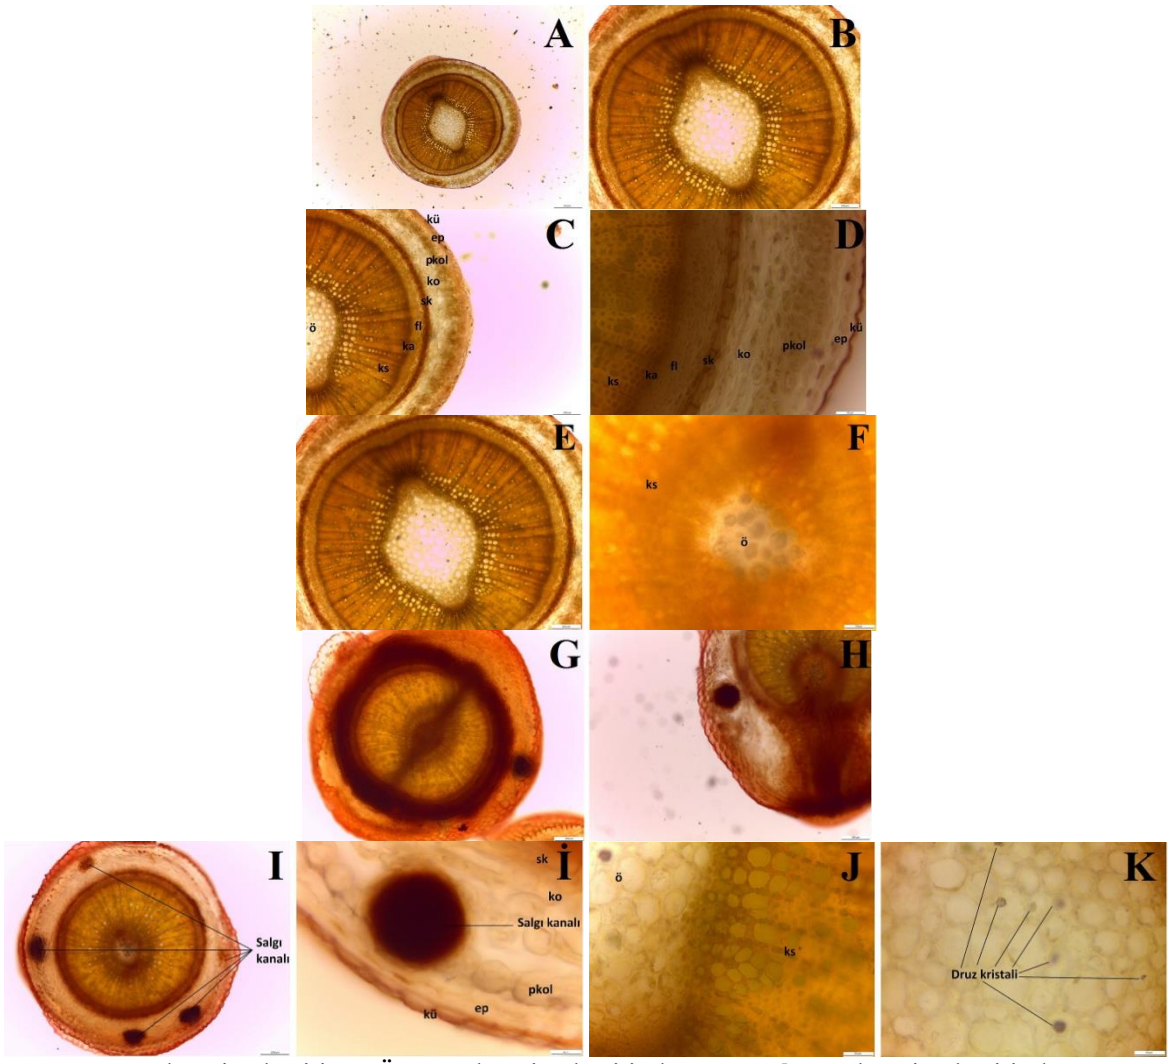
BULGULAR

Kök anatomisi: Kök enine kesitinde en dışta peridermisin üzerinde kalın bir kütikül vardır. Peridermis hücrelerinin şekli kare ya da dikdörtgendir ve 3-4 sıradan oluşur. Korteks, en dış yüzeyde çok katmanlı ve neredeyse dikdörtgen hücrelerden oluşur. Kortekste salgı kanalları yoktur. Korteksin altında sırayla floem, kambiyum ve ksilem bulunur. Floem tabakasında salgı kanalları gözlenmez. Ksilemde ışınlar tek sıralıdır, ksileminin çoğunu oluşturan trakeitler küçük bir lümen ile iyi bir şekilde odunlanmıştır. En içte bulunan kökün özü tamamen ksilem elementleri ile kaplıdır (Şekil 4).



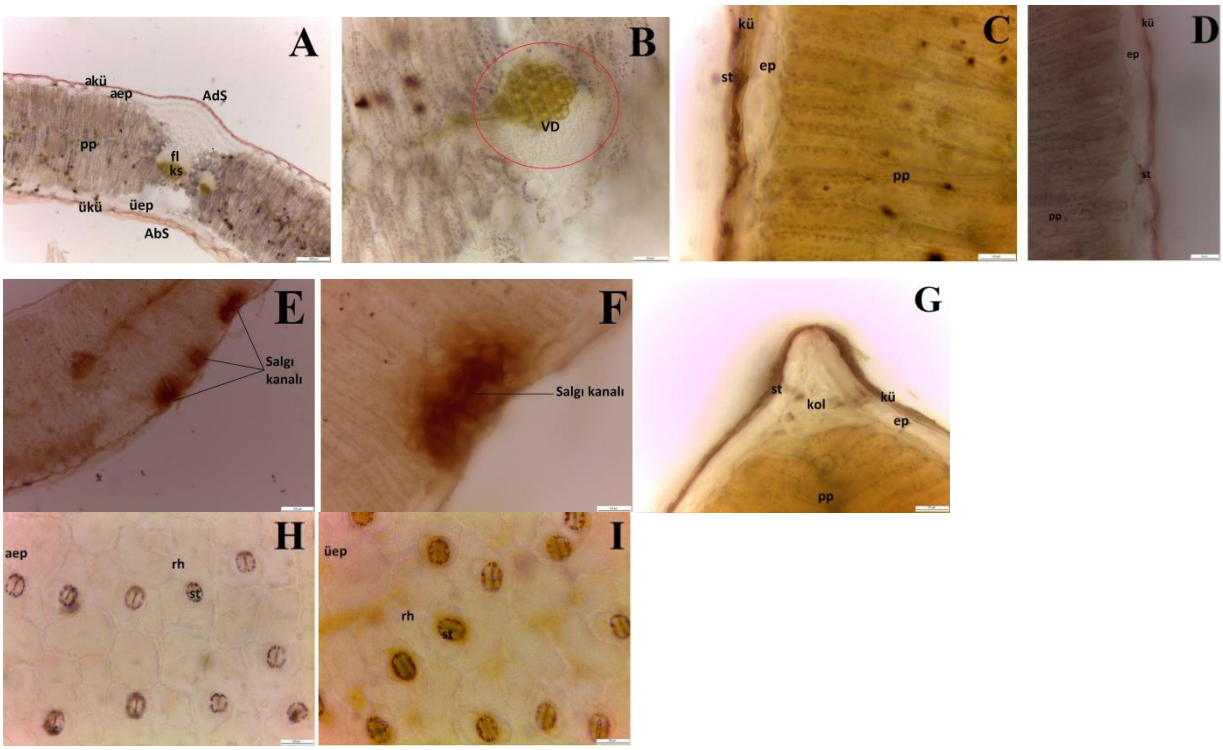
Şekil 4. Kök enine kesiti (pe: peridermis, ko: korteks, fl: floem, ka: kambiyum, ks: ksilem; A- Bar: 200 µm, B- Bar: 50 µm, C- Bar: 50 µm).

Gövde anatomisi: Gövde enine kesiti yuvarlaktan elipse doğru bir şekle sahip olup iki kanatlıdır (Şekil 5). En dıştaki kütikül tabakası kalındır ve altında tek katlı bir epidermis bulunur. Trikom gözlenmez. 3-4 sıra plaka kollenkiması bulunur. Bu tabakanın altında 3-4 sıralı, kloroplast içeren bir korteks bulunur. Salgı kanallarına rastlanmaz, ancak gövdenin köke yakın kısımlarında kollenkima ve korteks tabakası arasında siyah salgı kanalları bulunur (Şekil 5). Tek katlı karemsi ve dikdörtgenimsi hücrelerden oluşan şerit halka halinde bulunan sklerenkima, korteks ve floem arasındadır. Floem tabakasında büyük salgı kanalları gözlenmez. Kambiyum ksilem ile floem arasında bulunur. Ksilem halka halindedir ve ışınlar tek sıralıdır ve öze doğru şerit şeklinde ışınlar oluşturarak uzanır. Halka ksileminin çoğunu oluşturan trakeitler küçük bir lümen ile iyi bir şekilde kökte olduğu gibi odunlanmıştır. Öz hücreleri çapları değişen hücrelerden oluşup bu hücreler büyük ve silindiriktir. Öz hücreleri gövdenin ortasında bir araya gelerek bazılarında yuvarlaksı bazılarında elips şeklinde kümelenmiştir. Öz bölgesinde druz kristallerine rastlanır. Köke yakın gövdedeki öz bölgesi küçüktür (Şekil 5).



Şekil 5. A-D: Gövde enine kesiti, E- Üst gövde enine kesitinde öz, F- Alt gövde enine kesitinde öz, G-H Kök-gövde geçiş bölgesi, I-İ- Köke yakın gövdede plaka kollenkiması ve kortekste salgı kanalı, J- Gövde enine kesitinde öz ve ksilem, K- Öz bölgesinde druz kristali (kü: kütikül, ep: epidermis, pkol: plaka kollenkiması, ko: korteks, ks: ksilem, sk: sklerenkima fl: floem, ka: kambiyum, ks: ksilem, ö: öz; A- Bar: 500 µm, B-C-E-G-H-I-Bar: 200 µm, D-F-İ-J-K-Bar: 50 µm).

Yaprak anatomisi: Enine kesitte yaprak üst ve alt yüzeyinde üst ve alt epidermal tabakalar kalın bir kütikül tabakası ile kaplıdır. Epidermis, enine kesitte dikdörtgenimsi şekilli epidermal hücrelerden oluşan tek bir tabakadan oluşur. Tipik olarak epidermal hücrelerin genişliği boy uzunluğundan daha uzundur. Alt ve üst epidermis arasında kalan alan çift palizat parankiması ile kaplıdır. Epidermis ve palizat parankimasında salgı kanalı vardır. Yaprağın kenar kısımlarında kollenkima tabakasına rastlanır. Merkezi damar demeti, yanal olanlardan açıkça daha büyüktür ve yaprakların belirgin bir orta damarı vardır. Üst ve alt epidermada stomalar genellikle 4 nadiren 5 komşu hücre ile kuşatılmıştır. Stoma bekçi hücreleri epiderma hücreleri ile aynı düzeyde konumlanmış olup, yaprak amfistomatik ve eşyüzlüdür. Ayrıca refakatçi hücrelerin şekline göre stoma tipi anomositiktir. Stoma indeksi Formül 1 ve 2 ile hesaplandı (Tablo 1, Şekil 6) (Meidner ve Mainsfield, 1969).



Şekil 6. A- Yaprak enine kesiti, B- Vasküler demetler, C-D- Palizat parankiması, E-F- Yaprak enine kesitinde salgı kanalı, G- Yaprak kenarında kollenkima, H- Yaprak alt yüzeyi, I- Yaprak üst yüzeyi (AdS: Adaksiyal, AbS: Abaksiyial, akü: alt kütiküla, ükü: üst kütiküla, aep: alt epidermis, üep: üst epidermis, pp: palizat parankiması, st: stoma; fl: floem, ks: ksilem, kü: kütikula, ep: epidermis, st: stoma, kol: kollenkima, VD: Vasküler Demetler, rh: refakatçi hücre; A-E-Bar: 200 µm, B-C-D-F-G-H-I-Bar: 50 µm).

$$\text{Stoma indeksi} = \frac{\text{mm}^2\text{'deki stoma sayısı X 100}}{\text{mm}^2\text{'deki stoma sayısı} + \text{mm}^2\text{'deki epidermis hücresi sayısı}} \quad (1)$$

$$\text{Stoma indeksi} = \frac{\text{Üst stoma indeksi}}{\text{Alt stoma indeksi}} \quad (2)$$

Alt ve üst yaprak yüzeyi stoma indeksi orantılandığında üst yüzeydeki stoma indeksinin büyük olduğu belirlendi. Su stresi arttıkça bitki yapraklarında stoma yoğunluğunun da arttığı görüldü. Huimin ve Genxuan (2001) ve Yongping ve ark. (2006) buğdayda; Laajimi ve ark. (2011) kayısıda; Ennajeh ve ark. (2010) ve Aktepe Tangu (2012) zeytinde; Fu ve ark. (2013) patlıcan bitkisinde benzer sonuçlar elde etmişler ve su stresi arttıkça stoma yoğunluğunun da arttığını belirlemişlerdir. Fazla ışık ve sıcaklıktan dolayı stoma boyutunun küçük ve stoma indeksinin büyük olduğu gözlendi (Kılınç ve ark., 2008).

TARTIŞMA

Hypericum türleri üzerinde çok sayıda anatomik çalışma yapılmıştır ve ekolojik ortamın türün adaptasyonunda önemli olduğu görülmektedir (Perone ve ark., 2013; Akçin ve ark., 2016; Altınbaşak ve ark., 2021; Verma ve ark., 2022). *H. salsugineum*'da da tuzcul ve dönemsel bataklıklar içinde yetişen tür, fazla ışık ve sıcaklığa karşı adaptasyonlar göstererek kalın kutikula, küçük boyutlu stoma ve stres etkisiyle artan bir stoma indeksi değerine sahiptir.

*H. salsugineum'*da kök, ksilemden oluşurken *H. perforatum* L.'da kök öz bölgesi dejenere olduğu için merkezinde büyük bir boşluk bulunmaktadır (Verma ve ark., 2022). *H. salsugineum'*da kökte salgı doku bulunmazken *H. orientale* L.'de kök korteksinde ve floemde A tipi glandüler kanallar (Akçin ve ark., 2016), *H. kotschyanum* Boiss.'da çok sayıda salgı kanalı içeren korteks dokusu bulunur (Altınbaşak ve ark., 2021).

*H. salsugineum'*da köke yakın bölgede öz bölgesi kökten uzak gövdeye göre küçük ve darken *H. perforatum*'da öz bölgesinde hücreler arası boşluk yok ve merkeze doğru dejeneredir. *H. salsugineum'*un gövdesinde kambiyum ayırt edilirken *Hypericum orientale* gövdesinde kambiyum ayırt edilemez. *H. kotschyanum* gövdesinde epidermal tabaka üzerinde çok sayıda tek hücreli eglandüler trikom bulunur. *H. pubescens* gövdesinde trikomlar kurur ve en dıştaki katmanlar süberin ile zenginleşme eğiliminde olduğu için kısmen kaybolur. *H. salsugineum* gövdesinde ise trikom gözlenmez. *H. kotschyanum* gövdesinde floem tabakasında büyük salgı kanalları gözlenir. *H. pubescens* gövdesinde dış kortekste, floemde, ksilem ve floem arasındaki sınırda ve ayrıca medullaya teğet olan ksimatik halkanın sonunda siyah nodüller bulunur. *H. salsugineum'*da ise kökten uzak gövdenin enine kesitinde siyah nodüllere rastlanmaz, gövdenin köke yakın kısımlarında siyah salgı nodülleri vardır (Perone ve ark, 2013; Akçin ve ark., 2016; Altınbaşak ve ark, 2021; Verma ve ark., 2022).

H. perforatum'da yapraklar hipostomatöz ve anizositik stoma içermektedir. *H. orientale* stomaları, adaksial yüzeyde anizositik, abaaxial yüzeyde anomositik ve anizositiktir. *Hypericum kotschyanum*'da stoma yaprağın sadece alt yüzeyinde bulunmuştur. Stomalar anomositik tiptir ancak 3-5 hücre stomaya bitişiktir. *Hypericum salsugineum'*da üst ve alt epidermada stomalar genellikle 4 nadiren 5 komşu hücre ile kuşatılmıştır. Stoma

bekçi hücreleri epiderma hücreleri ile aynı düzeyde konumlanmış olup, yaprak amfistomatik ve eşyüzlüdür. Ayrıca refakatçi hücrelerin şekline göre stoma tipi anomositiktir. *Hypericum perforatum*'da mezofil, tek katmanlı bir palizat hücresine ve 2-3 katmanlı süngerimsi parankime farklılaşmıştır. *H. orientale*'de mezofil bölgesi, adaksiyal yüzeyde 2-3 sıra uzunlamasına dikdörtgen palizat hücrelerden ve abaksiyal yüzeyde 1 sıra ve 2-3 sıra düzensiz süngerimsi parankim hücrelerinden oluşur. *H. kotschyanum*'da yaprak mezofil kesitinde üst epidermisin altında palizat parankiması hücreleri yer alır ve bu parankima tabakasının altında süngerimsi parankima hücreleri bulunur. Mezofil iki yüzlüdür. *H. pubescens*'de mezofil, palizat ve süngerimsi parankimadan oluşur. *Hypericum perforatum*'da tamamen palizat parankiması içerir (Perone ve ark, 2013; Akçin ve ark., 2016; Altınbaşak ve ark, 2021; Verma ve ark., 2022).

SONUÇ

Bu çalışmada, *H. salsugineum'*un anatomik özellikleri incelenmiştir. Tür hakkında anatomik özelliklerle ilgili daha detaylı bilgiler elde edilmiş bu konudaki eksiklikler tamamlanmaya çalışılmıştır. *H. salsugineum'*un anatomik özellikleri, genel olarak *Hypericum* cinsi ile uyum göstermektedir. *H. salsugineum* kök, gövde ve yaprak anatomik özellikleri incelenmiş olup ayırt edici karakterler tanımlanmış ve fotoğraflanmıştır. Türün anatomik özellikleri ilk kez tarafımızdan çalışılmış olup *Hypericum* cinsine ait diğer türlerin anatomik incelemelerine ışık tutacağı öngörülmektedir.

Alt ve üst yaprak yüzeyi stoma indeksi orantılandığında üst yüzeydeki stoma indeksinin büyük olduğu belirlendi. Su stresi arttıkça bitki yapraklarında stoma yoğunluğu da artmaktadır. Fazla ışık ve sıcaklıktan dolayı stoma boyutunun küçük ve stoma indeksinin büyük olduğu gözlenmiştir. *H. salsugineum*'da bazı anatomik karakterlerin sistematik açıdan önemli olduğu görülmüştür. Bu karakterler mezofil durumu (palizat ve sünger parankiması ayırımı), salgı doku ve konumu, stoma tipi, stomaların yoğunluğu ve indeksi şeklindedir.

Özet

Son yıllarda atık sulardan kaynaklanan boya ve pigmentasyon kontaminasyonlarının en aza indirilmesi için yeni malzemeler ve prosesler geliştirilmesine yönelik yapılan çalışmalar hız kazanmıştır. Suların organik kirleticilerden uzaklaştırılması için düşük maliyetli, basit ve pratik olarak adsorpsiyonu fotokatalitik bozunma tekniğiyle birleştirmek, fotokatalizör nanopartikülleri için adsorban görevi görmekte ve atık sulardan boyaların uzaklaştırılması kolaylaşmaktadır. Son yıllarda özellikle organik kirleticileri temizlemek için yarı iletkenlerin fotokatalizör olarak kullanılması etkili bir yöntem olarak kabul edilmektedir. Metal oksit fotokatalizörlerden biri olan tungsten oksit (WO_3), kimyasal ve fotokimyasal kararlılık özelliği ile yarı iletkenler arasında fotokataliz uygulamalarında yaygın olarak kullanılmaktadır. WO_3'ün düşük adsorpsiyon bant aralığına sahip olması ve yüksek rekombinasyonu gibi olumsuz özelliklerinden dolayı kullanımı kısıtlanmaktadır. Metal oksit nanoyapılarının fotokatalitik performanslarını geliştirmek için grafen ve türevleri ile kompozit yapıların oluşturulması geliştirilen yöntemlerden biridir. Bu çalışmada, in situ sentez yöntemiyle tungsten oksit/grafen oksit (WO_3/GO) nanokompozit yapılarının sentezlenerek metilen mavisi (MM) gideriminde fotokatalitik etkinliğinin geliştirilmesi amaçlanmıştır. Nanokompozit yapılar SEM ve FTIR karakterizasyonları ile aydınlatılmıştır. WO_3/GO nanokompozitin fotokatalitik aktivitesi MM boya adsorpsiyonu ve görünür ışık altında fotokatalitik bozunma aktivitesi UV-vis spektroskopisi ile değerlendirilmiştir. Sentezlenen WO_3/GO nanokompozit yapının, organik boyar maddenin ayrışması için yüksek fotokatalitik aktivite gösterdiği gözlemlenmiştir.

Anahtar Kelimeler: Tungsten oksit, Grafen oksit, Metilen mavisi, Fotokataliz

Development of graphene oxide doped photocatalysts

Abstract

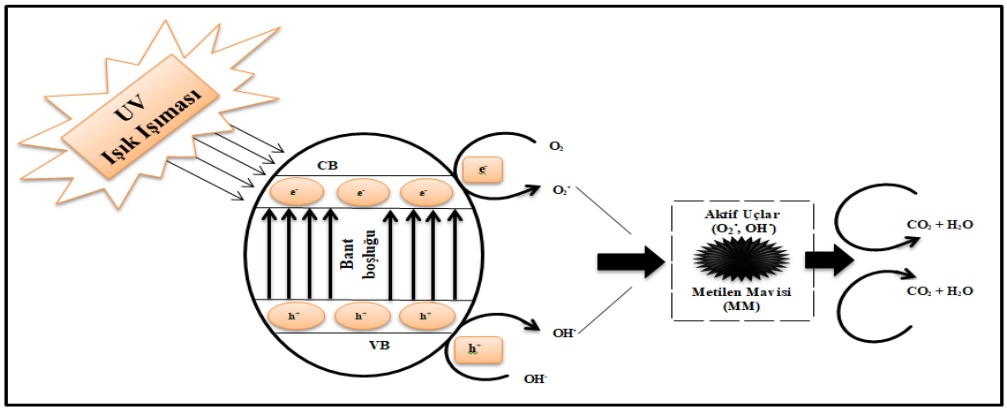
In recent years, in order to minimize dye and pigmentation contamination from wastewatere efforts to develop new materials and processes have gained momentum. Combining adsorption with photocatalytic degradation technique in a low-cost, simple and practical way to remove organic pollutants from water acts as an adsorbent for photocatalyst nanoparticles and facilitates the removal of dyes from wastewater. Especially the use of semiconductors as photocatalysts has been accepted as an effective method, to clean organic pollutants. Tungsten oxide (WO_3), one of the metal oxide photocatalysts, is widely used in photocatalysis applications among semiconductors with its chemical and photochemical stability. The use of WO_3 is restricted due to its negative properties such as low adsorption band gap and high recombination. In order to improve the photocatalytic performance of metal oxide nanostructures, the formation of composite structures with graphene and its derivatives is one of the developed methods. In this study, it was aimed to improve the photocatalytic efficiency of methylene blue (MB) removal by synthesizing tungstenoxide/graphene oxide (WO_3/GO) nanocomposite structures by in situ synthesis method. Nanocomposite structures were examined by SEM and FTIR characterizations. Photocatalytic activity of WO_3/GO nanocomposite was evaluated by MB dye adsorption and photocatalytic degradation activity under visible light by UV-vis spectroscopy. It was observed that the synthesized WO_3/GO nanocomposite structure showed high photocatalytic activity for the decomposition of organic dyestuff.

Keywords: Tungsten trioxide, Graphene oxide, Methylene blue, Photocatalysis

GİRİŞ

Son yıllarda dünya çapında temiz su kaynaklarına ulaşmak önemli bir sorun haline gelmiştir. Nüfustaki üstel artış, sulama uygulamaları ve hızlı sanayileşme ile birlikte su kaynaklarının çeşitli kimyasal ve biyolojik ajanlarla kirlenmesi endişe verici bir oranda artmaktadır (Sousa ve ark., 2018). Sulardaki kirletici boyaları

arıtmak için adsorban kullanarak adsorpsiyon ve fotokatalitik bozunma en etkili, basit, düşük maliyetli ve pratik yöntemler olarak kabul edilmektedir (Salehi ve ark., 2012). Boyalar, özellikle biyobozunur olmamaları, canlı dokularda birikme potansiyelleri ve çok düşük konsantrasyonlar da dahi toksik etki gösterebilmelerinden dolayı insan sağlığı ve ekosistemdeki diğer canlılar için önemli bir tehdit unsuru olarak görülmektedir. Metilen mavisi (MM), fotodegredasyon ve adsorpsiyon yöntemlerinde sentezlenen solüsyonun renk gideminde kolaylıkla gözlemlenebilmesi açısından sıklıkla tercih edilmektedir (Khojasteh ve ark., 2018).
Metal oksit malzemeler, çeşitli uygulama alanlarında kullanımlarından dolayı literatürde önemli bir yere sahiptir (Hossain ve ark., 2019; Alam ve ark., 2022). Bu malzemeler arasında çevre dostu bir n-tipi yarı iletken olan tungsten oksitin (WO_3), görünür aralıktaki ışık absorpsiyonu sayesinde iyi bir fotokatalizör olduğu bildirilmiştir (Weng ve ark., 2014; Fu ve ark., 2015). Ancak, iletim bandı konumu ve elektron-deliği rekombinasyonu eğilimiyle, WO_3 zayıf bir aktivite göstermektedir (Bai ve ark., 2014; Cao ve ark., 2010). WO_3'ün fotokatalitik aktivitesini geliştirmek için katkılanması etkili bir yaklaşım olarak görülmektedir (Zheng ve ark., 2011; Singh ve ark., 2020) (Şekil 1).



Şekil 1. Fotokatalitik bozunma süreci

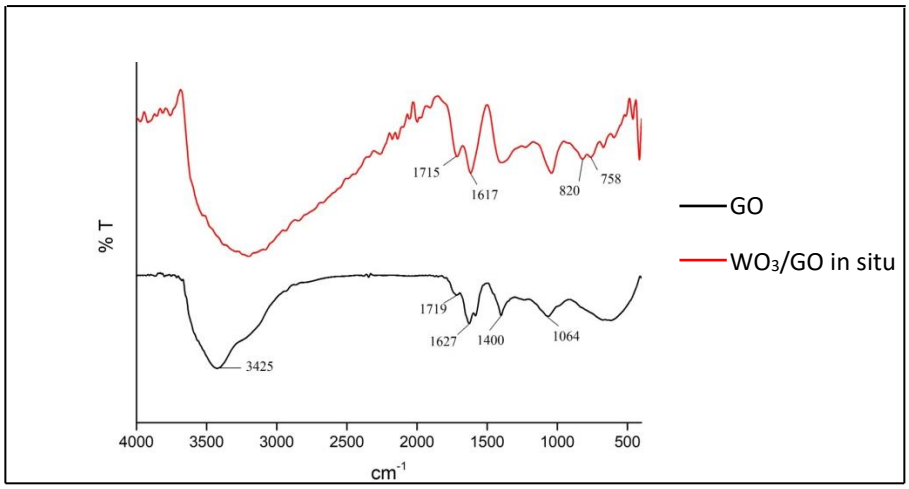
Son zamanlarda karbon bazlı kompozitler, fotokatalitik alanda potansiyel uygulamaları nedeniyle sıklıkla tercih edilmektedir. Grafen, benzersiz 2D yapısı, geniş teorik yüzey alanı ve yük taşıyıcılarının mükemmel hareketliliği nedeniyle yüksek performanslı fotokatalizörlerin yapımında büyük ilgi görmektedir (Pu ve ark., 2017). Grafen oksit (GO)'in oksijen içeren fonksiyonel grupları ve yapısında bulunan grafen iskeleti sayesinde farklı uygulamalarda kullanılması üstün özellikler gösteren bir malzeme olduğunu göstermektedir. GO geniş yüzey alanıyla yüksek mekanik, termal ve optik özellikleriyle kimyasal/elektrokimyasal açıdan kararlı bir yapıdadır. Bu nedenle GO, içeriğindeki fonksiyonel gruplar sayesinde boya molekülleri ile arasında hidrojen bağları ve elektrostatik etkileşimler kurarak, yüksek adsorpsiyon bölgelerinin varlığıyla iyi adsorban özelliğine sahip ve MM'de kısa sürede dengeye ulaşabilen bir adsorban olarak boya adsorpsiyonunda uygun bir aday haline gelmiştir (Nguang ve ark., 2017; Dai ve ark., 2018).
Bu çalışmada, yenilenebilir enerji elde etme yöntemlerinden biri olan yüksek verimli fotokatalizörlerin geliştirilmesi amaçlanmıştır. Bu amaç doğrultusunda tungsten oksit/grafen oksit (WO_3/GO), in situ sentez yöntemiyle elde edilen nanokompozit yapının görünür ışık altında MM boyasında fotokatalitik etkinliği değerlendirilmiştir.

MATERYAL VE METOD

Tungsten oksit/grafen oksit (WO_3/GO) nanokompozit sentezi için flake grafit, sülfürik asit (H_2SO_4) ve tungsten karbür (WC) tozu buz banyosunda karıştırıldıktan sonra belirlenen oranlarda potasyum permanganat ($KMnO_4$) sürekli karıştırarak kademeli olarak ilave edilmiştir. Karışım 2 saat daha karıştırılıp hidrojen peroksit (H_2O_2) ilave edildikten sonra elde edilen solüsyon santrifüjlenip 60°C'de 24 saat kurutulmuştur.
Sentezlenen WO_3/GO kompozitin fotokatalitik aktivitesini incelemek için adsorban olarak metilen mavisi (MM) boyası tercih edilmiştir. Boyar maddeyi simüle etmek için 20 ppm MM solüsyonu hazırlanmıştır. Çözeltilerden birine WO_3, diğer çözeltiye katalizör olarak WO_3/GO ilave edilmiştir. Adsorpsiyon-desorpsiyon dengesinin sağlanması için çözeltiler eşit miktarlarda ayarlanmış ve karanlıkta 30 dakika karıştırıldıktan sonra UV kabine konulmuştur. Solüsyonlar, 660 nm dalga boyunda MM'nin bozunmasını gözlemlemek için belirli aralıklarla kabinden alınmıştır.

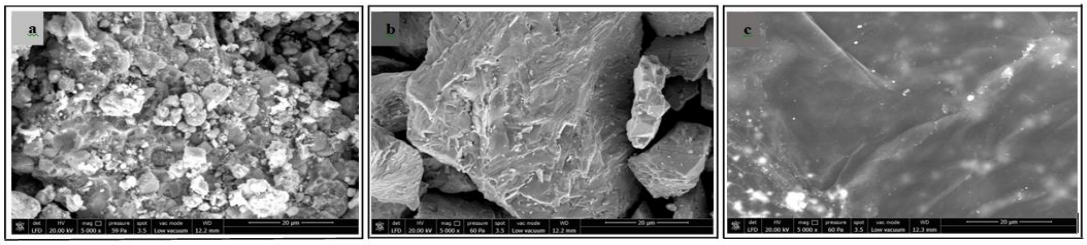
BULGULAR ve TARTIŞMA

Şekil 2'de GO ve WO_3/GO kompozitine ait FTIR spektrumu incelendiğinde GO'ya ait aromatik bağ (C=C) 1627cm^{-1}'de, epoksi bağı (C-O) 1400 cm^{-1}'de karbonil bağı (C=O) 1719 cm^{-1}'de, alkoksi bağı (C-O) 1064 cm^{-1} 'de ve hidroksil bağı (-OH) 3425 cm^{-1}'de olduğu görülmektedir. Sentezlenen kompozit yapısında O-W-O gerilme titreşimleri <1000 cm^{-1} altında kalan pikler olarak varlığını göstermiştir. In situ sentezlenen kompozit yapısında 1715 cm^{-1} ve 1617 cm^{-1}'de görülen bantlar C=C ve C=O titreşimlerine ait GO'nun kompozit yapıdaki varlığını göstermektedir.



Şekil 2. GO ve WO_3/GO in situ FTIR spektrumu

Şekil 3'de WO_3, WC ve WO_3/GO kompozitine ait SEM görüntüleri verilmiştir.



Şekil 3. (a) WO_3, (b) WC, (c) WO_3/GO SEM görüntüleri

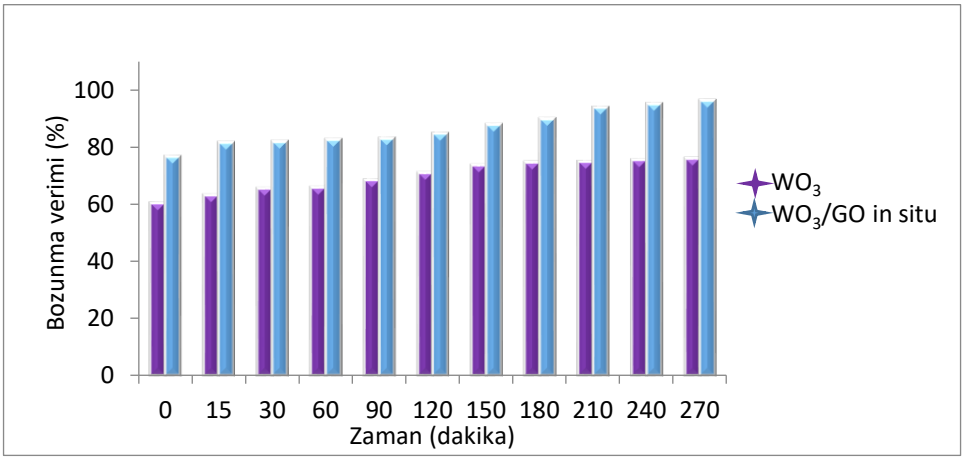
WO_3 yapısında, aralarda boşluklar gözlemlenen süngerimsi yapıdan oluşmuş ve WC'nin ise düzensiz bir dağılım sergilediği ve büyük tanelerden oluştuğu gözlemlenmiştir. WO_3/GO in situ sentez morfolojisinin GO ve WC arasında düzgün ara yüzey etkileşimleriyle homojen bir kompozit morfolojisi gözlemlenmiş ve aynı zamanda GO yüzeyinde WO_3'ün düzgün dağılımı, FTIR sonuçlarında gözlemlenen O-W-O titreşim bantların varlığını doğrulamıştır.

MM'nin sulu çözeltilerinden fotokatalitik etki performanslarını değerlendirmek için deneyler, sıcaklık ve çözelti hacmi sabit tutularak gerçekleştirilmiştir. Belirlenen zaman aralıklarında örnekler kabinden çıkarılmış, santrifüjlenip UV Spektroskopisi ile analiz edilmiştir. Aşağıda verilen bozunma verimliliği denkleminde C_0, t=0'daki maksimum absorpsiyonu ve C, bozunmadan sonraki maksimum absorpsiyon değerini ifade etmektedir. Bozunma verimliliği Denklem 1 kullanılarak hesaplanmıştır :

$$\eta\% = (1 - \frac{C}{C_0}) \times 100 \quad (1)$$

Bozunma verimliliği grafiğinde, 3 saatlik deney süresince, WO_3 ve WO_3/GO nanokompoziti sırasıyla %75.79 ve %96.30'luk en yüksek bozunma verimliliğine sahip olduğu görülmektedir. WO_3'ün iletim bandı ve

elektron-deliği yüksek rekombinasyonu gibi olumsuz özelliklerinin yapıya GO eklenmesiyle bozunma etkinliği oranının ve fotokatalitik aktivitenin artış gösterdiği Şekil 4'de gösterilmiştir.



Şekil 4. Bozunma verimi ve zaman arasındaki ilişki

SONUÇ

Bu çalışmada, grafit ve WC kullanılarak in situ sentez yöntemiyle hazırlanan WO_3/GO kompozit yapısının fotokatalitik aktivitesi geliştirilmiştir. GO, Modifiye Geliştirilmiş Hummers metoduyla sodyum nitrat ($NaNO_3$) kullanmadan sentezlenmiştir. WO_3 ve WO_3/GO nanokompozitinin fotokatalitik bozunması katyonik bir boya olan MM'si kullanılarak gözlemlenmiştir. Zamana karşı çizilen grafikte, 3 saatlik deney sonrası zamanla fotokatalitik etkinliğin arttığı gözlenmiştir. Bozunma verimi grafiklerinde, WO_3'ün %75.79 oranında, WO_3/GO nanokompozitin ise %96.30 oranında ölçülmesi, kompozitin görünür ışık ışıması altında gelişmiş fotokataliz etkinliğinin geliştiğini göstermektedir. GO'nun geniş yüzey alanı, WO_3'ün düşük bant aralığı enerjisini geliştirerek ve yapının fotokatalitik etkinliğini iyileştirmiştir.

Abstract

The novel and prominent method of multiscale recordings of microscopic brain activity reveal the dynamic spatial structure of the neural processes and allow prediction of the appearance of microepileptic seizures It combines the achievements of the experimental methods with the advanced theoretical background to describe the fine features of the brain activity at the scales of small neural populations. The great experimental progress in detecting micro-epileptic behavior is based on using micro-electrocorticography electrode arrays. It allows the identification of the approximate onset region for the spatially distributed seizures. Nevertheless, the experimental data sets demand the development of numerical simulation techniques to model the experiment. Especially, the feedback control algorithms still are not enough studied for the purpose of driving the excitation level of small neural clusters. In this article we focus on the ODE model for the small-scale epileptic seizures developed in 2020 recently by Tomanik, and re-formulated in a simplified manner by Ahmed. We add the control inputs to the dynamical equations and derive the feedback algorithm based on the speed gradient method to drive efficiently the rates of the excited and unexcited populations of cells in the small neural clusters. Then we present an example of suppressing hyperexcited dynamics and discuss possible developments and applications of our algorithm. The development of feedback control algorithms for Tomanik's and similar types of models open a gate for the novel technique of detecting and suppressing seizures in the small populations of neuron clusters. The model discussed here can be easily extended to the case of drug-resistant seizures and other cases of micro-epilepsy.

Keywords: Epileptic seizures, Tomanik-Ahmed model, Speed gradient feedback control.

INTRODUCTION

The recent progress in the description of epilepsy at the level of small-scale neuron populations (Kim et al, 2009; Abdullahi and Adamu, 2017; Namiki et al, 2020) still demonstrates the lack of theoretical modeling methods for efficient prediction and driving the epileptiform behavior in the neural clusters (Rosenow, 2001; Li et al, 2021).

The novel and prominent method of multiscale recordings of microscopic brain activity reveal the dynamic spatial structure of the neural processes and allow the prediction of the appearance of microepileptic seizures (Schevon et al, 2019; Yang et al, 2021). It combines the achievements of the experimental methods with the advanced theoretical background to describe the fine features of brain activity at the scales of small neural populations.

The great experimental progress in detecting micro-epileptic behaviour is based on using micro-electrocorticography electrode arrays (Sun et al, 2022). The records coming from the electrode contacts are spatially averaged, and the number of detected microseizures decreased rapidly with increasing contact diameter and decreasing contact density (Stead et al, 2010). It allows the identification of the approximate onset region for the spatially distributed seizures (Sun et al, 2022).

Nevertheless, the experimental data sets demand the development of numerical simulation techniques to model the experiment (Hill et al, 2018). Especially, the feedback control algorithms still are not enough studied for the purpose of driving the excitation level of small neural clusters.

In this article we focus on the ODE model for the small-scale epileptic seizures developed recently in (Tomanik, 2020) and re-formulated in a simplified manner in (Ahmed, 2020). We add the control inputs to the dynamical equations and derive the feedback algorithm based on the speed gradient method (Fradkov, 2007) to drive efficiently the rates of the excited and unexcited populations of cells in the small neural clusters.

Then we present an example of suppressing hyperexcited dynamics and discuss possible developments and applications of our algorithm.

MATHEMATICAL MODELS AND CONTROL METHODS

Tomanik Model for the Epileptic Seizures

Here we focus on the Tomanik model for epileptic seizures based on the complex network approach (Tomanik, 2020). Tomanik proposed to study the three levels of the excitations for the cells participating in the seizure: the low (unexcited) population *L*, the medium excited population *M*, and the high (excited) population *H*. Their dynamics are covered with the coupled set of three ODEs:

$$\begin{aligned} \frac{dL}{dt} &= aL\cdot(1-L)-H\ ; \\ \frac{dM}{dt} &= bL-H\ ; \\ \frac{dH}{dt} &= cL+M-d\cdot H\ . \end{aligned} \tag{1}$$

Here *a*, *b*, *c* and *d* are positive constants. The populations *L*, *M*, *H* are normalized such that the value 1 corresponds to 100% of the cells.

In this paper we use the reduced model (without the medium set *M*) (Ahmed, 2020):

$$\begin{aligned} \frac{dL}{dt} &= aL\cdot(1-L)-H+u_L(t); \\ \frac{dH}{dt} &= cL-d\cdot H+u_H(t). \end{aligned} \tag{2}$$

In RHS(2) we added the control inputs $u_L(t)$ and $u_H(t)$ serving for the external stimulation of the unexcited cells to drive them to the excitation or, vise versa, to inhibit them.

For that we define the target time-dependent populations $L_T(t)$ and $H_T(t)$ which should be achieved as a result of our feedback control, i.e. the control goal is *tracking*. If the target populations L_T and H_T are constants, the control goal is called *stabilization*.

Speed Gradient Method

Fradkov's speed gradient method (Fradkov, 2007) is based on the definition of the observing non-negative differentiable target function ψ:

$$\psi_G=\frac{1}{2}\left(G-G_T\right)^2\ , \tag{3}$$

where $G=\{L, H\}$ in our case, and the forming the g2D-vector gradient-based control signal:

$$\mathbf{u}=\begin{pmatrix}u_L\\u_H\end{pmatrix}=-\gamma\cdot\nabla_{\mathbf{u}}\left(\frac{d\boldsymbol{\psi}}{dt}\right);\quad \boldsymbol{\psi}=\begin{pmatrix}\psi_L\\\psi_R\end{pmatrix}\ . \tag{4}$$

In (4) the gradient operator acts in the space of control parameter **u** (2-dimensional in our case), and algorithm (4) minimizes the target function (3). The positive constant γ in (4) is an inverse scale for the characteristic gradient control time.

Example: Suppressing Hyperexcited Dynamics

In this example, we apply the speed gradient control only on the excited cells to suppress their dynamics. Let's choose the control signal $u_L = 0$, and the target for the H-population is to stabilize it at the zero level: $H_T = 0$. That implies:

$$\psi_H = \frac{1}{2} H^2 \ , \tag{5}$$

and the control signal becomes:

$$u_H = -\gamma \frac{\partial}{\partial u_H} \left(\frac{d\psi_H}{dt} \right) \tag{6}$$

(for one-dimensional control the gradient is reduced to the partial derivative).

Substitution (5) to (6) provides:

$$u_H = -\gamma \frac{\partial}{\partial u_H} \left(H \frac{dH}{dt} \right) \ , \tag{7}$$

And after the computation of the partial derivative we get:

$$u_H = -\gamma \cdot H \ . \tag{8}$$

Thus, in this particular case, the speed gradient control is reduced to the re-scaling of the constant d in the RHS(1). For further computation, we consider d to be included in γ.

Numerical simulations for the control (8) are shown in Fig.1. Here $L(0) = 0.5$, $H(0) = 0.5$, $a = b = 1$, and the control scale $\gamma = 50$.

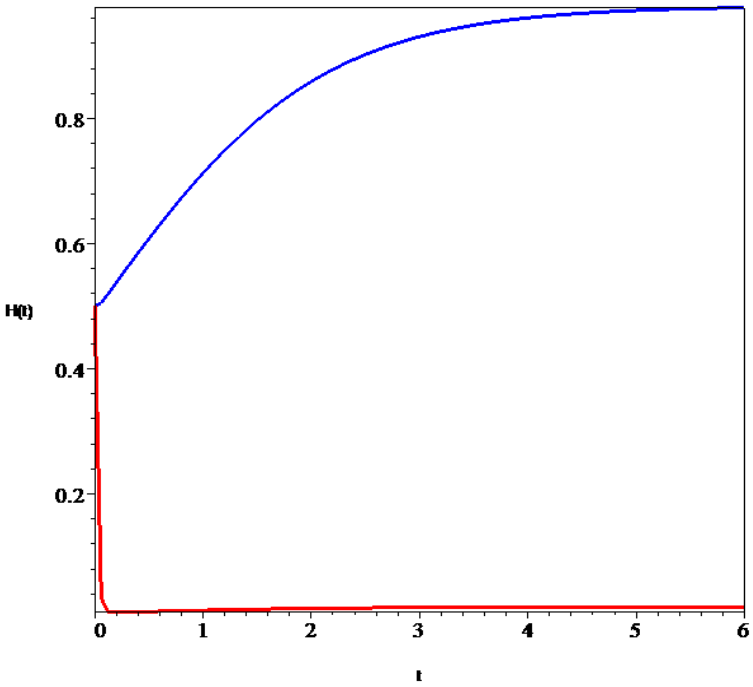

Figure 1. Suppressing excited dynamics in the small neural cluster for the unexcited (blue) and excited (red) cell populations.

We can see that the excited population (red color) is stabilized at the time scale $1/\gamma$ and stays at this target zero level. The stabilization of the unexcited level (blue color) appears later.

RESULTS AND DISCUSSION

The detection and suppression of the epileptiform behavior can be described in the small neural populations via the control over the excited and hyper-synchronized cells in the frame of the complex network approach.

The set of ODE models of type (1) for different levels of excitation (low, medium and high) can be equipped with the control mechanisms for efficient driving (stabilization or tracking) of the target neuron populations for each of these levels.

The control model proposed here can cover alternative methods of the feedback control: gradient algorithms of Fradkov's type (Fradkov, 2007) and the 'synergetic' algorithms of Kolesnikov's type (Kolesnikov, 2012) forming the artificial target attractors in the dynamical system.

The achievement of the control goal in the speed gradient is provided by the Fradkov-Pogromsky theorem (Fradkov and Pogromsky, 1998) for the task of stabilization. For the tracking goals, it should be investigated separately.

CONCLUSION

Development of feedback control algorithms for Tomanik's and similar types of the models open a gate for novel technique of detecting and suppressing seizures in the small populations of neuron clusters.

The model discussed here can be easily extended to the case of drug-resistant seizures (Kwan et al., 2011) and other cases of micro-epilepsy.

Abstract

In this work, a triazole derivative that is commonly employed in industry, healthcare, particularly the pharmaceutical sector, was theoretically analyzed. The spectroscopic, electronic, thermodynamic, HOMO-LUMO, MEP and NLO properties of molecule were calculated. The molecule optimized with 6-311G(d,p) basis set and B3LYP functional of density functional theory (DFT) method. The structural properties such as dipole moment (μ), the total energy, electronic properties (electron affinity, molecular softness, ionization potential, molecular hardness and electronegativity), thermodynamic of molecule were determined. The infrared (FT-IR) vibrational data of molecule were determined with Veda 4 software set. The ^{1}H and ^{13}C NMR calculations spectral data were obtained using the GIAO approach in the same basis set and than chemical shift values were compared with experimental data in literature. Also, the surface map such as MEP were obtained and thus, the electrophilic and nucleophilic moieties were shown on the compound. The nonlinear optical properties (NLO) were examined and the results were compared with the urea reference. Finally, the spectral and structural data of 1,2,4-triazole derivative compound were obtained and assessed in this theoretical study.

Keywords: B3LYP, DFT, MEP, NLO.

INTRODUCTION

Triazoles including three nitro atoms are five-membered heteroaromatic compounds. This properties of allows easy synthesis of new triazole derivatives. The triazole derivatives have wide usage areas in organic chemistry, pharmacology especially drug designe. Many studies on the evaluation of the biological of the triazoles have shown that the triazole compounds exhibit anti-fungal (Peyton et al, 2015; Shalini et al., 2011; Koltin & Hitchcock, 1997), anti-oksidant (Yüksek et al., 2006; Kotan, 2021), anti-bacterial (Al-Radadi et al., 2020; Boy et al., 2021), anti-cancer (Kamal et al., 2008), anti-tuberculos (Zhang et al., 2017), anti-HIV (Li et al., 2013) properties. The compound whose theoritical properties were investigated in this study is a triazole Schiff Base. The Schiff Baze compounds containe azomethine grup (-C=N-) and generaly obtaine by the reaction of aldehyde or ketone with primary amine (Berhanu et al., 2019). The Schiff Bazes which have important uses fields as organic chemistry, analitycal chemistry, metal chemistry have played effective role in coordination chemistry and bioinorganic chemistry (Uddin et al., 2020). Many study deal with the Schiff Bazes ligands and their complexes have reported that these compounds show anti-cancer (Zafar et al., 2021), anti-fungal (Chohan et al., 2010), anti-microbiyal (Manap, 2020) properties. In addition , these compounds are inclued in the structure of drugs used in the treatment of many diseases in medicine (Uddin et al., 2020). All theoretical calculations for the target compound were calculated with the Gaussian 09W program (Frisch et al., 2009). Firstly, molecule was optimized by using the DFT method (Frisch et al., 2009; Wolinski et al 1990). The theoretical calculations were performed by using optimized molecule with DFT(B3LYP)/6-311G(d,p). The experimental data obtained from the literature (Bahçeci et al., 2017). These values were compared and presented in tables and graphs.

RESULT AND DISCUSSION

Computational Details

The Gaussian 09W packet software (Frisch et al.,2009) was used to compute all quantum chemical calculations. The GaussView application was used to sketch the molecule Figure 1 depicts the geometric structure and formula that has been optimized. It is the molecule's most stable three-dimensional structure.

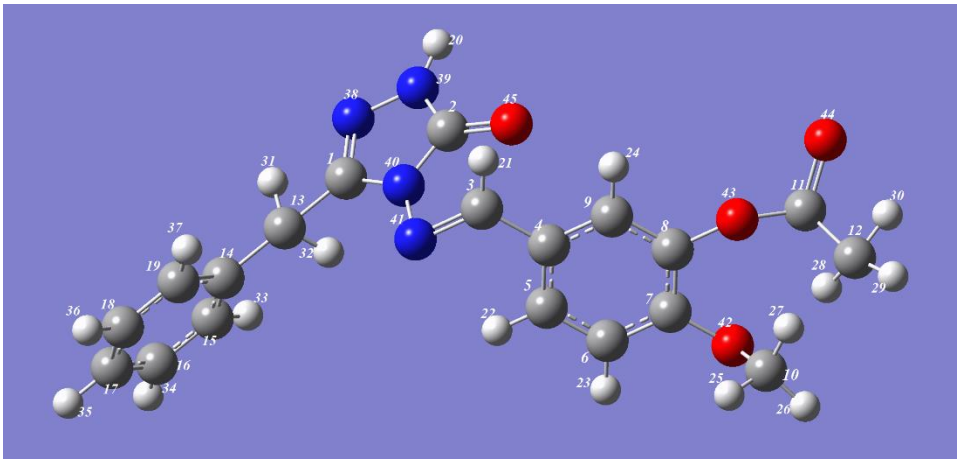

Figure 1. The Gaussview structure of the molecule.

^{1}H-NMR calculations

When compared to the experimental values taken from the literature , the theoretical ^{1}H-Nükleer magnetic rezonans chemical shift values were computed in gaseous and solvent (DMSO) environments and are displayed in Table 1. The "GIAO" method (Wolinski, 1990) was used to calculate the proton NMR chemical shift values. These values were then compared to the experimental data, regression analyses were performed, and graphs were created.

The relation between R values of the compound

There is such a relationship between R^2-values of the compound. B3LYP/6-311G(d,p) (DMSO): ^1H: 0.8303, These value for compound were seen in the Figure 2. Theoretical and experimental proton chemical shifts ratios between R^2 lineer a correlation were observed.

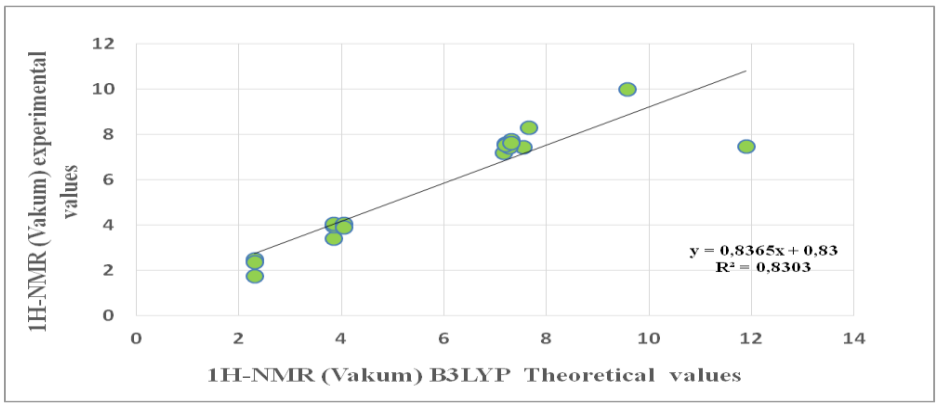

Figure 2. The correlation graphs for B3LYP 6-311G (d,p) /DMSO chemical shifts

The vibration frequency of the compound

Theoretically, scala values and IR values were calculated using the Veda 4F software (Jamroz et al., 2004). The harmonic vibrational frequency readings were scaled for the B3LYP level using 0.9688. (Merrich et al., 2007). In the data, a positive frequency was discovered. In accordance with DFT method, IR spectrums were drawn using the measured data. Theoretical and empirically obtained IR values were compared, and it was discovered that their values agreed.

Table 3. Significant vibrational frequencies (cm^{-1})

vibrational frequencies	Experimental IR	Scaled B3LYP
ν (NH)	3186	3565
ν (C=O)	1765, 1705	1806-1750
ν (C=N)	1604-1590	1613, 1593
ν (COO)	1276	1279

Figure 3. Experimental Theoretical IR spectrums simulated with B3LYP/6-311G(d,p)

The mulliken charge calculation

With the use of the 6-311G(d,p) basis set and the "B3LYP" approach, the molecule's mulliken charge values were computed. The mulliken atomic charges (Mulliken, 1955) of the electronegative N38-N41 atoms in the molecule were estimated as negative, while the mulliken charges of all protons in the molecule were computed as positive, according to the findings of the calculations with 6-311G(d,p). In addition, it was discovered that "C1, C2, C3, C7 and C8" atoms had positive mulliken charge values whereas other carbon atoms had negative values. This is due to the presence of one electronegative oxygen atom and two electronegative nitrogen atoms next to the C1, C2, and C3 atoms, respectively.

FMO's Calculations

Quantum chemical characteristics, for example, E_{HOMO}, E_{LUMO}, and ΔE are useful indicators of a chemical's reactivity. The zone of reactivity at a molecule's border is indicated by the electron density of the molecule. Using DFT/6-311G(d,p), the frontier electron density was determined (Fukui et al., 1952) The excitation energy is determined as the difference between the lowest unoccupied molecular orbital (LUMO) and the highest occupied molecular orbital (HOMO). This energy gap represents the stability of molecules. In a molecule, LUMO stands for an electron acceptor and HOMO for an electron donor (Amudha et al., 2022)

Non-Linear Optic Analysis (NLO)

Numerous technologies, including optical computers, dynamic image processing, optical switches, dye lasers, telecommunication devices, and optical disks, have benefited greatly from the development of nonlinear optical (NLO) materials. As a result, efforts are being made to mimic several NLO-phores, including inorganic and organic semiconductors, naturally occurring and artificial nanomaterials, polymers and dyes (Fonseca et al., 2018; Halasyamani et al., 2017; Hussain et al., 2020; Deb et al., 2020; Guo et al., 2018). NLO parameters such as the total static dipole moment (μ), average linear polarizability (α), anisotropy of polarizability ($\Delta\alpha$), and first hyperpolarizability (β_{total}) were determined with B3LYP functional using 6-311G(d,p) basis set.
Polarizability ($\alpha xx, \alpha xy, \alpha yy, \alpha xz, \alpha yz, \alpha zz$)= 347.2495516; 34.860844; 263.7561871; 1.4105161; 7.1858105; 165.1231724 and HyperPolar ($\beta xxx, \beta xxy, \beta xyy, \beta yyy, \beta xxz, \beta xyz, \beta yyz, \beta xzz, \beta yzz, \beta zzz$) = -139.2929225; 1.2451982; 33.584864; 175.4535599; 42.7543767; -36.4465889; -32.4295204; 15.8601426; 54.6213466; -29.2101699 values, respectively were obtained. These values using assigned theoretical results are $\boldsymbol{\alpha_{total}}$: 38.341x10^{-24} esu, $\boldsymbol{\Delta\alpha}$: 23.402 x10^{-24} esu and $\boldsymbol{\beta^0}$: 20.83 x10^{-31} esu. The primary reference material for NLO qualities is the urea molecule. The NLO parameters for urea refereans according to literature are $\boldsymbol{\alpha_{total}}$: 5.07643717x10^{-24} esu, $\boldsymbol{\Delta\alpha}$: 2.13568262x10^{-24} esu and $\boldsymbol{\beta^0}$: 7.2228469891x10^{-31} esu (Kotan et al., 2022). The NLO values were 7.6, 11, and 2.8 times more than urea as compared to the reference material.

Table 8. The total energy $\mathbf{E_{total}}$ (Hatree), the electric dipole moment **μ** (Debye), the average polarizability $\boldsymbol{\alpha_{total}}$ (10^{-24} esu) and first hyperpolarizability $\boldsymbol{\beta_{total}}$ (10^{-31} esu) of molecule

CONCLUSION

Some theoretical calculations of the target molecule were made. By comparing the proton nmr data with the experimental one, regression graphs were created. As a result, it was seen that there was a deviation in the ^{1}H-NMR because of the acidic proton (N-H). In addition, the reactivity of the molecule was calculated from the HOMO-LUMO energy difference and many electronic parameters were calculated using this difference. MEP surface map was created and as a result electrophile and nucleophile atoms were determined. Mulliken load values were found. IR vibration frequency values were calculated and compared with experimental data, their were in agreement with each other.

Özet

Beslenme, sağlıklı bir yaşamın sürdürülmesinde ve hastalıkların önlenmesinde önemli bir role sahiptir. Beslenme ve tıp bilimindeki gelişmelerle yaşlanma sürecinin gecikmesine bağlı olarak yaşam süresi ve kalitesi de artmıştır. Diğer taraftan insanların gıdaya ulaşmak için daha az fiziksel aktiviteye ihtiyaç duymaları ve fast-food tarzı beslenme alışkanlıklarının giderek yaygınlaşmasıyla birlikte obezite, diyabet, tansiyon, kanser, nörolojik ve kardiyovasküler hastalıklar gibi bazı sağlık sorunları daha sık görülmeye başlamıştır. Bu sebeple insanlar tükettikleri besinlerin nitelikleri ve sağlığa olan katkıları hakkında daha duyarlı ve daha bilinçli hale gelmişlerdir. Sağlıklı yaşam ile ilgili yapılan araştırmalar, doğru beslenme ve fiziksel aktivite alışkanlıklarının başta obezite olmak üzere birçok sağlık sorununun önlenmesinde önemli rol oynadığını göstermiştir. Bu durum son yıllarda giderek önem kazanan 'fonksiyonel gıda' kavramını ortaya çıkarmıştır. Yapılan birçok bilimsel çalışmada, fonksiyonel gıdaların içerisindeki özel etkili biyoaktif maddelerin hastalık gelişme riskini azalttığı ve sağlıklı bir yaşamın sürdürülmesinde etkili olduğu kanıtlanmıştır. Hangi besinde hangi biyoaktif maddenin olduğunun ve bu biyoaktif maddenin sağlayabileceği faydaların bilinmesi, insanların sağlıklı bir yaşam sürdürebilmeleri açısından önemlidir. Hazırlanan bu çalışmada fonksiyonel gıdalar, bunların biyoaktif bileşenleri ve sağlık üzerine etkileri son literatür bilgileri derlenerek verilmiştir.

Anahtar Kelimeler: Beslenme, Biyoaktif bileşenler, Fonksiyonel gıda, Sağlıklı yaşam

Abstract

Nutrition plays an important role in maintaining a healthy life and preventing diseases. With the developments in nutrition and medical science, life expectancy and quality have increased due to the delay in the aging process. On the other hand, some health problems such as obesity, diabetes, blood pressure, cancer, neurological and cardiovascular diseases have started to be seen more frequently with people's need for less physical activity to reach food and the increasing prevalence of fast-food-style eating habits. For this reason, people have become more sensitive and more conscious about the qualities of the foods they consume and their contribution to health. Studies on healthy living have shown that proper nutrition and physical activity habits play an important role in preventing many health problems, especially obesity. This situation has revealed the concept of 'functional food', which has become increasingly important in recent years. In many scientific studies, it has been proven that the special effective bioactive substances in functional foods reduce the risk of disease development and are effective in maintaining a healthy life. Knowing which bioactive substance is in which food and the benefits that this bioactive substance can provide is important for people to lead a healthy life. In this study, functional foods, their bioactive components and their effects on health are given by compiling the latest literature information.

Keywords: Nutrition, Bioactive components , Functional food, Healthy living

1. GİRİŞ

Yirmi birinci yüzyılda dünya nüfusunun hızla artmasıyla birlikte sınırlı olan besin maddelerinin daha verimli kullanılması kaçınılmaz hale gelmiştir. Beslenme ve tıp bilimindeki gelişmeler sonucu yaşlanma sürecinin yavaşlatılmasına bağlı olarak yaşam süresi ve kalitesi de artmıştır. Bu gelişmelerle birlikte, insanlar tükettikleri besinlerin nitelikleri ve sağlığa olan katkıları hakkında daha duyarlı ve bilinçli hale gelmişlerdir (Güven ve Gülmez, 2006; Deveci ve ark.,2022). Günümüzde insanlar, sağlıklı bir yaşam sürdürebilmek için normal beslenmenin ötesinde, sağlığa katkı sağlayan ekstra faydalı gıdalara yönelmektedir. Diğer taraftan insanlar gıdaya ulaşmak için daha az fiziksel aktiviteye ihtiyaç duymaları ve fast-food tarzı beslenme alışkanlıkları sonucu enerji dengesinin ayarlanmasında bazı problemler ortaya çıkmaktadır. Bunun sonucu olarak obezite ile birlikte kronik ve teşhisi zor olan hastalıklar, kanser, diyabet tansiyon, kalp ve damar hastalıkları sıklıkla görülmeye başlamıştır (Karaduman, 2011; Deveci ve ark.,2022). Gelişmiş ülkelerde ortaya çıkan kronik hastalıkların risk faktörlerinden biri de sağlıksız beslenme alışkanlıklarıdır. Ancak, antioksidan bakımından zengin besinler kanser, diyabet, kardiyovasküler hastalıklar, Parkinson, Alzheimer, Multiple skleroz ve serbest radikallerin neden olduğu digger hastalıklara karşı koruyucu etki gösterebilmektedir (Adefegha, 2018; Ede ve Yalçın,2021; Deveci ve ark., 2022).

Son zamanlarda bazı gıda ve gıda bileşenlerinin hastalıkların önlenmesi ve tedavisinde etkinliğinin bilimsel olarak ortaya konulmasıyla birlikte sağlığımızın korunmasında beslenme desteğinin önemi daha da artmıştır. Bu nedenlerle fonksiyonel gıdalar ve diğer doğal sağlık ürünleri toplum tarafından daha fazla tüketilir hale gelmiştir (Deveci ve ark., 2022)

2. FONKSİYONEL GIDALAR

Fonksiyonel gıdalar, vücudun temel besin ögesi gereksinimlerini karşılamanın yanında metabolik fonksiyonlarda, hastalıklardan korunmada ve sağlığın geliştirilmesinde rol alan, biyoaktif maddeler içeren gıda veya gıda bileşenleridir. Fonksiyonel gıda, besinin doğal formunda bulunan aktif bir bileşen olabileceği gibi, teknolojik işlemlerle biyoaktif unsurlarla zenginleştirilmiş ve böylece sağlık üzerinde olumlu etkileri olan bir besin de olabilir (Crowe ve Francis, 2013; Büyüktuncer, 2018; Almasi ve Fisunoğlu, 2020; Özkaya, 2021). Bir gıdanın, fonksiyonel gıda olarak tanımlanabilmesi için aşağıdaki bazı özellikleri taşıması gerekmektedir (Erenoğlu,2019; Deveci ve ark., 2022).

a) Fonksiyonel gıda, yiyecek formunda ve günlük beslenmemizin bir parçası olmalıdır.

b) Fonksiyonel gıdanın besleyici ve sağlığı olumlu etkilerinin beslenme bilimi ve tıp açısından sağlam temelleri olmalıdır.
c) Fonksiyonel gıda, vücut fonksiyonlarını iyileştirme veya hastalık riskini azaltma etkilerine sahip bir biyoaktif madde içermelidir.
d) Fonksiyonel gıdayı oluşturan biyoaktif bileşenler sağlığı tehdit edecek unsurlar içermemelidir
f) Fonksiyonel gıda içerisindeki gıda bileşeninin niceliksel ve niteliksel özellikleri tespit edilmiş olmalıdır.
g) Fonksiyonel gıda, herhangi bir işlem görerek fonksiyonel bir nitelik kazanmışsa besleyiciliğinde bir azalma olmamalıdır.
h) Fonksiyonel gıda, kesinlikle ilaç, kapsül, tablet yada bir başka gıda destek ürünü şeklinde olmamalıdır.

2.1. Fonksiyonel Gıdaların Kaynakları ve Sağlığa Etkileri

Fonksiyonel gıdalar ve bunların biyoaktif bileşenleri, insan sağlığının iyileştirilmesi ve kronik hastalık riskinin azaltılması için kapsamlı bir şekilde incelenmektedir. Fonksiyonel gıdaların sağlığa yararlı etkileri içerdikleri biyoaktif bileşenlerden kaynaklanmaktadır. Artan bilimsel kanıtlar, bazı gıda

ve gıda bileşenlerinin insan vücudunda çeşitli biyolojik aktiviteye sahip olduğunu göstermektedir. Tablo 1.'de bazı fonksiyonel gıdaların biyoaktif bileşenleri, kaynakları ve sağlığa faydaları gösterilmiştir (Abuajah ve ark., 2015; Deveci ve ark., 2022).

Tablo 1. Bazı fonksiyonel gıdaların biyoaktif bileşenleri, kaynakları ve sağlığa etkileri.

Biyoaktif Bileşenler	Kaynaklar	Sağlık Etkileri
Karotenoidler and Likopen		
Alfa-Karoten, Beta-Karoten, Lutein, Zeaksantin	Havuç, kabak, tatlı patates, ıspanak, domates, mısır, brokoli, narenciye, yumurta	Göz sağlığının korunmasını destekler. Serbest radikalleri nötralize eder Serbest radikalleri nötralize eder.
Likopen	Karpuz, kırmızı/pembe greyfurt, domates ve domates ürünleri	Prostat sağlığının korunmasını destekler. Serbest radikalleri nötralize eder
Diyet Lifleri		
Çözünür diyet lifi Çözünmeyen diyet lifi	Yulaf, arpa, fasulye, elma, psyllium tohumu kabuğu, narenciye tam buğday, pirinç	Koroner kalp hastalığı riskini azaltır
Yağ asitleri		
Tekli doymamış yağ asitleri	Zeytin ve kanola yağı	Koroner kalp hastalığı riskini azaltır
Çoklu doymamış yağ asitleri Omega-3 yağ asitleri Alfa-linolenik asit (ALA) Dokosaheksaenoik asit (DHA) Eikosapentaenoik asit (EPA)	Ceviz, keten tohumu, ton balığı, somon, diğer balık ve yağlar	Kalp, göz ve beyin sağlığının korunmasını destekler.
Konjuge linoleik asit (KLA)	Peynir, hindi, kuzu eti, dana eti	Kanser riskini azaltır.
Fenolikler		
Antosiyanidinler, Kateşinler, Flavononlar, Flavonlar, Lignanlar, Tanninler	Çilek, kiraz, üzüm, elma, tarçın, yer fıstığı, çay, keten, narenciye, çavdar	Serbest radikalleri nötralize eder. Kanser riskini azaltır.
Bitki stanolleri/sterolleri		
Stanoller/Steroller ve esterler	Mısır, soya, buğday, takviye edilmiş yiyecek ve içecekler	Koroner kalp hastalığı riskini azaltır.
Soya bitkiöstrojenleri		
Izoflavonlar: Daidzein, Genistein	Soya fasulyesi, soya bazlı gıdalar	Kemik sağlığını, sağlıklı beyin fonksiyonlarını ve bağışıklık sistemini destekler.
Prebiyotikler ve Probiyotikler		
İnülin, Polidekstroz Fruktooligosakkaritler **(Prebiyotikler)**	Tahıllar, soğan, sarımsak, meyveler, bal, takviye edilmiş yiyecek ve içecekler	Sindirim sistemi sağlığını ve kalsiyum emilimini destekler
Maya, Bifidobakteriler, Lactobasiller ve diğer bakteriler ***(Probiyotikler)***	Yoğurt, süt ürünleri	Sindirim sistemi ve bağışıklık sistemini destekler.
İzotiyosiyanatlar		
Sülforafan	Karnıbahar, brokoli, lahana, brokoli filizi	Detoksifikasyonda rol oynayarak antioksidan savunma sistemini destekler.

Fonksiyonel gıdalar kaynaklarına göre bitkisel ve hayvansal kaynaklı fonksiyonel gıdalar olarak ikiye ayrılmaktadır (Güven ve Gülmez, 2006; Özkaya, 2021, Deveci ve ark., 2022).

2.1.1. Bitkisel Kaynaklı Fonksiyonel Gıdalar

Bitkisel kökenli fonksiyonel gıdalara aynı zamanda fitokimyasallar adı verilmektedir. Fitokimyasallar meyve, sebze ve tahılda bulunan, günlük diyetle alınabilen ve insan metabolizmasını çeşitli hastalıklara karşı koruyan maddelerdir. Diyetle tüketilen sebze, meyve ve tahıllarda yaklaşık olarak 8000 farklı fitokimyasal bileşik bulunmaktadır (Çiçek, 2016; Yalçın, 2016; Özkaya, 2021, Deveci ve ark., 2022). Bu bileşikler; flavonoidler, karotenoidler, polifenoller, izoflavonlar, indoller, lignanlar, saponinler, organosülfür bileşikleri ve monoterpenlerdir. Bu bileşikler immünomodülatör, nöroprotektif, antikarsinojenik, antioksidan, antiinflamatuar, antibakteriyel, antiviral, antifungal, antialerjik ve antihipertansif etki göstermektedir. Özellikle son yıllarda birçok kronik hastalığın gelişmesinde etkili olan oksidatif stresin önlenmesi için antioksidan özellikli fitokimyasalların tüketilmesi önerilmektedir (Deveci ve ark., 2016; Özkaya, 2021, Deveci ve ark., 2022).

Fitokimyasallar antioksidan etkisini; reaktif oksijen/nitrojen türlerinin baskılanması için enzim üretimini aktive ederek göstermektedir. Antioksidanlar ilaç olarak alınmaktansa sebze ve meyve gibi doğal bitkisel kaynaklardan alınmalıdır. Antioksidanlar çeşitli sebze ve meyveler aracılığıyla ile dengeli bir şekilde alınırsa vücutta toksik boyutlara ulaşmaz. Böylece diğer fonksiyonel bileşenler sinerjistik etki ile fonksiyonel etkinin artmasına yardımcı olmaktadır (Liu, 2003; Prior, 2003; Deveci ve ark., 2022).

Akdeniz diyeti fitokimyasal açısından zengin bir beslenme modelidir. Akdeniz diyetinde zeytinyağı, baklagil, kuruyemiş, şarap, meyve ve sebze gibi yüksek fitokimyasal içeriğe sahip gıdaların tüketilmesiyle günlük 290 civarında fitokimyasal alımı sağlanmaktadır (Zhang ve ark., 2019; Özkaya, 2021). Fermente sebze, meyve ve tahıllar da birçok biyoaktif bileşene sahip olduklarından fonksiyonel besin olarak kabul edilmektedir. Geleneksel bitkisel fermente besinler arasında boza, tarhana, turşu, soya ürünleri, hardaliye, şalgam, sofralık zeytin, şarap ve bira yer almaktadır (Büyüktuncer, 2018; Torres, 2020; Özkaya, 2021).

2.1.2. Hayvansal Kaynaklı Fonksiyonel Gıdalar

Kırmızı et ve et ürünleri, deniz ürünleri ve fermente süt ürünleri hayvansal kaynaklı fonksiyonel gıda sınıfında yer almaktadırlar. Taurin, L-karnitin, kreatin ve KLA gibi besin ögelerini içerdiklerinden dolayı kırmızı et fonksiyonel gıda kabul edilmektedir. Geviş getiren hayvanların etlerinde ve süt ürünlerinde bol miktarda bulunan KLA antiaterojenik ve antikarsinojenik etki göstermektedir (Yalçın, 2016; Özkaya, 2021, Deveci ve ark., 2022).

Hayvansal kaynaklı fonksiyonel gıdalardan biri de fermente süt ürünleridir. Fermente süt ürünleri içerdikleri laktik asit bakterileri, biyoaktif bileşenlerler ve metabolitler nedeniyle fonksiyonel gıda olarak kabul edilmektedir. Fermente süt ürünlerinin hipokolesterolemik, antihipertansif, antioksidan, antimikrobiyal, antiaterojenik, antikarsinojenik ve antialerjenik etkilerinin olduğu bildirilmektedir (Güven ve Alkış, 2018; García-Burgos ve ark., 2020; Güven ve ark., 2021). Kefir, kımız, yoğurt, bazı peynir türleri ve diğer fermente süt ürünlerinin biyoaktif peptit içermeleri nedeniyle fonksiyonel gıda kabul edildiği, bunların düzenli tüketiminin *Bifidobakterium* ve laktik asit bakterilerinin sayısını artırdığı, *Enterobacteria* ve *Clostridia* sayılarını azalttığı bildirilmektedir (Guarner ve ark., 2012; García-Burgos ve ark., 2020).

Deniz ürünleri omega-3 yağ asitleri, antioksidanlar ve diğer biyoaktif bileşikler yönünden zengin olup, fonksiyonel gıda olarak kabul edilmektedir. Somon, ton, uskumru, sardalya gibi balıklarda bulunan omega-3 yağ asitleri en önemli hayvansal kaynaklı fonksiyonel gıdalardan biridir. Omega-3 yağ asitlerinin immün sistemi güçlendirdiği, kanser, diyabet ve kardiyovasküler hastalık riskini düşürdüğü, yaşa bağlı bilişsel gerilemeyi yavaşlattığı, dermatolojik, alerjik, psikolojik ve nörolojik hastalıkların klinik belirtilerini hafiflettiği bildirilmektedir (Schunck ve ark., 2018; Iwatani ve Yamamoto, 2019; Özkaya, 2021). Deniz algleri ve yağlı balıklar yüksek oranda DHA ve polisakkarit içermeleri nedeniyle antiaterojenik, antiinflamatuar, antihipertansif, antioksidan, antiviral ve antikarsinojenik etki göstermektedir (Yalçın, 2016; Özkaya, 2021, Deveci ve ark., 2022).

3. SONUÇ

Bireylerin gıdalara yönelik talep ve tutumlarının farklılaşması, gıda tedariğinin yeniden şekillenmesi, gıda sanayisindeki ileri teknoloji ve beslenme bilimindeki gelişmeler sağlık üzerine olumlu etkileri olabilecek yeni gıda ve gıda ürünlerinin keşfinin önünü açmıştır. Günümüzde beslenme bilimi, günlük beslenmenin yanında sağlığın korunmasını destekleyen gıdaların ve bunların biyoaktif bileşenlerinin belirlenmesi için yoğun araştırmalara

yönelmiştir. Bu da son yıllarda popüler bir kavram olan 'fonksiyonel gıda'' kavramını ortaya çıkarmıştır. Fonksiyonel gıdaların tüketimi ile toplumun daha sağlıklı beslenebileceği, yaşam kalitesinin artabileceği, hastalıkların engellenebileceği ve tedavi harcamalarının azalabileceği düşünülmektedir. Bu yüzden fonksiyonel gıda kaynaklarının belirlenmesi, fonksiyonel gıdaların içerisindeki biyoaktif bileşenlerin belirlenmesi ve bunların sağlığa etkilerinin belirlenmesi toplum sağlığı açısından büyük önem arz etmektedir. Ayrıca fonksiyonel gıdalarla ilgili daha fazla araştırmanın yapılması ve desteklenmesi, objektif ve bilimsel ölçütlere dayalı uluslararası görüş birliğine varılması gerekmektedir. Bu amaçla hazırlanan bu çalışmada fonksiyonel gıdalar, bunların biyoaktif bileşenleri ve sağlık üzerine etkileriyle ilgili bilgiler, güncel literatür çalışmaları gözden geçirilerek verilmiştir.

Abstract

The 20th century faces significant increases in the global population and fossil fuel consumption. There have been significant increases in the concentration of GHGs in the atmosphere from human activities. The GHGs build up in the atmosphere and cause the increase in earth's atmospheric temperature, which leads to many other changes around the world. In addition, increasing greenhouse gas emissions and decreasing fossil fuel sources has been posed new challenges to agriculture, which is agricultural feedstock production, especially due to fertilizer production. The purpose of this study is to investigate the life cycle of producing ethanol comparing an annual and perennial biomass crops, which are corn and switchgrass, respectively. This study employs the use of the full life-cycle model which is known as Greenhouse gases, Regulated Emissions, and Energy use in Transportation (GREET 2021) model by Argonne National Laboratory to obtain the emission data. According to the results, total GHG emissions are around 0,012 kg N_2O/mm BTU; 0,0071 kg CH_4/mm BTU; 3,407 kg CO_2/mm BTU from the corn to ethanol production per year. However, total GHG emissions are around 0,133 kg N_2O/mm BTU; 0,093 kg CH_4/mm BTU; 41 kg CO_2/mm BTU from the switchgrass to ethanol production per its life time (approximately 15 years). We concluded that the various feedstocks, nutrients, and enzymes will affect the ethanol yield in the well-to-wheel analysis of ethanol production.

Keywords: ethanol production; corn; crop farming; switchgrass; life cycle assessment

INTRODUCTION

The human population has continued to grow at a significant rate and is expected to increase from 8 billion in 2022 to 9.7 billion by 2050 (Laurance and Engert 2022). This rapid increase in the population of humans and urban development since the mid-1970`s causes significant increase in energy consumption (Avtar et al. 2019). Meanwhile extensive consumption of fossil energy resources has been associated with a significant increase in the mass of greenhouse gases (GHG), which are known to inhibit long-wavelength radiation from escaping into space, into the atmosphere (Smithson 2002; Galloway et al. 2008). We already see the effects of global warming as higher sea levels, more severe storms, dirtier air, higher wildlife extinction rate, higher death rates, and so on (Singer 2006). Moreover, the world faces an energy crisis since the demand for fossil fuels such as coal, oil, natural gas, is growing in most countries in the world. According to the predictions of the scientists, crude oil reserves will run out by 2052, natural gas will run out by 2060, and coal will run out by 2090 if the fossil fuels's consumptions continue at the present rate (Agency 2020). The global energy system is 85.5% dependent on fossil fuels right now, and US, China, and India are the most fossil fuel dependent countries (Ediger 2019). According to the US Department of Energy in 2010, the US consumed on average 19.1 million barrels per day and imported 11.8 million barrels per day of petroleum products (EIA 2011). With increasing strain between the US and its foreign oil suppliers it has become imperative that the US becomes less reliant on international suppliers. Because of the potential future effects of using fossil fuels, people want to produce renewable fuel to eliminate the adverse impacts, so biomass crops (or bio-crops) have great potential to displace fossil fuel to lower net greenhouse emissions, and to diversify the ecosystems.

Ethanol (C_2H_6O) is presently the most well developed possible liquid fuel substitute for gasoline. It is an alcohol and a clean, renewable fuel that can be made from biomass. Bioethanol is an alcohol mainly produced from agricultural residues such as corn and sugarcane feedstocks. According to the 2015 statistics, USA at the top list of bioethanol producers with 56.05 mi m^3 from corn as main sources . Interestingly, even though Brazil is not a member contry of Organization for Economic Co-operation and Development (OECD), Brazil has the 2nd highest bioethanol producer country with 26.85 mi m^3 due to huge availability of sugarcane, a very productive biomass for ethanol production (Manochio et al. 2017). While annual bioenergy crops (such as oil palm, and corn) can be used successfully as feedstocks, perennial crops (such as miscanthus and switchgrass) can also be used and provide promising features such as higher productivity and low input requirements. Corn is one of the annual crops, which is also the most ubiquitous crop with the highest cultivation intensity due to optimum climate conditions. Because of its availability and production rate at the required amount for industry scale, corn is one of the most important feedstocks for biofuel production (Woiciechowski et al. 2016). In addition, its fibrous structure and carbohydrate rates make it an interesting feedstock for biofuel production. On the other hand, switchgrass (*Panicum virgatum* L.) is a C_4 perennial sustainable bio-crop, which evolved in many different environments from cold northern to warm southern areas in the US with an average lifetime of 15-20 years. Switchgrass can cultivate in poor soil, drought, and flooded conditions, but it still needs to appropriate conditions to produce economical biomass yields and persist for several years. This study focuses on the potential environmental risk of producing ethanol using two biomass crops, which are corn and switchgrass. A comparison of these two crops will bring to light the differences when using a perennial and annual biomass crop and their effect on global warming and human health.

METHODOLOGY

Life cycle assessment (LCA) is a methodology, which is used to obtain GHG emission data to evaluate risk assessment based on corn and switchgrass to ethanol production. According to the International Organisation for Standardisation (ISO) in ISO 14040, LCA has four different stages including (1) goal and scope definition, (2) inventory analysis, (3) impact assessment, and (4) interpretation. The first part of a LCA study generally starts with defining the goal of the study, its scope and functional unit (Rebitzer et al. 2004). The goal of the current study is to determine the environmental point of view using corn and ethanol crops to produce ethanol. The intended audience of the study will be the researchers and technical experts in the area of environmental sciences especially environmental impacts of agriculture. Once the goal and the scope of the study are chosen, the next step is to set the functional unit, which should be chosen based on the goal of the study. The functional unit for the study was 1 ton of dry bio-crop. The initial boundaries of the system will be determined by the goal and the scope of the study. The system boundaries of biomass crops to ethanol for LCA are shown in Figure 1.

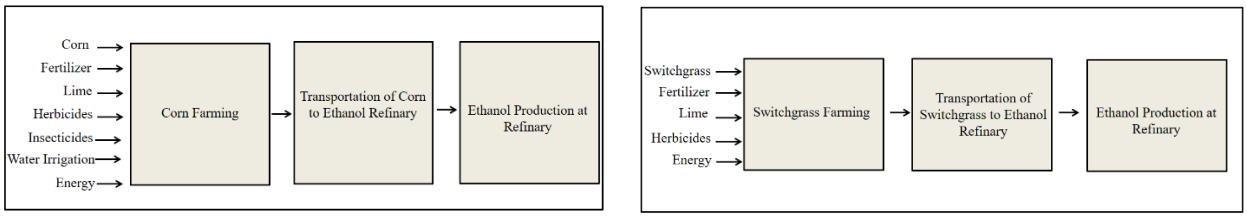

Figure 1. System boundary of corn and switchgrass feedstock to ethanol

Life cycle inventory (LCI) step involves the data collection and calculation input and output flows to complete the inventory (Hospido et al. 2004). In an LCA, an important aspect is the selection of the appropriate impact categories, which is in life cycle impact assessment (LCIA) stage. In this study, we consider GHG emissions including nitrous oxide (N_2O), methane (CH_4), and carbon dioxide (CO_2) as the environmental impact at a problem level. This study employs the use of the Greenhouse gases, Regulated Emissions, and Energy use in Transportation (GREET™) model. The GREET model will estimate the greenhouse gas emission and butanol production for various input parameters. We used the GREET model to obtain emissions from the corn and switchgrass crops to generate ethanol in this study. While the main data source is the GREET model, input parameters pertaining to the farming operations include fertilizers, lime, pesticides, energy and also transportation of bio-crops to the refinary were used during ethanol production. Table 1 presents the key assumptions and GREET inputs for the corn and switchgrass crops.

Table 1. GREET Input Parameters for Corn and Switchgrass

Parameters	Corn	Switchgrass
Life span (years)	1	15
Yield (t/ha)	11	14,2
Energy use (Btu/mmbu)	47224,0	4361,863
Herbicide (g/bu)	5,85	53,10
Insecticide (g/bu)	0,01	0
Nitrogen (g/bu)	401,5	4877,4
P_2O_5 (g/bu)	150,6	2307,8
K_2O (g/bu)	152,3	32004
$CaCO_3$ (g/bu)	1457,0	5846,9

RESULTS AND DISCUSSION

The primary aim of this study is to evaluate the potential environmental risk of producing ethanol using corn and switchgrass. The main material inputs were listed in Table 1 as fertilizers, lime, pesticides, insecticides, energy, and etc. Then, using all inputs data the results were scaled as needed and summed up all outputs in the Greet model. The emissions (N_2O, CO_2 and CH_4), which can be presented as CO_2 equivalents, using GWP factors from the Intergovernmental Panel on Climate Change (IPCC)'s report (GWP for CH_4 = 25, GWP for N_2O = 298). Therefore, the GHG emissions factor of input materials is calculated using Eq.1.

$$EF = E_{CO_2} + 25x\, E_{CH_4} + 298x\, E_{N_2O} \quad (1)$$

Since the functional unit for the study was 1 tons of bio-crop, first we calculated the total GHG emissions for the both crops.Total CO_2 emission is 3,407 kg CO_2/mm BTU; N_2O emission is 12,319 kg N_2O/mm BTU; CH_4 emission is 7,129 kg CH_4/mm BTU from corn to ethanol production per year. Total GHG emission of 1-ton corn ethanol is calculated approximately as 0,0072 t CO_2 equivalents/ t ethanol. Nearly 50% of total GHG emissions come from N_2O emissions because of its highest effect on GWP, and over 90% of N_2O emissions are derived from nitrogen fertilizer. Since 11-ton corn can be produced per hectare area, total N_2O emissions is around $5.412x10^{-3}$ t N_2O/ha relase to the atmosphere from corn farming. On the other hand, total CO_2 emission is 41,866 kg CO_2/mm BTU; N_2O emission is 0,133 kg N_2O/mm BTU; CH_4 emission is 0,093 kg CH_4/mm BTU from the switchgrass to ethanol production per its life time. Total GHG emission of 1-ton switchgrass ethanol is calculated approximately as 0,083 t CO_2 equivalents/ t ethanol. According to GREET data, switchgrass farming seems to generate higher emissions rates, but its life span is 15 years, so in total corn farming produce more GHG emissions than switchgrass farming. These results provide that switchgrass would be a viable option for production of ethanol. However, the suitable environment conditions to grow switchgrass might be difficult, and should be considered.

Table 2. GHG Emissions from Corn and Switchgrass to Ethanol Production

Parameters (kg)	Corn	Switchgrass
CO_2	3407	41,866
N_2O	3,407	0,093
CH_4	7,129	0,133
Total GHG emissions	7,25	83,825

CONCLUSION

People want to produce biobutanol because of extensive consumption of fossil fuels and increasing GHG emission. However, GHG emissions increase because of feedstock production especially fertilizer production. Especially in developed countries biomass production is one of the major industries, so it is important to pay attention to the effects on human health and the environment. This study aimed to investigate the life cycle energy risk of producing ethanol using an annual and perennial biomass crop, which are corn and switchgrass, respectively. Even though switchgrass farming seems to generate higher emissions rates, its life span is 15 years, so in total corn farming produce more GHG emissions than switchgrass farming. These results provide an opinion about environmental effects of two crops, which is using of a perennial grass such as switchgrass would be a viable option for production of ethanol.

Abstract

As a conclusion of growing global population and extensive fossil fuel consumption during the last century, the mass of greenhouse gases has been critically increased. Increasing greenhouse gas emissions and decreasing fossil fuel sources has been posed new challenges to agriculture, which is agricultural feedstock production. Because of the potential future effects of global climate change, people want to produce renewable fuel to reduce greenhouse gas emissions (GHG), but at the same time GHG emission increase because of feedstock production and fertilizer production. The purpose of this study is to investigate the life cycle energy and the potential risk of producing biobutanol from corn crop, which is one of the most used bio-crops all over the world. This study employs the use of the full life-cycle model GREET 2021 (Greenhouse gases, Regulated Emissions, and Energy use in Transportation) to obtain the emission data for the corn crop farming stage. According to the results, total nitrous oxide emissions are around 2.73×10^{-3} t N_2O/t butanol per year from the corn farming. Also, the analysis of non-carcinogenic health risk of exposure to N_2O from the United States Environmental Protection Agency standards shows that adults are at considerable non-carcinogenic risk and there is no serious adverse health effect for adults at corn farming per hectare.

Keywords: Biobutanol production; corn; crop farming; risk assessment

INTRODUCTION

During the last two decades, approximately two billion people were added to the world population, and expected to increase to 9.7 billion by 2050 (Rubino et al. 2019; Laurance and Engert 2022). With this rapid increase in the population of humans cause to increase in energy consumption (Avtar et al. 2019). Extensive consumption of fossil energy resources has been associated with a significant increase in the mass of greenhouse gases (GHGs). Besides the adverse environmental and public health impacts of GHGs, the world faces an energy crisis since the global energy system is 85.5% dependent on fossil fuels right now (Ediger 2019). Due to the potential future effects of using fossil fuels, people want to produce renewable fuel to eliminate the adverse impacts, so biomass crops have great potential to displace fossil fuel to lower net greenhouse emissions. Nitrous oxide (N_2O) is one of the important anthropogenic GHG with tremendous global warming potential (GWP) (Wang and Sze 1980). The atmospheric concentration of N_2O has risen approximately 18% in the past two hundred years and continues to rise. Based on the current U.S. GHG Inventory, N_2O contributes approximately 6.5% to total GHG emissions (in CO_2 equivalents), and N_2O emissions from agricultural soils account for more than 50% of the global anthropogenic N_2O flux (Hénault et al. 2019; USEPA 2006; Reay et al. 2012). Increasing GHG emissions and decreasing fossil fuel sources have posed new challenges to agriculture (Fließbach et al. 2009). People want to produce renewable fuels because of the increasing N_2O emissions but increasing feedstock production will significantly increase N_2O emissions. In this context, feedstock production for biofuels production started to become a current challenge worldwide. Butanol has become a fuel of interest because of its ability to be easily incorporated into the fuel market. Currently, butanol is mainly produced using fossil fuels, but there is great potential for it to be produced using biomass (Harvey and Meylemans 2011). Biobutanol, butanol produced from

biomass, has a higher energy density than ethanol and thus would be a more advantageous fuel to substitute for gasoline (Ranjan, 2012).

From an environmental view of the point, the lower GHG emission potential also makes biobutanol a more attractive option. After the development of butanol production using bioenergy crops in recent years, many studies have been published to evaluate the sustainability of bioenergy crop production. The current butanol industry has been used bioenergy crops to produce butanol. Corn is one of the annual crops, which has the potential to have high yields. Because of its availability and production rate at the required amount for industry scale, corn is one of the most important feedstocks for biofuel production (Woiciechowski et al. 2016). More than 1 billion tons of corn is produced worldwide, and the US is the largest corn producer with the 400 million tons' production volume per year. In addition, its fibrous structure and carbohydrate rates (cellulose and hemicellulose) make it an interesting feedstock for butanol production. At this point, it is necessary to evaluate the risk of exposure to N_2O because of the importance of using corn crops for producing biobutanol to prevent adverse health effects. This study aims to determine the potential risk of producing biobutanol using corn biomass crop. The study will bring to light corn crop and their effect on global warming and human health.

METHODOLOGY

Life cycle assessment (LCA) methodology is used to obtain GHG emission data to evaluate risk assessment based on biomass crop farming. The goal of the current study is to determine the environmental point of view using corn biomass crop to produce butanol. The intended audience of the study will be the researchers and technical experts in the area of environmental sciences. Once the goal and the scope of the study are chosen, the next step is to set the functional unit, which should be chosen based on the goal of the study. The functional unit for the study was 1 ton of corn. The initial boundaries of the system will be determined by the goal and the scope of the study. The system boundaries of biomass crops farming for LCA are shown in Fig. 1.

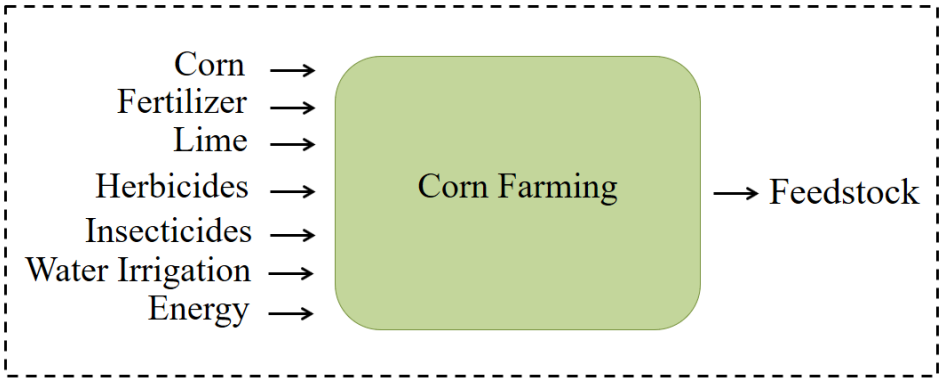

Figure 1. System boundary of corn production.

We used Argonne National Laboratory's Greenhouse gases, Regulated Emissions, and Energy use in Transportation (GREET™) model in this study. We only used the model to obtain data for the risk assessment part of the current study. The GREET model calculates the consumption of total energy, GHG emission, and air criteria pollutants. We used the GREET model to obtain N_2O emissions from the corn to generate butanol in this study. While the main data source is the GREET model, input parameters pertaining to the farming operations include fertilizers, lime, pesticides and energy were used during feedstock production. Table 1 presents the key assumptions and GREET inputs for the corn crop.

Table 1. GREET Input Parameters for Corn Butanol Production.

Parameters	Corn
Life span (years)	1
Yield (t/ha)	11
Energy use (Btu/mmbu)	32,350
Herbicide (kg/ton)	0.234
Insecticide (kg/ton)	0.0004
Nitrogen (kg/ton)	16.06
P_2O_5 (kg/ton)	6.024
K_2O (kg/ton)	6.092
$CaCO_3$ (kg/ton)	58.25

In this study, we used the US national values for corn production that 33 million bushels of corn produce 150,000 tons of butanol, so the yield of corn is 18%. Also, according to the US Department of Agriculture, the corn yield is 11 tons/ha for the US, which can produce 1,98 tons of butanol with 18% of corn yield per hectare (Gonzalez et al. 2011). In theory, corn-derived butanol is produced from (ABE) fermentation, but we allocated the other ABE products except for butanol in this study.

In a simple definition, risk assessment can be defined as the process of estimating both the probability that an event will occur, and the probable magnitude of its adverse effects such as economic, health-related, or ecological from a chemical or stressors over a specified time period (Olson and Gurian 2012; Gerba 2006). A formal risk assessment has four steps: hazard identification, exposure assessment, dose-response assessment, and risk characterization as shown in Fig. 2 (Gerba 2006).

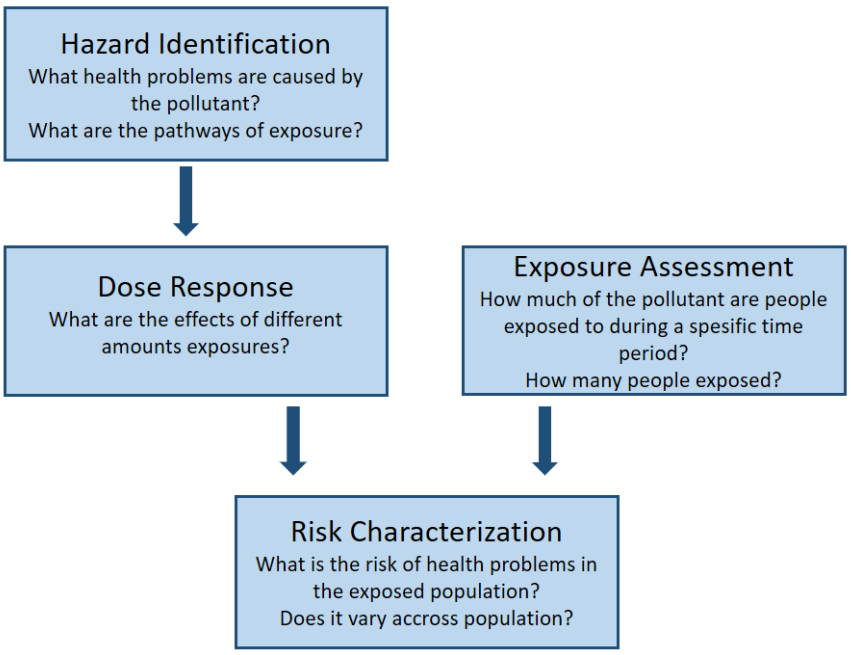

Figure 2. The process of risk assessment.

To quantify the adverse effects arising from exposure to a hazard on the degree of exposure Eq. 1 is used. For average exposure dose of N_2O is normalized as milligrams of N_2O inhaled per kilogram of body weight per day (mg kg^{-1} day^{-1}).

$$D = \frac{C\ x\ IR\ x\ EF\ x\ ED}{BW\ x\ AT} \quad (1)$$

Where D is exposure dose; C is concentration of chemical in each medium (e.g., mg/L for water or mg/m^3 for air); IR is intake/contact rate (L/day); EF is exposure frequency (days/year); ED is exposure duration (years); BW is body weight (kg); AT is averaging time (period over which the exposure is averaged-days). According to United States Environmental Protection Agency (EPA 1991), standard default exposure factors for inhalation of contaminants: IR is 20 m^3/day; EF is 350 days/year; ED is 30 years; BW is 70 kg; AT is 24500 days (350 days/year x 70 years). After calculating exposure dose, the non-carcinogenic health risk of chronic exposure to nitrous oxide was assessed by the following equation.

$$HQ = \frac{ED}{AOEL} \quad (2)$$

Where AOEL is acceptable operator exposure level which is equal to 106.4 (mg kg^{-1} day^{-1}) for N_2O. HQ values more than one represents the potential of adverse health effects (Hamsan et al. 2017). As a summary, the objective of the risk characterization is to summarize the outputs from the previous sections and provide an overall conclusion about the risk.

RESULTS AND DISCUSSION

Since the primary aim of this study is to evaluate the potential risk of producing butanol using corn crop, based on crop farming, our system includes only crop farming stage in the system boundary shown in Fig. 2. However, farming stage has specific parameters for both crops in itself. The main material inputs were listed in Table 1 as crop seed, fertilizers, lime, pesticides, machinery, electricity, and etc. Therefore, using all inputs data the results were scaled as needed and summed up all outputs in the Greet model. Even though the paper focus on N_2O emissions from crop faming, we also show the other emissions (CO_2 and CH_4), which can be presented as CO_2 equivalents, using GWP factors from the Intergovernmental Panel on Climate Change (IPCC)'s report (GWP for CH_4 = 25, GWP for N_2O = 298). Since the functional unit for the study was 1 tons of biomass, first we calculated the total GHG emissions for the both crops. Total CO_2 emission is 3,407 g/bu; N_2O emission is 12.319 g/bu; CH_4 emission is 7.129 g/bu from corn farming and total emissions of 1-ton corn butanol is calculated as 0.755 t CO_2 / t butanol; 2.73×10^{-3} t N_2O / t butanol; and 1.58×10^{-3} t CH_4 / t butanol. Total GHG emission of 1-ton corn butanol is calculated as 1.608 t CO_2 equivalents/ t butanol using the Eq.3. Nearly 50% of total GHG emissions come from N_2O emissions, and 93% of N_2O emissions are derived from nitrogen fertilizer. Since 11-ton corn can be produced per hectare area, total N_2O emissions is around 5.412×10^{-3} t N_2O/ha from corn farming, which equals to total around 2.73×10^{-3} t N_2O/t butanol per year per hectare. The results show that the predominant contributor of total GHG emissions for corn crops is ammonia nitrate, which is commonly used in agriculture as a high nitrogen fertilizer. However, in practical application nitrogen fertilization is the limiting factor for crop growth, this is often a reason for lower crop yields in farming, but also a reason for lower emissions (Fließbach et al. 2009). On the other hand, using an extensive amount of nitrogen fertilizer to get higher crop yields may lead to higher GHG emissions. Because of the potential future effects of global climate change, people want to produce renewable fuel to reduce GHG emissions. However, at the same time, N_2O emissions increase because of feedstock production and fertilizer production, which creates a paradox.

This study was conducted to assess the non-carcinogenic health risk of exposure to N_2O from corn farming, which was calculated by the EPA method. It is useful to perform a risk assessment to compare the creation of global warming and human health effects of N_2O emissions from corn crops to see the effect on global warming and human health. To quantify the chronic daily exposure dose from corn is normalized as milligrams of N_2O inhaled per kilogram of body weight per day (mg kg^{-1} day^{-1}) using the Eq. 1. As mentioned earlier, data of the medical use of N_2O is used for the calculation. The results showed that the chronic daily exposure doses of corn farming per hectare for a year are 2.94×10^{-12} mg kg^{-1} day^{-1}. Since we only used the emissions concentrations per hectare area of farming, the real-life results will be a higher amount of emissions. However, the result provides an opinion

about corn production to biobutanol. Finally, the non-carcinogenic health risk of chronic exposure to N_2O was assessed by Eq.2 and found that corn farming per hectare for a year don't directly create a cancer risk.

CONCLUSION

People want to produce biobutanol because of extensive consumption of fossil fuels and increasing N_2O emission. However, N_2O emissions increase because of feedstock and fertilizer production at the same time. Especially in developing countries agriculture is one of the major industries, so it is important to pay attention to the effects on human health besides the environment. This study aimed to investigate the life cycle energy and the potential risk of producing biobutanol using corn crop. Even though corn farming generates higher emissions rates, the estimated health risk assessment of N_2O emissions from both crop farming showed that adults are at considerable non-carcinogenic risk and there is no serious adverse health effect for adults.

Abstract

The quantum chemical calculation studies are very significant for organic chemistry and drug chemistry because these studies give knowledge about compound's structure properties, spectroscopic values, energ and reaction areas (electrofilic, nucleofilic area) without experimental studies. As know that, all knowledges could obtained about molecule using experimental studies but the this studies are very costly and take long time. In this work, theoretical properties of 3-ethyl-4-(3-carboxyphthalimido)-4,5-dihydro-1*H*-1,2,4-triazol-5-one were investigated using B3PW91 basis sets. Firstly, molecule was optimized by using the B3PW91/6-311++G(d,p) basis set. ^{1}H-NMR and ^{13}C-NMR isotropic shift values of molecules were calculated by the method of GIAO using the program package Gaussian 09W. The veda 4f program was used in defining IR data. IR (infrared) vibrational frequencie values were calculated in gas phase. Also, mulliken charges, the highest occupied molecular orbital (HOMO) energy and the lowest unoccupied molecular orbital (LUMO) energy, dipole moment, total energy were calculated. The Molecular Electrostatic Potantial (MEP) were visualized. NLO analyses were performed.

Keywords: 1,2,4-triazole, B3PW91,Veda 4, HOMO, LUMO

INTRODUCTION

The 1,2,4-Triazol and derivatives are very important molecules in medicinal and pharmaceutical chemistry due to their wide biological activities (Billes et al., 1999). Numerous biological actions have been found for 1,2,4-triazole derivatives (Jones et al., 1965; Mullican et al., 1993; Subashchandrabose et al., 2010). Triazole derivatives are also used to make plant growth hormone insulators, antibiotics, fungicides, and weed killers (Li et al.,2004). They may also be effective in inhibiting corrosion (Phadke Swathi etal., 2017). The ligands 1,2,4-triazoles are excellent for coordination chemistry. 1,2,4-Triazole compounds that widly used in medicine world just like Schiff base are heteroaromatic molecules. The Schiff base derivatives of these compounds, which have three nitrogen atoms are the core structures widly used in the pharmaceutical fields with anti-fungal (Sumrra et al., 2021), anti-cancer (Zafar et al., 2021; Utthra & Raman, 2018), anti- bacteriyal (Borase et al., 2021; Cebeci & Karaoğlu, 2021), anti-oxidant (Kotan, 2022; Zafar et al., 2021; Bahçeci et al., 2017), antileishmanial (Süleymanoğlu et al., 2019). The Gaussian 09W (Frisch, et al., 2009; Wolinski, 1990) package is utilized in this investigation because it has a wide range of theory and basic set possibilities, including molecular mechanics, semi-empirical, and ab-initio approaches. The structure of molecules is determined using B3PW91/6-311++G(d,p) functional and basis set. By comparing the theoretically calculated spectral data with the experimental data from the literature (Yüksek et al, 2006) the results are presented in tables and regression graphs.

RESULTS AND DISCUSSION

Theoretical calculations

The B3PW91/6-311++G(d,p) basis set was used to optimize the molecule (Frisch et al., 2009; Wolinski, 1990). The Gauss-View package program (Dennington, 2009) was used to determine the three-dimensional structure of the molecule in space.

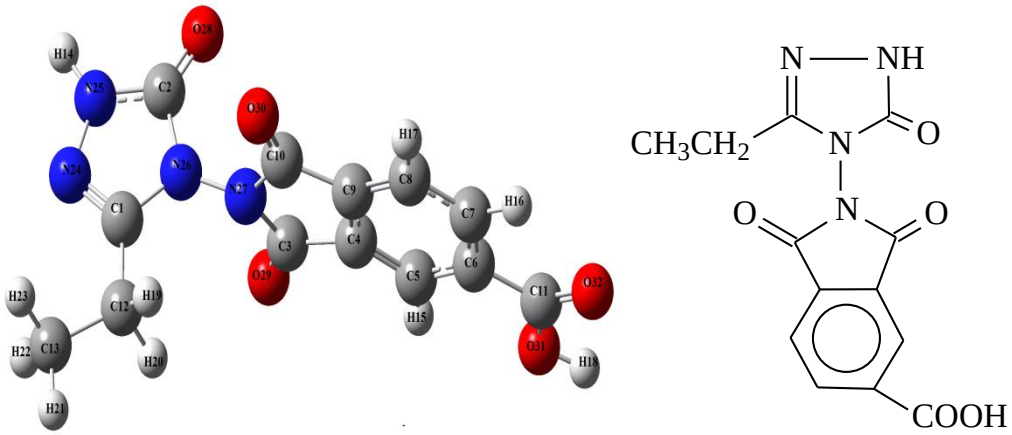

Figure 1. The GaussView structure and chemical formule of molecule

Calculated NMR values

Based on the optimized structure, $^{1}H/^{13}C$-NMR spectral data were calculated according to the GIAO (Wolinski, 1990) technique of the Gaussian G09W software package in gaseous media and listed in Table 1. Correlation graphs were created for the obtained chemical shifts and are shown in Figure 1.

FT-IR analysis

Theoretically, scala vibration values were calculated from IR data using the Veda4f software (Jomroz, 2004). Theoretical IR data are multiplied by the proper correction factors, which are 0.9906 for the DFT/(B3PW91)6-311++G(d,p) basis set (Merrich et al., 2007). Data was found to be positive. This finding indicated the stability of the structure. With the help of the data collected using the DFT approach, IR spectrum were drawn (Figure 3). Theoretically predicted IR details were compared to experimental IR values, which are shown in Table 2.

Table 2. The calculated frequencies values and vibration types of the molecule.

Vibration Types	Experim.	Scaled DFT
ν (NH)	3182	3758
ν (C=O)	1697	1798
ν (C=N)	1593	1654
ν (COO)	1536	1521

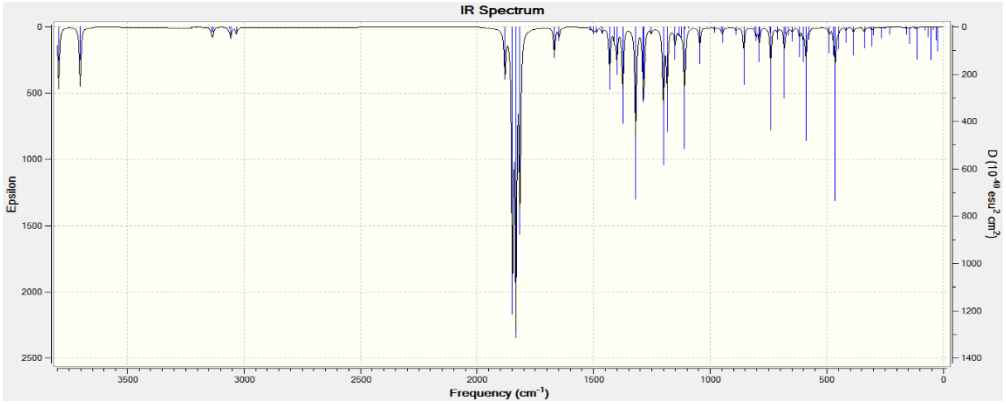

Figure 3. The theoretical IR spectrum

The HOMO-LUMO

In quantum chemistry, the highest occupied molecular orbital (HOMO) and the lowest unoccupied molecular orbital (LUMO) (Fukui, 1982) are crucial variables. These numbers serve as examples of the molecule's chemical reactivity and kinetic stability. A big HOMO-LUMO gap actually denotes excellent molecular stability since it means the molecule will be less reactive during chemical processes (Arjunan, 2014; El-Gammal, 2014). The capacity to give an electron is represented by the HOMO, while the ability to take an electron is represented by the LUMO. The B3PW91 technique and 6-311++G(d,p) basis sets were used to do the HOMO-LUMO energy calculations in order to assess the energetic behavior of the title chemical. As a result of the calculation, Elumo= -0.1236 Hatree and Ehomo= -0.2489 Hatree and the energy difference between them is ΔEg= 3.409. Using these data, all the electronic parameters ($A, I, \chi, Pi, \omega, IP, S, \eta$) of the molecule have been calculated and represented in Table 3. The homo-lumo orbitals are on different atoms in the molecule. Red and green, respectively, are used to indicate the positive and negative phases and shown in Figure 4.

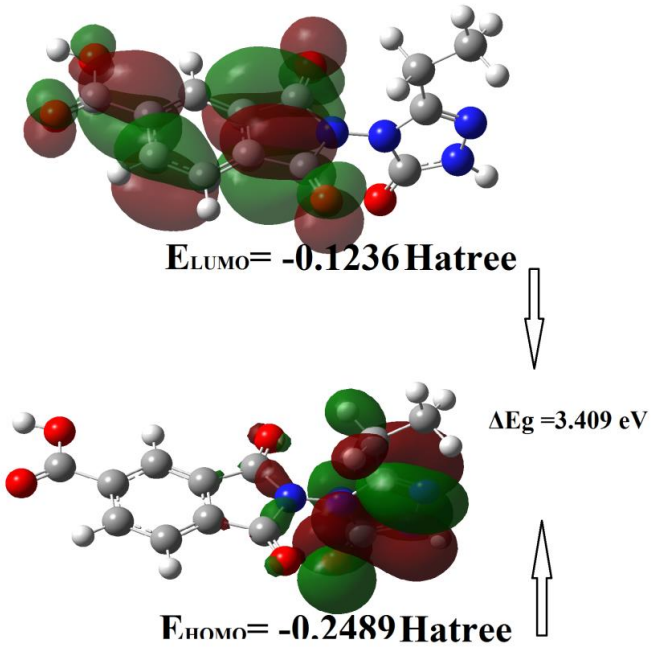

Figure 4. Calculated HOMO-LUMO shapes of the molecula by B3PW91 method 6-311++G (d,p) basis set

Nonlinear optical properties (NLO)

Researchers have examined molecular materials having quadratic nonlinear optical (NLO) responses to electromagnetic fields. NLO features play a crucial role in supplying the essential frequency shifting, optical switching, optical logic, optical memory and optical modulation, functionalities for technologies used in fields including telecommunications, optical interfaces and signal processing (Sajan et al., 2006). The polar αxx, αxy, αyy, αxz, αyz, αzz values are 270.4472036, -1.4940625, 153.6873908, -3.8444643, -15.7549385, 160.934329, respectively. The HyperPolar $\beta_{xxx,}$ $\beta_{xxy,}$ $\beta_{xyy,}$ $\beta_{yyy,}$ $\beta_{xxz,}$ $B_{xyz,}$ $B_{yyz,}$ $\beta_{xzz,}$ $\beta_{yzz,}$ $\beta_{zzz,}$ β_{total} values are -144.9459501, 140.7393349, -53.2269799, 41.7290588, -99.6941849, 50.2126696, 46.0020185, -64.9574036, -2.4204656, 101.9467899, respectively. The total static dipole moment $\boldsymbol{\mu_{toplam}}$= 1.4520 debye, average linear polarizability $\boldsymbol{\alpha}$= 28.902x10^{-24} esu, anisotropy of polarizability $\boldsymbol{\Delta\alpha}$=16.793x10^{-24} esu and initial hyperpolarizability $\boldsymbol{\beta_{total}}$= 26.01x10^{-30} esu are among NLO properties. These parameters were calculated by B3PW91 6-311++G (d,p) basis set and listed in Table 4. The urea molecule serves as the main reference for NLO characteristics. The NLO parameters are $\boldsymbol{\alpha_{total}}$**:** 5.07643717x10^{-24} esu, $\boldsymbol{\Delta\alpha}$**:**=2.13568262x10 $^{-24}$ esu, and $\boldsymbol{\beta^0}$= 7.2228469891x10^{-31} esu. When compared to the reference material, the NLO values were 5, 8, and 3.7 times higher than urea (Kotan et al., 2020).

Mulliken Charge data

When applying quantum mechanical calculations to molecular systems, the determination of atomic charges is crucial. Mulliken charges of each atom are calculated and shown in the table and figure. Accordingly, some carbon atoms, N27 and H14-H23 atoms are all positive. Other carbon, nitrogen (N24-N27) and oxygen atoms are negative (Mulliken, 1955) and shown in the Table / Figure 5

Table 5. The calculated mulliken charge data

MEP analysis

The MEP, a depiction of electrostatic potential projected onto the surface of constant electron density. Given that an approaching electrophilic would be drawn to negative areas, the MEP is a valuable feature to analyze reactivity. The highest negative region in most MEP is depicted by the color red, whereas the maximum positive region, which is chosen for nucleophilic assault, is indicated by the color blue. Red, blue, and green are the regions of highest negative, highest positive, and zero electrostatic potential, respectively. They reflect the varying values of the electrostatic potential at the MEP surface (Figure 6). These maps have a color code that falls between 7.163e-2 a.u. (red) and -7.163e-2 a.u. (blue) in compound (Kotan et al., 2020; Murray & Sen, 1996; Luque et al., 1993).

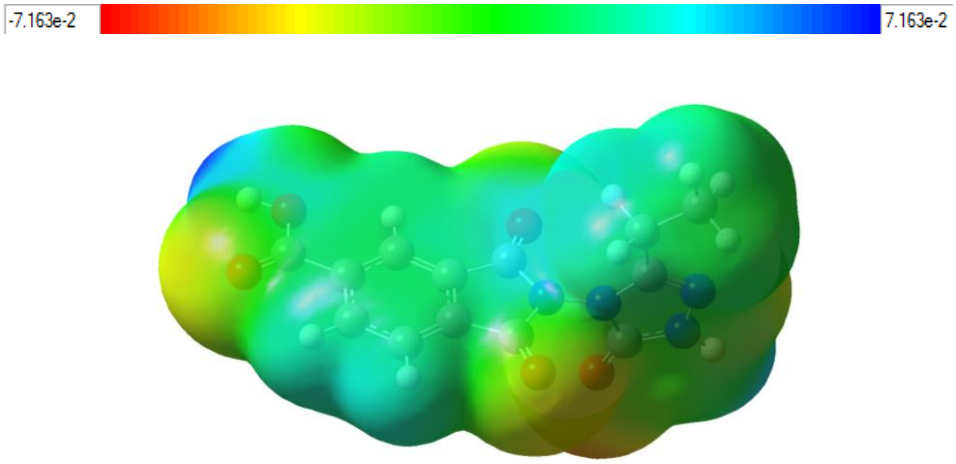

Figure 6. The MEP surface map

CONCLUSIONS

In this theoretical investigation, calculations of the molecule were done using DFT (B3PW91) techniques, employing the software package Gaussian G09W's 6-311++G(d,p) basis set. The calculations' $^{1}H/^{13}C$ chemical shifts and FT-IR data are shown to be in agreement with the empirical data. The R2 values showed a linear association, although the 1H-NMR correlation graph shows a minor divergence. The N-H acidic proton (H14) in the molecule is the cause of this divergence. The sole explanation for the infrared data's lack of negative frequency is the molecule's stability. The LUMO-HOMO energy gap (3.409 eV), the total energy and certain electronic properties were also estimated. Furthermore, Molecular electrostatic potential (MEP) was used to show the electron density distribution, and the electrophilic and nucleophilic areas were identified. NLO analysis was performed and the results were compared with urea values. The non-linear optic feature of the molecule was higher than that of urea.

Abstract

Soils intended to support structures, pavements or other loads should be evaluated by geotechnical engineers to predict their behavior under conditions of applied forces and varying humidity. Soil mechanics tests in geotechnical laboratories measure particle size distribution, shear strength, moisture content, and the potential for expansion or contraction of cohesive soils. Atterberg limit tests determine the moisture content at which fine-grained clay and silt soils transition between solid, semi-solid, plastic and liquid states. Artificial neural networks (ANN) is an information processing technology inspired by the information processing technique of the human brain. In this study, the determination of the Atterberg limits, which are frequently used for the determination of soil properties in geotechnical engineering and their comparison with experimental data, were determined and the results showed a very similar pattern.

Keywords: Plasticity Index, Liquid Limit, Geotechnical Engineering, Artificial Neural Networks, Civil Engineering

INTRODUCTION

Applications of Artificial Neural Networks (ANNs) in civil engineering, including geotechnical, have increased. Işık and Özden (2013) used ANN prediction models to estimate the compression parameters of both coarse and fine-grained soils. A total of 200 soil mixes were prepared and compacted in standard Proctor energy. Compression parameters were estimated through ANN models using different input datasets. ANN prediction models have been developed to find which index features are well correlated with compression parameters.

Transition fine content ratio (TFR) was defined as a new input parameter in addition to the soil index parameters. It has been shown that the optimum water content (Wopt) and maximum dry unit weight estimation can be made with high accuracy using the parameters of the foundation soil index. However, the desired predictive accuracy and generalization ability can be achieved by properly normalizing and dividing the data.

In this study, it is aimed to determine the Atterberg limits from the soil properties experimentally and to estimate them using artificial neural networks and compare the values. Such studies have been carried out before in geotechnical engineering experiments. To give one recent example, Azadmard et al. (2020) conducted a study to compare the effectiveness of multiple linear regression (MLR) and hybrid GA method with ANN for the prediction of nearly saturated soil hydraulic properties. The results of the MLR analysis showed that this method has the potential to predict nearly saturated soil hydraulic properties in the study area. The higher performance of the GA-ANN models compared to the MLR models confirmed the existence of nonlinear relationships between the physical and chemical properties of the soil and the hydraulic properties.

MATERIALS AND METHODS

In fine-grained soils (cohesive), the softness and hardness of the soil is indicated by the consistency. As the amount of water in the fine-grained soils increases, it varies in a wide range from a very solid state to a fluid liquid consistency. Accordingly, there are great differences in engineering properties such as strength, strain under load, and compression.

In order to experimentally determine the changes in the consistency of fine-grained soils depending on the water content, some limit water content values have been defined. Experiments developed by Swedish scientist Atterberg are used to determine these values, known as consistency limits.

The liquid limit is the water content when the soil changes from a plastic material to a flowing material. There are several methods for determining the liquid limit. Among these, the Casagrande Method is widely used. The Casagrande liquid limit instrument is placed on a solid rubber block by 1 cm when the handle is turned. It consists of a hemispherical brass bowl falling from a height.

Performing the Liquid Limit Experiment:

a) Some amount is taken from the ground that has been dried and passed through the sieve no. 40, placed in a porcelain bowl and mixed by adding some distilled water.

b) Wait for a while for the sample to cure.

c) A little is taken from the mixed sample. The rice bowl is placed. It is smoothed out with a spatula. The sample in the bowl is divided into two with a slit cutter. Once again, the upper part is corrected, while dividing it into two, care is taken to ensure that both parts are of equal size.

d) Then the handle of the tool is turned and the stone is 1 cm. It is dropped from height 2 times per second. With the effect of falling, the cavity begins to close, and the two separated parts begin to approach each other.

e) Each stroke from the start, the slot 1.12 cm. counted until closing. As soon as it is closed, some sample is taken from here to determine the water content and the number of strokes is recorded.

f) The bowl is cleaned, a little more distilled water is added to the sample in the mixing bowl and mixed.

g) Operations c, e, f are done sequentially. This process should be repeated at least 4 times.

At the end of the experiment, a logarithmic scaled stroke number – water content graph is drawn. The water content value corresponding to 25 strokes from the graph is determined as the liquid limit value.

Plasticity is a feature of fine-grained soils and means being able to be shaped without breaking. The plastic limit is defined as the water content at which cracks appear on the surface of the wet soil during kneading. In other words, the plastic limit is the water content value at which the soil transforms from a semi-solid material to a plastic material.

Performing the Plastic Limit Experiment:

a) A portion of the sample, which has been passed through the sieve no. 40 and used for the liquid limit test, is rolled on the frosted glass with the palm of the hand.

b) 3 mm formed during rounding with the palm. thick bars, when cracks and self-breaking occur, they are taken into the sample cup to determine the water content.

c) The sample weighed together with the sample container is left for drying in the oven.

d) If the ground rods do not crack or split even though the diameter is below 3 mm, the ground is considered to be plastic yet.

e) It is expected that the water content will decrease for a while. The experiment is continued by repeating the rounding process with the palm of the hand, and it is applied for options b and c.

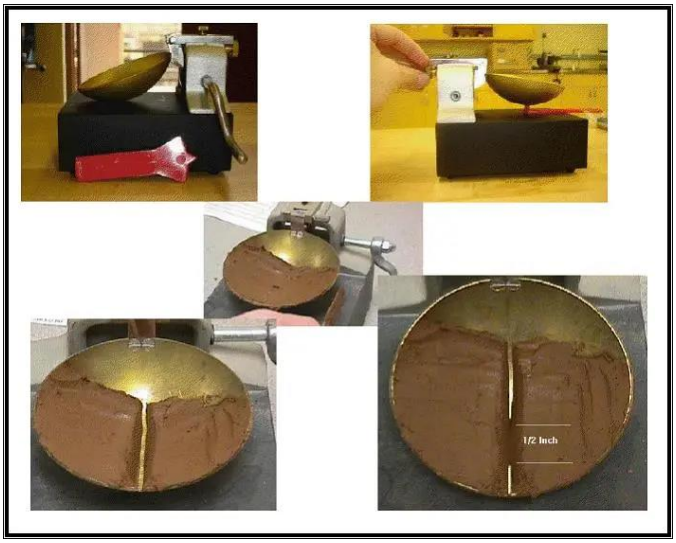

Figure 1. Casagrande Apparatus

RESULTS and DISCUSSION

Figures 2 and 3 show the graphical comparison of Liquid limit and plasticity Index values, respectively. The X-axis shows the experimentally calculated data, while the Y-axis shows the predicted data by the ANN. As can be seen from the figure, the estimated and data overlap very significantly with the experimental data. So much so that the R^2 values are very close to 1.

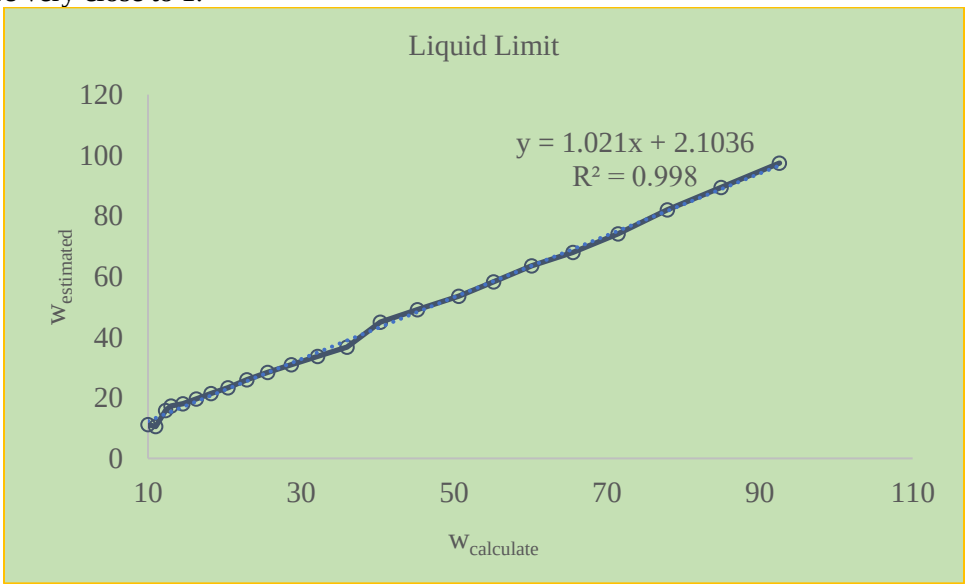

Figure 2. Liquid Limit Comparison

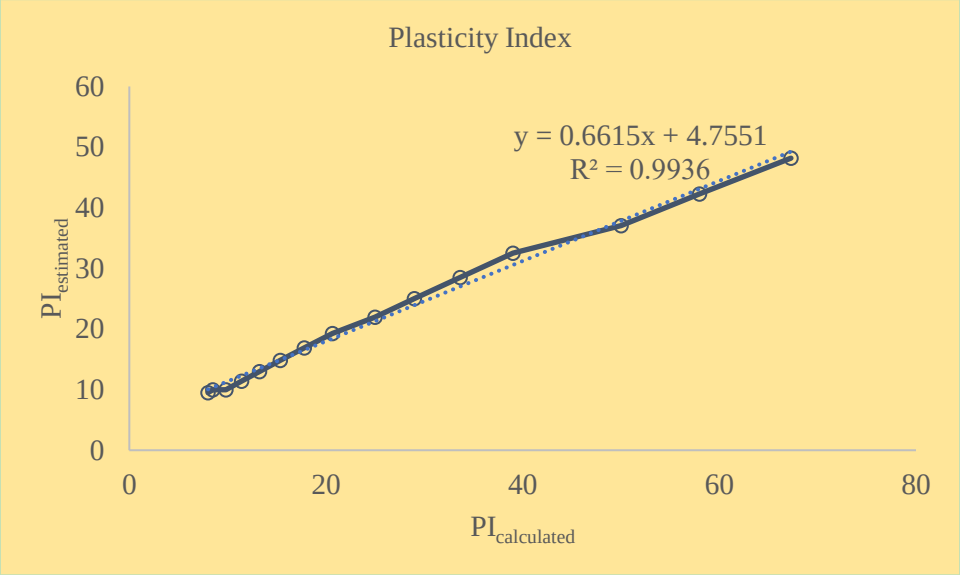

Figure 3. Plasticity Index Comparison

CONCLUSION

In recent years, the use of expert systems such as machine learning or artificial intelligence methods has become widespread in the creation of soil properties and soil behavior prediction models. It is seen in the literature that soil properties are successfully estimated using expert systems. This study, it is aimed to introduce new generation methods for determining soil properties (Atterberg limits) and explaining soil behavior in geotechnical engineering. Artificial intelligence methods such as artificial neural networks and fuzzy logic are frequently used today to determine soil properties and explain soil behavior. Artificial neural networks are an advantageous method compared to traditional regression methods.

It should be emphasized that once the model has been trained and tested, it can be used as an accurate and fast tool for estimating settlements under specified conditions. It is thought that a new phase has been passed with the use of these new-generation trends in geotechnical engineering.

Abstract

Nowadays, intensive work is being done on the evaluation of household waste and during the production of various products. This study compiles studies investigating the usability of wastes such as marble dust, fly ash, phosphogypsum, and glass dust in asphalt pavement mixtures. Marshall stability samples were prepared by using asphalt cement at 3.5, 4.0, 4.5, 5.0, 5.5, 6.0, and 6.5 ratios to determine the optimum binder ratio. The optimum bitumen percentage was determined by applying the Marshall stability test to the prepared samples. Marshall stability test was applied to the samples for the optimum bitumen percentage found as 4.9%. The variation of Marshall stability and yield values in bituminous mixtures using industrial waste fillers were investigated. In addition, the usability of used engine oils in the modification of bituminous binders has also been mentioned. For this purpose, bitumen was modified by mixing horse engine oil in 5 different ratios ranging from 1% to 5% from 70/100 penetration class to bitumen using a standard method. The changes in the bitumen as a result of the modification were investigated on basic engineering properties such as penetration, softening, flash point, and viscosity. At the same time, it was revealed how the temperature sensitivity of the bitumen and the mixing and compaction temperatures changed after the bitumen was modified with used engine oil. In addition, the modification index is defined for each test method. As a result, a significant change has occurred in the basic engineering properties of the modified bitumen samples using different ratios of used engine oil additives. It was determined that the softening point, flash point, and viscosity values of the bitumen with an increase in the penetration value were decreased. According to the evaluations made on the basic engineering properties of bitumen, it was predicted that it would be possible to recycle used engine oils by using them in bitumen modification.

Keywords: Transportation Engineering, Pavement, Waste Materials, Circular Economy, Civil Engineering

INTRODUCTION

The storage or abandonment of various products obtained as waste creates great difficulties and brings great problems to a society, including environmental pollution. Today, intensive work is being done on the evaluation of by-products or wastes obtained during the production of various products. Different applications are seen in obtaining high-performance mixtures. Among these applications are the use of various additives, material selection with high-performance value, high-quality control, different design methods, and up-to-date testing techniques. One of the methods applied in the production of high-performance bituminous hot mix used on roads is the use of industrial waste materials as an additive. With the evaluation of waste materials, environmental pollution caused by wastes is prevented and some properties of roads are improved by using these wastes. In addition, the evaluation of waste, considering the principles of circular economy, it also contributes to the national economy.

METHODS

Waste engine oil was added to the supplied bitumen samples at the rates determined by the bitumen weight (from 1% to 5%) and the modification was carried out.

(i) Heating the bitumen at 145±5 °C, discharging the bitumen into containers of 500 grams,

(ii) Adding the waste engine oil additive to the bitumen at the determined rates,

(iii) Processing the bitumen-waste engine oil mixture at 140±5 °C at 1000 revolutions per minute. It is mixed for hours.

In the study, the physical and mechanical effects of industrial wastes with different properties (marble dust, fly ash, phosphogypsum, and glass dust) on the asphalt concrete wear layer were investigated. Bituminous mixtures prepared with fixed bitumen content and different stone dust and industrial waste fillers (marble dust, fly ash, phosphogypsum, and glass powder) ratios. Marshall stability test was performed and the variation of void, stability, and yield values were investigated.

In another different type of study, the changes in the basic engineering properties of modified bitumen obtained by adding Waste Engine Oil at different rates were investigated. In this study, penetration, softening point, viscosity, and flash point tests were carried out to determine the changes in bitumen.

RESULTS and DISCUSSION

According to the penetration test results, it will be seen that there is a significant increase in the penetration value with the increase in the ratio of Waste Engine Oil added to the bitumen. According to the penetration classification system, bitumen modified with Waste Motor Oil up to 3% remains in the pure bitumen class (70/100). However, modified bitumen containing 4 and 5% WASTE ENGINE OIL changes the existing bitumen class. Waste Engine Oil modified bitumen samples at the specified rates provide 100/150 bitumen class penetration values. In addition, it is observed that with each unit increase of Waste Engine oil up to 3%, approximately 5 units of penetration increase occurs, but at 4%, the increasing amount is 10 units compared to 3%, and 5% of the increasing amount is 4%.

According to softening test, as the waste motor oil and additive ratio increases, there is a significant decrease in the softening point of the modified bitumen. In addition, an increase in the ratio of one unit of Waste Engine Oil caused a decrease in the softening point of 2°C on average.

It has been revealed that the flash points of bitumen modified with different ratios of Waste Motor Oil decrease up to 30 °C. It has been observed that the bitumen modified with 5% waste engine oil has reached the limit value defined in the TS EN 12591 standard, 230 °C, for most of the bitumen samples. For this reason, it becomes necessary to inspect the modified bitumen obtained by adding 5% and more Waste Engine oils to the bitumen in terms of safety.

According to the viscosity test results, the viscosity value was found to be high for all samples at temperatures of 110 °C. However, the viscosity values measured in the modified bitumen with Waste Engine Oil were lower than that of the pure bitumen. In addition, the decrease in viscosity becomes more pronounced as the waste-engine oil ratio increases. A similar trend is observed at other temperatures (135 and 165 °C). However, no large differences were observed between the measurements made at high temperatures compared to those made at low temperatures. For example, in the viscosity measurements made for pure bitumen at 165 °C, a value of 139 cP was reached, while this value was determined as 90 cP in modified bitumen with 5% Waste Engine Oil. However, considering the viscosity values at 110 °C, this value was measured as 2263 cP for pure bitumen, and 1154 cP for modified bitumen with 5% Waste Engine Oil.

In another different type of study, the results of the tests (void values in terms of %, and yield values in mm) performed for mixtures with filler additives such as marble powder, phosphogypsum, fly ash, glass powder and stone powder are shown in Figure 1.

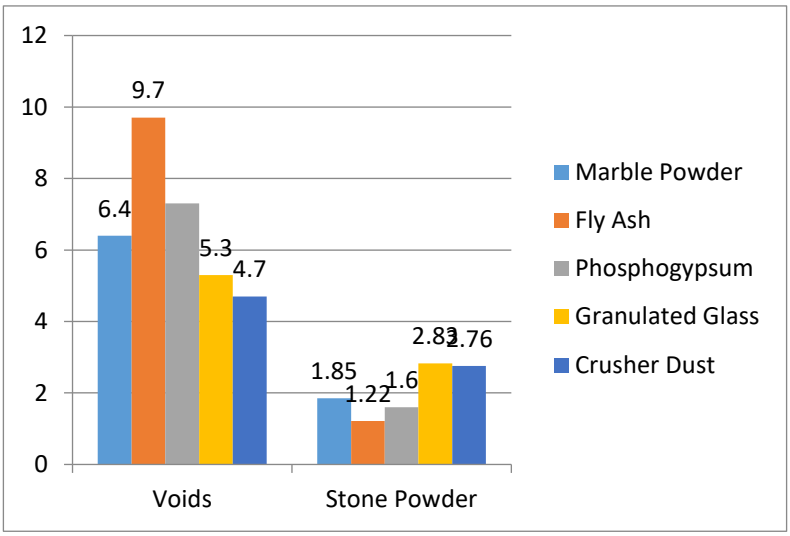

Figure 1. Test Results for different filler types

The changes occurring in pure bitumen with a penetration class of 70/100 modified with AMY at intervals ranging from 1% to 5% by bitumen were investigated over the basic engineering properties of bitumen. And as a result, as the rate of waste engine oil increases;

(i) Increase in penetration values,

(ii) Decrease in softening points,

(iii) Decrease in flashpoints,

(iv) Decrease in viscosity values,

(v) Increased sensitivity to temperature

(vi) A decrease in mixing and compaction temperatures was observed.

In the other type of study, Marshall stability tests were applied to the samples with the same grain distribution and optimum bitumen content, prepared by using natural fillers in the aggregate and industrial waste materials instead of natural fillers. Evaluations of the results were made with void, stability, and yield values. The void percentage values of the mixtures prepared with the addition of marble dust and glass powder fillers are between 3 - 5%, which are the specification limits, and the fly ash and phosphogypsum void values are well above the specification limits. Therefore, it is concluded that it cannot be used in special cases where impermeability is required. The stability values of the mixtures with marble dust, fly ash, phosphor, and glass powder fillers were above the lower limit value of the specification, 900 kg. The yield values of the mixtures with marble powder, phosphogypsum, and glass powder fillers remain between the specification limits of 2 mm – 4 mm. The flow values of fly ash fillers are below the specification limits. These values show that fly ash behaves like a brittle material with increasing filler ratios.

In general, as the waste filler ratio increases, the void ratio and stability values increase and the flow values decrease in all industrial wastes except glass powder waste.

In experimental studies, it was determined that the most suitable industrial waste filler ratio in terms of Marshall stability test results was 4% stone dust - 3% industrial waste filler. Even at the rate of 0% stone dust - 7% industrial waste filler, specification limits are provided.

The test results show that industrial waste filler materials can be used at a rate of 7% instead of stone dust filler in hot bituminous mixtures. It is thought that the coating layers produced by using marble dust, fly ash, phosphogypsum, and glass dust industrial waste fillers in hot bituminous mixtures will have good strength.

CONCLUSION

Industrial enterprises generally do not expect any financial income from waste. The circular economy, on the other hand, aims to preserve their value for as long as possible by minimizing waste generation and returning materials and resources to the product cycle at the end of their use. They want to get rid of these wastes that occupy the field unnecessarily. Therefore, in road pavement works, taking into account the transportation cost, using industrial wastes as fillers, or adding waste materials to bituminous mixtures, both economic gain will be achieved and these materials that cause environmental pollution will be evaluated in this way.

Özet

İnsan nüfusunun artmasıyla birlikte insanlar ve hayvanlar arasındaki etkileşim artmaktadır. Bu durumla paralel olarak özellikle evde beslenen hayvan sayısı da çoğalmıştır. Artan teknolojik gelişimle birlikte gerek şehir hayatında gerekse kırsal alanlardaki hayvanların başta trafik kazaları olmak üzere, yüksekten düşme, ateşli silah yaralanmaları, hayvanların birbiriyle olan kavgaları ve travmalar sonucunda kemik kırıklarıyla sıklıkla karşılaşılmaktadır. Bunların tedavisine yönelik birçok seçenek bulunmaktadır. Konservatif tedavi süreci, anatomik ve rijit fiksasyonun uygulandığı mekanik ve operatif dönem ile devam etmiş; bugün ise biyolojik ve mekanik prensiplere dayanan yeni bir döneme geçilmiştir. Kırık biyolojisinin kırık iyileşmesi üzerindeki sürecin daha iyi anlaşılması ve mutlak stabiliteye kıyasla, göreceli stabilite kavramının ortaya konması, kırık tedavisinde biyolojik tespit yöntemlerinin daha da gelişmesine yol açmıştır. Öncelikli olarak hayvan refahının göz önünde bulundurulduğu ve konforunun düzeltilmesi hedeflenmektedir. Tüm ortopedik operasyonlardan sonra kırılan kemiğin bir an önce iyileşmesi ve hastanın tekrar eski sağlığına kavuşması amaçlanmaktadır. Kırık iyileşme komplikasyonlarını en aza indirgemek ve kırık iyileşmesini hızlandırmak için kullanılacak bütün implant çeşitlerinde biyolojik osteosentez ilkelerine uyularak opere edilmeye özen gösterilmelidir. Biyolojk osteosentez ilkeleri; eksen düzgünlüğü, kemiğe gelen damarsal bağlantının zarar görmesini engelleyecek uygun bir fiksasyon sistemi ve non invaziv operasyon seçeneklerinden yararlanmaktır. Daha önceleri kırık hattındaki mekanik yaklaşıma verilen önem giderek yumuşak doku desteğinin, canlılığının korunmasına ve bu anlamda biyolojik görüşe doğru yönelmektedir. Biyolojik osteosentez ilkelerini prensip edinen birçok implant üretilmekte ve gün geçtikçe ortopedi ve travmatoloji alanında çalışmalar devam etmektedir.

Anahtar Kelimeler: biyolojik osteosentez, göreceli stabilite, kırık iyileşmesi, mutlak stabilite

Biological osteosynthesis in orthopedic surgery

Abstract

The interaction between humans and animals is increasing along with the human environment. In parallel with this situation, the number of animals living at home has also increased. Along with the increasing technological development, animals in rural areas, especially traffic accidents, fall from height, explosion gun spills, fights from animals and animals in rural areas. As a result of trauma, long bone fractures occur. Compared to the operation on it, better results and absolute stability, it is aimed to reveal the final stability construction, to re-fried the geometric fixation methods in the fracture treatment, and to provide the comfort of the fracture treatment. is intended. Major axis straightness benefits from an appropriate fixation operation that will prevent damage to the vascular connection to the bone. Many implants are produced and continue to operate in the field of orthopedics and traumatology.

Keywords: absolute stability, biological osteosynthesis, fracture healing, relative stability

GİRİŞ

Kırık iyileşmesinde tarihsel olarak alçı tespiti ve traksiyon uygulamaları ile başlayan konservatif tedavi süreci, anatomik ve rijit fiksasyonun uygulandığı mekanik ve operatif dönem ile devam etmiş; bugün ise biyolojik ve mekanik prensiplere dayanan yeni bir döneme geçilmiştir.
Kırıkların sağıltımında önemsenmesi gereken en kısa zamanda uygun pozisyonda kemiğin kaynamasını sağlayıp, kırılan kemiğin eski işlevsel fonksiyonuna en erken sürede döndürebilmektir. Kırık biyolojisinin daha iyi anlaşılması, kırık fiksasyonunda, yumuşak dokuların ve kemiğin lokal beslenmesinin korunmasının önemini göstermiştir. Kırık iyileşmesinde, kırık bölgesindeki yumuşak dokuların ve lokal kan dolaşımının uygulanan tedavi ile mümkün olan minimum zarar görmesi, kırık iyileşmesini hızlandırmakta ve enfeksiyon yatkınlığını düşürmektedir.
Daha önceleri kırık hattındaki mekanik yaklaşıma verilen önem giderek yumuşak doku desteğinin ve canlılığının korunmasına ve bu anlamda biyolojik görüşe doğru yönelmektedir.

GENEL BİLGİLER

Genel olarak kırık sağaltımındaki hedef, en kısa sürede kırık hattında kaynama, erken fonksiyonel iyileşme ve postoperatif dönemde hayvanın rahatlığını sağlamak olmalıdır (Harasen, 2013).
Diafizyal ve metafizyal kırıklarda indirek redüksiyon tekniği ve minimal hasar ancak optimal materyalin kullanımı, ortopedi'de yeni bir görüş olarak ortaya çıkmıştır. Kırık iyileşmesinde osteosentezle elde edilen primer stabilitenin etkinliği çok fazla olmadığından, bilhassa parçalı diafizyal kırıklarda, kırık fragmanların rijit tespitinin çok önemli olduğu görüşü artık güncelliğini kaybetmiştir. Redükte edilmemiş canlı fragmentlerın kırık kallusuna hızla entegrasyonu, kırık hattının mekanik gücünü arttırmakta ve implantın aşırı yüklenmesi ve yorgunluğa bağlı oluşacak yetmezlik riskini azaltmaktadır. Minimal invaziv tekniklerle; kesin rijit tespitteki kompresyon uygulamasının aksine, kırık hattı kompresyon uygulanmadan, köprü şeklinde kat edilerek dizilim sağlanır (Muratlı ve ark., 2003).
Köprüleme osteosentezi (bridging osteosynthesis) ve indirekt redüksiyon biyolojik osteosenteze yakın anlamlarda kullanılan diğer terimleridir (Denny ve ark., 2003, Johnson ve ark., 1998, Palmer 1999).
Osteosentez terimini ilk olarak Belçikalı bir cerrah olan Lambotte kullanmıştır. Her ne kadar Lane ve Lambotte gibi cerrahlar daha 20. yüzyılın başlarında kırıkların internal tespit ile tedavisini uygulamışlarsa da rijit tespit ile primer kemik iyileşmesi elde edilmesi kavramı 20. yüzyılın ortalarında Danis'in yaptığı çalışmalar ile popüler olmaya başlamıştır. Danis'in çalışmalarından esinlenen Müller ve ark. 1950'lerin sonunda AO (Arbeitsgemeinschaft für Osteosynthesenfragen) grubunu kurmuşlar ve kırıkların internal tespiti ile ilgili prensiplerini oluşturmaya başlamışlardır. 1990'lı yılların başına kadar AO'nun kırık tedavisindeki prensipleri:

- Anatomik redüksiyon
- Fragmentlerin rijit tespiti
- Kan dolaşımının korunması
- Erken eklem hareketi olarak tanımlanmıştır.

Bu prensipler ışığında kırıkta kallus dokusu olmadan primer kemik iyileşmesi hedeflenmiştir. Radyografik olarak kallus dokusu görülmesi tespitin stabilitesinin yetersiz olduğu şeklinde yorumlanmıştır. Anatomik redüksiyon ve rijit tespit sonrası hastalara erken hareket verilebilmesi ve başarılı sonuçlar elde edilmesini sağlamıştır (Yurdakul ve Sağlam, 2009, Gauıter ve Sommer, 2003).

Kemiğin Anatomi ve Histolojisi

Kemik Dokusu

Organizmada destek görevi yapan dokudur. Kemikler iskelet kaslarına bağlanma yerleri sağlayarak, pasif hareket sistemini oluştururlar. Kemikler ayrıca organizmanın kalsiyum depolarıdır. Bunlara ek olarak, bir takım kan hücreleri (eritrositler, granulositler, trombositler) yapan kırmızı kemik iliğini barındırırlar. Hücreler arası madde kalsiyum tuzları ile doymuş durumdadır. Sert olmasına rağmen, kıkırdak dokusundan farklı olarak damar içerir (Aslanbey, 2002).

Kemik Anatomisi

Ektremite uzun bir kemikte orta bölümde diaphysis, uçlarda ise epiphysis bulunur. İkisinin arasında kalan bölüme de metaphysis adı verilir. Bu bölgede epiphyseal kıkırdak diskler (cartilago epiphysealis) bulunur. Kemiğin uzunlamasına büyümesini sağlarlar. Kemik iliği boşluğunu endosteum sarar (Onar, 2008)

Kemik Histolojisi

Kemik, bütün canlı vücudunun en sert dokularından biridir. Mekanik özellikleri kolay anlaşılabilir nitelikte olan kemiğin, gerilme direnci neredeyse dökme demirinkine eşit, bununla beraber üç kat daha hafif ve on kat daha esnektir. Vücutta sağlam bir destek dokusu olmasının yanında, aynı zamanda mineral dengesinin düzenleyicisi ve kan hücreleri rezervuarı olarak da görev alır.
Kemik dokusu; canlı, oldukça iyi kanlanan ve innervasyona sahip, dinamik, mineralize bir bağ dokusudur. Kemik dokusu, ekstraselüler matriks içerisine gömülmüş mezenkimal hücreler içermektedir. Kemik iliğinin mekanik hasarı, kemik ve periost hücrelerinin aktivitelerini etkileyebilir (Bucholz ve ark., 2011, Jungueria ve ark., 1995, Schenk 2003, Miller 2004).

Kemik Zarları

Kemiklerin iç ve dış yüzlerini saran birer zar mevcuttur. Dış yüzeydekine periosteum, iç yüzeydekine ise endosteum adı verilir. Periosteum kompakt bağ dokusu, endosteum ise hücresel bir yapıdadır (Aslanbey 2002).

Kemik Hücreleri

Kemik dokularında dört çeşit kemik hücresi vardır.

Osteoprogenitor Hücreler

Bunlar kemiğin ana hücreleri olup şekilci fibroblastlara benzeyen mezenkim hücreleridir. Endostun ve periostun iç katında ve Havers kanalları bölgesinde bulunurlar. Osteoprogenitor hücreler kemik yapımı sırasında daha bol ve aktiftirler.
Sekunder kemiklerde yıkımlanmada bunlar aktifleşip bölünür, kemik yapımı ve kemik kıkırdaklarının tamiri sırasında hızla bölünüp çoğalır ve bir kısım osteoblastlara dönüşürler (Aslanbey 2002, Arıcan 2020).

Osteoblastlar

Kemik yapımında görev alan, çekirdekleri büyük olan hücrelerdir. Osteoblastlar, kemik üretiminin yoğun olduğu bölgelerde epitel hücrelerine benzer şekilde dizilmişlerdir. Endoplasmik retikulumları oldukça gelişmiş olup, bol miktarda golgi vezikülleri ve yüksek metabolik aktiviteyi karşılayacak miktarda mitokondriumları ve kapillerleri mevcuttur. Bu durum osteoblast'ların kemik dokusundaki protein sentezindeki önemini açıklamaktadır. Kemiğin üst yüzeyinde bulunurlar (Aslanbey 2002).

Osteositler
Yassı şekilde ve ince stoplazmik uzantıları bulunan kemik hücreleridir. Osteositler lamellerin longitüdinal ve radial akslarına uygun olup düzenli olarak dizilmişlerdir. Bu hücrelerin asıl görevi madde alışverişini sağlamaktır. (Aslanbey 2002, Arıcan 2020).

Osteoclastlar
Çekirdek yapıları ve sayıları farklı olup, kemik rezorbsiyonunda görev alan hücrelerdir. Osteoclastlar hem hücreler arası matriksi hem de mineralleri abzorbe eder. (Aslanbey 2002, Arıcan 2020).

Kırık (Fracture)

Kemik dokusunun patolojik veya travmatik sepeblerden dolayı anatomik bütünlüğünün bozulmasıdır. Kırıklar, geniş ayrılma ve parçalanma şeklinde oluştuğunda çevresindeki kas, tendo, ligament, damar, sinir ve diğer herhangi bir organ yaralanabilir. Hareket sisteminin travmatik bir hastalığı olarak değerlendirilebilir (Altunatmaz 2004)

Etiyoloji

Kemiklerde kırığı oluşturan nedenler travmatik etkiler ve predispozisyon oluşturan birçok etken vardır. Bundan dolayı, hazırlayıcı ve yapıcı olarak iki bölümde incelemek gerekir.

Hazırlayıcı Nedenler;

- Yaşlılık
- Aşırı yorgunluk
- Mineral madde ve vitamin dengesizlikleri
- Lokal bozukluklar (avasküler nekroz)
- Hormonal bozukluklar (osteodystrophia fibrosa)
- Neoplazik oluşumlar (losteosarcoma)
- Yangısal kemik hastalıklar (osteomiyelitis purulenta)
- Metabolik kemik hastalıkları (Raşitizm) (Fossum 2013)

Yapıcı Nedenler

Çok çeşitli travmatik nedenlerdir. Vurma, çarpma, yüksekten düşme, ısırılma,ezilme, sıkıştırma zorlama ve ateşli silah yaralanmalarının yanında, kemik üzerine aniden fazla bir kuvvet veya yükün binmesi, uzun kemiklerin ekseni etrafında zorlayıcı dönmeler, şiddetli kas kontraksiyonları sayılabilir (Aslanbey 2002, Arıcan 2020, Altunatmaz 2004).

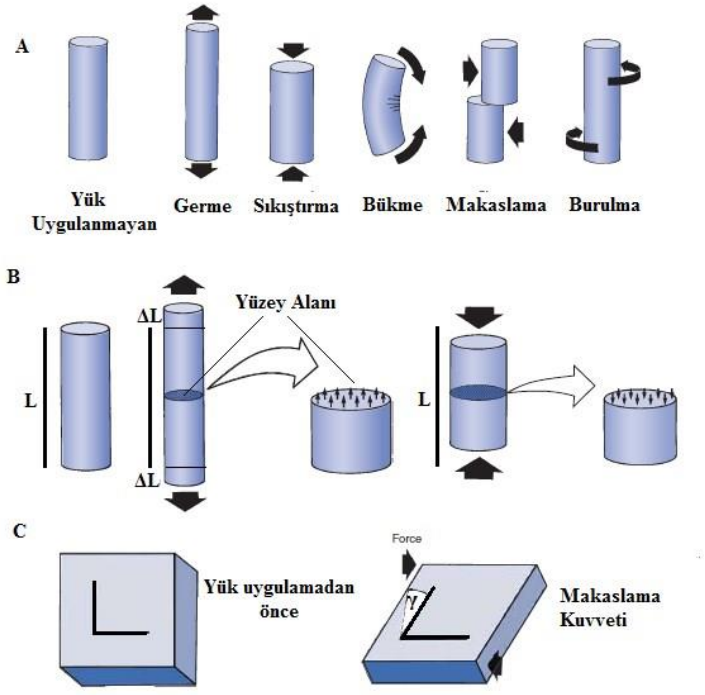
Kırığı oluşturan kuvvet mekanizması

Stres, mühendislik alanında birim alan başına uygulanan kuvvet olarak tanımlanır ve kuvvetin alan başına yoğunluğunu ifade eder. Mekanik fizikte üç çeşit tek-yönlü kuvvet bulunur.

Bunlar;

- germe (tensile),
- sıkıştırma (compression)
- makaslama (shear).

Eğer kemik dikey kuvvetlerin etkisi altında ise germe veya sıkıştırma stresine, paralel kuvvetlerin etkisi altında ise makaslama stresine maruz kalır (Resim 1) (Gürgül ve ark., 2016).



Resim1: A) Saf kuvvetler B) Sıkıştırma ve germe kuvveti etkisi altındaki bir cisimde gözlenen boyca kısalma ve boyca uzama deformasyonu (ΔL) C) makaslama kuvveti etkisi altındaki bir cisimde gözlenen açısal deformasyon

Kırık İyileşmesi

Kırık iyileşmesinin temeli bir bağ dokusu iyileşmesine dayanmaktadır. Yumuşak dokudan farklı olarak, osteoblast ve osteoklastların aktiviteleri ile özelleşmiş kalsifiye kemik dokusu oluşumudur.
Yaralanma anından itibaren diğer dokulardan farklı olarak skar dokusu bırakmadan eski haline ve eski fonksiyonuna en yakın düzeye gelene kadar devam eden bir süreçtir.
Bütünlüğü bozulan kemiğin iyileşme süreçlerini primer ve seconder olarak incelemek gerekir. Primer kırık iyileşmesi operatif müdahale yapılarak (pin, plak, vs) iyileşme şekli, belirgin bir kallus oluşmadan temasla iç kallus oluşumuyla, seconder kırık iyileşmesi ise kırık fragmentlerine herhangi bir müdahale yoktur. Onarım evresinde dış kallus oldukça belirgindir, hatta fragmentlerin birbirine uyumsuz pozisyonları sonrasında makroskobik olarak şiddetli kallus yapıları görülebilir.
İyileşmedeki en önemli ön koşul ilgili dokuların canlılığının yıkıma uğramamış olmasıdır. Kemik fragmanlarının avaskülarizasyonu kırık boşluğundaki kallus köprüsünü engeller.
Kırık şekillendikten ve iyileşme oluncaya kadar kemikte bir takım fizyolojik olaylar meydana gelmekte, bozulan anatomik kemik bütünlüğünün yeniden sağlanmasına yönelik olup düzenli kemik dokusu ile tekrar birleşmesine kadar devam eder. Temel olarak iki tip kırık iyileşmesi bulunmaktadır (Robins ve Kumar 1990, Burgucu 2016, Kılıçoğlu 2002, Frıgg 2001, Gauıter ve Sommer 2003).

Primer Kırık İyileşmesi

Primer kırık iyileşmesi dislokasyona uğramamış kırık fragmentlerin uçlarında veya rijit osteosentez uygulanan kırıklarda görülen bir kırık iyileşmesi şeklidir. Belirli bir dış kallus oluşmadan, sadece iç kallusla devam eden temas iyileşmesi şeklinde oluşmaktadır. Radyolojik olarak kallus görülmez. Kırık uçlarında bulunan nekrozu, osteoklastlar rezorbe eder. Peşinden osteoblastlar yeni kemik yapısını oluşturur. Kıkırdak süreç olmadığından dolayı intramembranöz kemikleşmeye benzetilir. Arzu edilen bir iyileşme türüdür.
Kırık sağaltımında fragmentlerin redüksiyonu sağlandıktan sonra bölgede uygun bir kompresyon ve rijid internal fiksasyon ile mutlak bir immobilizasyon sağlanır ise, bu sayede kırık iyileşmesi, endosteal ve periosteal kallus oluşumu ile olmayıp, direk kortikal kemiğin gelişmesiyle oluşur (Erol ve ark., 2014)

Sekonder Kırık İyileşmesi

Sekonder kırık iyileşmesi daha çok rastlanan, kırığın rijit fikzasyonunun yeterli yapılmadığı veya kapalı fikzasyonun yapıldığı durumlarda şekillenmektedir. Doğal iyileşme şekli budur. Biyolojik osteosentez yapılan olgularda seconder kırık iyileşmesi oluşur. Yapılan deneysel çalışmalarda, anatomik redüksiyon ve rijid tespit ile kıyaslandığında biyolojik tespit grubunda kemik köprüleşme ve kallusun mineralizasyonun daha hızlı ve etkin olduğu saptanmıştır. Radyolojik olarak bu iyileşme çeşidinde kallus izlenir. Sekonder kırık iyileşmesi birkaç evreye ayrılmıştır. Bu iyileşme süreleri zaman olarak birbirlerinden kesin sınırlar ile ayrılmazlar. Histolojik görünümlerine göre yapılan bu sınıflandırmalar ufak farklılıklar hariç, genel olarak aynı bulgular kabul edilip benzer sıralamalar yapılmıştır (Erol ve ark., 2014, Dernell 1999).

Hematom Devresi

Kemik kırılınca, kemiğin ve çevredeki yumuşak dokuların parçalanması sonucu ortaya çıkan kan, lenf ve eksudat infiltrasyonu kırık bölgesinde birikerek hematomu oluşturur. Hematom devresi yaklaşık 2-3 hafta kadar sürer. Hematom içerdiği hücrelerle ve ajanlar sayesinde ileriki zamanda doku matriksinin oluşumunda yardımcıdır (Gartner ve Hıatt 2006, Arıcan 2020)

Primer Kallus (Gelişme) Devresi

Osteojenik Hücrelerin Farklılaşması ve Proliferasyonu

Bu aşamada, 48 saat içinde iyice gelişir. Kapillarlardan zengin olan bölgelerde farklılaşma osteoblast halinde, damarı az olan bölgelerde chondroblast halinde olur ve daha sonra kemikleşir.

Proliferasyon Dokusunun İlerlemesi:

Periost'un osteojenik katını oluşturan hücrelerin osteoblast veya chondroblast halinde farklılaşması sonucu bu kat kalınlaşır. Bu oluşumlardan kurulu yeni doku, fragmentlerin uçlarından birbirine doğru ilerler, karşılaşır ve birbirlerine karışırlar (Yorgancıgil 2001, Yavuz 2012).

Konsolidasyon (Pekişme) Devresi

Fragmentlerin anatomik devamlılığı ve temas işlemi, kırık uçlarının osteojenik tabakalarının birleşmesi ve kaynaşması ile olur. Dıştan eksternal (periostal) kallus, içten ise, medullayı dolduran endosteal kallus ilerler. Endokondral kemik dokusu gelişir ve kemikleşme başlar (Buckwalter ve ark., 1995, Burgucu F 2016).

Kemiğin Yeniden Şekillenmesi

Bu matriks yapımı ve yeni kan damarlarının oluştuğu granülasyon döneminden sonra bölgede kıkırdak gelişimi görülür. Bu taze kıkırdak dokusu gelişimi ve damarlanmasını takiben kalsifikasyon başlar ve artık yeniden şekillenme hareketi de başlamıştır. Kırık iyileşmesinin ilk dönemlerinde periosteal damarlar, geç dönemde ise besleyici (nutrisyen) damarlar, kılcal damarların tomurcuklanmasına yardımcı olur. Fakat kılcal damar gelişimi osteojenik hücre çoğalması kadar hızlı olmadığından, beslenmenin daha iyi olduğu kemiğe yakın seviyedeki hücreler, osteoblastlara dönüşür. Fragmentlerin ölü uçları rezorbe olur, aradaki açıklık eksternal ve endostal kallustan gelişen spongiyöz kemik trabekülleri ile doldurulur. Bu koşullarda yeniden şekillenme evresi en uzun periyottur.
Son dönemde yapılan çalışmalarda kırık iyileşmesindeki biyolojik dönemler şöyle tanımlanır:

1. Yangı (İnflamasyon) evresi,
2. Onarım (Reperasyon) evresi,
3. Yeniden şekillenme (Remodeling) evresi (Gartner ve Hıatt 2006, Arıcan 2020, Kılıçoğlu 2002, Denny 2000).

BİYOLOJİK OSTEOSENTEZİN ÖNEMİ

Son yıllarda kırık tedavisinde önemli gelişmeler olmuştur. Kırık fragmanlarının anatomik redüksiyonu ve kompresyon sağlanarak stabilize edilmesi, bu tip tespitte mekanik stabilite ön planda tutulmaktaydı. Kırık biyolojisinin kırık iyileşmesi üzerindeki sürecin daha iyi anlaşılması ve mutlak stabiliteye kıyasla, göreceli stabilite kavramının ortaya konması, kırık tedavisinde biyolojik tespit yöntemlerinin daha da gelişmesine yol açmıştır. İntramedüller çivi ve eksternal fiksatör gibi kırığı atelleyen yöntemler ile elde edilen başarılı sonuçlar, plakların da aynı amaçla kullanılmasını gündeme getirmiş ve plaklama tekniği daha popüler olmuştur. Minimal invaziv plak osteosentezi tekniğinde kırık hattı açılmadığı için kırık bölgesinde dolaşım bozulmamaktadır.
Mekanik stabiliteye önem veren tespit yöntemleri giderek yerini biyolojik tespit yöntemlerine bırakmış ve bununla birlikte tüm cerrahi alanlarda olduğu gibi ortopedik travma cerrahisinde de minimal invaziv yöntemler popüler olmaya başlamıştır. Tanım olarak minimal invaziv osteosentez, kemiğe yumuşak doku pencerelerinden ulaşıldığı, kemik ve yumuşak dokuya saygılı indirekt redüksiyon tekniklerinin kullanıldığı, kırık hattına direkt redüksiyon gerekirse bunun minimal ek travma oluşturarak yapıldığı ve olabildiğince minumum iz bırakan cerrahi aletlerin kullanıldığı bir tekniktir. Goodship ve Kenwright, kırık hattındaki mikro hareketin kal oluşmasını artırdığını göstermişlerdir. Hareketin aşırı olması ise doku farklılaşmasını durdurmakta ve kaynamamaya yol açmaktadır. Yapılan esnek tespit ile kırıkta kontrollü harekete izin verilirken bu aşırı hareket engellenmektedir. Esnek tespit sonrası oluşan kal dokusu ise kırık bölgesinin stabilitesini artırmakta ve implantın aşırı yüklenmesini önlemektedir. Esnek tespit sonrası elde edilen stabilite "göreceli stabilite" olarak adlandırılmaktadır. Göreceli stabilite sonrası esnekliğin ne kadar olacağı ise Perren ve Boitzy'in tanımladığı "boşluk gerilim teorisi" ile açıklanabilir. Kırık hattındaki gerilim (ε), kırık hattındaki hareketin (δL) fragmentler arasındaki boşluğun genişliğine (L) oranı olarak tanımlanmıştır; ε= δL/L. Bu teoriye göre boşluk dar olduğu zaman aradaki granülasyon dokusunun gerilimi fazla olmakta ve hareketi daha az tolere etmektedir. Kırık hattının doğal rezorpsiyonu bu boşluğu genişleterek bir anlamda gerilimi düşürmektedir. Boşluğun geniş olduğu kırıklar ise belli miktarda harekete karşı daha dayanıklıdır. Sonuç olarak kırık bölgesindeki gerilimin %2'den az olması kal dokusu oluşmasını sağlamaktadır, %10-30 arasındaki gerilim ise yetersiz kemikleşmeye ve fibröz kaynamamaya yol açmaktadır. Biyolojik tespit ve Minimal İnvaziv Plak Osteosentezi (MİPO) Kırık tedavisinde göreceli stabilite kavramının anlaşılması, plak osteosentezinde daha biyolojik tespit yöntemlerinin kullanılmasını gündeme getirmiştir. Her ne kadar bu tekniklerde klasik uzun cerrahi kesiler kullanılmış olsa da, kırığın özellikle medialinde yumuşak doku diseksiyonu

yapılmadığı için kırık bölgesindeki lokal kan dolaşımı korunmuştur. Son yıllarda vida başlarının plağa kilitlendiği kilitli plakların geliştirilmesi MİPO tekniğinin de gelişmesine olanak sağlamıştır. PC-Fix geliştirildikten sonra başı kilitli vidaların biyolojik avantajları anlaşılmış ve AO tarafından distal femur ve proksimal tibiada MİPO tekniği ile uygulanabilecek LISS (Less invasive stabilization system) implantı üretilmiştir. LISS, vida başlarının plağa kilitlendiği bir sistemdir ve bir plaktan ziyade internal fiksatör olarak görev yapmaktadır. Vida başlarının kilitlenmesi stabilitenin plak-vida birleşim yerinde olmasını sağlamakta ve plak kemik ile temas etmemektedir. Bu nedenle periosteal dolaşım korunmaktadır. Bu kolay monte edilen kılıflar vasıtası ile kendi delen-kendi yiv açan vidalar küçük cerrahi kesilerden perkütan olarak uygulanabilmektedir. Tüm bu özellikler sayesinde distal femur ve proksimal tibia kırıklarında MİPO tekniği daha sık uygulanmaya başlamış ve oldukça başarılı erken klinik sonuçlar alınmıştır (Gönç ve ark., 2012, Yurdakul ve Sağlam 2009).

Özet

Küresel ticarette taşınan yüklerin hacim olarak yaklaşık % 90'ı deniz yoluyla yapılmaktadır. Bu durumun iki önemli nedeni vardır. İlki tek seferde taşınabilen yük miktarının çok fazla olması, ikincisi ise birim taşıma maliyetlerinin diğer taşıma yöntemlerine göre çok düşük olmasıdır. Deniz taşımacılığının bu avantajları kaza durumunda ise etkilerinin büyüklüğünden dolayı bir dezavantaja dönüşmektedir. Deniz kazalarına bakıldığı zaman gemi-gemi çatışma kazalarının en sık meydana gelen kaza türlerinden olduğu görülmektedir. Çatışma kazalarının diğer kazalardan farkı kazaya iki gemi birden karıştığı için etkilerinin ve sonuçlarının da daha büyük ve yıkıcı olmasıdır. Bu çalışmada ülkelerin ulusal ve küresel deniz kazası veri tabanlarından elde edilen 1000'e yakın kaza raporu incelenmiş ve bu raporlardan sadece ticari gemilerin karıştığı kazalar ele alınmıştır. Sonuçta 572 çatışma kazasına ait veriler sistematik şekilde değerlendirilmiştir. Değerlendirme sonucunda çatışma kazalarında kaç kişinin yaşamını yitirdiği, kaçında yangın, karaya oturma, çevre kirliliği meydana geldiği, kazaların nedenleri gibi birçok önemli bilgi elde edilmiştir.

Anahtar Kelimeler: Çatışma kazaları, Deniz kazaları, Deniz taşımacılığı, Denizcilik

Systematic review of the causes and consequences of ship collision accidents

Abstract

In terms of volume, about 90% of the cargoes carried in global trade are transported by sea. There are two important reasons for this fact. The first is that the amount of cargo that can be transported at once is too much, and the second is that the unit transportation costs are very low compared to other transportation methods. These advantages of maritime transport turn into a disadvantage in the event of an accident due to the magnitude of its effects. When maritime accidents are considered, it is seen that ship-ship collision accidents are among the most common types of accidents. The difference of collision accidents from other accidents is that the effects and consequences are greater and more devastating since two ships are involved in the accident. In this study, nearly 1000 accident reports obtained from national and global maritime accident databases were examined and only the accidents involving commercial vessels were discussed. Finally, the data of 572 collision accidents were evaluated systematically. As a result of the evaluation, many important information such as how many people lost their lives in collision accidents, how many fires, grounding, environmental pollution occurred, and the causes of the accidents were obtained.

Keywords: Collision accidents, Marine accidents, Maritime transport, Maritime

GİRİŞ

Denizcilik insanlığın en eski ulaşım ve taşıma yöntemidir ve kanıta dayanan bilimsel tarihi M.Ö. 8000 yıllarına kadar uzanmaktadır (Cherry ve Leppard, 2015). Deniz taşımacılığı günümüzde de geçmişte olduğu gibi önemini sürdürmekte, küresel ticaretin ham madde ve nihai ürünlerin taşınmasında ana taşıma yöntemi olarak hayatımızda büyük bir yer tutmaktadır. Hava ve kara taşımacılığına göre birim taşıma maliyetlerinin düşük olması ve tek seferde taşınan yük miktarı bakımından rakipsiz olması küresel ticarette yüklerin hacim olarak %90'ının deniz yoluyla taşınmasının başlıca nedenleridir (Global, 2018). Sağladığı avantajlar beraberinde büyük sorunlara da yol

açmaktadır. Örneğin artan gemi sayısı, tonajı ve trafiği, mevcut limanların yetersiz kalması, giderek artan çevre kirliliğine yol açması gibi. Bu gibi sorunlar doğru planlama, yenilikçi ve çevreci teknolojilerin denizciliğe uygulanması ve kontrollü büyüme ile bir dereceye kadar tolere edilebilmektedir. Ancak söz konusu gemi kazaları olduğunda; kazaların öngörülemez doğası, çoğunlukla insan hatası kaynaklı olması (Rothblum, 2000), sonuçlarının felaket boyutlarında olması gibi üstesinden gelinmesi ve telafisi zor sonuçlar doğurmaktadır.

Son yıllarda, gemilerin emniyetli seyrini sağlamak için ulusal ve uluslararası düzeyde azami çaba gösterilmektedir. Denizdeki emniyet düzeyini artırmak için denizcilik otoriteleri bir dizi kural ve yönetmelik kabul etmişlerdir, çünkü her yıl meydana gelen binlerce deniz kazası yaralanmalara, ölümlere, deniz kirliliğine ve büyük maddi kayıplara neden olmaktadır (Akyuz ve Celik, 2015). Bu nedenle, emniyet uygulayıcıları olan Uluslararası Denizcilik Örgütü (IMO), Uluslararası Çalışma Örgütü (ILO), Uluslararası Sınıflandırma Kuruluşları Birliği (IACS), Uluslararası Deniz Ticaret Odası (ICS) gibi uluslararası denizcilik kurumları alternatif çözümler sunmaya çalışmaktadır (Akyuz, 2017). Deniz, basit bir olayla birçok insanı öldürebilen emniyetsiz bir ortamdır ve hata da insanın bir parçasıdır. Kurumlar hatayı sıfıra indirmeye çalışsa da bu hedef ulaşılamazdır. İnsanın dahil olduğu operasyonlar karmaşık bir ortamda gerçekleştiği sürece hata oluşacak ve stres, yorgunluk ve ekstra iş yükü koşulları altında da hata olasılığı artacaktır (Mokhtari ve Khodadadi, 2013).

Uzun yıllara dayanan gemi kazası istatistikleri incelendiğinde çatışma kazalarının karaya oturmayla birlikte en sık görülen iki gemi kazası türünden biri olduğu görülmektedir (EMSA, 2021). Ancak gemi-gemi çatışma kazalarını diğer kazalardan daha önemli kılan olgu kazaya iki veya daha fazla geminin dahil olması nedeniyle kazanın sonuçlarının daha büyük ve yıkıcı olmasıdır. Bu durum çatışma kazalarını daha çok üzerinde durulması ve araştırılması gereken bir konu haline getirmektedir. Çatışma kazalarını inceleyen literatüre bakıldığında genelde belirli gemi tipi (Kim ve ark., 2017) ya da belirli bir deniz alanına (Cucinotta ve ark., 2017) odaklanıldığı görülür. Bu çalışmada bütün gemi tipleri ve dünyadaki bütün su yollarında meydana gelen deniz kazaları bir bütün olarak ele alınmıştır.

MATERYAL VE METOD

Çalışmada incelenen veriler, ulusal (Deniz Kazası Araştırma Şubesi – MAIB, Federal Denizcilik Kaza Soruşturma Bürosu – BSU, Ulusal Ulaşım Emniyet Kurulu – NTSB) ve uluslararası gemi kazası veri tabanlarından (Küresel Entegre Taşımacılık Bilgi Sistemi – GISIS) elde edilen 1000'den fazla gemi-gemi çatışma kazasının içinden, çatışan gemilerden en az birinin ticari gemi olması, elektronik seyir yardımcılarına sahip olması gibi kriterler gözetilerek seçilen 572 kaza raporundan elde edilmiştir. Çatışma kazaları sistematik olarak incelenmiş ve Tablo 1'de sınıflandırılan veriler elde edilmiştir.

Tablo 1. Çatışma kazası verileri

Değişkenler	Kategoriler
Kazalara neden olan faktörler	COLREG ihlali, çevresel etkenler, mekanik arıza, STCW ihlali, organizasyonel hata, eksik/bozuk ekipman, yerel kuralların ihlali
Kazaların sonuçları	Tamamen kayıp, yangın, çevre kirliliği, oturma, can kaybı, yapısal hasar
Can kaybı	1-5, 6-10, 11-50, 51 den fazla

Raporlardan elde ve Tablo 1'de gösterilen verilerin frekansları denklem 1 ve kümülatif dağılımları denklem 2 ile hesaplanmıştır.

$$f = \frac{n}{T} \tag{1}$$

Denklemde f, frekansı yani olgu ve olayların meydana gelme sıklığını, n meydana gelen olay/olgu sayısını ve T de olayların meydana geldiği zaman aralığını yıl cinsinden göstermektedir. Çalışmamızda 1978 ve 2022 yılları arasında meydana gelen çatışma kazaları incelenmiştir, yani toplamda 44 yıllık bir periyot göz önünde bulundurulmuştur.

Kümülatif dağılım, bir frekans ile tanımlanmış belirli bir sınıf aralığına kadar bir frekans dağılımındaki tüm frekansların toplamıdır. İncelediğimiz olay ve olguların kümülatif dağılımlarının bulunmasında aşağıda yer alan denklem 2 kullanılmıştır.

$$CD = \frac{f_n}{\sum f} \text{ x } 10^2 \quad (2)$$

Denklem 2'de *CD* kümülatif dağılımı, f_n herhangi bir olaya ait frekansı, Σf de frekans değerlerinin toplamını ifade etmektedir.

Yapılan araştırmaların çoğu, deniz taşımacılığının bir "insan sistemi" olduğunu ve bu şekilde ele alınması gerektiğini vurgulamıştır (Hetherington ve ark., 2006). Çok sayıda deniz kazası ve olayı bir çeşit insan hatası içerir ve insan hataları ancak bir kayıp meydana geldiğinde göz önünde bulundurulur (Harati-Mokhtari ve ark., 2007). Literatürde deniz kazalarına ve özelliklede çatışma kazalarına neden olan faktörler incelendiğinde baskın faktörün insan hatası olduğu görülmektedir (Ugurlu ve Cicek, 2022). Deniz kazaların ana nedeninin ve hâkim faktörün insan unsuru olduğu konusunda araştırmacılar arasında bir fikir birliği vardır (Kirwan, 1987; Martins ve Maturana, 2010; Rothblum, 2000). Yapılan çalışmaların tarihleri göz önüne alındığında insan faktörünün deniz kazalarındaki etkisinin ve oranının önemli ölçüde değişmeden geçmişten günümüze kadar güncelliğini koruduğu görülmektedir. Son 60 yılda, denizcilik endüstrisi kayıpları azaltmak ve verimliliği artırmak için gemi yapısını ve gemi sistemlerinin güvenilirliğini geliştirmeye odaklanmıştır. Günümüz gemi sistemleri teknolojik olarak gelişmiş ve son derece güvenilirdir. Ancak, deniz kazalarının oranı hala yüksektir. Çünkü gemi yapısı ve sistem güvenilirliği emniyet denkleminin görece küçük bir parçasıdır.

Bu çalışmada çatışma kaza raporlarından veri madenciliği ile elde edilen 13 farklı kaza nedeni olduğu görülmüştür. Bu nedenler: insan hatası, hidrodinamik etki/bank etkisi, makine arızası, demir tarama, organizasyonel hata, dümen arızası, fırtına, seyir cihazı arızası, gemi trafik sistemi (VTS) hatası, eksik donanım, römorkör eksikliği, sağlık sorunu, şiddetli akıntı olarak bulunmuştur (Tablo 2).

İnsan hatası seyir hataları, manevra hataları, algısal hatalar ile bireysel hataları içermektedir. Seyir hataları geminin seyri esnasında köprüüstünde seyir cihazlarının yanlış kullanımı/hiç kullanılmaması, haberleşme hataları, prosedür eksikliği ya da prosedürlere uymama, cihazlara fazla güvenme gibi nedenler sonucu ortaya çıkmaktadır. Hidrodinamik etki ve/veya bank etkisi geminin bulunduğu su yolunun dip ve kenar yapısı nedeniyle gemi teknesi üzerinde oluşturduğu ve gemideki operatör tarafından kısmen kontrol edilebilen ve geminin manevrasını genelde olumsuz etkileyen etkenler olarak ifade edilir. Makine arızası iki kısma ayrılabilir; birincisi geminin ileri geri hareketini sağlayan ana makine arızası, ikincisi de geminin güç kaynağı olan jeneratör arızasıdır. Demir tarama gemilerin demirli olduğu durumda demirin dibe tutunamaması sonucu geminin sabit olması gerekirken rüzgâr, akıntı gibi etkenlerle sürüklenmesidir. Organizasyonel hata gemi yönetimi için konulan kuralların gerektiği gibi işlememesi sonucu ortaya çıkan hatalardır. Dümen arızası gemide kumanda edilebilen iki etkenden biri olan geminin yönünü değiştirme fiilini gerçekleştiren düğmen donanımının bu işlevini yerine getirememesi yani geminin istenilen yönde döndürülememesidir. Fırtına denildiğinde büyük dalgalar ve şiddetli rüzgarlar kastedilmektedir. Fırtınalar gemilerin çatışmasına farklı şekillerde etki etmektedir. İlki gemilerin kumanda edilmesini imkânsız hale getirmesi, ikincisi kısıtlı görüşe neden olarak diğer gemilerin görülmesini engellemesi ve gemilerin demir taramasına neden olmasıdır. Radar, otomatik tanımlama sistemi (AIS), küresel konumlama sistemi (GPS) gibi seyir cihazları gemilerin emniyetle seyrinde büyük öneme sahiptir. Bu cihazlardan birinin veya tamamının arızalanması kazaların yaşanmasına neden olabilmektedir. Kısıtlı sularda gemileri yönlendiren ve gemilerin seyrine rehberlik yapan VTS adı verilen yapılar yer alır. VTS operatörlerinin hataları bazen kazaların yaşanmasına sebebiyet verebilmektedir. Gemilerin idare ve kontrolünde halatlar, cihazlar ve diğer donanımlar hayati öneme sahiptir. İhtiyaç duyulduğu anlarda bunlardan birinin eksikliği geminin gerektiği şekilde kontrol edilmesine engel olur ve kazaların yaşanması kaçınılmaz hale gelir. Dar su yollarında gemiler kendi imkanlarıyla manevra yapmakta zorlandıkları ve manevraların riskli olması nedeniyle römorkör adı verilen küçük ama güçlü teknelerden yardım alırlar. Gemilerin manevrası esnasında emniyetli manevra yapılabilmesi için gerekli sayıda römorköre ihtiyaç vardır. Geminin idaresi esnasında kilit personelden ortaya çıkabilecek sağlık sorunları o kişinin görevini tam olarak yapmasını engelleyebilmektedir. Son olarak da fırtına da olduğu gibi şiddetli akıntı da geminin sevk ve idaresini zorlaştırmakta ve istenmeyen hareketler yapmasına yol açmaktadır.

Tablo 2. Çatışma kazalarının nedenleri ve kümülatif dağılımları

Kaza Nedeni	Kaza Sayısı	Kümülatif Dağılım (%)
İnsan hatası	488	81.87919463
İnsan hatası - Hidrodinamik etki / Bank etkisi	19	85.06711409
Makine arızası	11	86.91275168
Demir tarama	9	88.42281879
Hidrodinamik etki / Bank etkisi	9	89.93288591
İnsan hatası - Organizasyonel hata	8	91.27516779
İnsan hatası - Makine arızası	7	92.44966443
Dümen arızası	7	93.62416107
Fırtına	4	94.29530201
İnsan hatası - Demir tarama	4	94.96644295
İnsan Hatası - fırtına	4	95.63758389
İnsan hatası - Seyir cihazı arızası	3	96.1409396
İnsan hatası - Eksik donanım	3	96.6442953
Makine arızası - Hidrodinamik etki	2	96.97986577
İnsan hatası - Bank etkisi - Fırtına	2	97.31543624
İnsan hatası - VTS hatası	2	97.65100671
İnsan hatası - Makine arızası - Organizasyonel hata	2	97.98657718
İnsan Hatası - Dümen arızası	2	98.32214765
İnsan hatası - Bank etkisi - Organizasyonel hata	2	98.65771812
Şiddetli akıntı	2	98.99328859
Demir tarama - Şiddetli akıntı	2	99.32885906
İnsan hatası - Demir tarama - Fırtına	2	99.66442953
Eksik donanım - Römorkör eksikliği	1	99.83221477
İnsan hatası - Sağlık sorunu	1	100

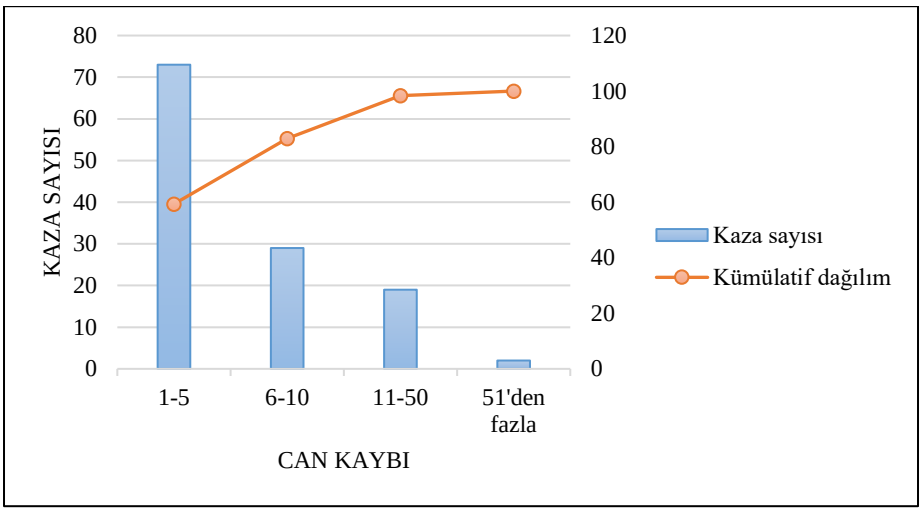
Denizde emniyet ve deniz kazaları söz konusu olduğunda farklı öncelikler ortaya çıkmaktadır. Bunlardan ilki ve en önemlisi insan hayatıdır. İnsan hayatını sırasıyla çevrenin korunması/çevre kirliliğinin önlenmesi ve gemi ve yük kaybını içeren maddi kayıplar gelmektedir. Çatışma kazalarının sonucunda can kaybının yanı sıra yangın, çevre kirliliği, gemilerin karaya oturması, tamamen kaybı ya da yapısal hasarı ortaya çıkmaktadır. Kazaların sonucunda ortaya çıkan bu sonuçların dağılımları ve frekansları Tablo 3'de gösterilmektedir. Can kaybı kaza esnasında hayatını kaybeden yolcu ve personeli, çevre kirliliği kaza yapan gemilerden kaynaklanan petrol türevi ve kimyasal maddeleri, oturma çatışma sonucu kazaya karışan gemilerin birinin veya her ikisinin karaya oturmasını, tamamen kayıp gemilerin batmasını veya kurtarılamayıp hurda olarak ilan edilmesini, yapısal hasar da çatışan gemilerde meydana gelen her türlü hasarı ifade etmektedir.

Tablo 3. Gemi-gemi çatışma kazalarının sonuçları ve frekansları (CK: Can kaybı, ÇK: Çevre kirliliği, O: Karaya oturma, TK: Tamamen kayıp, Y: Yangın, YH: Yapısal hasar)

Kazanın Sonucu	Kaza Sayısı	Frekansı
YH	322	7.318
TK	20	0.455
O + YH	8	0.182
CK + TK	28	0.636
CK + YH	23	0.523
TK + YH	35	0.795
ÇK + YH	40	0.909
O + TK	1	0.023
Y + YH	4	0.091
ÇK + TK	3	0.068
CK + TK + YH	56	1.273
CK + Y + YH	2	0.045
CK + TK + Y	2	0.045
CK + ÇK + TK	2	0.045
ÇK + TK + YH	13	0.295
ÇK + O + YH	1	0.023
CK + ÇK + O + YH	1	0.023
ÇK + YH + Y + O	1	0.023
CK + ÇK + TK + YH	6	0.136
CK + TK + Y + YH	2	0.045
CK + ÇK + TK + Y + YH	1	0.023

Tablo 3'de de görüldüğü üzere çatışma kazalarının sonucunda meydana gelen kazaların %56'sında sadece yapısal hasar oluşmakta, bunu sırasıyla %9,8'le can kaybı, tamamen kayıp ve yapısal hasarla sonuçlanan, %7'yle de çevre kirliliği ve yapısal hasarın birlikte görüldüğü kazalar oluşturmaktadır.

Çalışmanın çatışma kazalarının neden ve sonuçlarına odaklanmasına rağmen, kazaların neden ve sonuçlarından bağımsız olarak kaza sonuçlarından biri olan can kaybı sayılarına dikkat çekmek için can kaybı ile ilgili ayrıca bir inceleme yapılmıştır (Şekil 1). Gemi-gemi çatışma kazası raporları incelendiğinde 572 kazanın 123'ünde can kaybı meydana geldiği görülmüştür. Bu kazalarda toplam 5140 kişi yaşamını yitirmiştir. 1987 yılında Filipinler'de yaşanan Dona Paz – Vektör çatışma kazasında 4386 kişi hayatını kaybetmiştir (Perez ve ark., 2011). Tarihte en çok can kaybının meydana geldiği deniz kazası Titanik'in batması olarak bilinse de Dona Paz feribotu ile Vektör tankerinin çatışmasında Titanik kazasının yaklaşık üç katı kadar insan yaşamını yitirmiştir.



Şekil 1. Gemi-gemi çatışma kazaları sonucunda meydana gelen can kaybı dağılımları

BULGULAR ve TARTIŞMA

Tablo 2'de de görüldüğü üzere kazalara neden olan faktörlerin başında insan hatası gelmektedir. Gemi-gemi çatışma kazalarının tek başına %81,88'i insan hatası kaynaklıdır. İnsan hatasıyla birlikte müşterek olarak kazaya neden olan faktörlerle birlikte insan hatasının bir şekilde nedeni olduğu kazaların oranı %92 olarak karşımıza çıkmaktadır. Bu değer deniz kazaları ve çatışmaları inceleyen literatürdeki değerlere paralellik göstermektedir. Bu çalışmada diğer çalışmalardan farklı olarak sadece gemi çatışma kazaları ele alınmıştır. Yine literatürde çatışma kazaları ile ilgili diğer çalışmaların tek bir gemi tipi veya belirli bir deniz alanına odaklanmış olmasına rağmen burada küresel olarak ve her gemi tipi göz önünde bulundurularak değerlendirme yapılmıştır.

İncelenen kaza raporlarından elde edilen verilerden kazaların neden ve sonuçlarına ek olarak bazı önemli bilgilerde elde edilmiştir. Gemilerden birinin hareketsiz olduğu yani tek taraflı çatışma sayısı 82'dir. Bu değer incelenen çatışma kazalarının %14,3'üne denk gelmektedir. Çatışma kazalarının 31 tanesinde (%5,4) yasak olmasına rağmen gemilerin en az birinin köprüüstünde operatör bulunmadığı görülmüştür. Kazalardaki çatışma sayısına göre ortalama can kaybı sayısı 8,98 kişidir. Bu değer can kaybının meydana geldiği kazalar için ise 41,79 kişi gibi oldukça yüksek bir sayıya denk gelmektedir.

Deniz doğası gereği oldukça zorlu şartlara sahip bir ortamdır. Nükleer reaktörler, havacılık, kimya tesisleri gibi gemiler de oldukça riskli birer çalışma ortamıdırlar. Gemilerin/denizciliğin diğer alanlardan farkı kaza durumunda genellikle müdahale edilememesi ya da müdahale için çok geç kalınmış olmasıdır. Diğer riskli sektörler yaşanan kazalardan gerekli dersleri çıkararak emniyetin arttırılması ve kazaların önlenmesi için risklerin bertaraf edilmesi konularında büyük yol almış ve hedeflerine ulaşmışlardır. Ancak denizcilikte raporlama kültürünün zayıf olması, kaza sonucunda delillerin bazılarının suya gömülmesi nedeniyle ortaya çıkan veri eksikliği gibi durumlar gerekli önlemlerin alınmasını geciktirmekte ve zorlaştırmaktadır. Ama açıkça görülmektedir ki kazalarda baskın faktör insan hatasıdır ve en çok üzerinde durulması gereken konudur.

SONUÇ

Riskin olduğu her yerde kazaların yaşanması kaçınılmazdır. Özellikle kazaların en büyük nedeni insansa bu çözülmesi daha zor bir problemle karşı karşıya olunduğunu göstermektedir. Çünkü insan doğası ve yapısı gereği hata yapmaya meyillidir. Kazaların tamamen engellenemeyeceği herkes tarafından kabul edilse de kabul edilebilir seviyelere çekilebileceği de kanıtlanmıştır.

Diğer alanlardan farklı olarak deniz taşımacılığı dışa kapalıdır. Öncelikle bu duruma çözüm bulunması gereklidir. İnsan faktörü ile ilgili olarak bu ancak raporlama kültürünün geliştirilmesi, suçlama yerine teşvik etme davranışının aşılanması, riskin olduğu her konuyla ilgili gerçekçi ve anlaşılır eğitim ve talimlerin yapılması, personelin zihinsel ve fiziksel olarak yapılacak işe uygun olduğunun ölçülmesi gibi proaktif yaklaşımlarla çözülebilir. Başka bir çözüm denklemden insanı kademeli olarak çıkarmaktır. Otomasyon fabrikalarda olduğu gibi işlerin daha sorunsuz ve risksiz ilerlemesi için denizcilik sektörünün otomasyonla tanışması gerektiği aşikardır.

Bunun çözümü de insansız su üstü araçlarının kullanıma sokulmasıdır. Otonomluğa geçişin bir anda gerçekleşmesi günümüz teknolojisiyle mümkün olmamakla birlikte aşama aşama geçilmesi için de bir engel bulunmamaktadır. İnsansız gemilerle ilgili hukuki süreçlerin yeterli olgunluğa erişmemesi, insansız gemilerin açık denizlerde tamamen insan kontrolünden bağımsız hareket edememeleri, araçların denizde birden fazla fiziksel ortamla temas halinde olması gibi sorunları mevcuttur.

Abstract

Sewage sludge is a by-product of the wastewater treatment process. Dewatering of the sewage sludge in the wastewater treatment plants (WWTPs) is a major challenge due to the large amounts of residual sludge that are produced. Anaerobic digestion is commonly used in WWTPs to stabilize sludge produced in primary and secondary treatment and reduce their volume for final disposal. In recent years, research and development have focused on improving the dewatering process to reduce subsequent sludge handling and transport costs. To achieve this, optimization of the temperature and organic loading rate (OLR) in anaerobic sludge digestion at mesophilic and thermophilic conditions were studied in the present study. The influence of anaerobic digestion process temperature at mesophilic (35°C) and thermophilic (52°C) temperatures and three levels of OLR of 0.72, 0.94 and 1.3 kg VS/m^3/day was investigated on the dewaterability using the Time-to-Filter (TTF) parameter.
The lowest TTF values under mesophilic and thermophilic conditions were obtained as 200 and 450 s, respectively, at the lowest OLR level (0.72 kg VS/m^3/day). Dewaterability was kept mostly similar at mesophilic level but worsened significantly at thermophilic level and OLR increases. The TTF at 35 and 52°C, respectively, were 230 and 600 s at OLR 1.3 kg VS/m^3/day, much better dewaterability at mesophilic level despite higher VS content. The results showed that mesophilic operating level can provide lower chemical costs for dewatering and keep iths characteristics even at higher OLR despite higher volatile solid reduction in thermophilic digestion. Increase in colloidal substances due to enhanced hydrolysis may be a governing factor for the worsened dewaterability in the thermophilic digestion compared to mesophilic condition.

Keywords: anaerobic digestion, dewaterability, time-to-filter (TTF) , mesophilic, thermophilic, temperature.

INTRODUCTION

A significant cost issue in the operation of wastewater treatment plants is the dewatering and disposal of waste sludge. Sludge dewatering accounts for 30–50% of annual operational expenditures. Additionally, there are significant expenditures associated with the following disposal. The best sludge management practices include: a high dewatering rate; a low conditioner dose; a low sludge mass for disposal; and low solids mass and high dry matter content of the dewatered sludge cake. Dewatering often has no impact on the overall amount of solids for disposal, but stabilization through anaerobic digestion provides reduction in the volatile content (Mikkelsen and Keiding, 2002). The success of anaerobic digestion is attributed to the advantageous economics of methane production. It is now economically advantageous to subject primary and activated sludge to anaerobic digestion prior to dewatering and disposal due to rising sludge disposal prices. Thermophilic digestion has been preferred progressively due to its lower retention time need and higher reduction ability. When mesophilic digestion is switched to thermophilic, existing anaerobic reactor's capacity increases. As a result, reactors designed for primary sludge digestion may have their capacity increased to handle both primary and activated sludge. This lowers the total solids mass for disposal in the future but could affect dewaterability (Mikkelsen and Keiding, 2002). Anaerobic digestion has long been practiced in mesophilic (35-37ºC), and thermophilic (50–60ºC) temperature with good operational results (Kim et al., 2002). Contrarily, mesophilic anaerobic digestion (MAD) of sewage sludge is more frequently employed than thermophilic anaerobic digestion (TAD) because it requires less energy and has a more stable process despite higher methane yield and organic reduction in thermophilic digestion. Studies conducted by a number of researchers revealed that thermophilic systems had a greater specific growth rate and were able to handle higher organic loadings than mesophilic operation (Kim et al., 2002). Anaerobic digestion's (AD) temperature (mesophilic or thermophilic) influences particle size, protein, polysaccharide and

the protein/polysaccharide ratio in EPS of sludge flocs which influences the dewaterability of the digested sludge. Therefore, OLR, biogas output and dewaterability of digested sludge are crucial factors in the sludge line economics (An et al., 2017). Numerous investigations have demonstrated that sewage sludge dewaterability is significantly influenced by the properties of extracellular polymeric molecules (EPS) (Lü et al., 2015). According to Houghton and Stephenson's findings in 2002, the best sludge dewaterability can be obtained with an ideal EPS content and composition. Particle size and feed substrate composition, operation temperature, sludge age, and EPS production are factors that affect dewaterability (Suhurtini et al., 2014). The operating conditions have an impact on the sludge floc size distribution which is altered by anaerobic digestion (Mahmoud et al., 2006). The filtration rate has typically been evaluated in terms of the capillary suction time (CST) or specific resistance to filtration in studies on sludge dewatering (SRF). Whether the increase in dispersed particles is due to physical chemical or biological processes, the presence of dispersed particles adversely affects filtration rate. The amount of dispersed particles has also been linked to the amount of polymer needed to condition sludge optimally before dewatering. With regard to filtering rates and conditioner dosing, the distribution of sludge mass between flocs and dispersed colloidal particles is crucial.

The influence of anaerobic digestion process temperature at mesophilic (35°C) and thermophilic (52°C) levels and increasing OLR was investigated on the dewaterability of the digested sludge using the Time-to-Filter (TTF) parameter in this study.

MATERIALS AND METHODS

Materials

Primary sludge (PS) and waste activated sludge (WAS), collected from a full-scale municipal WWTP in Konya with an equivalent population of 1.2 million, employed in this study. As a feed sludge, a mixture of PS and WAS at a fixed ratio (60:40, v: v) was used. Raw sludge samples were stored at 4±1°C, immediately after collection, to avoid biodegradation during storage. Sludge from the mesophilic digestion of a real-scale municipal wastewater treatment plant (WWTP) was used as the seed. The Total solids (TS) of PS and WAS ranged between 30000-50000 and 7000-11000 mg/L respectively. The Volatile solids values determined 20000-35000 mg/L for PS and 5000-8000 mg/L for WAS.

The experimental set-up

Semi-continuous, laboratory-scale anaerobic digester was fed at three levels of organic loading rates (OLRs) (0.72, 0.94, and 1.3 $kgVS/m^3d$) consecutively as two periods at mesophilic (35°C) and thermophilic temperature (52°C). The experimental reactor was a completely mixed reactor has 5 L total volume. The system was run on a semi-continuous basis by daily peristaltic pump feeding and withdrawal of sludge. The reactor's temperature was controlled with a SCADA (supervisory control and data acquisition) system.

Analyses

Sludge filterability was measured by Time-to-Filter method (2710 H) (APHA, 2005) enabling comparison of the samples capacity to release their water content. Better dewaterability at a lower filtering time indicated lower chemical need for decanting of the stabilized sludge. Total solids (TS) and volatile solids (VS) were determined (2540B and 2540E, respectively) according to the Standard Methods (APHA, 2005).

RESULTS and DISCUSSION

The sludge's dewaterability characteristics as TTF values were presented in the Figure 1. Lower filtering times of the digested sludge were obtained at 35°C compared to 52°C digestion. Filtration times for OLR 0.72, 0.94 and 1.3 kgVS/m^{3}d at 35°C under steady-state conditions were found to be 205, 210 and 230 s. As can be seen in the results, increase in the OLR did not produce a significant effect on the dewaterability of the digested sludge in mesophilic digestion. Contrarily, the temperature had a negative effect on dewatering ability. TTF values were obtained as 450, 500 and 610 s at increasing OLRs in thermophilic digestion. TTF increase to multiplied durations despite lower VS content (higher VS reduction) compared to mesophilic digestion was correlated to a higher inorganic content in the thermophilicly digested sludge (Figures 2-3). Dewaterability seemed unaffected by the TS and VS increase in the mesophilicly digested sludge. As OLR increase from 0.72 to 1.3 kg VS/m^3/d resulted in 20 and 14% higher TS and VS concentrations at thermophilic digestion, hydrolysis rate seemed to be exceeded by the OLR. Similarly, studies on capillary suction time and filterability at 33, 35, 37, 39 and 55°C in a completely mixed continuously fed reactor showed the best result at 37°C and worsening at 55°C (Bouskova et al., 2006).

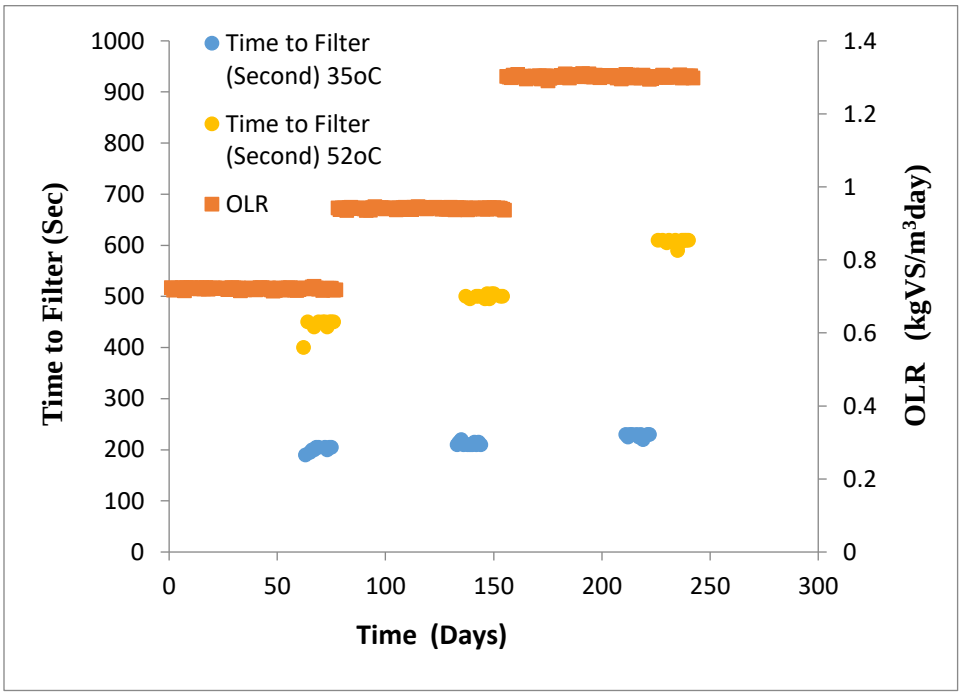

Figure 1. Effect of temperature on dewatering

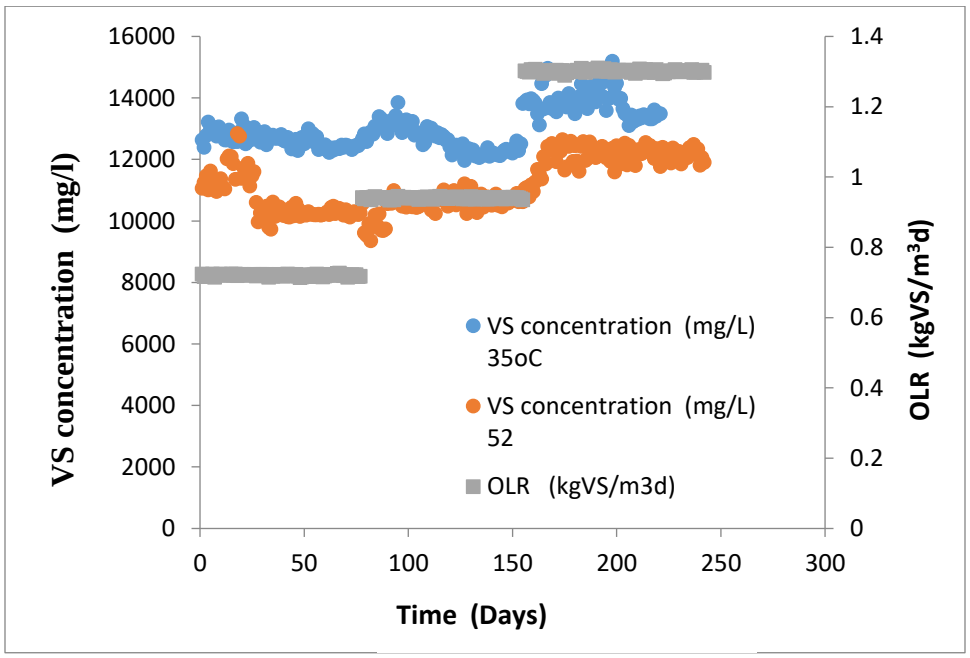

Figure 2. VS concentration against OLR change in effluent sludge

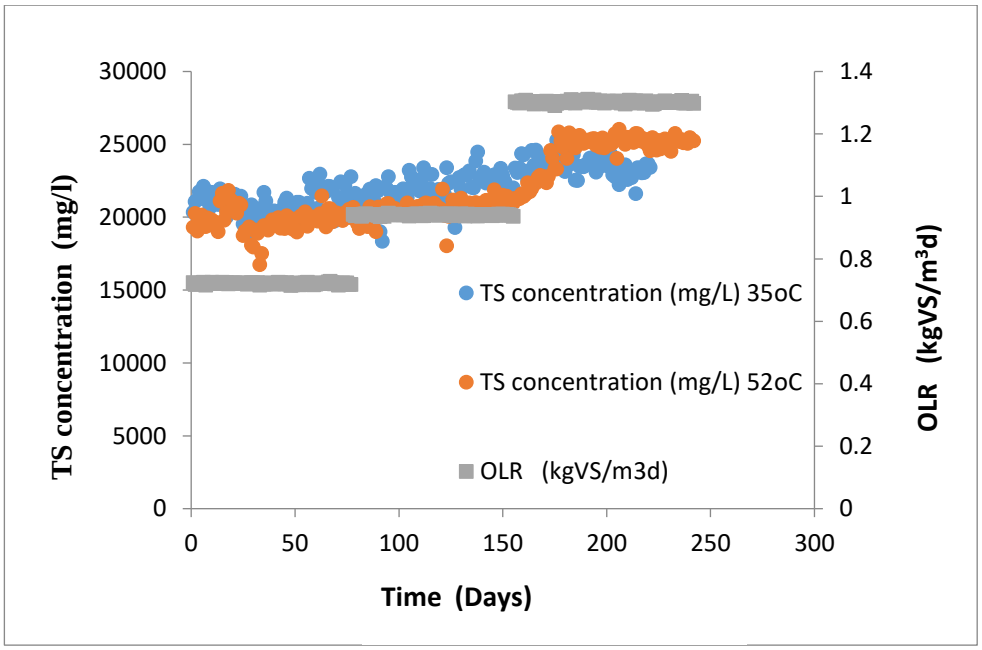

Figure 3. TS Concentration against OLR change in effluent sludge

CONCLUSION

The effect of OLR and temperature on the dewaterability of sewage sludge at anaerobic mesophilic and thermophilic digestion was investigated. The best dewaterability was obtained at OLR 0.72 kgVS/m^{3}d at 35°C. TS and VS increased for OLR 1.3 kgVS/m^{3}d at mesophilic temperature, there was no increase in filtration time. Increase in OLR and subsequently in TS and VS content was tolerated by the mesophilic digestion in terms of dewaterability. The increase to thermophilic temperature had a significantly negative effect on dewatering despite lower VS content that was correlated to the higher inorganic content of the digested sludge.

Abstract

Anaerobic digestion has been considered as the most suitable stabilization process for sewage sludge due to conversion to methane (energy) and useful biosolid as the end products. This study was conducted to evaluate the effect of different organic loading rates (OLR) and operational temperatures on the methane yield of the sewage sludge digestion in a municipal wastewater treatment plant (WWTP). The mesophilic temperatures of 35 and 38°C and three levels of OLR (0.72, 0.94 and 1.3 kg VS/m^3/d) were applied to a laboratory-scale semi-continuously fed anaerobic digester. The duration of the digestion was approximately 90 days for each level of OLR. The methane yield and volatile solids removal (VS_r) increased with increasing OLR and temperature. Methane yields at 0.72, 0.94 and 1.3 kg VS/m^3/day OLRs, respectively, were obtained as 0.32, 0.42 and 0.44 L/(gVS_{fed}.d) at 35°C and 0.42, 0.48 and 0.52 L/(gVS_{fed}.d) at 38°C. VS_r increased from 42 to 55% with increasing temperature and OLR. As the result, 38°C and 1.3 kg VS/m^3/day OLR proved to be beneficial for the anaerobic digestion of sewage sludge.

Keywords: anaerobic digestion, sewage sludge, methane, mesophilic, temperature.

INTRODUCTION

More focus has been placed on renewable and sustainable energy as an alternative to fossil fuels due to the continued growth of the global population and the steep rise in energy source demand. Future power sources that promise to be dominant include renewable energy (Zhou et al., 2012). Methane gas, a valuable and environmentally beneficial biofuel, is the major component of biogas, a promising renewable fuel produced by the anaerobic digestion (AD) of sewage sludge. Methane gas can be pumped into the natural gas distribution system or used directly to generate heat and electricity (Alqaralleh et al., 2015). Sludge and wastewater are the two main components that need to be handled in municipal wastewater treatment plants (WWTP). Stabilization and disposal of the sewage sludge generated during the treatment process is one of the most challenging and expensive issues in the field of environmental engineering. Primary sedimentation removes settleable materials that are easily thickened by gravity, producing primary sludge (PS) as a byproduct. Waste activated sludge (WAS) is biological sludge made up of particles that escape primary treatment and biological conversion products as bacterial cells and related polymers from soluble organic matter in the primary effluent (Arnaiz et al, 2006). The mixture of PS and WAS is thickened and stabilized in anaerobic digesters that produce methane which can recover up to 75% of the energy used by the entire WWTP (Erdirencelebi and Kucukhemek, 2015). Sludge management at municipal WWTPs is a persistent environmental issue. 25–65% of the total operating expenses may go toward the stabilization and disposal of the sludge (Liu, 2003). As the number and capacity of municipal WWTPs increases, the amount of sewage sludge produced will reach high volumes globally (Alqaralleh et al., 2016). Sewage sludge will induce a persistent waste issue that needs an appropriate solution since municipal wastewater treatment can be thought of as a continuous operation in the future (Riau, et al., 2010). Anaerobic digestion needs to be improved in performance as the oldest and most significant method for stabilizing sewage sludge. Its potential advantages over other stabilization processes include the production of energy as methane, a reduction of 30–50% in the volume of sludge requiring final disposal and the production of sludge residue that, when sufficiently digested, can be free from most pathogens and offensive odours (Nges and Liu, 2010).The rate of methane production and digestion performance can be improved varying process parameters, such as temperature, sludge retention time (SRT), and organic loading rate (OLR) (Ferrer et al., 2011). Together, they have an impact on the composition of microbial communities, biochemical conversion pathways, reaction kinetics and thermodynamic equilibrium, and

stoichiometry of the products produced (Labatut et al., 2014). Anaerobic digestion can be conducted at psychrophilic (<25°C), mesophilic (25-40°C), and thermophilic (>45°C) temperatures. The most common temperature applied is 35°C due to lower energy consumption and higher stability compared to thermophilic range (Gavala et.al, 2003). In this study, the effect of OLR and and temperature increase was evaluated on the performance of anaerobic digestion as methane yield and volatile solid removal (VSr) of the mixed sewage sludge under mesophilic conditions.

MATERIALS AND METHODS

Wastewater sludges

The mixed sewage sludge used in this study were obtained by mixing of PS and WAS obtained from a full-scale municipal WWTP in Konya. PS and WAS were mixed in a fixed proportion of 60:40 (v:v) and used as the feed sludge. The raw sludge samples were kept in the refrigerator to be stored at 4°C during the experimental periods. Mesophilic seed sludge was collected from an anaerobic digester's outlet at the same WWTP. The main characteristics of PS, WAS and inocula used in this study were presented in Table 1.

Table.1 Characterization of the raw sludge fractions

Sludge type	pH	TS (mg/L)	VS (mg/L)
Primary Sludge	6.5-7.2	30000-50000	20000-35000
Waste activated sludge	6.9-7.8	7000-11000	5000-8000

Semi-continuous reactor operation

The semi-continuous anaerobic digester (total volume 5 L) was a laboratory-scale "New Brunswick Scientific Bioflo IIc" batch/continuous fermenter operated at mesophilic (35 and 38 °C) temperature levels until achieving a steady state. The study was carried out at 3 different OLRs and 2 temperature levels applied consecutively as presented in the Table 2. The reactor was considered to be in a steady-state condition when the methane yield was constant in a lower change range of 10%. Mesophilic anaerobic digestion study was carried out for a continuous period of over 240 d for both temperatures.

Analytical methods

Analysis of total solids (TS), volatile solids (VS), were performed daily according to the Standard Methods (APHA, 2005), pH of the sludge samples was measured by Hach Lange HQ40d Multi parameter instrument. The process performance was daily monitored with parameters of methane yield (CH4) and VS removal (VSr) during the experimental study. Methane production was measured by liquid (% 3 NaOH) displacement method. Methane yield was calculated by dividing daily methane production (L.d) by the amount of VS_{fed} (g).

RESULTS and DISCUSSION

Methane Yield

The methane yield, daily methane production and VSr efficiencies obtained during the experimental study were presented in the Figures 1-3. For all temperature and OLR periods, the anaerobic digester reached steady-state condition after a certain acclimatization period. Methane yields were obtained as 0.32, 0.42 and 0.44 L/g VS_{fed}/d, respectively, at OLRs 0.72, 0.94 and 1.3 kg VS/m^3/d under steady-state conditions at 35°C. When OLR was increased to 1.3 kg VS/m^3/d a similar degree of increase was not obtained in the methane yield despite higher methane production (Fig. 1-2). This indicated that the rate of hydrolysis was exceeded. This observation was supported by the VS accumulation as presented in the Figure 3. Although the hydrolysis reaction was rate limiting, OLR increase promoted acidogenic and methanogenic activities. Similar finding was observed at 38°C. Likewise, after a certain acclimatization period, steady state conditions were reached. Under steady-state conditions, methane

yields obtained were 0.42, 0.48 and 0.52 L/g VS_{fed}/d at OLR 0.72, 0.94 and 1.3 kg VS/m^3/d, respectively. Methane yield increase occurred at 14-31% at 38ºC. Higher VS concentration in the digester at OLR 1.3 kg VS/m^3/d showed an accumulation supporting limited hydrolysis rate, similarly to 35ºC. In summary, increase in temperature did not enhance hydrolysis rate but the rate of intermediate reactions and methanization. Another factor enabling higher methane yields and daily production values was evaluated as the low decreases in the HRT (SRT) values while implementing OLR changes.

Table 2. Anaerobic digester's operating programme

Temperature (℃)	**OLR (kg VS/m^3.d)**	**HRT:SRT (d)**
35	0.72	30
	0.94	25
	1.3	22
38	0.72	28
	0.94	24
	1.3	20

VS Removal

Change in VS concentration and VSr efficiencies were presented in the Figure 3. VSr was obtained as 42, 48 and 53% at OLR 0.72, 0.94 and 1.3 kg VS /m^3/d, respectively, at 35ºC. Parallel increase in VSr indicated a degree of augmented hydrolysis rate but not at an equal degree compared to OLR increase. VSr occurred at higher levels as 44, 48 and 55%, respectively, at the same OLR values at 38ºC. The positive effect was significant on the VSr efficiency by OLR and temperature. VS accumulation in the digester indicated that the hydrolysis rate was exceeded at the highest OLR and proved useful to evaluate the optimum operational conditions for both methane recovery and VS reduction.

Compared to the previous studies carried out in the anaerobic digestion of sewage sludge (Table 3), the methane yield and VSr obtained for the mixed sludge digestion at 35ºC were mostly higher. Davidson et al. (2008) obtaind the lowest methane yield as 0.271 L/g VS_{fed}/d in the continuous reactor operated under extreme conditions at 35℃, HBS:13 d and OLR 2 kg VS/m^3/d. This indicated that high OLR and low HRT were not favorable for sewage sludge digestion resulting in considerably low methane yield. Malekzada (2019) obtained the methane yield at the highest level as 0.665 L/g VS_{fed}/d at 38℃ and a similar OLR using an intermittent mixing mode. The general summary was that optimization of OLR was effective to reach the maximizable methane yield for any sewage sludge where extremely high OLRs and low HRTs would not be practicable in anaerobic digestion as the hydrolysis stage is slow and rate-limiting due to the slow biodegradability of the complex organic content for which chemical and physical pre-treatment methods are currently applied for fastened or up-graded anaerobic digestion process at real-scale.

CONCLUSIONS

The highest methane yield and VSr for this study was obtained at 38ºC and OLR 1.3 kg VS/m^3/d. Increase in the methane yield, production and VSr efficiency was enhanced as the OLR and temperature increased. Increase in temperature to 38ºC did not enhance hydrolysis rate significantly but the rate of intermediate reactions and methanization augmented. The hydrolysis rate was exceeded at 1.3 kg VS/m^3/d and resulted in VS accumulation at some degree despite increase in the digestion performance. Optimization of the anaerobic digestion of sewage sludge through operational parameters is simple and crucial and can reveal potential benefits in sludge line management in the municipal WWTPs.

Özet

Günümüz dünyasında seri üretim artık çok önemli bir noktaya ulaşmış, ürünleri tek tek elde ederek rekabet etmek oldukça zorlaşmıştır. Bu durumun bir getirisi olarak seri üretim metotları kaçınılmaz olarak artmış ve gelişmiştir. Kalıpla üretim hızlı, kaliteli ve daha üretken olduğundan üretim metotlarının en önemlilerinde biri haline gelmiştir. Günlük hayatımızda, otomotivden gıda sektörüne kadar geniş bir kullanım alanı sağlayan plastik ürünler de plastik enjeksiyon kalıpları ile üretilmektedir. Plastik enjeksiyon kalıplama (PIM), parçaların düşük maliyetle ve seri üretilmesini sağlayan birden fazla aşamadan oluşan karmaşık bir prosestir ve her aşama birbiriyle bağlantılıdır. Bu nedenle bir problem tüm prosesi etkileyebilmektedir. Bu problemlere bir örnek parçanın kompleks geometriye sahip olması ve kalıptan sorunsuz çıkamamasıdır. Bunun için kalıplarda maça sistemleri kullanılmaktadır ancak bazı durumlarda, parça üzerinde ters açıda kalan bölge, hareket başladıktan sonra girişim yaparak kalıptan çıkarılamamakta ve parçalarda kopmalara (yırtılmalara) neden olmaktadır. Yapılan çalışmada, bu problemin giderilmesi için özel yay mekanizmalı birleşik bir eğik maça sistemi geliştirilmiştir.

Anahtar Kelimeler: Plastik enjeksiyon kalıpları, Eğik maça, Mekanik maça

A Unified Inclined Core System with Special Spring Mechanism

Abstract

In today's world, mass production has reached a very important point, and it has become very difficult to compete by obtaining products one by one. As a result of this situation, mass production methods have inevitably increased and developed. Since mold production is fast, high quality and more productive, it has become one of the most important production methods. In our daily life, plastic products that provide a wide area of use from the automotive to the food sector are also produced with plastic injection molds. Plastic injection molding (PIM) is a complex multi-stage process that enables low cost and mass production of parts, and each stage is interconnected. Therefore, a problem can affect the entire process. An example of these problems is that the part has complex geometry and cannot come out of the mold smoothly. For this, core systems are used in molds, but in some cases, the area on the part at an opposite angle cannot be removed from the mold by interference after the movement starts, causing breaks (tearing) in the parts. In this study, a combined inclined core system with a special spring mechanism has been developed to overcome this problem.

Keywords: Plastic injection molds, Lifter, Slider

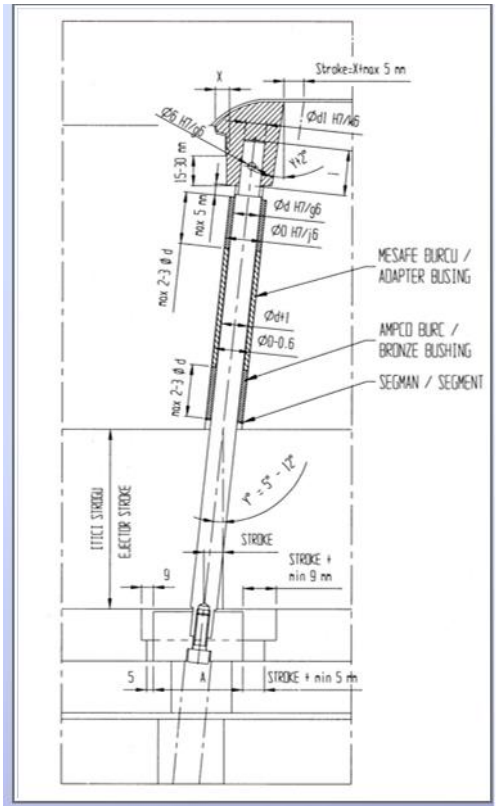
GİRİŞ

Günümüz dünyasında seri üretim artık çok önemli bir noktaya ulaşmış, ürünleri tek tek elde ederek rekabet etme olanağı neredeyse kalmamıştır. Bu durum seri üretim metotlarının kaçınılmaz olarak artmasına ve gelişmesine neden olmuştur. Bu metotların en önemlilerinden biri olan kalıpla üretim metodu daha hızlı, daha kaliteli ve daha üretken çalışmanın ana unsuru haline gelmiştir. [5]

Kalıpla üretim metotlarını kullanarak üretilen ürün gruplarından biri hiç tartışmasız plastik malzemelerdir. Plastik sektörü başta otomotiv, inşaat, beyaz eşya ve gıda olmak üzere birçok farklı sektöre girdi sağlamaktadır. Plastik malzemeler günlük hayatımızda geniş bir yer tutmakta ve doğrudan tüketim malzemesi olarak karşımıza çıktığı gibi yalıtım, dayanıklılık, şekil verilebilirlik gibi özellikleriyle farklı ürünlerle de karşımıza çıkmaktadır. Plastik malzemelerin elde edilmesi için plastik enjeksiyon kalıpları üretilmektedir. Kalıplama, istenilen boyut ve şekillerde dikişsiz ürünlerin kolay bir şekilde üretilmesine olanak sağladığı için endüstrinin çoğu alanında yaygın olarak kullanılmaktadır. Plastik enjeksiyon kalıplama (PIM), parçaların düşük maliyetle üretilmesini sağlayan birden fazla aşamadan oluşan karmaşık bir prosestir ve her aşama birbiriyle bağlantılı olarak ilerlemektedir. [1,2] Bu nedenle herhangi bir aşamada meydana gelen problem bütün kalıplama prosesini etkilemektedir.

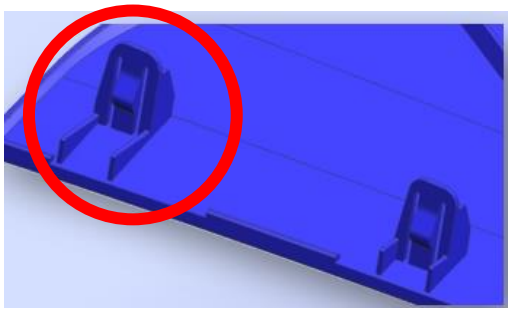
Plastik enjeksiyon kalıplamanın son proses adımı parçaların kalıp içerisinde soğuduktan sonra kalıptan alınması işlemidir. Sorunsuz bir kalıptan alma işleminin gerçekleşebilmesi için parçanın geometrik sınırlarına uyulması gerekmekte ve çoğunlukla kompleks geometrilerden kaçınılmaktadır. Parçaların kalıptan ayrılması itici sistemlerin yardımıyla gerçekleşmektedir.

Karmaşık geometrilerin kaçınılamaz olduğu, ters açı bulunduran tasarımlarda ise parça üzerindeki girintileri çıkaracak şekilde kalıba kenar yüzeylerden hareket edecek hidrolik maça, eğik maça ve mekanik maça gibi maça sistemleri kullanılmaktadır. [3,4]



Şekil 1: Normal Eğik Maçanın Çalışma Mekanizması

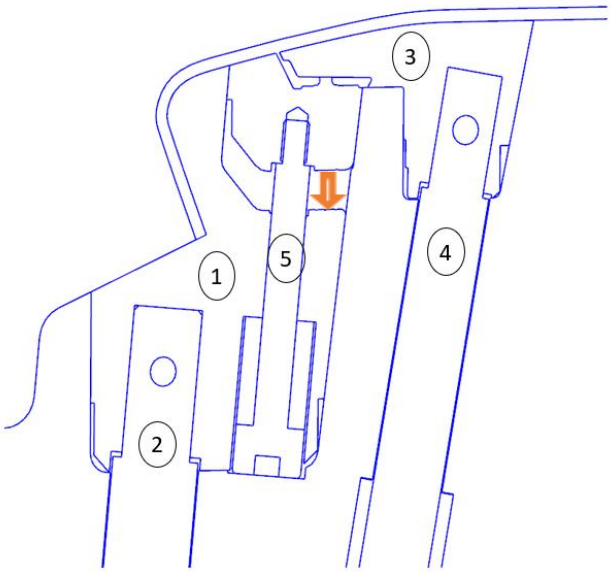
Şekil 2: Ters Açıda Kalan Geometriler



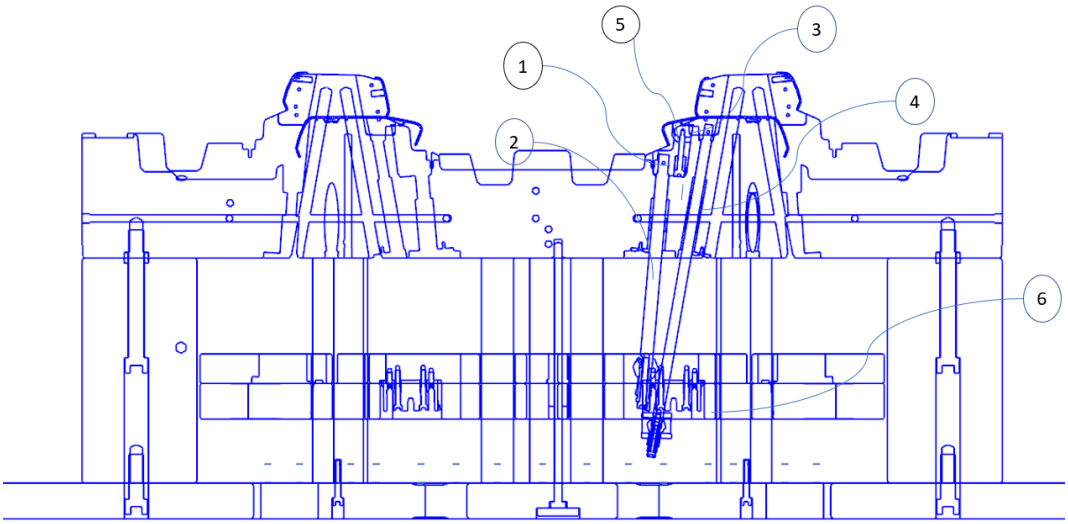
Şekil 3: Ters Açıda Kalan Geometriler

Şekil 1'deki teknik resimde normal bir eğik maçanın çalışma mekanizması gösterilmektedir. Plastik parçada Şekil 2 ve 3'te belirtilen ters açıda kalan geometriler için eğik maça tasarımı yapılmaktadır. Eğik maça; maça bloğu, mil, hareketi sağlayan kızak sistemi ve merkezleme burcu olarak dört bölümden oluşmaktadır. Kalıp çalışma açısına göre terste kalan bölgenin uzunluğu eğik maça bloğunun hareket mesafesini belirlemektedir. Bu durumun oluşması için itici plakasına bağlı olan kızak sitemi hareket ettikçe mil hem yatay hem yukarı yönde ilerlemektedir. Üst tarafta maça bloğuna bağlı olan mil, hareket ettikçe maça bloğunun çekilmesine neden olmakta ve böylece ters açıda kalan bölge oluşmaktadır.
Bu mekanizma ile parça üzerinde ters açıda kalan bölge, hareket başladıktan sonra girişim yaparak kalıptan çıkarılamamakta ve parçalarda kopmalara (yırtılmalara) neden olmaktadır.
Yapılan çalışmada, bu durumun oluşmasını önlemek ve plastik parçanın ürün formunda değişiklik yapılmadan girişim yapan bölgenin engellenmesi ve plastik enjeksiyon kalıbından elde edilemeyen geometrinin çıkarılmasını sağlamak için birbiri ile iç içe geçmiş 2 eğik maça ve bir yaylı mekanizma sistemi geliştirilmiştir.

MATERYAL VE METOD



Şekil 4: Strok Uygulanmadan Önce Perspektif

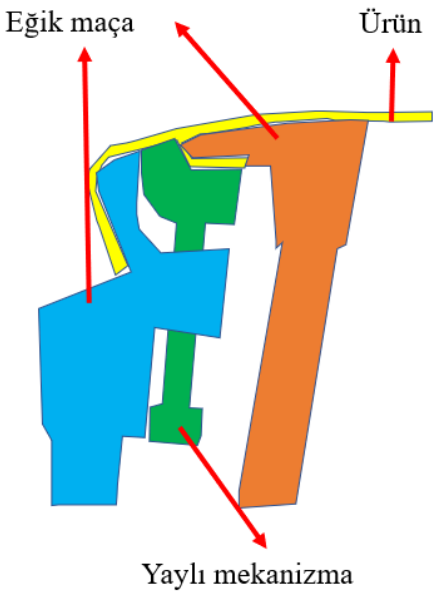


Şekil 5: Sistemin Önden Kesit Alınmış Hali

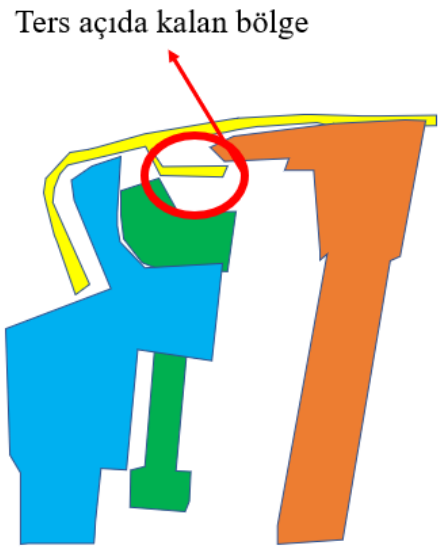
Şekil 4'te görünen kesitte 1 ve 3 numaralı kısımlar eğik maça bloklarını, 5 numaralı kısım özel yaylı mekanizmayı, 2 ve 4 numaralı kısımlar eğik maçalara ait milleri, turuncu renkli ok ise strok mesafesini göstermektedir. Eğik maçaların kızak sistemi, Şekil 5'teki itici plakasına (6) monte edilmektedir.

Enjeksiyon tamamlanıp kalıp açıldığında ve itici plakalar öne doğru hareket ettiğinde kızaklara bağlı olan maça milleri de ileriye doğru konumlanmaktadır. 1 numaralı eğik maça çalışma açısı kadar yukarıya hareket ettiğinde yaylı mekanizma aradaki boşluk kadar sıkışmakta ve eğik maçanın daha fazla hareket etmesini engelleyerek durdurmaktadır. Bu sırada 3 numaralı eğik maça hareket ederek, üründe terste kalan bölgenin maçadan kurtarılmasını sağlamaktadır.

Yaylı mekanizma, 1 numaralı eğik maçaya gecikme sağlayarak 3 numaralı maçanın hareekt açısı kadar ilerlemesini sağlamakta, maçalar geri konumlandıklarında ters açılı geometrinin parçadan çıkarılmasını sağlamaktadır.

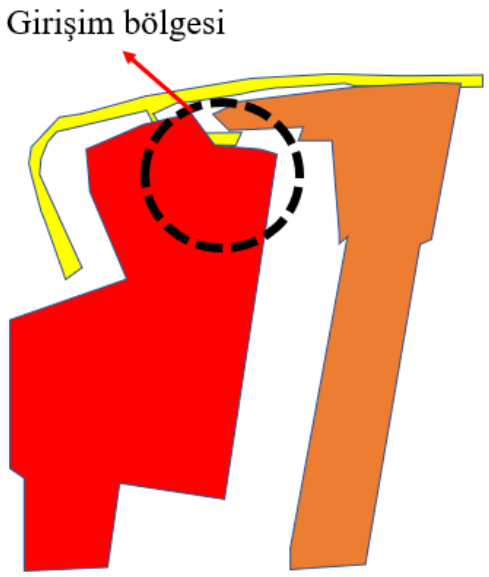


Şekil 6: Strok Uygulanmadan Önce Perspektif



Şekil 7: Strok Uygulandıktan Sonra Perspektif

Yaylı mekanizma, 1 numaralı maça bloğuna gömülüdür ve hareketiyle beraber sıkışmaktadır. Strok mesafesi, 1 numaralı maça bloğunun üst parçası ve yaylı mekanizma arasındaki mesafe yani yayın sıkışması için gerekli mesafedir. Yay sıkıştıktan sonra 1 numaralı maça bloğu ile hareket etmekte bu sayede bu maçaya gecikme verilmiş olmaktadır. Strok mesafesi, 3 numaralı maça bloğunun hareket açısına bağlı olarak ürünü kurtaracak optimum mesafedir. Şekil 6 ve 7 strok uygulanmadan önceki ve sonraki durumları göstermektedir. Yaylı mekanizma ile gecikme verilmeseydi eğer eğik maça ve ters açıda kalan geometrinin girişim yaparak üründe kopma (yırtılma) gibi olası kusurlara sebep olması Şekil 8'de gösterilmektedir.



Şekil 8: Yaylı Mekanizma Olmayan Perspektif

SONUÇ

Yapılan çalışma ile;

- Parçanın girişim yapmadan ürün datası görseli ile birebir şekilde elde edilmesi
- Geliştirilen yenilikçi yönün yani yay mekanizmasının başka kalıp tasarımlarına da uyarlanabilmesi
- Ürün tasarımında değişiklik yapılma ihtiyacının ortadan kalkması
- Eğik maçaya gecikme verilerek prosese yeni bir bakış açısı kazandırılması gibi sonuçlara varılmıştır.

Çalışma sonunda elde edilen sistem sanayi alanlarında uygulanabilir ve teknik açıdan uzman kişilerce farklı uygulamalara evrilebilecek niteliğe sahiptir.

TEŞEKKÜR

Bu çalışma, Karel Kalıp Sanayi A.Ş. tarafından desteklenmiştir. Makaleye konu olan çalışmaya katlılarından dolayı Levent Saraç'a teşekkürlerimizi sunarız.

Özet

Bant geçiren filtreler (BGF) belirli frekans aralığındaki bantları geçiren aktif veya pasif devrelerdir. Aktif bant geçiren filtre işlemsel kuvvetlendirici merkezlidir, pasif bant geçiren filtre ise kondansatörler ve indüktörler gibi pasif elemanları muhteva eder. Bant geçiren filtre, temelde yüksek geçiren filtre (YGF) ve alçak geçiren filtre (AGF) olarak iki devrenin birleşiminden oluşmaktadır. Bant geçiren filtreler aynı zamanda belirli topolojilere (Butterworth, Cheybshev vs) ayrılmaktadır. Bu çalışmada, gerçekleştirilen bant geçiren filtre pasif bir filtre olup, Cheybshev topolojisi ile tasarlanmış, benzetimi yapılmış ve FR4 PCB üzerine baskısı gerçekleştirilmiştir. Bant geçiren filtrenin frekans özellikleri; 866 MHz merkez frekans (35 cm dalga boyu) ve yaklaşık 100 MHz bant genişliğidir. Bu frekans aralığı, elektronik devrelerde elektromanyetik dalga olarak yayılan sinyalleri hedefleyecek şekilde, yer uydu istasyonu kablosuz haberleşme sinyallerinde, LoRa haberleşmesinde (sadece belirli bir bandında), hırsız alarmlarında ve daha bir çok sinyal uygulamalarında kullanılabilir. Yapılan çalışmada bant geçiren filtrenin teorik hesabına, benzetimine, devrenin tasarımına ve gerçekleştirilmesine dair konular incelenmiştir.

Anahtar Kelimeler: Bant geçiren filtre, kablosuz haberleşme, Cheybshev topolojisi.

Example of 866 MHz frequency (35 cm wavelength) band pass filter (BPF) circuit for wireless communication circuits

Abstract

Band pass filters (BPF) are active or passive circuits that pass bands in a certain frequency range. The active band pass filter is operational amplifier centered, while the passive band pass filter contains passive elements such as capacitors and inductors. Band pass filter basically consists of two circuits as high pass filter (HPF) and low pass filter (LPF). Band pass filters are also divided into certain topologies (Butterworth, Cheybshev etc.). In this study, the realized band pass filter is a passive filter, designed with Cheybshev topology, simulated and implemented on FR4 PCB. Frequency characteristics of the band pass filter is 866 MHz center frequency (35 cm wavelength) and approximately 100 MHz bandwidth. This frequency range can be used for targeting signals emitted as electromagnetic waves in electronic circuits, earth satellite station wireless communication signals, LoRa communication (only in a certain band), burglar alarms and many other signal applications. In this study, the theoretical calculation, simulation, design and implementation of the band pass filter were examined.

Keywords: Bandpass filter, wireless communication, Cheybshev topology.

GİRİŞ

İşlemsel kuvvetlendirici (Op-Amp) devresi olmaksızın tasarlanan elektronik frekans süzgeçlerine pasif bant geçiren filtre (BGF) adı verilmektedir. Ardı sıra bağlanan yüksek geçiren filtre (YGF) ve alçak geçiren filtrelerin (AGF) kesişim frekansları bant geçiren filtrenin işlevini gerçekleştirdiği frekans aralıklarıdır. Op-Amp devresi ayrı olarak tasarlanıp BGF'den sonra da devrede yerini alabilir (Rashid, 1999; Dorf ve Svoboda, 2001).

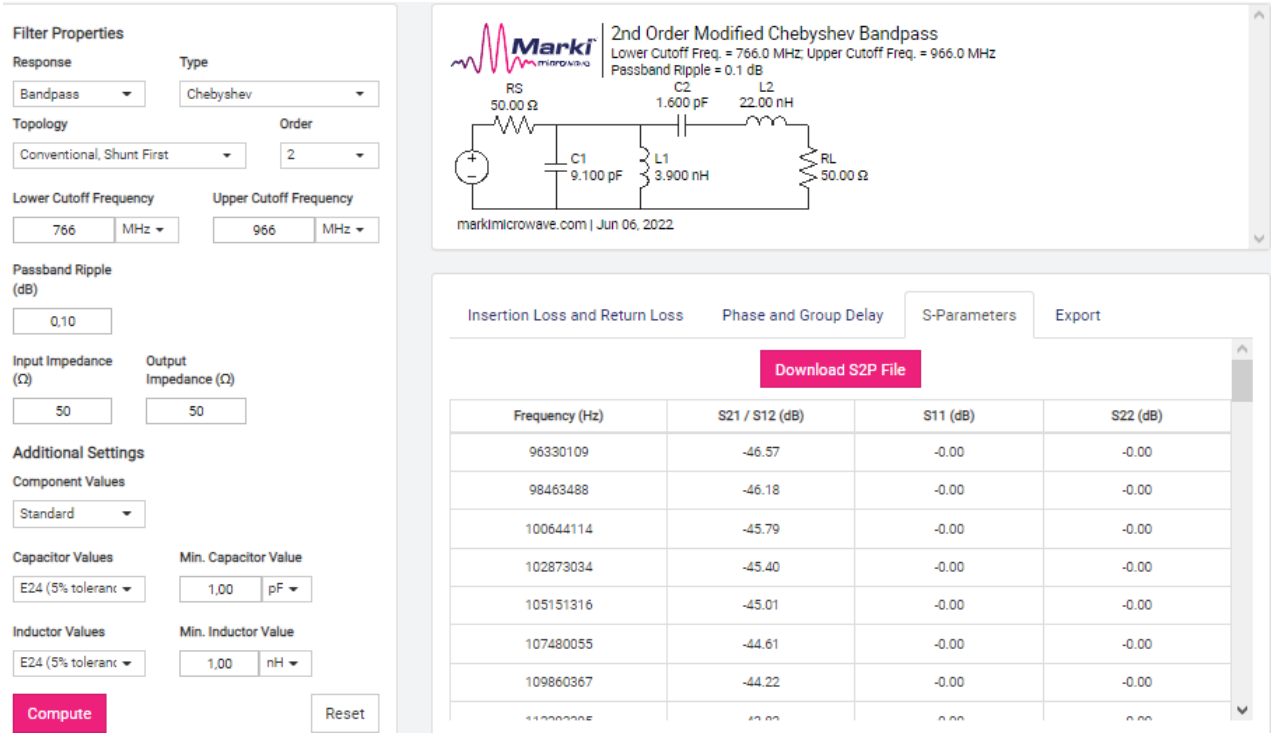
Pasif BGF oluşturmanın birkaç yöntemi vardır. Bu yöntemler ise farklı topolojiler veya farklı dereceler olarak kısaca özetlenebilir. Cheybshev, Butterworth, Bessel, Legendre ve eliptik tipleri BGF oluşturmada en sık kullanılan LC (indüktans-kapasitans) tipi toploloji örnekleridir. Derece (order) ise 1 veya daha fazla sayıda olabilmektedir. Derece arttıkça aynı oranda kullanlan pasif eleman sayısı da artar. Paralel (shunt) kapasite ile veya seri (series) kapasite ile devre kurulumuna başlamak da BGF örneklerini çeşitlendirmektedir. Aynı durum, tasarımcının indüktans ile nasıl başlayacağı kararına göre de oluşmaktadır. Sadece pasif devre elemanları ile değil mikroşerit hatlar ile de filtre tasarımını ve gerçeklemesini yapmak mümkündür. Bu noktada mikroşerit hatlar indüktans gibi ya da kapasitans gibi davranabilir. Mikroşerit hatların genişliği, uzunluğu, kullanılan alt tabanın dielektrik geçirgenliği hatta hattın geometrik şekli dahi indüktans ya da kapasitans gibi davranan yapının nicel değerini belirleyebilir (Çakır ve ark., 2006; Pozar, 2011).

Pasif bant geçiren filtreler için kazanç-frekans grafiği göz önüne getirildiğinde en üst noktadaki kazanç değeri olan 0 dB'den 3 dB azaldığı noktalar arası bant genişliği olarak ifade edilir. Bağlantı önceliği YGF olmalıdır ki durgun banttan geçiş bandına; akabinde AGF gelmelidir ki geçiş bandından durgun banda grafik oluşabilsin. Nihayetinde kesişen bölgeler geçiş bandının frekans cevabı olarak adlandırılır (Aribowo ve ark., 2018; EverythingRF, 2019). Transfer fonkiyonlarının türevlerini kullanarak (Wan ve ark., 2019) BGF tasarımı mümkündür. Sadece belirli bir bölge için değil birden fazla frekans bölgesi için de çoklu BGF tasarımları (Ss, 2022) yapılabilir. WLAN, Bluetooth, LoRa, ZigBee veya uydu uygulamaları gibi pek çok kablosuz haberleşme uygulamasında ya da hoparlör gibi elektrik devrelerinde BGF devresi görmek olasıdır (Nosrati ve Mohammad-Taheri, 2020; Ss, 2022; Dong ve Shen, 2020). Taşınabilir kablosuz haberleşme sistemleri arttıkça boyut ve ağırlık olarak minimum kalabilmek önem taşır, T şeklindeki mikroşerit yapılar ile oldukça ufak boyutlarda BGF'ler üretilebilmektedir (Yoon ve Kim, 2021).

Görülmektedir ki; günlük hayatımızda elektronik aygıtlar arttıkça teknolojide de güncel gelişmeler hızla devam etmektedir. Bu çalışmada, elektronik devreler konusuna katkı olması düşüncesiyle 866 MHz merkez frekans bandında çalışabilen ve yaklaşık 100 MHz bant genişliğine sahip olan BGF devresi anlatılmıştır. Cheybshev topolojisi ile tasarlanan ve gerçekleştirilen BGF, Nano VNA cihazı ile ölçülmüştür. İlgili çalışmalar Materyal ve Metod bölümünde, deney çıktıları Bulgular bölümünde, daha iyi nasıl olabilir sorusunun cevabı Tartışmalar bölümünde ve son olarak projenin sonucu Sonuçlar bölümünde okuyucuya aktarılmıştır.

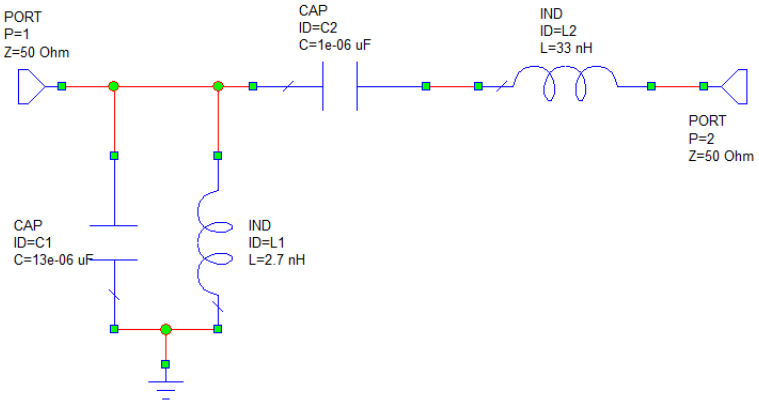
MATERYAL VE METOD

Bant geçiren filtre vb uygulamalar için öncelikle teorik hesaplamalar (Rashid, 1999; Dorf ve Svoboda, 2001; Çakır ve ark., 2006; Pozar, 2011) yapılır. İlgili teorik denklemlerin gömülü olduğu WEB siteleri (RFTools, 2022; Falstad, 2022) üzerinden hesaplamalar için yardım alınabilir. Bu projede, Marki Microwave firmasının desteklediği RFTools çevrim içi tasarım programı kullanılmıştır. Şekil 1'de RFTools ekran görüntüsü verilmiştir.



Şekil 1. RFTools LC filtre ekran görüntüsü

Şekil 1'de görüleceği üzere geçiş bandında hafif dalgalanmalara izin veren böylece modülasyon yaptırmaya daha açık olan Chebyshev, 2. dereceden, 766 MHz alt kesim frekanslı ve 966 MHz üst kesim frekanslı, hem girişte hem de çıkışta 50 Ω empedansa sahip filtre tasarımı program tarafından sunulmuştur. C1, L1, C2 ve L2 kapasitans ve indüktans değerleri Şekil 1 üzerinde aktarılmıştır. Bu aşamadan sonra AWR Microwave Office programı kullanılmış ve devre AWR programına aktarılmıştır. AWR programının ekran görüntüsü Şekil 2'de verilmiştir.

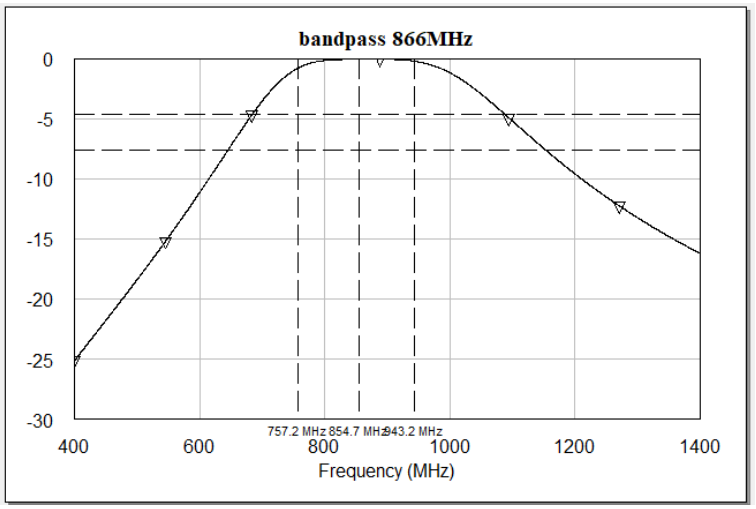


Şekil 2. AWR programına aktarılan nihai BGF devresi

AWR programına Şekil 1'deki indüktans ve kapasitans değerleri aktarılıp kazanç-frekans grafiği oluşturulduğunda beklenen orta frekans değeri olan (866 MHz) elde edilememektedir. Bu sebeple, pasif devre elemanlarında değişikliklere gidilmiştir. Bu aşamada, değişiklikler yapılırken laboratuvar ortamında yapılacak olan gerçekleştirme işlemleri göz önünde bulundurulmalı ve pasif devre elemanı üreten fabrikaların üretmediği ürünlerin kullanılmamasına dikkat edilmelidir. Şekil 2'de görülen yeni L ve C değerleri için bu konuya özen gösterilmiştir.

RFTools çevrim içi tasarım programının verdiği değerlere çok yakın fakat üreticilerden alınabilecek değerlerin ideal olan modelleri, merkez frekansın 866 MHz olmasına gayret edilerek, AWR programında, Şekil 2'deki gibi kullanıldığında Şekil 3 kazanç-frekans grafiği elde edilmiştir.

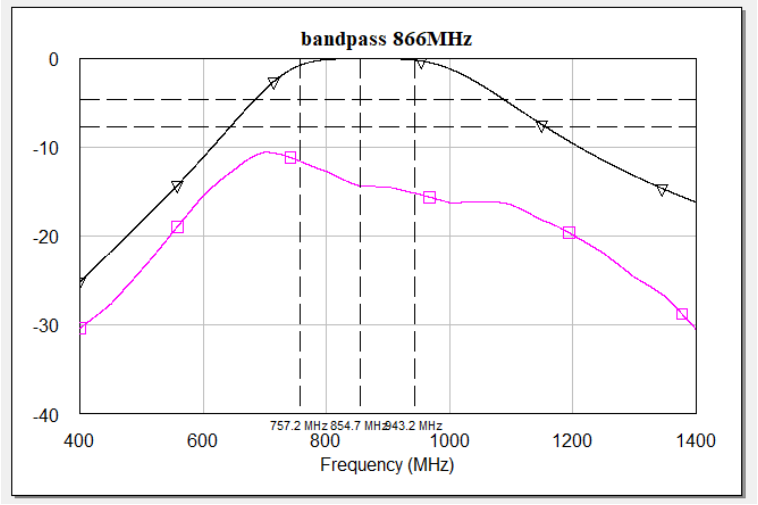
Şekil 3 incelendiğinde, merkez frekans değeri 854.7 MHz'dir. 866 MHz frekansına yakın olduğu için aradaki 11.3 MHz frekanslık kayma ihmal edilebilir. Zira alt ve üst kesim frekansları 757.2 ve 943.2 MHz olarak bulunmuştur. Bu değerler baz alındığında 186 MHz bant genişliği elde edildiği görülebilir ki bu değere bakıldığında 11.3 MHz orta frekans kayması önemsizdir.



Şekil 3. BGF için kazanç-frekans grafiği

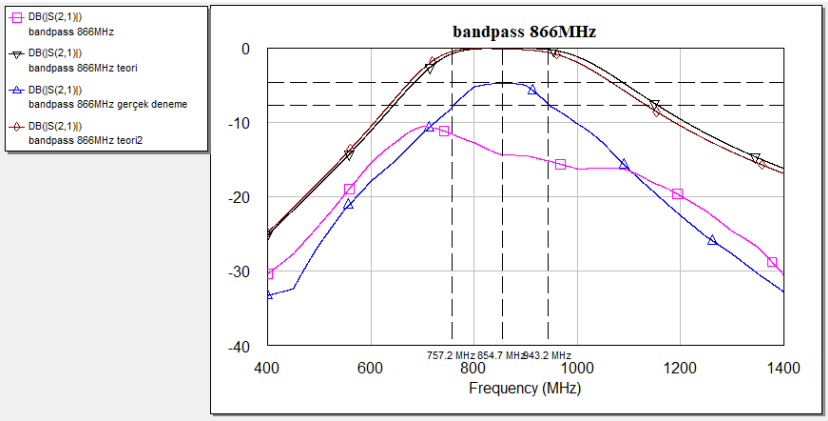
AWR programı üzerinde, ideal tasarımdan gerçek ürünlerle program üzerinde yapılacak yeni tasarıma geçmek gerekir. En kolay ulaşılabilecek olan ürünler gözden geçirilmiş akabinde indüktörler Johanson, kapasitörler ise Samsung marka olarak seçilmiştir. Bu seçim işlemi, AWR üzerinden "Library" sekmesi ile yapılırken aynı marka ve model ürünler laboratuvarda hazır tutulmaktadır.

Nihai devre için AWR programında kazanç-frekans grafiği sorgulandığında Şekil 4 elde edilmiştir.



Şekil 4. İdeal ürünler ve gerçek ürünler ile tasarlanan BGF için kazanç-frekans grafiği

Laboratuvar ortamında üretilecek olan BGF kartına montelenecek L ve C değerine göre yapılan AWR tasarımında, ideal tasarıma göre iyi bir sonuç elde edilememiştir. Bu noktada, AWR programı üzerinden "Tune Tool" kullanılır. İnce ayarlamaların yapıldığı bu araç kullanılırken yine üretim esnası göz önünde bulundurulmuş ve ulaşılabilecek ürünler üzerinden ince ayar denemeleri yapılmıştır. Bu denemeler göstermiştir ki; ideal olmayan gerçek değerler (aynı zamanda laboratuvarda kullanılabilecek olan değerler) ile istenilen grafik değerlerine ulaşılabilmiştir. Şekil 5'te yeni ürünler ile tasarlanan BGF için kazanç-frekans grafiği verilmiştir.



Şekil 5. BGF için bütün kazanç-frekans grafiklerinin karşılaştırılması

Şekil 5'teki pembe çizgi "Tune Tool"dan önceki, mavi çizgi ise "Tune Tool"dan sonraki değerler ile oluşturulan grafiklerdir. Her ikisi de gerçek değerler ile "Library" üzerinden tasarlanmıştır. Siyah ve kahverengi çizgiler ise sırasıyla "Tune Tool"dan önce ve sonra olmak üzere teorik değerler ile tasarlanan grafiklerdir. Yapılan geliştirmeler neticesinde hem merkez frekans istenilen düzeye çekilmiş hem de bant genişliği 100 MHz olarak daraltılmıştır.

Son tasarım için elde edilen gerçek malzemeler için liste şu şekildedir;

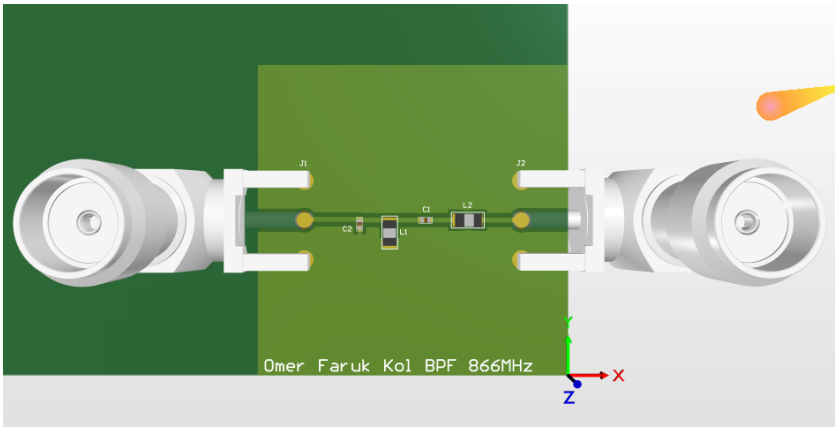
C1, 27 pF ±5% 25V Ceramic Capacitor C0G, NP0 0201 (0603 Metric)

C2, 1.5 pF ±0.1pF 25V Ceramic Capacitor C0G, NP0 0201 (0603 Metric)

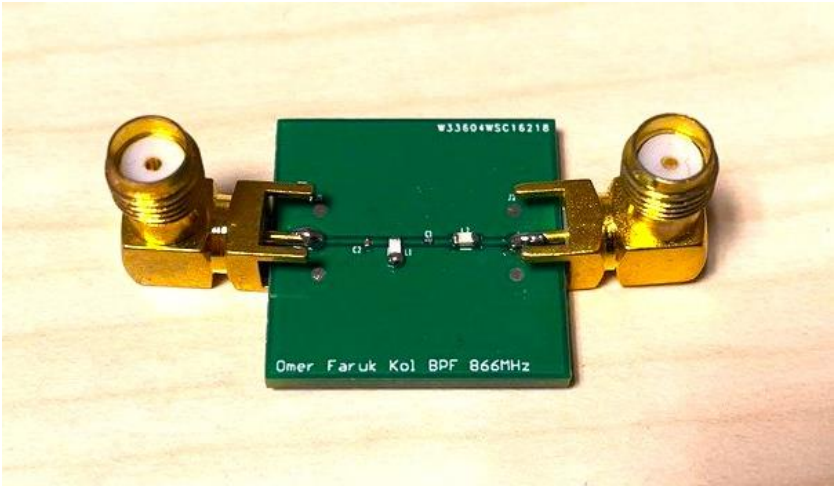
L1, 3.9 nH Unshielded Multilayer Inductor 300 mA 250mOhm Max 0603 (1608 Metric)

L2, 22 nH Unshielded Multilayer Inductor 300 mA 650mOhm Max 0603 (1608 Metric)

İlgili malzemeler kullanılarak oluşturulan BGF'nin Altium tasarım programındaki 3 boyutlu görüntüsü Şekil 6'da, baskı devre yapıldıktan sonraki gerçek fotoğrafı Şekil 7'de verilmiştir. Kapasitör ve indüktörlerin 201 ve 603 kılıf olduğu Şekil 6 ve 7'den görülebilir.



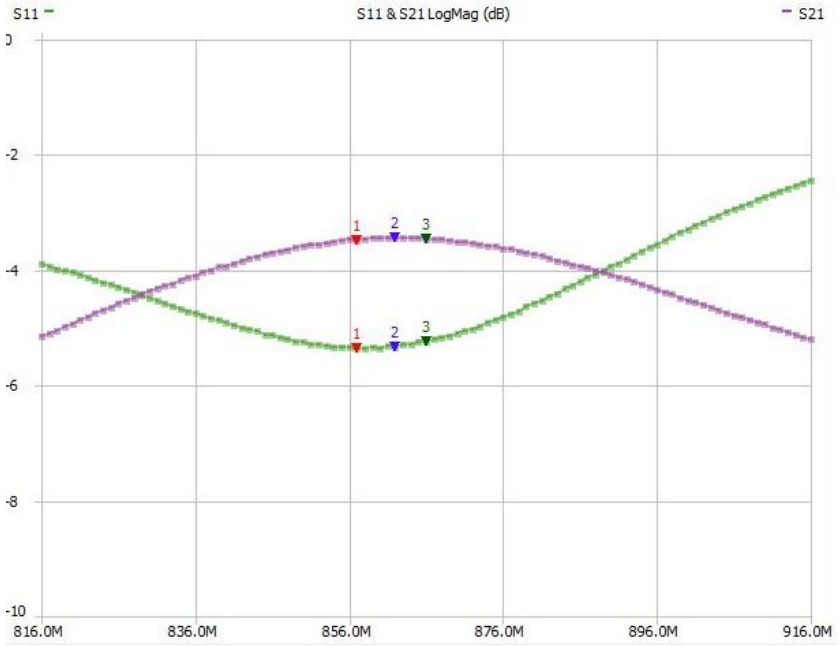
Şekil 6. Altium programı ile oluşturulan 3B çizim



Şekil 7. BGF'nin fotoğrafı

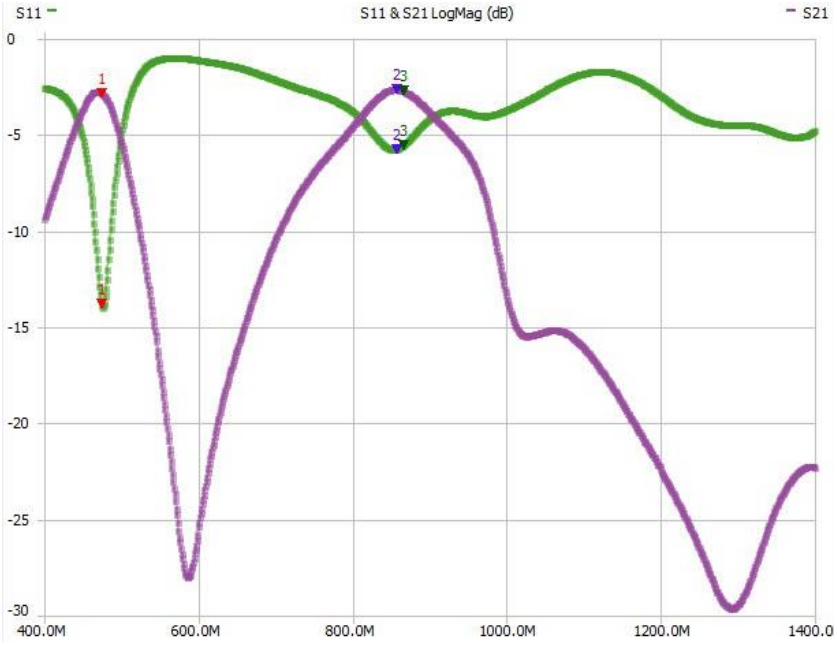
BULGULAR

Nano VNA V2 Plus 4 ölçüm cihazı ile laboratuvar ortamında yapılan ölçümlerde BGF merkez frekans değerinin 862 MHz olduğu ve istenilen değerden sadece 4 MHz kaydığı anlaşılmıştır. Voltaj durağan dalga oranı değerinin 3.365, kalite faktörünün 0.327, geri dönüş kaybının -5.324 dB (yeşil grafik) olduğu BGF devresine ait kazanç-frekans grafiği Şekil 8'de aktarılmıştır. Görüleceği üzere, kazanç değeri orta frekansta -3.447 dB (mor grafik) olarak elde edilmiştir. Pasif BGF'ler için en yüksek değer 0 olduğuna göre -3.447 dB iyi olarak sayılabilir.



Şekil 8. VNA ölçümü

400 MHz ile 900 MHz olarak genişletilen frekans eksenindeki geniş açılı kazanç-frekans grafiği Şekil 9'da verilmiştir. Bu grafik göstermektedir ki; 474 MHz frekansında da BGF özelliği elde edilmiştir. Sonuç olarak, çift bantlı BGF üretildiği aşikardır. İkinci bant için voltaj durağan dalga oranı değeri 1.513, geri dönüş kaybı -13.808 dB, kalite faktörü 0.421 ve kazanç -2.843 dB'dir. İkinci bantta BGF'nin daha iyi çalışabileceği bulgusuna ulaşılmıştır.



Şekil 9. Geniş açılı VNA ölçümü

TARTIŞMA

BGF derecesi artırılırsa daha iyi sonuçlar elde dilebilir. Ayrıca pasif eleman değerlerine "Tune Tool" ile farklı ince ayarlamalar yapıldığında ikinci bant ortadan kaldırılarak 866 MHz orta frekansında daha iyi bir kazanç elde edilebilir ayrıca 1'e daha yakın bir voltaj durağan dalga oranına, 0'a daha yakın bir kalite faktörü oranına ve daha az bir geri dönüş kaybına ulaşılabilir. Deneyler, anti statik bir ortamda veya temiz odada yapılarak hatasız sonuçlar alınabilir.

SONUÇ

Sonuç olarak, 866 MHz veya civarı uygulamalarda; özellikle de kablosuz haberleşme uygulamalarından yer uydu istasyonu kablosuz haberleşme cihazlarında, ve daha bir çok sinyal uygulamalarında kullanılabilecek bant geçiren filtre devresi üretilmiştir. İkinci bantta da ana bant kadar iyi çalışabilen bu devre sayesinde BGF'nin kullanım alanı artmaktadır.

BGF devresinin hem benzetim ortamında hem de laboratuvar ortamında gerçek cihazlarla ölçülmüş olması ve her iki durumda da istenilen kriterlere ulaşılmış olması projenin başarı ölçütlerini fazlasıyla karşılamış olduğunun göstergesidir.

Abstract

Alzheimer's disease continues to be a serious public health issue. Alzheimer's disease affects generally old people, and it is a neurological disorder. The most significant sign of Alzheimer's disease is memory loss, which becomes worse over time. Therefore, early Alzheimer's disease identification can aid in patients getting the proper care. One of the aims of this study is to automate the early diagnosis of Alzheimer's disease. While detecting automatically, a system that can improve itself by benefiting from previous experiences each time can be established with artificial neural network models. In this way, in late diagnosis, the bad effects of the disease can be protected at an early stage. Thanks to artificial intelligence and image processing algorithms, successful results can be achieved with MRI data used by transfer learning and deep learning models. In this study, a deep learning method with transfer learning based on brain MRI images for the detection of Alzheimer's disease has been proposed. In the experimental work, different convolutional neural network architectures and transfer learning methods have been tried. The results show that the detection of Alzheimer's disease can be detected with remarkable accuracy with the transfer learning method.

Keywords: Alzheimer's Disease, Brain MRI, Deep Learning, Transfer Learning, Convolutional Neural Networks, InceptionV3

INTRODUCTION

Alzheimer's disease is a worldwide neurodegenerative disease that occurs in the human brain and significantly affects the patient's quality of life (Arendt, 2009). It is reported that the number of globally affected patients is expected to double in the next 20 years, and one in 85 people will be affected by 2050 (Jellinger, 2003). Each year, 7.7 million new cases of dementia are reported globally (Bhagyashree and Sheshadri, 2018). One of the most well-known cases of dementia among the elderly is Alzheimer's disease. The following are some of the key signs of this dementia: difficulty communicating, memory issues, and different disabilities that make the patient's everyday life exceedingly challenging (Burkea et al., 2016). Besides that, Alzheimer's sufferers are troubled by perplexity, difficulty learning new situations, speech and language challenges, poor motivation, and other complications (Shimizu et al., 2018). Early and accurate diagnosing of Alzheimer's disease can greatly benefit its treatment. Alzheimer's disease is typically diagnosed in clinics after a clinical evaluation and the completion of a questionnaire by patients and their loved ones. Due to the lack of knowledge regarding disease-related brain regions and known symptoms such as brain shrinkage, it is a challenging undertaking (Kazemi et al., 2018). For several types of brain scans, including magnetic resonance imaging (MRI), well-known machine learning classification techniques have been used. Due to the complexity of medical imaging, this topic is still challenging. With the aid of ongoing and upcoming research in this area, we can better understand the course of the disease and create new treatments. Deep learning, a subclass of machine learning, has been used for intelligent systems in many fields, particularly in the processing of medical pictures, and it can handle difficult decision-making tasks. Convolutional neural networks have shown promising results for illness diagnosis and organ segmentation (Litjens et al., 2017). CNNs combine the three key phases of a classification job, namely feature extraction, feature selection, and classification, in contrast to conventional machine learning approaches. In automated medical image analysis, convolutional neural networks have achieved major advancements. Transfer learning is one of the most effective methods for training deeper networks without overfitting when the amount of data is smaller (Xiao et al.,

2018). A pre-trained network is the foundation of transfer learning. The transfer learning strategy can take advantage of the generic feature mappings and concentrate on learning the problem-specific ones for the problem of interest rather than training a specialized CNN from scratch.

In this work, we developed a deep learning method that automatically detects Alzheimer's disease by making tunings over a pre-trained model using the transfer learning method and applying data augmentation. We employed pre-trained networks that use different architectures such as InceptionV3, ResNet50V2, and Xception. An experimental work demonstrated that, as a base model, InceptionV3 can be used for the automatic detection of Alzheimer's disease and can be operated by the transfer learning method.

The rest of this work is organized in the following manner. The related work section reviews the existing methods and research in the literature related to Alzheimer's disease detection and classification. In the next section, it is an overview of the entire methodology of this study such as the used dataset and how it was obtained, deep learning, and transfer learning techniques and how they were used. Implementation details, results, and evaluation are discussed in the next section. Conclusions and final thoughts are mentioned in the last part of this paper.

RELATED WORK

In recent years, many different methods have been used for disease prediction in medical fields. Recent developments in the field of computer vision have focused on establishing models for the identification and categorization of Alzheimer's disease as well as extracting usable characteristics using a machine learning approach. Since the 1980s, brain imaging tools such as Magnetic Resonance Imaging (MRI), Positron Emission Tomography (PET) and Diffusion Tensor Image (DTI) have been used for the diagnosis and classification of Alzheimer's disease (McGeer, 1986).

For the segmentation of the gray matter, Nair and Mohan employed the Gaussian Mixing Model (Nahir and Mohan, 2017). Both the conventional classification problem and the difficulty of calculating the density are addressed by this paradigm. Then, features were retrieved using the Partial Least Squares approach, and the Support Vector Machine technique was employed for classification. In addition to these studies, a classification method built on level-set segmentation is offered (Rabeh et al., 2017). It begins by determining which of the four learning examples is closest to the new input using four distances in this investigation. A different approach has also been suggested, and they used 3D masking to isolate the Volume of Interest (VOI) region using voxel-based morphometry for feature extraction (Mufidah et al., 2017). Besides, the segmentation of images was used based on voxel morphometry to collect the 3 brain tissues (the white matter, the gray matter, and cerebrospinal fluid) (Angkoso et al., 2018). Different methods used deep learning architecture especially CNN to detect and classify Alzheimer's disease. A graph convolutional neural network (GCNN) classifier was employed by Song (Song et al., 2019). This network's eleven layers (nine convolutional layers and two fully connected layers) enable the division of Alzheimer's disease patients into four classes.

The work that used a 2D CNN with one convolutional layer, a max-pooling layer, and ultimately a neural network with a single hidden layer for classification is one of the earliest investigations of a transfer learning strategy for Alzheimer's disease diagnosis utilizing deep learning (Gupta et al., 2013). This study showed that the auto-classification encoder's performance in the subsequent layers can be improved by using real-world photos to train it. Later on, a different transfer learning technique was also put out, wherein three 2D CNNs with two convolutional layers were trained using only three slices from the middle of the MRI images of the hippocampal region (Aderghal et al., 2018). The impact of transfer learning when used for medical image classification was demonstrated in one of the subsequent studies (Shin et al., 2016). According to a study on several modalities, the results of the fine-tuning processes performed are superior. In addition, a transfer learning technique that uses ultrasound scans to locate plans and can transfer information on fewer layers is proposed (Chen et al., 2015). In recent years, as shown in Figure 1, interest in how artificial intelligence may be applied to medical imaging has increased exponentially. This interest is reflected in the rapid rise in publications in artificial intelligence from 200 peer-reviewed publications in 2010 to about 1000 in 2019 (Lui et al., 2020).

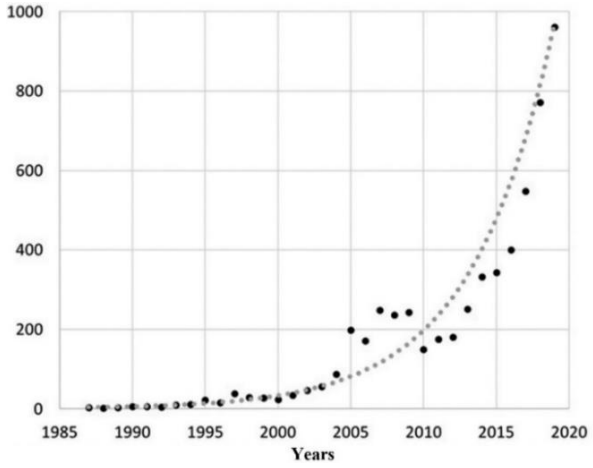

Figure 1. The number of neuroimaging artificial intelligence publications (Lui et al., 2020).

According to related works, transfer learning models can reach an accuracy equal to or greater than that of a 3D-CNN model trained from scratch. As in related previous studies, instead of creating something new from scratch, high accuracy values can be obtained and studies can become more efficient by transferring similar features with transfer learning, much easier.

MATERIALS AND METHODS

In this section, the dataset containing brain MRI images is prepared and described for Alzheimer's disease. In addition, deep learning models and transfer learning techniques are explained. After that, how Alzheimer's disease can automatically be classified in this study with artificial intelligence is explained with the dataset containing brain MRI images.

Dataset

The dataset used in this study is an open database on the Kaggle website [1]. The dataset consists of train and test folders containing a total of 6400 images. In this dataset, there are four classes of images: “Mild Demented”, “Moderate Demented”, “Non-Demented", and "Very Mild Demented". The main purpose of this dataset is to help researchers develop a model with high accuracy to detect and classify the stage of Alzheimer's disease.

Data Preparation

In the data preparation phase, libraries such as Tensorflow, Matplotlib, NumPy, and Pandas were installed and used. Afterward, paths to the images were identified and constants and seeds were determined for reproducibility. Then, the dataset was split into %80 train and %20 test batches consisting of 4 classes and determined the number of images for each class was. Images were copied and resampled from the train folder and split randomly with equal proportions in each class for the validation folder.

Data Preprocessing

Data were grayscale and they needed to be converted to RGB to use with pre-trained deep learning models. In the image transformation phase for data preprocessing, images were scaled. As shown in Figure 2, images are converted to RGB and set seed for reproducibility. Then, images were displayed in a grid of 9 images with their labels.

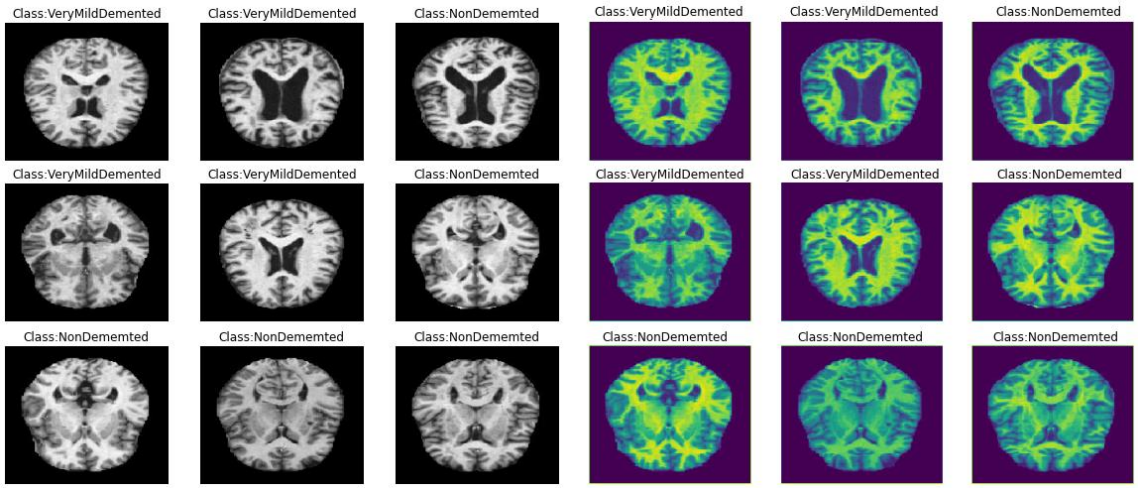

Figure 2. Brain MRI images with labels grayscale (left) and RGB (right).

Deep Learning

Deep learning is an interdisciplinary field of study developed on designing systems that require data, algorithms, and hardware knowledge, aiming to solve complex problems that humans can solve. Although there are different deep learning models used today, they vary according to the field of study and data. Convolutional neural networks are used for image data. Deep learning has approached the human level in image classification, voice recognition, and the ability to answer questions.

Convolutional Neural Network (CNN): CNN is a multilayered network structure that was developed using the multilayer perceptron, which is the standard neural network architecture. CNN designed for object detection finds its use in image classification, segmentation, pattern recognition, etc. Due to its autonomous style of operation, CNN has become a crucial tool for machine vision and artificial intelligence.

Pre-trained Models

InceptionV3: A module for GoogleNet, InceptionV3 is a convolutional neural network that facilitates object detection and picture analysis. The goal of the Inception V3 design is to support deeper neural networks without letting the number of parameters balloon out of control. Compared to AlexNet's 60 million parameters, InceptionV3 has fewer than 25 million (Szegedy et al., 2015).

ResNet50V2: The improved ResNet50V2 outperforms the original ResNet50 and ResNet101 on the ImageNet dataset.

Xception: The model is an extension of the Inception architecture, using depthwise separable convolutions in place of the normal Inception architecture modules.

Transfer Learning

One of the most well-known machine learning techniques for image categorization and detection is transfer learning. It enables the application of previously learned expertise from a highly accurate architecture to new issues (Mazo et al., 2018). Instead of rebuilding the models from scratch, transfer learning could use the model and the learned information to identify the images in the dataset containing brain MRI data. In our study, we use the InceptionV3 architecture of the convolutional neural network as a base model in our research. CNN is typically not optimized, despite the fact that training a CNN from scratch has been done in many experiments. In general, starting from scratch requires a lot of computing power, and there aren't always enough samples (Liu et al., 2018).

In this study, to reuse pre-trained model weights with the transfer learning method, it is necessary to freeze some model layers. For this process, a function is developed and it can freeze all, some, or none of the layers in a base model to freeze only some of the weights, layer names, and block numbers that need to be provided in this function.

Model Tuning: Model tuning is the process of choosing the model's parameters that produce the best outcomes for the research. The model's performance is evaluated in comparison to other builds after it has been trained numerous times using possible setups.

EXPERIMENTAL WORK

In this section, we evaluate the dataset containing brain MRI images. In addition, at this stage, the metrics used in this study and the performance obtained are mentioned.

Experimental Settings

To increase the test AUC of the model, some experimental settings have been made with the transfer learning method in this paper.

The function which builds the transfer model was tuned to add the additional layers. Also, additional convolution layers were added with dropout and batch normalization for regularization to increase the capacity of the model. In this way, it was given the additional capacity to the base model. At this stage, the epoch value was set to 50 and the learning rate was taken as 0.001.

Following this point, the training data revealed that the model was overfitting in the early epochs. Because of this, data augmentation was added to help generalize the model to new data. Changes have been made to the rescale, width shift range, rotation range, height shift range, and zoom range properties of images for data augmentation.

Finally, the model was re-trained with the tuned parameters using data augmentation and other techniques. In addition, early stopping was removed and the epochs were set to 150 to give the model as much time to train as possible without overfitting.

Metrics

The following metrics were used to evaluate the performance of the model described earlier.

1) Accuracy: It refers to the percentage of test samples that were successfully categorized.

2) F1-score: Calculating precision and recall is possible using the confusion matrix. After that, the F1-score is calculated as the harmonic mean of recall and precision.

3) Recall: Recall is a metric that shows how well we positively use our estimates.

4) Precision: Precision, on the other hand, shows how many of the values we estimated as positive are positive.

5) AUC: A popular metric for assessing the effectiveness of a multi-class classification system is the area under the receiver operator characteristic (ROC) curve. A ROC curve is a graph that shows the true and false positive rates.

Base Model Selection

In this section, InceptionV3, ResNet50V2, and Xception models are used. AUC, F1-Score, and Accuracy metrics of all models have been calculated. As a result of all these calculations, the InceptionV3 model got 85.00%, and the ResNet50V2 model and the Xception model got 81.00% AUC. The model with the best AUC value was selected from the 3 models. That model was InceptionV3, with an AUC value of 85.00%. After this section, some improvements were applied to the InceptionV3 base model.

Base Model Scores for Alzheimer's Disease	Accuracy	F1-Score	AUC
InceptionV3	0.65	0.49	%85.00
ResNet50V2	0.62	0.47	%81.00
Xception	0.57	0.49	%81.00

Table 1. Base model scores.

Performance Evaluation

In this study, after the base transfer learning model was trained, the base model was tuned and different improvements were made to the model to get better results. In this section, the changes made to the model and the results obtained are shown in Table 2.

Stages of the InceptionV3 model based on Transfer Learning	Accuracy	F1-Score	AUC
InceptionV3	0.65	0.49	%85.00
InceptionV3 + Additional Capacity	0.63	0.47	%84.00
InceptionV3 + Additional Capacity + Data Augmentation	0.68	0.50	%87.00

Table 2. Stages of the InceptionV3 model.

In figures 3, 4, and 5 below, confusion matrix and validation loss, validation AUC graphs of different periods can be observed, respectively, of the base model InceptionV3, InceptionV3 with additional capacity, and later InceptionV3 models with both additional capacity and data augmentation.

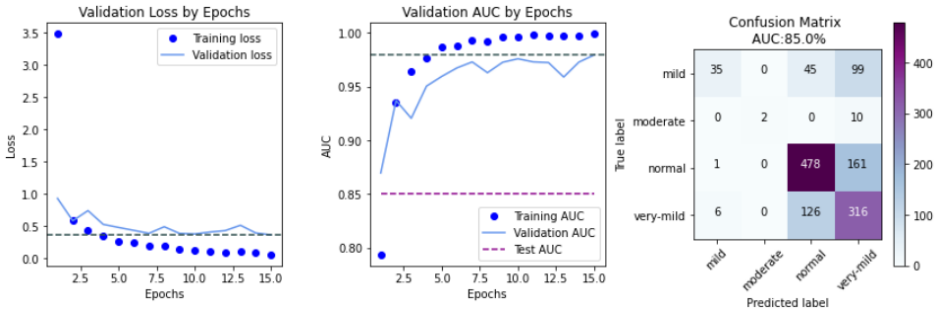

Figure 3. Base model InceptionV3.

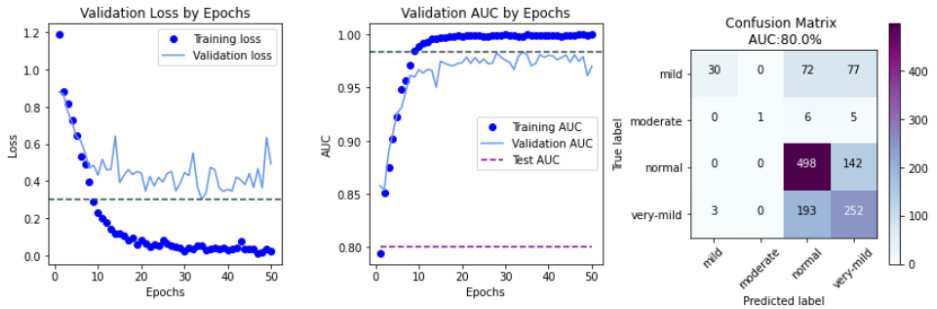

Figure 4. InceptionV3 + Additional Capacity.

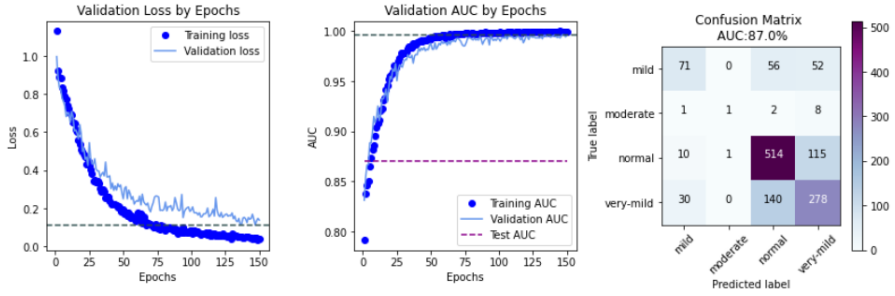

Figure 5. InceptionV3 + Additional Capacity + Data Augmentation.

CONCLUSION

In this study, the task of Alzheimer's disease classification is evaluated using the Alzheimer's Disease dataset consisting of 4 classes from Kaggle. Since InceptionV3 has the best AUC among ResNet50V2, Xception, and InceptionV3 models, InceptionV3 was used as the base transfer learning model, and then applied some tunings on the InceptionV3. Additional convolution layers were added to increase the capacity of the model and at this stage, the epoch value was set to 50 and the learning rate was taken as 0.001. After that process, the model was overfitting early in the epochs. Because of that problem, a data augmentation process was added to help generalize the model to new data. Some changes have been made to the rescale, width shift range, rotation range, height shift range, and zoom range properties of images for data augmentation. Finally, the model has trained again with the tuned parameters using data augmentation and additional convolution layers. During this process, the epoch value was set to 150 to give the model as much time to train as possible without overfitting.

Based on the data in the confusion matrix, it can be said that the model does best at identifying normal and very-mild MRIs and poorest at identifying moderate cases. Also, adding capacity to the model, searching for optimal hyperparameters, and adding data augmentation resulted in better performance on the test dataset. In future work, different datasets can be used for this problem. Different deep learning approaches and hybrid models may achieve a better result.

Abstract

Polymeric nanoparticles have drawn attention as drug delivery systems due to their high biodegradability and biocompability. Their release characteristics strongly depend on the structure of the polymer molecule, particle size and size distribution, surface charge and morphology of particles. In this study, polycaprolactone nanoparticles were synthesized through a microfluidic device to obtain nanoparticles with a narrower size distribution. Effects of polymer concentration, flow rate ratio and channel geometry on average particle size and polydispersity index were examined. The results indicated that channel geometry significantly affects both size and size distribution of the produced nanoparticles. Polymer concentration and flow rate ratio were found to be effective on particle size as lower polymer concentration resulted in smaller particles while a fall in particle size was obtained by increased flow rate of non-solvent phase. Optimum conditions for the production of polycaprolactone nanoparticles were determined as 8 mg/ml polymer concentration, 10/400 solvent to non-solvent flow rate ratio and X-junction geometry resulting in particle size of 269 nm and polydispersity index of 0.364.

Keywords: microfluidics, nanoparticles, nanoprecipitation, particle size, polycaprolactone, size distribution.

INTRODUCTION

Drug delivery systems are platforms that enable to overcome various limitations for the application of therapeutic agents such as low bioavailability and solubility, short circulation lifetime and potential toxicity (Ajazuddin, 2010; Blanco et al., 2015; Tiwari et al., 2012). Among these systems, polymeric nanoparticles are one of the most attractive group due to their morphological variability, higher stability, and ease of functionalization (Bains et al., 2017; Rizvi and Saleh, 2018). These nanoparticles are made from natural (alginate, chitosan, gelatin) or synthetic (polylactic acid, polycaprolactone) polymers and the properties of selected polymer significantly affect the performance of the drug delivery system. Synthetic polymers have various advantages over natural polymers since they are biologically inert, have high purity and reproducibility, and their structure and composition can be tailored for desired application. Polycaprolactone (PCL) is a semicrystalline aliphatic polyester which is approved by Food and Drug Administration. As a biocompatible and biodegradable synthetic polymer, PCL is used in a wide range of biomedical applications due to its high drug permeability and *in vivo* slow degradation rate. Emulsification/solvent evaporation, salting out and nanoprecipitation are common methods for the production of PCL nanoparticles (Behl et al., 2020; Byun et al., 2011; Ramanujam et al., 2018).

Nanoprecipitation, also known as solvent displacement or interfacial deposition, is a simple and fast method mainly used for the encapsulation of hydrophobic drug molecules (Lepeltier et al., 2014; Rivas et al., 2017). In this method, two miscible solvents are required to prepare nanoparticles. First, polymer is dissolved in a solvent and added dropwise to a non-solvent under continuous stirring. The contact of two solvent phases results in the precipitation of polymer. Then, organic solvent is removed by evaporation and prepared nanoparticles are separated by centrifugation. In general, an organic solvent contains polymer and drug molecule while non-solvent includes water and stabilizing agents. Although nanoprecipitation commonly used to encapsulate hydrophobic molecules, hydrophilic molecules are also effectively encapsulated (Badri et al., 2017; Ramanujam et al., 2018). A traditional approach for the synthesis of particles by nanoprecipitation is bulk mixing which is consisting of two mixing stages as macromixing and micromixing. Macromixing is driven by convection and turbulence of the production medium while micromixing occurs at molecular scale by Fick's law. Traditional bulk mixers are lack

of precise control on mixing and therefore on particle size distribution (Othman et al., 2015a-b). It is a common knowledge that some properties of nanoparticles such as size, size distribution, shape and zeta potential strongly affect their degradation and release characteristics (Łukasiewicz et al., 2021; Zanetti et al., 2019). Thus, novel mixing strategies are under consideration to overcome drawbacks of traditional mixing equipments.

Microfluidics is the science and technology of manipulating fluids in channels with dimensions less than a millimeter and microfluidic devices offer several advantages over conventional systems such as compact design, enhanced mass and heat transfer, reduced reagent consumption, ease to parallelization, low energy demand and precise control (Barry and Ivanov, 2004). Microfluidic systems possess a great potential for the synthesis of micro and nanoparticles due to the strict control of the mixing. In these systems, macromixing can be avoided and mixing merely occurs by molecular diffusion via passive and active mixing strategies. Channel geometry, junction design and operation parameters largely affect the mixing in microchannels and particle properties (Heshmatnezhad & Nazar, 2020a).

In this study, PCL nanoparticles were prepared in a microfluidic device and the effects of channel geometry, polymer concentration and solvent to non-solvent flow rate ratio on particle size and size distribution were examined.

MATERIALS AND METHODS

Polycaprolactone (Sigma) nanoparticles were prepared by nanoprecipitation method through microfluidic devices. For this purpose, PCL was dissolved in acetone (Merck) at different concentrations (4-8 mg/ml) and fed to metal microfluidic device by a syringe pump (New Era pump systems Inc.). Aqueous polyvinyl alcohol (PVA) (Sigma) and Tween 20 (Merck) solution was prepared as non-solvent at constant PVA:Tween 20 ratio as 1:20. To determine the effect of channel geometry, two different microfluidic devices were used. Each device was made from stainless steel and channel diameter was 250 µm with two different channel geometry as T- and X-junction. Flow rate of polymer solution was kept constant at 10 µl/min and flow rate of aqueous phase varied between 100 and 600 µl/min to determine the effect of flow rate ratio. The effluent was collected in tubes and centrifugated after solvent evaporation (Figure 1). Particles were characterized in terms of size and polydispersity index (PDI).

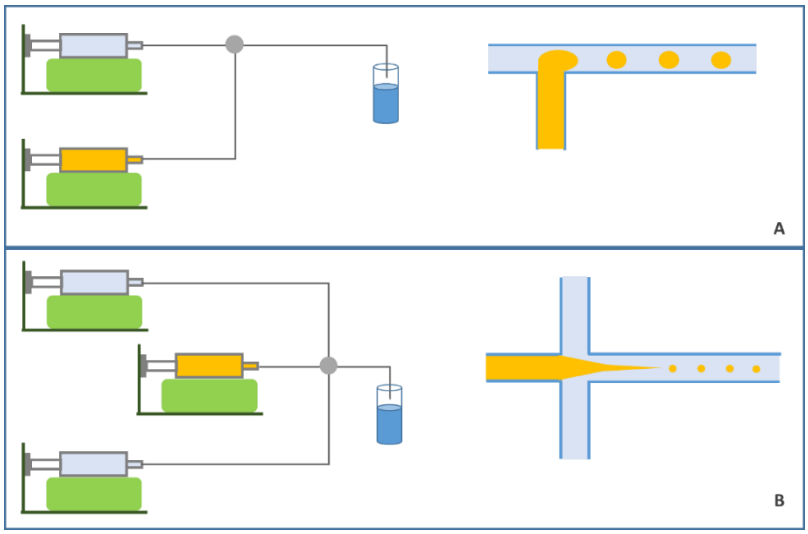

Figure 1. PCL nanoparticle production through T-junction (A) and X-junction (B) microfluidic devices.

RESULTS AND DISCUSSION

PCL nanoparticles were prepared by nanoprecipitation method. Acetone and water were used as solvent and non-solvent phase, respectively. In nanoprecipitation method, nanoparticles are synthesized through nucleation, growth and aggregation stages. To prevent the agglomeration and coalescence of produced nanoparticles, natural or synthetic surfactants are used. The combined use of PVA and Tween 20 has been shown to contribute to nanoparticle synthesis with lower size and avoid the aggregation of produced particles in the final suspension

(Badri et al., 2017; Heshmatnezhad & Nazar, 2020b; Ramanujam et al., 2018). Therefore, an aqueous PVA:Tween 20 solution was used as a non-solvent in the experiments.

For the production of PCL nanoparticles by a T-junction microfluidic device, effect of varying flow rate ratio was examined by keeping PCL concentration and flow rate constant as 8 mg/ml and 10 µl/min, respectively. As shown in Table 1., increasing the flow rate of aqueous phase resulted in decrease of average particle size while PDI values showed an inverse proportion. The smaller particle size was obtained at 400 µl/min aqueous phase flow rate. For 10/400 flow rate ratio, decreasing of polymer concentration from 8 mg/ml to 4 mg/l led a significant decrease of nanoparticle size from 738 nm to 466 nm. Polymer concentration have a significant effect on the nanoparticle formation in microfluidic systems. Channel clogging is a common problem for microfluidic devices which avoids the use of high polymer concentration. On the other hand, there is a strong relationship between polymer concentration and the amount of produced particles. For microfluidic particle synthesis, polymer concentration should be high enough to ensure a sufficient production yield and also low enough to prevent the clogging of channels (Lince et al., 2008; Rhee et al., 2011).

Table 1. Size and PDI of PCL nanoparticles produced through microfluidic devices.

Channel geometry	PCL concentration (mg/ml)	Flow rate ratio	Particle size (nm)	PDI
T-junction	8	10/100	788	0.417
	8	10/200	767	0.520
	8	10/400	738	0.563
	4	10/400	466	0.585
X-junction	8	10/100	315	0.225
	8	10/200	304	0.271
	8	10/400	269	0.364
	8	10/600	144	0.433

For X-junction microdevice, particle synthesis was carried out at constant polymer concentration and flow rate. Increase of aqueous phase flow rate from 100 to 600 µl/min significantly decreased the particle size from 315 to 144 nm (Figure 2). As flow rate ratio increased, a faster mixing and a higher supersaturation gradient occurred which results in spontaneous nucleation and small nuclei formation and consequently reduction of particle size. Although, PDI values of nanoparticles increased by increasing flow rate, they were still in an acceptable range (Table 1).

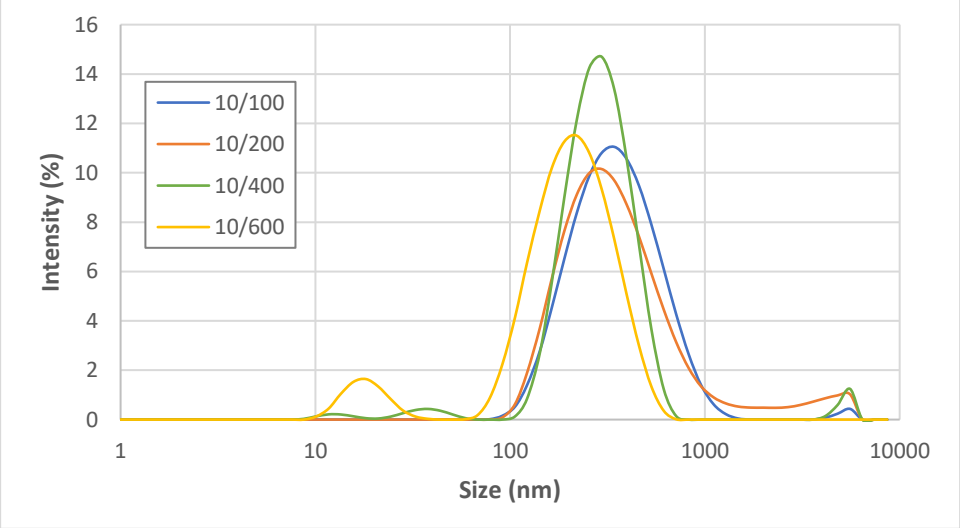

Figure 2. Size distribution of PCL nanoparticles produced in X-junction microfluidic device.

The obtained results showed that channel geometry had a significant effect on the size and size distribution of produced nanoparticles. For all tested conditions, X-junction microdevice produced smaller nanoparticles with a narrower particle size distribution compared to nanoparticles produced by T-junction.

CONCLUSION

In this study, PCL nanoparticles were prepared in microfluidic devices by nanoprecipitation method. Effects of channel geometry, polymer concentration and flow rate ratio on particle size and size distribution were investigated. Obtained results showed that channel geometry significantly affects the size and size distribution and X-junction was found to be a more suitable geometry for the production of PCL nanoparticles. Flow rate ratio and polymer concentration were effective parameters on particle size as lower polymer concentration resulted in smaller particles while a fall in particle size was obtained by increased flow rate of non-solvent phase. As a conclusion, effect of synthesis conditions on microfluidic PCL nanoparticle production was elicited and 8 mg/ml polymer concentration, 10/400 flow rate ratio and X-junction geometry were found as optimum conditions for the preparation of PCL nanoparticles resulting particle size of 269 nm and polydispersity index of 0.364.

Özet

İlaç sektöründeki gelişmeler ve artan ilaç kullanımına bağlı olarak, tüketim sonrasında ortaya çıkan ilaç blister ambalaj atıkları kentsel katı atıklarla birlikte genellikle yer alarak düzenli depolama alanlarında ve daha düşük bir oranda insinerasyon ile bertaraf edilmektedir. Blister ambalajlar, ürün için gerçek kabarcıklara sahip olan plastik film (ağırlıkça %80-85) ve alüminyum kapak malzemesinden (ağırlıkça %15-20) oluşurlar. Kapak malzemesi (ağırlıkça %15-20) ambalajın dayanıklılığını artıran ve basınç altında kırılmasına izin verebilen metalik (genellikle alüminyum) bir folyodur, plastik şekillendirme filmi (ağırlıkça %80-85) ise çoğunlukla düşük maliyeti sebebiyle PVC yapıda olmakla birlikte PP, PET, PVDC gibi farklı yapılarda olabilmektedir. Son yıllarda artan ilaç kullanımına bağlı olarak ilaç blister ambalaj atıkları da artışa geçmiş ve araştırmacılar bu atıklara odaklanarak ilaç blister ambalaj atıklarından metalik ve plastik fraksiyonların geri kazanımı için çeşitli çalışmalar gerçekleştirmişlerdir. Bu noktadan hareketle bu çalışmada, karmaşık kompozit benzeri yapısı sebebiyle geri dönüşümü ve geri kazanımı oldukça zor olan ilaç blister ambalaj atıklarının bir başka tarımsal atıkla (şeker pancarı küspesi) birlikte piroliz edilmesi ve hem ambalajda bulunan alüminyumun geri kazanılması hem de daha etkin bir atık yönetim sisteminin değerlendirilmesi amacıyla şeker pancarı küspesi ve ilaç blister ambalaj atıkları, 10°C/dk ısıtma hızında 400, 450 ve 500°C sıcaklıklarda önce ayrı ayrı piroliz edilmiş olup daha sonra aynı ısıtma hızı ve sıcaklıklarda ko-piroliz işlemi uygulanmıştır. Her bir piroliz ve ko-piroliz prosesi sonrasında elde edilen katı ürünlerin karakterizasyonu için elementel analiz, XRD analizi ve klor analizi gerçekleştirilmiştir. Şeker pancarı küspesinin tek başına pirolizine kıyasla, ko-piroliz prosesinde, ilaç blister ambalaj atıklarında bulunan PVC varlığından kaynaklanan HCl emisyonlarının reaksiyonu hızlandırdığı, aynı zamanda ko-pirolizden kaynaklanan gaz emisyonlarının katı ve sıvı üründe tutulduğu sonucuna ulaşılmıştır.

Anahtar Kelimeler: İlaç blister ambalaj atıkları, ko-piroliz, piroliz, şeker pancarı küspesi

Pyrolysis and co-pyrolysis solid comparative analysis of pharmaceutical blister packaging and sugar beet pulp

Abstract

Blister packages consist of plastic forming film (80-85% by weight) and aluminum closure material (15-20% by weight). The plastic forming film used in thermoform blister packaging is mainly shaped in PVC structure due to its low cost (Wang et al., 2015). Due to the developments in the pharmaceutical industry and the increasing use of drugs, the pharmaceutical blister packaging wastes generated after consumption are disposed of in municipal solid wastes by landfilling or incineration. Although many researchers have investigated the pyrolysis of plastic to obtain high quality petroleum products, PVC has generally been excluded from these experiments due to its adverse effects on pyrolysis products and catalysts. In the co-pyrolysis of PVC with solid biomass, PVC generally provided a positive synergy on solid residues. In this study, sugar beet pulp was used in the pyrolysis of PVC-containing pharmaceutical blister packaging waste. Sugar beet pulp and pharmaceutical blister packaging waste were first separately pyrolyzed at 400, 450 and 500°C at a heating rate of 10°C/min. It was then co-pyrolyzed at the same heating rate and temperatures. Characterization, elemental analysis, XRD analysis and chlorine determination of solid products formed after each pyrolysis and co-pyrolysis processes were performed. As a result, aluminum found in pharmaceutical blister packaging waste, which is very difficult to recover due to its complex composite-like structure, was recovered. Compared to the pyrolysis of sugar beet pulp alone, it was

concluded that in the co-pyrolysis process, HCl emissions caused by the presence of PVC in waste drug blister packages accelerate the reaction, while gas emissions from co-pyrolysis are retained in the solid and liquid product.
Keywords: Co-pyrolysis, pharmaceutical blister packaging, pyrolysis, sugar beet pulp

GİRİŞ

Son yıllarda hızla gelişme gösteren ilaç sektöründeki üretime paralel olarak, sağlık sektöründe sıkça kullanılan kapsüller veya tabletler tüketildikten sonra veya belirli sebeplerle (son kullanma tarihi geçmiş ilaçlar, eczanelerde stok birikimi sonucu bozulan ilaçlar, ilaç endüstrisinde ilaç üretimi sürecinden kaynaklanan ilaçlar ve ambalajları) kentsel katı atıklarla birlikte genellikle yer alarak düzenli depolama alanlarında ve daha düşük bir oranda insinerasyon ile bertaraf edilmekte ya da çevreye bilinçsizce atılarak ciddi problemler yaratmaktadır. Çevre, Şehircilik ve İklim Değişikliği Bakanlığı, 2019 yılında 4.101.155 kg atık ilaç toplandığını açıklamıştır. Bir ara depolama tesisinin verilerine göre ise, Türkiye'de 2 milyar kutu tablet ilaç üretilmekte ve sadece bunların ağırlığı 100 milyon kg'ı bulmaktadır (http 1, 2022). Blister ambalaj, 1960'larda katı ilaçları ambalajlamanın bir yolu olarak yaygınlaşmaya başlamıştır. Geleneksel cam veya plastik şişelerden çok daha üstün özellikleri olan blister ambalajlar, sızdırmazlık özelliklerine ek olarak farmasötikleri gazlardan veya nemden izole ederek daha iyi bir raf ömrü sağlarlar (Nieminen ve ark., 2020). Kapak malzemesi (ağırlıkça %15-20) ambalajın dayanıklılığını artıran ve basınç altında kırılmasına izin verebilen metalik (genellikle alüminyum) bir folyodur, ürün için gerçek kabarcıklara sahip olan plastik şekillendirme filmi (ağırlıkça %80-85) ise çoğunlukla düşük maliyeti sebebiyle PVC yapıda olmakla birlikte PP, PET, PVDC gibi farklı yapılarda olabilmektedir. Son yıllarda artan ilaç kullanımına bağlı olarak ilaç blister ambalaj atıkları da artışa geçmiş ve araştırmacılar bu atıklara odaklanarak ilaç blister ambalaj atıklarından metalik ve plastik fraksiyonların geri kazanımı için çeşitli çalışmalar gerçekleştirmişlerdir. Gente ve ark. (2003) tarafından termoform ilaç blister ambalaj atıklarından alüminyum ve plastik bileşenlerin ayrılmasını sağlamak için kriyojenik öğütme ile atıkların parçalanması ve ardından elektriksel ayırma testleri gerçekleştirilmiştir. Önerilen işlemlerden sonra hiçbir fraksiyon saf olmadığından, geri kazanılan materyallerin yeniden kullanımı ile ilgili olarak ek işleme hala ihtiyaç duyulduğu ve yöntemin uygulanması sırasında yüksek enerji tüketiminin olduğu vurgulanmıştır (Nieminen ve ark. 2020). Wang ve ark. (2015), ağırlıkça %14 alüminyum ve %86 PVC içeren ilaç blister ambalaj atıklarındaki alüminyumu PVC'den ayırmak için hidrometalurjik bir yöntem olarak hidroklorik asit (HCl) çözeltisi ile farklı sıcaklık, konsantrasyon, reaksiyon süresi, katı/sıvı oranı ve çalkalama hızının etkilerini incelemişlerdir. Optimum koşullar altında, Al'un geri kazanımı %100'e yakın olmuş ve ilaç blister ambalaj atıklarından Al ve PVC'nin tamamen ayrılması sağlanmıştır. Sodyum hidroksit çözeltisi kullanılarak yapılan benzer çalışmada da (Wang ve ark., 2015) ilk çalışmalarındaki sonuçlara benzer şekilde, Al ve PVC için mükemmel geri kazanım oranları (optimum koşullarda %100'e kadar) elde edilse de bileşenlerin geri kazanımında çevreye zarar veren aşındırıcı ajanların kullanımının bir dezavantaj olduğu vurgulanmıştır (Nieminen ve ark., 2020). Litvanya'daki yerel hastanelerde oluşan ilaç blister ambalaj atıklarından çok katmanlı yapının organik kısmını çözmek için ana işlem olarak değiştirilebilir hidrofilisite çözücüsü (DMCHA) kullanılmış, ardından ultrasonik işlem, santrifüjleme, kalsinasyon ve filtrasyon yöntemleriyle, ana element alüminyum olmak üzere %16,5 metalik fraksiyon ve ana polimerik fraksiyon PVC olmak üzere %81,2'sinin geri kazanıldığından bahsedilmiştir. Ayrıca geliştirilen yaklaşım ile 633 $/ton ekonomik fayda elde edilebileceği ve geri dönüşüm oranının yüksek (~%98) olduğundan da bahsedilmiştir. (Yousef ve ark., 2018). Nieminen ve ark. (2020) tarafından, yeşil çözücüler olarak kabul edilen derin ötektik çözücü (DES, laktik asit - kolin klorür) ve saf laktik asit kullanılarak alüminyum ve plastik fraksiyonların ayrılmasının uygulanabilirliğinin değerlendirildiği SEM-EDS analizinin sonuçlarına göre, alüminyum fraksiyonu, araştırılan farklı koşullarda laktik asit ile muameleden sonra görünüşte zarar görmemişken, DES işlemi alüminyumu aşındırarak alüminyum laktat oluşumuna neden olmuştur. Laktik asit işleminin plastik veya alüminyum üzerinde önemli bir hasar etkisi olmadığı için, mevcut haliyle oldukça umut verici bir ayırma teknolojisi olduğu ancak, alüminyum geri kazanımı ile ilgili kullanılan DES işleminin daha fazla araştırmaya ihtiyaç duyduğundan bahsedilmiştir. Çözücülerin kullanıldığı kimyasal uygulamaların, yeşil çözücülerde bile (örn. değiştirilebilir hidrofiliklik, laktik asit ve DES) (Nieminen ve ark., 2020; Yousef ve ark., 2018) çözücülerin toksisitesi ve işlem sırasında gaz emisyonları nedeniyle henüz benimsenmediği, bu sebeple, endüstriyel ölçekte uygulamasının henüz olmadığı vurgulanmıştır (Yousef ve ark., 2021).

Bu bağlamda etkili ve ümit verici bir termokimyasal dönüşüm teknolojisi olarak piroliz; ürün verimini optimize etmek için proses parametrelerinin uygun şekilde kullanımına olanak tanıyan ve sonunda katı, sıvı ve gaz

atıklarının tamamının ürün olarak geri kazanılabildiği bir prosestir. Birçok araştırmacı yüksek kaliteli petrol ürünleri elde etmek için plastiğin pirolizini araştırmış olsa da genellikle PVC, piroliz ürünleri ve katalizörler üzerindeki olumsuz etkilerinden dolayı bu deneylerin dışında tutulmuştur. PVC atıklar çoğunlukla oldukça bol bulunan biyokütle atıklarıyla birlikte piroliz (co-pyrolysis) edilmiştir. Yine de ko-piroliz ürünlerinin özellikleri ve verimi ve negatif veya pozitif sinerji hammadde ve çeşitli proses seçeneklerine bağlı olsa da PVC'nin katı biyokütleyle ko-pirolizinde PVC genellikle, katı kalıntılar üzerinde pozitif bir sinerji sağlamıştır. Ahşap ve PVC'nin ko-pirolizi sırasında HCl emisyonunun ölçüldüğü piroliz deneylerinde, odundaki hemiselüloz varlığıyla Cl moleküllerinin çoğunun piroliz kalıntısına sabitlendiği, HCl emisyonunu önemli ölçüde azalttığı gözlenmiştir (Kuramochi ve ark., 2008). Czégény ve ark. (2015), odun-PVC karışımlarının ko-pirolizini incelemişler, ahşap numunesindeki selüloz içeriğinin PVC ile karıştırıldığında daha düşük sıcaklıkta ayrıştığını gözlemlemişlerdir. Tang ve ark. (2018) tarafından, soya fasulyesi ve PVC ko-piroliz özellikleri ve kinetik analizinin araştırıldığı çalışmada elde edilen sonuçlar, etkileşimin reaksiyonu hızlandırdığını göstermiş, PVC'den salınan HCl'in, depolimerizasyonu bastırmak ve yanma sürecini hızlandırmak için asit katalizörü olarak işlev görebileceğinden bahsedilmiştir.

Bu çalışmada ise, ülkemizde oldukça fazla ortaya çıkan şeker sanayi yan ürünü olan şeker pancarı küspesi ve ilaç blister ambalaj atıkları önce ayrı ayrı daha sonra da ko-piroliz edilmiş ve elde edilen katı ürün özellikleri karşılaştırılmıştır.

MATERYAL VE METOD

İlk aşamada, piroliz ve ko-piroliz prosesleri öncesinde reaktöre beslenecek olan atıklara ön işlemler uygulanarak analitik örnekler hazırlanmıştır. İlaç blister ambalaj atıkları toplandıktan sonra 10x10mm olacak şekilde boyutları küçültülmüştür. Şeker üretim prosesinde yan ürün olarak meydana gelen şeker pancarı küspesi, herhangi bir durulama-yıkama işlemi gerçekleştirilmeden etüvde kurutulmuş, ardından öğütülmüştür. Her iki atık türü için (Şekil 1), nem (ASTM D-3173), kül (ASTM D-3174), uçucu madde (ASTM E-897-82) ve sabit karbon tayinleri (ASTM D-3172), elementel analiz ve TG-dTG analizinden oluşan başlangıç analizleri yapılmıştır. Elementel analiz, Eskişehir Teknik Üniversitesi Çevre Mühendisliği Katı Atık Yönetimi Araştırma Laboratuvarı'nda bulunan LECO marka elementel analiz cihazı ile yapılmıştır. Termogravimetrik analiz (TG) ve türev termogravimetrik (dTG) analizleri, Eskişehir Teknik Üniversitesi Malzeme Bilimi ve Mühendisliği bölümünde bulunan diferansiyel termal analizör (DTA) ile birleştirilmiş SETERAM, Labys TG-DTA/DSC termogravimetrik analiz cihazı kullanılarak gerçekleştirilmiştir.

Şekil 1. İlaç blister ambalaj atıkları (solda) ve şeker pancarı küspesi (sağda)

İkinci aşamada, Eskişehir Teknik Üniversitesi Çevre Mühendisliği Bölümü Katı Atık Yönetimi Araştırma Laboratuvarı'nda bulunan, Şekil 2'de gösterilen, 380 S paslanmaz çelikten imal edilmiş, 240 cm^3 hacimli, sabit yataklı Heinze tipi piroliz reaktöründe piroliz ve ko-piroliz çalışmaları yapılmıştır. İlaç blister ambalaj atıkları ve şeker pancarı küspesinin piroliz ve ko-piroliz proseslerinde 30 g analitik örnek ile çalışılmıştır. Piroliz proseslerinde atıkların her biri ayrı ayrı, ko-piroliz proseslerinde ise homojen olarak 1:1 oranında olacak şekilde hazırlanmıştır. Hazırlanan analitik örnekler, proses öncesi azot gazıyla süpürülmüş reaktöre yerleştirilmiştir. Piroliz ve ko-piroliz proseslerinde meydana gelen sıvı ürünlerin toplanması amacıyla reaktöre, sıvı ürün toplama kaplarının bağlantıları yapılmış ve sıvı ürün toplama kapları, buz banyosuna yerleştirilmiştir. 400, 450, 500°C sıcaklıklarda 10°C/dk ısıtma hızında, atmosferik basınçta, her biri üçer kez tekrarlı olmak üzere piroliz ve ko-piroliz çalışmaları gerçekleştirilmiştir. Sıvı ürün toplama kapları içinde biriken ürün diklorometan (DCM) çözücüsü ile yıkanarak alınmış ve IKA marka döner evaporatörde 40°C sıcaklık ve 40 rpm dönüş hızı ile DCM

uzaklaştırılarak prosesler boyunca meydana gelen sıvı ürün miktarları hesaplanmıştır. Reaktör haznesinde kalan kalıntı miktarı tartılarak katı ürün miktarı bulunmuştur. Toplanan sıvı ürünler gravimetrik olarak, gaz ürün verimi ise toplam kütle denkliğinden yararlanılarak başlangıç atık miktarı ile katı ve sıvı ürün farkından hesaplanmıştır. Verim hesaplarına göre katı ürün miktarı göz önünde bulundurularak optimum proses sıcaklığı belirlenmiştir. İlaç blister ambalaj atıklarının tek başına yapıldığı piroliz ve şeker pancarı küspesi ile birlikte yapılan pirolizden elde edilen ürünlerde klor tayini yapılmış olup, belirlenen optimum proses sıcaklığında meydana gelen katı ürünlerde elementel analiz ve XRD (X- Işını Kırınım Yöntemi) analizi gerçekleştirilmiştir.

Şekil 2. Piroliz reaktörü

Piroliz ve ko-piroliz prosesleri sonrasında meydana gelen katı ve sıvı ürünlerin klor tayinleri, ASTM E776-16 standardına göre yapılmıştır. Klor tayini iki aşamalı olarak gerçekleştirilmiş olup, ilk aşamada IKA C 200 marka Kalorimetre ve ikinci aşamada ise HACH DR5000 marka Spektrofotometre cihazları kullanılarak her bir numune için sonuçlar spektrofotometrede üç tekrarlı olacak şekilde okunmuş ve çıkan sonuçların ortalaması alınarak katı ve sıvı ürünlerde bulunan klor miktarları belirlenmiş, başlangıç klor miktarından katı ve sıvı ürünlerin toplamı çıkarılarak gaz ürünlerin içerdiği klor miktarı hesaplanmıştır. Ürünlerin elementel analizleri başlangıç analizlerindeki gibi gerçekleştirilmiştir. XRD analizi, her bir kristal fazın kendine özgü atomik dizilimlerine bağlı olarak X- ışınlarını karakteristik bir düzen içerisinde kırması esasına dayanır. Her bir kristal faz için kırınımlar, o kristali tanımlamaktadır. XRD analizleri, Eskişehir Teknik Üniversitesi Malzeme Bilimi ve Mühendisliği bölümünde bulunan, Rigaku miniflex 600 marka XRD cihazı ile, 3°-70°'lik 2θ tarama aralığında yapılmıştır.

BULGULAR ve TARTIŞMA

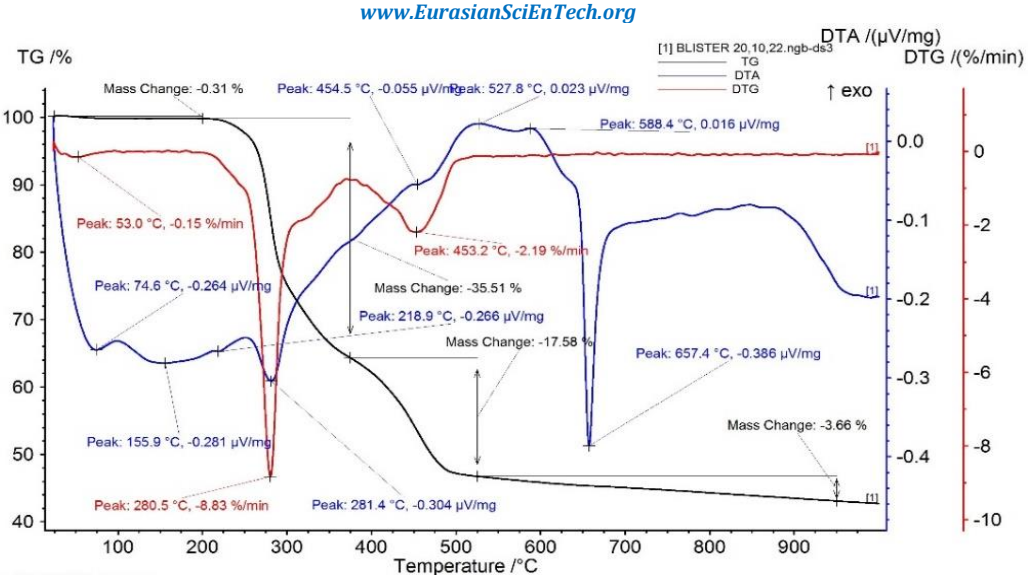
İlaç blister ambalaj atıkları ve şeker pancarı küspesi başlangıç analizleri

Tablo 1'de atıkların başlangıç analiz sonuçları verilmiştir. Şeker fabrikasından temin edilen şeker pancarı küspesinin etüvde kurutulmadan önceki nem içeriği %3,40, kurutma aşamasından sonra ise %0,18 'dir. Küspenin karbon açısından zengin bir biyokütle kaynağı olduğu görülmektedir.

Tablo 1. Piroliz ve ko-piroliz prosesleri öncesinde atıkların başlangıç ve elementel analizleri

Parametre (%)	Şeker pancarı küspesi	İlaç blister ambalaj atıkları
Nem	0,18	0,00
Kül	2,97	34,95
Uçucu madde	11,18	35,65
Sabit karbon	85,67	29,40
Karbon	42,25	29,95
Hidrojen	6,29	4,63
Azot	3,79	1,67

Ağırlık ve enerji değişimlerini grafiksel olarak belirlemek amacıyla yapılan DTA-TGA analizi sayesinde, malzemelerde kristalografik dönüşümler, erime, bozunma, su kaybı gibi özellikler belirlenebildiğinden, çalışmada da bu analiz yapılmış ve Şekil 3'te atıkların TG-dTG eğrisi verilmiştir. İlaç blister ambalaj atıklarının ağırlık kaybı iki aşamada gerçekleşmiştir. Maksimum ağırlık kaybının gerçekleştiği ilk aşama, 220-380 °C aralıklarında olup, maksimum ağırlık kaybı 280,5°C'de meydana gelmiştir. Reaksiyonun ikinci aşaması 380-520°C aralıklarında gerçekleşmiştir. Oda sıcaklığından 900°C' ye kadar olan reaksiyon süresinde toplam kütle kaybı %57,06'dır.



Şekil 3. İlaç blister ambalaj atıklarının TG-dTG eğrisi

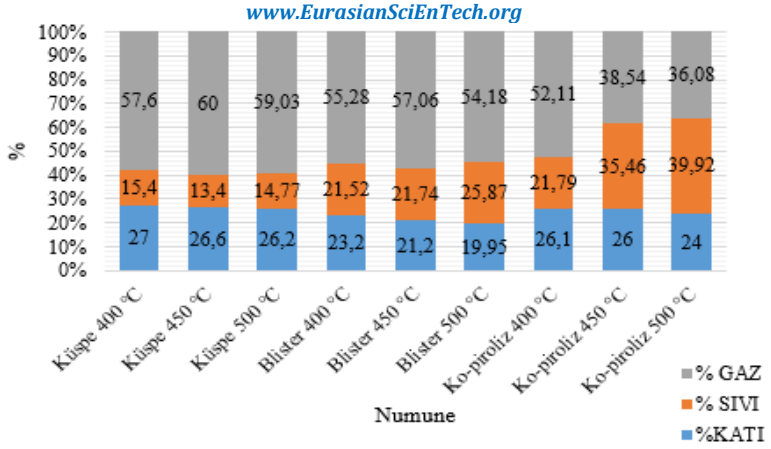
Katı ürünlerin karakterizasyonu

Klejnowska ve arkadaşlarının ilaç blister ambalaj atıklarının piroliz deneyleri öncesinde termogravimetrik çalışma ile belirledikleri proses sıcaklıkları (400, 425 ve 450 °C), ilaç blister ambalaj atıklarının TGA analizi ve atığın alüminyum içermesi sebebiyle alüminyumun erime noktası da (~ 660 °C) göz önünde bulundurularak piroliz ve ko-piroliz prosesleri için çalışma sıcaklıkları 400, 450 ve 500°C olarak belirlenmiştir. Tablo 2'de reaksiyon süresine bağlı olarak piroliz ve ko-piroliz proseslerinin sıcaklık değerleri verilmiştir. 400 °C'deki piroliz ve ko-piroliz proseslerinde 30. dakikadan sonra reaksiyonların başladığı, 40. Dakikada reaktörün gösterge sıcaklığı; şeker pancarı küspesinin pirolizinde 268°C, ilaç blister ambalaj atıklarının pirolizinde 322°C, şeker pancarı küspesinin tek başına pirolizine kıyasla ko-piroliz prosesinde ise ilaç blister ambalaj atıklarının varlığı reaksiyon sıcaklığını hızlı bir şekilde artırarak 315°C sıcaklığa ulaştırdığı görülmektedir. Tablo 2'den hareketle şeker pancarı küspesinin tek başına pirolizine kıyasla, ilaç blister ambalaj atıklarının pirolizi ve ko-piroliz proseslerinde reaktörün gösterge sıcaklığındaki değerlerin yüksek olması, ilaç blister ambalaj atıklarında düşük maliyeti sebebiyle ağırlıklı olarak PVC yapının kullanımına bağlı olarak piroliz ve ko-piroliz proseslerinde sıcaklığın artmasıyla birlikte meydana gelen HCl gazının katalizör görevi görerek reaksiyonu hızlandırabileceği ve ilaç blister ambalaj atıklarının alüminyum içermesine bağlı olarak alüminyumun ısı iletimi yüksek bir malzeme olmasına bağlanmıştır.

Tablo 2. 400°C' de piroliz ve ko-piroliz proseslerinde reaksiyon süresine bağlı olarak sıcaklığın değişimi

Reaksiyon süresi (dk)	Şeker pancarı küspesi pirolizi (°C)	İlaç blister ambalaj atıkları pirolizi (°C)	Ko-piroliz (°C)
0	19,3	19,8	18,7
10	23,5	25,4	24,6
20	62,6	68,1	67,8
30	141,8	172,1	170,8
40	268	322	315

Şekil 4'te prosesler sonrasında elde edilen katı, sıvı ve gaz ürünlerin verimleri verilmiştir. İlaç blister ambalaj atıklarından alüminyumun geri kazanımı hedeflendiği ve çalışmanın daha sonraki aşamalarda katı ürüne odaklanılacağından, maksimum katı ürün veriminin elde edildiği; şeker pancarı küspesinin pirolizi (%27), ilaç blister ambalaj atıklarının pirolizi (%23,2) ve ko-piroliz prosesi (%26,1) için 400 °C optimum sıcaklık olarak seçilmiş ve Tablo 3'te 400°C'de piroliz ve ko-piroliz proseslerinde elde edilen katı ürünlerin elementel analiz sonuçları verilmiştir. Ko-piroliz prosesinde, sıcaklığın artmasıyla birlikte sıvı ürün veriminde artış gözlenmiştir.

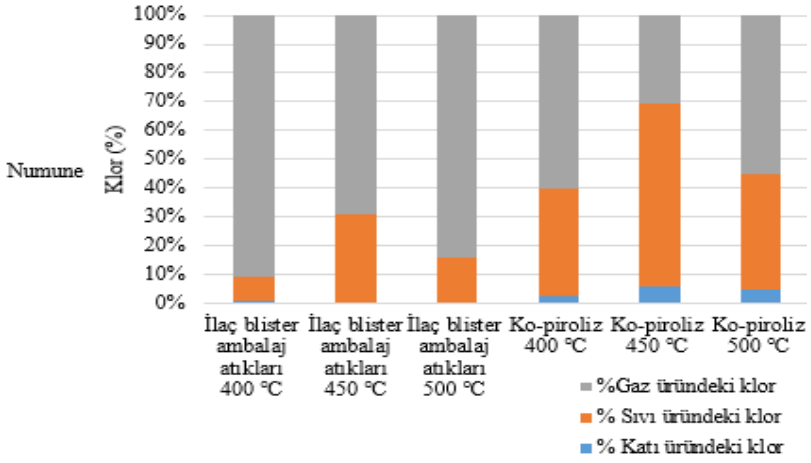


Şekil 4. 400, 450, 500 °C'de piroliz ve ko-piroliz proseslerinde elde edilen ürün verimleri

Tablo 3. 400°C'de piroliz ve ko-piroliz proseslerinde elde edilen katı ürünlerin elementel analizleri

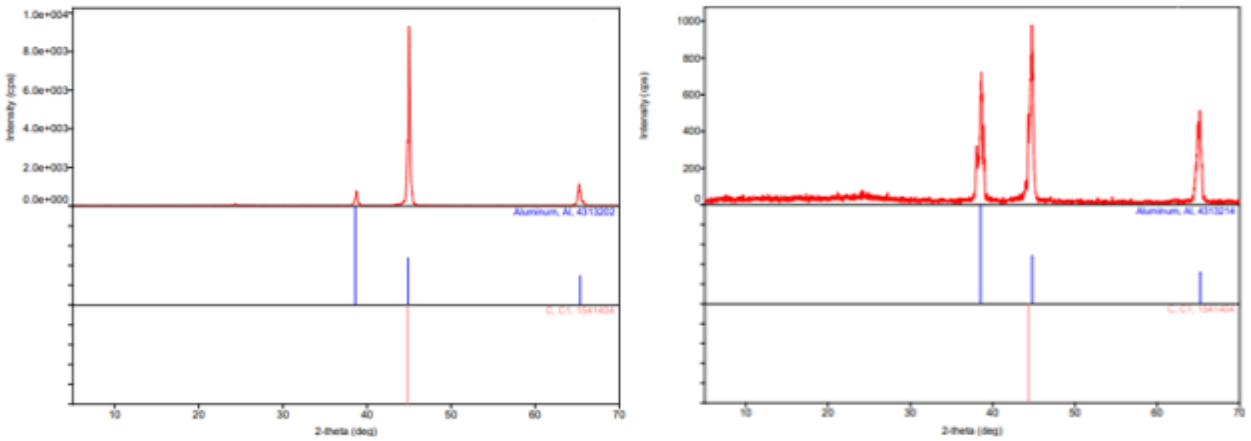
Parametre (%)	Şeker pancarı küspesi piroliz	İlaç blister ambalaj atıkları piroliz	Ko-piroliz
Karbon	72,10	16,70	41,00
Hidrojen	3,46	0,39	1,55
Azot	5,31	2,77	3,89

Şekil 5'te ko-piroliz prosesleri sonrasında ve ilaç blister ambalaj atıklarının pirolizi sonrasında elde edilen katı ve sıvı ürünlerin klor analizi sonuçları verilmiştir. İlaç blister ambalaj atıklarının başlangıç klor içeriği %26,22, şeker pancarı küspesinin başlangıç klor içeriği %0,040, ko-piroliz prosesinin başlangıç klor içeriği ise %16,91 olarak bulunmuştur (Şekil 5). İlaç blister ambalaj atıklarının pirolizinde sıcaklığın 450 °C'ye gelmesiyle katı ürünün içerdiği klor miktarı azalmış, sıvı ürün klor içeriği %2,08'den %8,12'ye çıkmıştır. Ko-piroliz prosesinde sıcaklığın 450°C'ye yükselmesiyle katı ürünün içerdiği klor miktarı, %0,48'den %0,99'a, sıvı ürün klor içeriği %6,26'dan %10,75'e çıkmıştır.



Şekil 5. 400, 450, 500 °C'de piroliz ve ko-piroliz proseslerinde elde edilen katı, sıvı ve gaz ürünlerin klor tayini

Şekil 6'da 400 °C'de ilaç blister ambalaj atıklarının pirolizi sonrasında elde edilen katı ürünlerin ve 400°C'de ko-pirolizde elde edilen katı ürünlerin XRD analizi sonuçları verilmiştir. Piroliz prosesi ile, karmaşık kompozit benzeri yapısı sebebiyle geri dönüşümü ve geri kazanımının oldukça zor olduğu ilaç blister ambalaj atıklarından alüminyum oksitlenmeden geri kazanılmıştır. Ko-piroliz prosesi sonucunda elde edilen katı üründe ise alüminyum ve karbon pikleri görülmektedir.



(a) (b)

Şekil 6. 400 °C'de ilaç blister ambalaj atıklarının pirolizinde elde edilen katı ürün (a) ve ko-piroliz katı ürünü (b) XRD analizi

SONUÇ

Bu çalışma ile, ilaç blister ambalaj atıkları ve şeker pancarı küspesi kullanılarak piroliz ve ko-piroliz proseslerinden elde edilen katı ürünlerin karakterize edilmesi amaçlanmıştır. Karmaşık kompozit benzeri yapısı sebebiyle geri dönüşüm ve geri kazanımının oldukça zor olduğu ilaç blister ambalaj atıklarından piroliz prosesi ile alüminyum geri kazanılmıştır. Piroliz ve ko-piroliz proseslerinde en yüksek katı ürün verimlerine 400°C sıcaklıkta ulaşılmıştır. İlaç blister ambalajlarında düşük maliyeti sebebiyle ağırlıkla PVC yapıların kullanımı, klor tayini ile analiz edilerek klorun mevcudiyeti doğrulanmıştır.

TEŞEKKÜR

Bu çalışma, 2210-C Yurt İçi Öncelikli Alanlar Yüksek Lisans Burs Programı kapsamında TÜBİTAK ve 22ADP334 No'lu proje kapsamında Eskişehir Teknik Üniversitesi Bilimsel Araştırma Projeleri Komisyonu tarafından desteklenmiştir.

Abstract
Electric vehicles developed for both domestic, medical, and military applications in the industry need a portable source energy units implemented with Lithium-ion (Li-ion) cells. In these energy units, it is necessary to have both an internal charging unit and a battery management system providing the charge of the Li-ion cells in balance by voltage or state of charge (SOC) equalization. In this study, a small-power portable energy unit is designed by connecting 4 Li-ion cells in series and includes an built-in charger unit and a passive voltage balancing method-based BMS. In the proposed BMS, voltage-based passive balancing method is implemented in order to control the voltage status of 4 series connected cells during charging. Also a small power built-in charger is proposed by using general flyback converter topology in order to charge the battery pack from the grid which is operating at variable output voltage and constant output current. The performance of the energy unit realized with the BMS based on passively balancing the cell voltages and the built-in charger is tested in simulation. The charge and control performance of the built-in charger and passive cell voltage equalization-based BMS is tested in simulation with MATLAB Simulink Simspace.
Keywords: Passive cell balancing, Battery management system, Flyback converter topology.

INTRODUCTION

Lithium-ion (Li-ion) batteries have become popular with the developing technology on systems where energy can be stored (Milas and Tatakis, 2022). Battery packs are formed by connecting multiple batteries in series in order to provide the supply voltage threshold values required by purely electric vehicles produced for various purposes (Nazi and Babaei, 2021). In order to prevent cell voltage and state of charge (SOC) imbalances that may occur between cells connected in series, due to the manufacturing or charge and discharge, it is necessary to ensure the balance between cells by constantly monitoring the voltage or SOC conditions of each cell in order to safely charge the battery pack (Guo et al., 2021; Conway, 2021). Also, any voltage imbalance between cells can cause overvoltages and a drop to the deep voltage level during charging and discharging of the battery package (Lee and Cheng, 2005; Lee and Chang, 2006). Voltage and charge imbalance in the cells adversely affects the operating performance of the entire battery pack. For this reason, the design of battery management systems (BMSs), in which cell balancing and charge/voltage status monitoring are carried out, becomes imperative in order to ensure the efficiency of the lifetime of the cells and the stability in the operating performance (Kutkut et al., 2009; Einhorn et al., 2011; Mestrallet et al., 2012; Cassani and Williamson, 2009; Kim et al., 2014; Guo et al., 2021).

In order to eliminate this imbalance between cells, many BMSs have been proposed in the literature. These management systems are divided into two classes as active and passive balancing topology-based (Guo et al., 2021). The active balancing method is also called as nondissipative balancing while the passive one is called as dissipative balancing method in the literature (Zhang et al., 2017; Cao et al., 2008). The proposed topologies in the active balancing system are based on the energy transfer between cells, through the entire battery pack and modules contain various number of cells. As mentioned in Guo et al. (2021), the active balancing topology uses energy storage elements as capacitors, inductors, and transformers in order to achieve energy transfer. Also the active cell balancing is provided by using various converter topologies (Das et al., 2020). The switched capacitor-based method (Ye and Cheng, 2015) has small size and simple

and flexible controllability feature but it does not have high efficiency balancing ability. Although inductor-based equalization systems (Lee et al., 2018) have high balancing efficiency, they increase the complexity and the volume of the control system hardware. In LC-based equalization topology (Shang et al., 2020) where both inductor and capacitor are used, the low balancing speed and the need for magnetic materials and high voltage capacity switching elements reduce the possibility of choosing this method in BMS. The popularity of the transformer and especially flyback converter topology-based active balancing systems (Turksoy and Teke, 2023; Milas and Tatakis, 2022; Guo et al., 2021; Conway, 2021) continue to increase in the literature compared to other balancing systems due to their high isolation level, high balancing capacity and easy controllability.

Some criteria should be considered in the design of BMSs. These criteria can be listed as precision in determining the SOC or voltage levels of the cells, balancing speed, efficiency, cost and physical size, as mentioned in Milas and Tatakis (2022). Considering these criteria, if our primary design criteria are low cost, ease of control and feasibility with minimum circuit elements in small size, passive balancing topology comes to the fore especially in industrial BMS designs, despite the inefficient energy usage and low balancing speed.

In this study, a small-power portable energy unit which can be used as an energy source in both small-power industrial applications on domestic, military, and medical products is designed by connecting 4 Lithium-ion (Li-ion) cells in series and includes an built-in charger unit and a BMS based on passively balancing the cell voltages. In the proposed BMS, cell voltage-based passive balancing method is implemented in order to control the voltage status of 4 series connected cells during charging. In addition, a flyback converter topology-based small power built-in charger is proposed in order to charge the battery pack from the grid which is operating at maxsimum $16.8V$ output voltage and constant $3A$ output current. The performance of the energy unit realized with the passive voltage equalization-based BMS and the built-in charger is tested in simulation.

This paper is organized as follows: after the introduction the mathematial equations of the built-in battery charger designed with the flyback topology is given. After that the passive equalization-based BMS is introduced and the simulation results of the overall system which contains the 4 series connected Li-ion cells, built-in charger and BMS is given. At the and of the paper the conclusions are presented.

FLYBACK CONVERTER DESIGN FOR BUILT-IN CHARGER

Within the scope of this study, a charging unit with a maximum voltage of $16.8V$ and a constant current supply capacity of $3A$ is designed to charge the battery pack consisting of 4 cells connected in series. The reason why the maximum voltage value is determined as $16.8\ V$ is that the maximum voltage values of the Li-ion cells are $4.2V$. Moreover the reason why the design is created at a constant current limit of $3A$ is that the charging unit is realized at low cost and the battery pack is charged with a value close to the cell rated charge current. In addition, it is the use of flyback topology, which has an important place in the literature in low-power converter design and can be realized with less circuit elements and a simpler control algorithm, as stated in ElMenshawy and Massoud (2022), compared to other isolated converters.

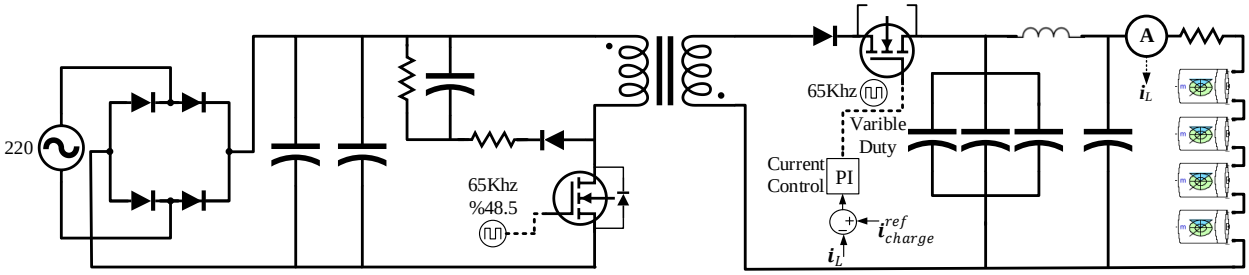

Figure 1. The flyback converter design for the built-in charger of battery package

The implemented built-in charger is seen in Fig.1. The charger is supplied from a single phase $220V\ 50Hz$ grid voltage and firstly this AC voltage is rectified with a bridge rectifier and then applied to the flyback converter as an input. The rectified voltage is filtered and regulated with filter capacitor at the entry of circuit. The regulated voltage is applied to flyback transoformer which has $11:1$ conversion rate. The storage energy in the primary side of the transformer is transfered to secondary winding of the transformer with N-channel MOSFET. Also there is a snubber circuit in the primary side of the transformer designed

for switching the mosfet under less voltage stress. There is a LC resonant circuit at the output of the converter in order to providwith the purpose of continuous output current. In addition, in order to keep constant the output current of the converter at $3A$, the load current is measured and feding back to PI type current controller which is used for switching an N-channel MOSFET with constant frequency and variable duty cycle. Thus, the load current control of the flycback converter is provided. Another point of attention in the design is that the duty cycle of the switching frequency of the mosfet on the primary side is determined below 50% in order to prevent the flyback transformer ferrite core from operating in the saturation region for discontinuous current mode (DCM) operation.

The mathematical expressions obtained in order to meet the design criteria and define the parameters during the design of the flyback converter are given below.

The turn ratio (n) of the flyback transformer is calculated from (1):

$$n = \frac{N_p}{N_s} = \frac{(V_{in} - V_{DS(on)})}{(V_{load} + V_f)} \frac{D_{max}}{1 - D_{max}} \tag{1}$$

where, N_p and N_s are the number of turns of primer and seconder windings, respectively. V_{in} is the input bus voltage of the converter obtained from the rectifier. $V_{DS(on)}$ is the voltage drop between drain and source of the MOSFET while the MOSFET is ON. V_{load} is the output voltage of the converter. V_f is forward bias voltage of the diode exist on the secondary side. D_{max} is the maximum duty cycle of the switching of the MOSFET positioned in primary side.

When the MOSFET on the primary side is cut off, the reflection voltage of the output voltage (V_R) on the input mosfet is determined as in (2):

$$V_R = (V_{load} + V_f) \frac{N_p}{N_s} \tag{2}$$

At duty cycle above 50%, the control structure of the flyback converter becomes unstable due to sub-harmonic oscillations. The maximum duty cycle is determined as given in (3):

$$D_{max} = \frac{V_R}{(V_{in_{min}} - V_{DS(on)})} + V_R \tag{3}$$

where, $V_{in_{min}}$ is the minimum input bus voltage of the converter.

The value of the magnetization inductance (L_m) where the energy to be transferred to the secondary side is stored is calculated as in (4):

$$L_m = \frac{(V_{in_{min}}^2 D_{max}^2)}{2 P_{in} f_s} \tag{4}$$

where, P_{in} is the input power of the flyback converter. f_s is the switching frequency of the primary windings of the flyback transformer.

It is sufficient to select a lower value than the calculated L_m value to ensure DCM operation. As a result of thiw, D_{max} of the switching frequency of the MOSFET is calculated again as in (5) and dead time is generated.

$$D_{max} = \sqrt{\frac{2 P_{in} f_s L_m}{V_{in}^2}} \tag{5}$$

Considering the new duty cycle ratio, duty ratio of the secondary rectifier diode (D_2) is calculated as in (6):

$$D_2 = \frac{N_p}{N_s} \frac{(V_{in} - V_{DS(on)}) D_{max}}{V_{load} + V_f} \tag{6}$$

The expected output voltage at the output load is calculated as in (7):

$$V_{load} = \left(\frac{N_s}{N_p} (V_{in} - V_{DS(on)}) \frac{D}{D_2} \right) - V_f \tag{7}$$

The peak current ($I_{p_{peak}}$) value passing through the MOSFET positioned in the primary side of the converter, which is one of the most critical parameters in flyback converter design, is determined as in (8):

$$I_{p_{peak}} = \frac{2P_{in}}{V_{in_{min}} D_{max}} \tag{8}$$

The average current ($I_{p_{avg}}$) value passing through the MOSFET positioned in the primary side of the converter is calculated from (9):

$$I_{p_{avg}} = \frac{I_{p_{peak}} D_{max}}{2} \tag{9}$$

The effective value of the current ($I_{p_{rms}}$) passing through the MOSFET positioned in the primary side of the converter is determined as in (10):

$$I_{p_{rms}} = I_{p_{peak}} \sqrt{\frac{D_{max}}{3}} \tag{10}$$

The input bulk capacitor, which has an importance in the stable operation of the flyback converter circuit, provides instant $I_{p_{peak}}$ and prevents the input bus voltage from collapsing. The value to be selected for this capacitor (C_{bulk}) is calculated as in (11):

$$C_{bulk} = \frac{D_{max} I_{p_{peak}} (1-0{,}5D_{max})^2}{2 f_s \Delta V_{in}} \tag{11}$$

N_p is calculated from (12):

$$N_p = \frac{L_m I_{p_{peak}}}{B_{max} A_e} \tag{12}$$

where, B_{max} is the maximum magnetizing flux density. A_e is the core cross-sectional area.

B_{max} value of the flyback transformer is obtained from (13) and it is preferred that its value is limitted with $300\ mT$ in the literature.

$$B_{max} = \frac{L_m I_{p_{peak}}}{N_p A_e} \tag{13}$$

The inductance value of the air gap (L_g) left between the ferrite cores is calculated as in (14) with inductance factor of the ferrite core (A_L). L_g allows us to manage the magnetic flux.

$$L_g = \mu_0 A_e \left(\frac{N_p^2}{L_m} - \frac{1}{A_L}\right) 10^3 \tag{14}$$

N_s is calculated from (15):

$$N_s = N_p \frac{1}{n} \tag{15}$$

The peak value of the seconder current ($I_{s_{peak}}$) passing through the rectifier diode located on the secondary side of the flyback transformer is calculated as given in (16):

$$I_{s_{peak}} = I_{p_{peak}} \frac{N_p}{N_s} \tag{16}$$

The effective value of the seconder current ($I_{s_{rms}}$) passing through the rectifier diode located on the secondary side of the flyback transformer is obtained from (17). Also the power loss on the rectifier diode is depend on $I_{s_{rms}}$.

$$I_{s_{rms}} = I_{s_{peak}}\sqrt{\frac{D_2}{3}} \tag{17}$$

While the mosfet on the primary side of the converter is conducting, the maximum reverse breakdown voltage value of the diode ($V_{d_{max}}$) located on the secondary side is calculated as in (18) and the reverse breakdown voltage strength of the selected diode should be higher than this value.

$$V_{d_{max}} = V_{load} + V_{in_{max}}\frac{N_s}{N_p} \tag{18}$$

The maximum voltage value that may occur between the drain and source terminals of the mosfet ($V_{DS_{max}}$) is determined as in (19), taking into account the leakage voltage ($V_{leakage}$) value, and the strength of the selected mosfet must be above this calculated value.

$$V_{DS_{max}} = V_{in_{max}} + V_R + V_{leakage} \tag{19}$$

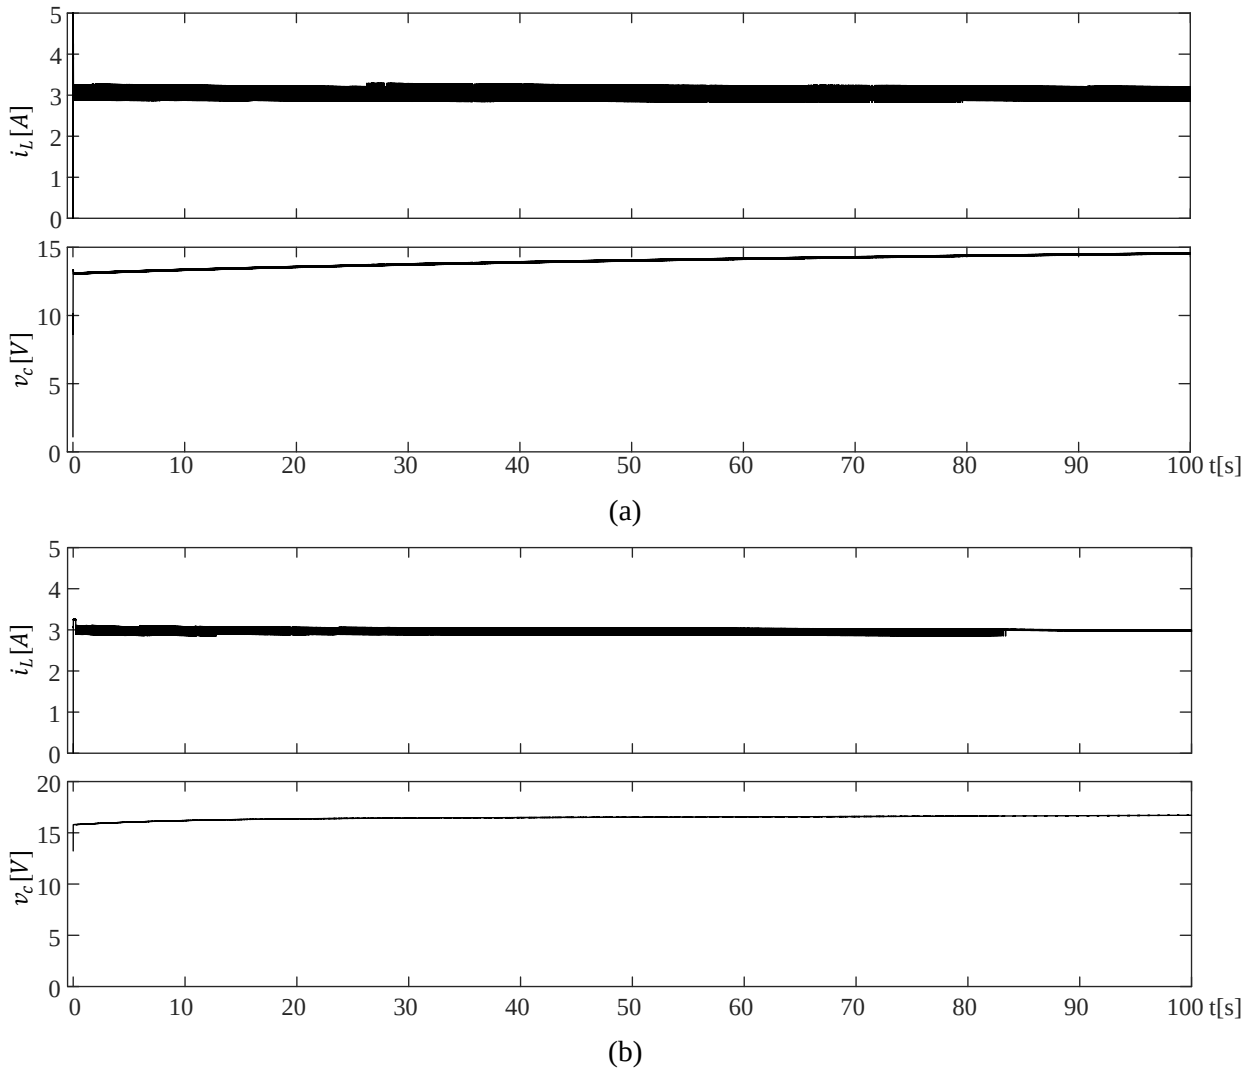

Figure 2. The flyback converter topolgy-based charger simulation results, a) Output charge voltage (v_c) and current (i_L) while low charged battery pack is connected to charger, b) $v_c$and i_L while almost fully charged battery pack is connected to charger

The current fluctuation on the output capacitor ($\Delta I_{cap_{out}}$) is calculated as in (20) respect to the $I_{s_{rms}}$ and load current (I_{load}). In case of insufficient current ripple level on the output capacitor, the capacitors are connected in parallel. As a result of parallel connection, the equivalent series resistance value decreases.

$$\Delta I_{cap_{out}} = \sqrt{I_{s_{rms}}^2 - I_{load}^2} \tag{20}$$

The capacity value of the output capacitor (C_{load}) is determined from (21):

$$C_{load} = \frac{I_{load} N_{cp}}{f_s \Delta V_{load}} \tag{21}$$

where, N_{cp} is the internal clock cycle coefficient and is taken as the 10-20 times of f_s.

The snubber resistor in the snubber circuit (R_{snb}) which is designed in order to prevent voltage spikes on the MOSFET due to the stored energy in primary winding leakage inductane of flyback transformer (L_{lp}) in the case that the MOSFET located on primary side is off, determined as in (22):

$$R_{snb} = \frac{V_s^2}{\frac{1}{2} L_{lp} I_{p_{peak}}^2 \frac{V_s}{V_s - V_R} f_s} \tag{22}$$

The power loss due to the snubber circuit (P_{snb}) is calculated as in (23):

$$P_{snb} = \frac{V_s^2}{R_{snb}} \tag{23}$$

The value of the snubber capacitor (C_{snb}) is selected according to the capacity value determined from (24):

$$C_{snb} = \frac{V_s}{\Delta V_s R_{snb} f_s} \tag{24}$$

The simulation results of the designed charging unit are given in Fig. 2. During the simulation tests, battery packs with two different initial SOC conditions are connected as separate loads. As can be seen from Fig. 2, it is verified that the designed charging unit is capable of delivering variable charging voltage and constant charging current under different load conditions.

Table 1. Parameter values of the flyback converter

$V_{in_{min}}$	V_{in}	$V_{in_{max}}$	V_{out}
195V	*220V*	*265V*	*16.8V*
I_{out}	f_s	D_{max}	V_R
3A	*65kHz*	*%48.5*	*185V*
L_m	N_p	N_s	L_g
950µH	*44 turn*	*4 turn*	*0.26mm*
B_{max}	C_{in}	A_l	C_{out}
0.25mT	*68µF*	*2700nH*	*2000µF*

As a result of all the calculations, the parameter values of the flyback converter design that meet the previously mentioned operating conditions are presented in Table 1.

PASSIVE VOLTAGE BALANCING-BASED BMS AND SIMULATION RESULTS OF THE WHOLE SYSTEM

In this study, a cell voltage-based passive balancing method is proposed in order to ensure balanced charging of 4 series connected Li-ion cells. In the BMS implemented by using cell voltage-based passive balancing method, each cell has an individual passive balancing circuit. In addition, a switch was used to cut the power supplied from the built-in charger unit during balancing. The small power battery pack design, which includes the proposed BMS and built-in charger unit using flyback converter topology, is shown in Fig. 3.

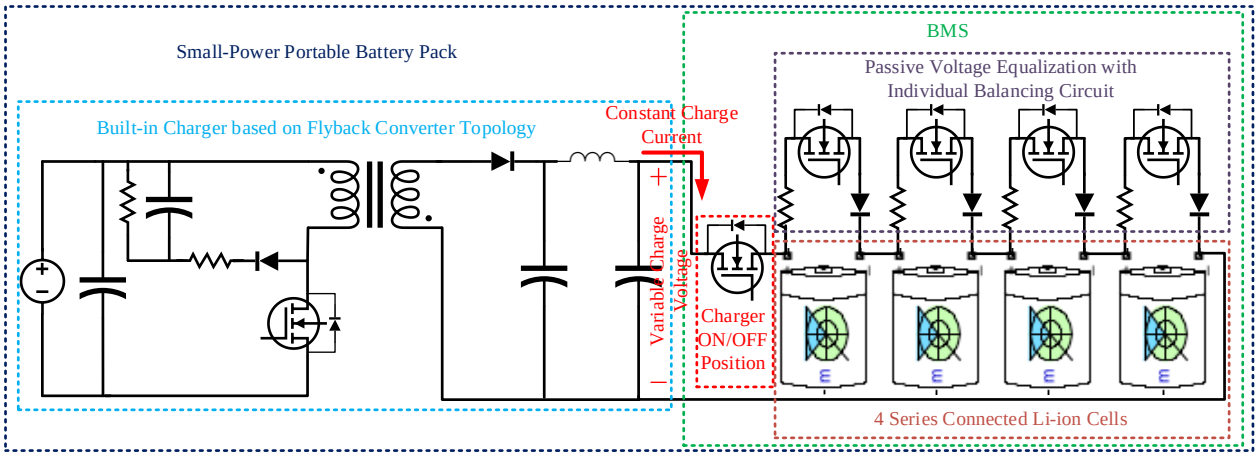

Figure 3. Small-power battery pack design with built-in charger and the BMS based on passively balancing the cell voltages

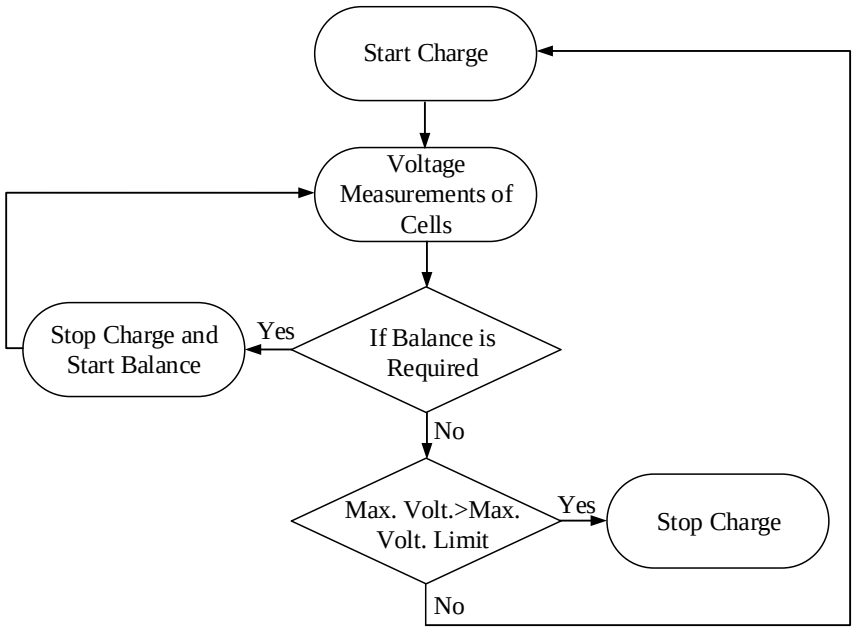

Figure 4. The block diagram of control algorithm of the proposed cell voltage-based passive balancing method

The Li-ion battery model used in the study carried out in the simulation has a nominal voltage of $3.6V$, capacity of $3.5Ah$, minimum threshold voltage of $2.7V$ and a maximum threshold voltage of $4.2V$. The control algorithm of the proposed cell voltage-based passive balancing method in this study is presented in Fig. 4.

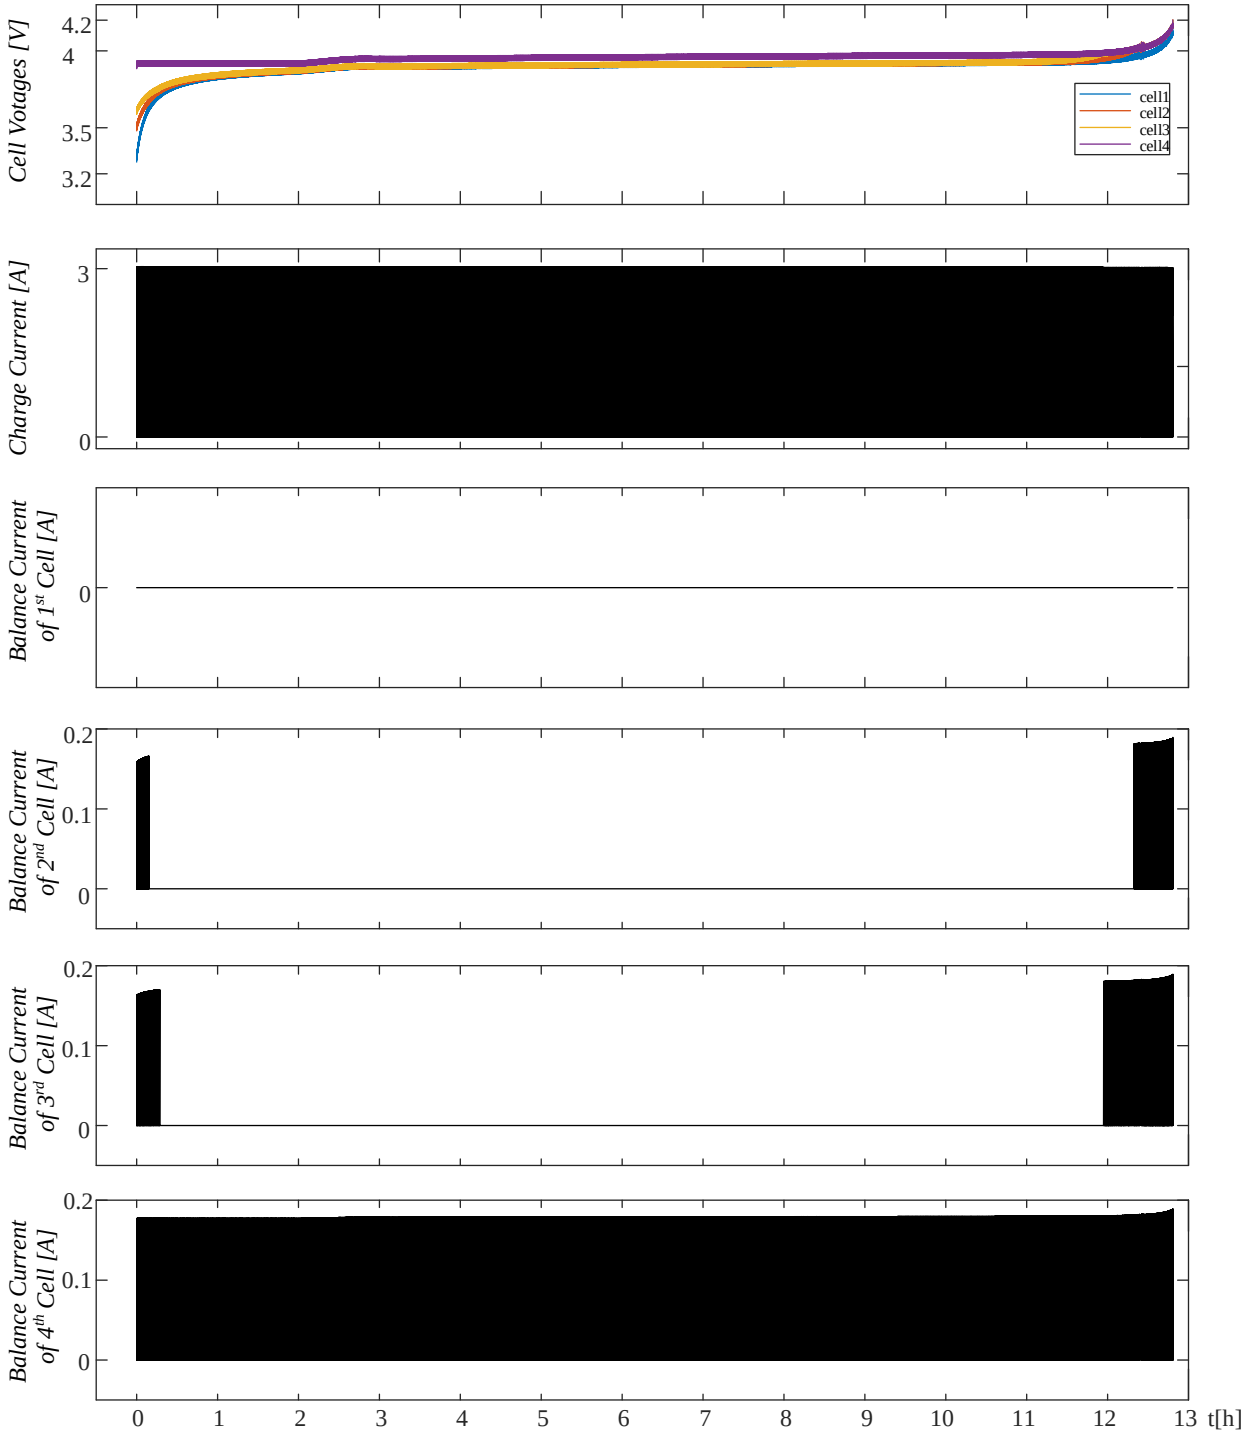

Figure 5. Simulation results of the proposed passive cell voltage balancing method-based BMS while charging the Li-ion cells

With the charging unit designed based on the flyback converter topology, the battery pack is charged even with variable charging voltage and constant $3A$ charging current. In the proposed BMS, the minimum voltage level for all cells is defined as $2.8V$, and no cell is subjected to balancing until the voltage of any of the cells reaches the threshold voltage level of $3.9V$. Thus, in the proposed BMS, the voltage equalization between the cells is performed only in the voltage range of $3.9V$ to $4.2V$. In the passive balancing method, which is based on the principle of equalizing the cell voltages, the voltage difference between the cell with the maximum voltage and the cell with the minimum voltage is monitored and determined during charging. This difference, which causes the voltage balancing process to start, is defined as $50mV$ for the BMS proposed in this study. In the passive balancing process performed between $3.9V$ and $4.2V$ voltage range, the balancing process starts as soon as the voltage difference between the cells reaches the determined threshold value. In this case, the cell voltage at the highest voltage level is discharged through the passive

balancing circuit until the voltage difference drops below the threshold value. Thus, the energy on the cell which has high voltage level is discharged as thermal loss. In the proposed BMS design, each cell has its own balancing circuit. In the balancing circuit, a high-power resistor connected to the cell in parallel with a MOSFET is activated and the discharge process is provided. Balancing current is kept in the range of $150mA$ to $200mA$ depending on the cell voltage status.

In Fig. 5, the control performance of the proposed BMS in the case of charging the battery pack at a constant charging current of $3A$ and the variation of the voltage level of each series cell during charging are given. In the simulation study, the initial SOC values of the cells so the initial voltage levels are assigned different from each other in order to test the performance of the passive balancing process in the proposed BMS. When the presented graphics are examined, it is seen that the proposed BMS control algorithm has stable structure. Considering these results, it is seen that the balancing process has an effective performance in the battery pack, the control algorithm has a good performance in the specified voltage limitations range, but it causes power loss during charging, as in all passive balancing systems.

CONCLUSION

In this study, a small power portable energy unit using Li-ion batteries for domestic, military, and medical applications is proposed by the authors and the performance of the built-in charging unit and BMS on the energy unit is tested in simulation.

In order to charge the battery pack, which is obtained by connecting 4 cells in series, with constant current and variable voltage, a charging unit is developed using a flyback converter topology which has high efficiency and control achievement performance in low power applications. Also, a BMS using cell voltage-based passive balancing method is proposed with the purpose of eliminating voltage imbalances during the charging of series connected Li-ion cells and to ensure that all cells are charged with equal voltage and to use the lifetime and capacity of the cells efficiently.

The performance test of the proposed energy unit is carried out by using the Li-ion cell model in Matlab Simulink Simpspace. As a result of all tests carried out in the simulation, it is understood that the proposed energy unit has a high performance and a remarkable practicality for small power industrial applications.

The proposed study is a first in the literature with these aspects. Future studies will be on real-time design of the proposed energy unit, whose performance is tested in the simulation, and testing it in different industrial applications.

Özet

Polimer matrisli kompozit malzemeler denizcilik, raylı sistemler, yenilenebilir enerji sistemleri, uzay ve havacılık, savunma sanayii, otomotiv, inşaat, sağlık, müzik aletleri, spor ekipmanları gibi alanlarda tasarımın yapılacağı malzemelere kullanıldığı alana özgü üstün özellikler sağlaması bakımından günümüzde yaygın olarak kullanılmaktadır. Bu alanlarda kullanılan kompozit malzemelerin üstün fiziksel, mekaniksel ve kimyasal özelliklere sahip olmaları istenir. Polimer matrisli kompozit malzemelerin dayanım değerlerini artırmak için genellikle cam, karbon, aramid ve bor elyafı gibi takviye elemanları kullanılmaktadır. Polimer matrisli kompozit malzemelerin özellikle aşınma dayanımı özelliklerinde iyileştirme yapmak için takviye elemanlarına ilaveten çeşitli seramik toz partiküllerde ilave edilmektedir. Ancak, kompozit malzemelere ilave edilen seramik toz partiküllerinin malzemenin diğer özelliklerini nasıl etkilediğinin de araştırılması gerekmektedir. Özellikle, kompozit malzemelerin darbe dayanımlarının bilinmesi tasarım aşamasında önemli bir kriter olmaktadır. Bu çalışmada, cam elyaf takviyeli epoksi reçine matrisli kompozit malzemelerde ilave parçacık olarak kullanılan Al_2O_3–%40 TiO_2 seramik tozlarının karışım oranlarının üretimi yapılan malzemenin darbe dayanımı özelliklerine etkisi deneysel olarak incelenmiştir. Kompozit malzemelerin üretimi için, takviye elemanı olarak 270 gr/m^2'lik dokuma kumaşlar, matris malzemesi olarak ise epoksi reçine kullanılmıştır. Üretimde epoksi reçine olarak Epikote Resin 828 Bisphenol-A-(Epichlorhydrin) ve sertleştirici olarak Epikure Curing Agent 875 kullanılmıştır. Karışım oranı 100:80'dir. Al_2O_3-%40 TiO_2 seramik tozları reçinenin içerisine % 0, %5, %10, %15 katkı oranlarında ilave edilmiştir. Kompozit malzemeler el yatırma yöntemi ile üretilmiştir. Üretilen kompozit malzemelerin elyaf ağırlık oranları ve porozite miktarları belirlenmiştir. Numunelerin Charpy çentik darbe dayanımı testleri ASTM D 6110 standardına göre yapılmıştır. Deneysel çalışmanın sonuçlarına göre; cam elyaf takviyeli epoksi matrisli kompozit malzemelerin üretimi esnasında reçine matris içine ilave edilen seramik tozların karışım oranlarının üretilen kompozit malzemelerin porozite miktarları ile darbe dayanımlarını önemli oranda etkilediği tespit edilmiştir.

Investigation of notch impact behavior of Al_2O_3-40%TiO_2 ceramic powder particle reinforced polymer matrix composite materials

Abstract

Composite materials with polymer matrix are widely used today in terms of providing superior properties to the materials to be designed in areas such as maritime, rail systems, renewable energy systems, aerospace, defense industry, automotive, construction, health, musical instruments and sports equipment. Composite materials used in these areas are required to have superior physical, mechanical and chemical properties. Reinforcing elements such as glass, carbon, aramid and boron fiber are generally used to increase the strength values of polymer matrix composite materials. In addition to reinforcement elements, various ceramic powder particles are added to improve the abrasion resistance properties of polymer matrix composite materials. However, it is necessary to investigate how ceramic powder particles added to composite materials affect other properties of the material. In particular, knowing the impact strength of composite materials is an important criterion in the design phase. In this study, the effect of mixing ratios

of Al_2O3–40% TiO_2 ceramic powders, which are used as additional particles in glass fiber reinforced epoxy resin matrix composite materials, on the impact resistance properties of the material produced was experimentally investigated. For the production of composite materials, 270 gr/m2 woven fabrics were used as reinforcement and epoxy resin was used as matrix material. In production, Epikote Resin 828 Bisphenol-A-(Epichlorhydrin) was used as epoxy resin and Epikure Curing Agent 875 as hardener. The mixing ratio is 100:80. Al_2O3-40%TiO_2 ceramic powders were added to the resin at 0%, 5%, 10%, 15% additive rates. Composite materials are produced by hand lay-up method. Fiber weight ratios and porosity amounts of the produced composite materials were determined. Charpy notch impact strength tests of the samples were performed according to ASTM D 6110 standard. According to the results of the experimental study; it has been determined that the mixing ratio of ceramic powders added to the resin matrix during the production of glass fiber reinforced epoxy matrix composite materials significantly affects the porosity amounts and impact strength of the produced composite materials.

GİRİŞ

Günümüzde kompozit malzemeler sanayi, inşaat, sağlık, spor, müzik gibi birçok alanda tasarlanan malzemeye üstün özellikler kazandırması bakımından tercih edilmektedir. Bu alanlarda kullanılan kompozit malzemelerin fiziksel, kimyasal ve mekaniksel özelliklerinin istenilen özelliklerde olması beklenmektedir. Kompozit malzeme üretimi yapılırken kullanılacağı yerdeki istenilen özellikleri sağlaması için kompozit malzemelerde farklı takviye elemanları ile farklı matris malzemeleri kullanılmaktadır (Mazumdar, 2002, Strong, 2008). Ayrıca, kompozit malzemelerin mekaniksel özelliklerini iyileştirmek amacıyla takviye elemanına ilaveten çeşitli seramik tozlar da kullanılmaktadır. Seramik toz ilavesi polimer matrisli malzemelerin mekaniksel özelliklerinin bazılarını olumlu bazılarını ise olumsuz yönde etkileyebilir (DeArmitt and Rothon, 2017, Fu ve ark. 2008). Kompozit malzemelere ilave edilen seramik toz partiküllerinin malzemenin özelliklerini nasıl etkilediğinin araştırılması gerekmektedir. Özellikle, kompozit malzemelerin darbe dayanımlarının bilinmesi tasarım aşamasında önemli bir kriter olmaktadır. Bu çalışmada, cam elyaf takviyeli epoksi reçine matrisli kompozit malzemelerde ilave parçacık olarak kullanılan Al_2O_3–%40 TiO_2 seramik tozlarının karışım oranlarının üretimi yapılan malzemenin darbe dayanımı özelliklerine etkisi deneysel olarak incelenmiştir.

MATERYAL VE METOD

Bu araştırma ile cam elyaf takviyeli polimer matrisli kompozit malzemelerde ilave parçacık olarak kullanılan seramik tozlarının karışım oranlarının üretimi yapılan malzemenin darbe dayanımına etkisini incelemek için, takviye olarak dokuma cam elyaf kumaşları, ilave parçacık olarak Al_2O_3–%40 TiO_2 seramik tozları kullanılmıştır. Dokuma kumaşlar ve tozlar üretici firmalardan hazır olarak temin edilmiştir. Dokuma kumaş olarak; hazır olarak satılan (woven) 270 gr/m^2'lik kumaşlar kullanılmıştır. Matris malzemesi olarak ise epoksi reçine kullanılmıştır. Kullanılan reçine olarak EPİKOTE Resin 828 (Momentive Marka) Bisphenol-A-(Epichlorhydrin), sertleştirici olarak Epikure Curing Agent 875 (Momentive Marka) Tetrahydromethylphthalicanyhydride kullanılmıştır. Karışım oranı 100:80'dir. Al_2O_3–%40 TiO_2 seramik tozlar matris malzemesi olan epoksi reçinenin içerisine %5, %10, %15 oranlarında ilave edilmiştir. Aşağıdaki Tablo 1'de çalışma kapsamında kullanılan seramik tozun özellikleri ve SEM görüntüleri verilmiştir.

Tablo 1. Seramik tozların özellikleri ve SEM görüntüsü.

Kompozit malzemelerin üretimi

Dokuma cam elyaf kumaş takviyeli epoksi reçineli seramik toz ilave parçacıklı kompozit malzemelerin üretimi için, öncelikle dokuma cam elyaf kumaşlar belli ölçülerde kesilmiştir. Matris malzemesinin hazırlanmasında, belirli oranlarda epoksi reçine ve sertleştirici karıştırıldıktan sonra uygulamaya geçilmesi için ısıtıcı bulunan bir kaba koyulmuştur. Bu ısıtıcı bulunan kapta epoksi reçine uygulanabileceği ideal sıcaklığa ulaşmıştır. Daha sonra reçine karışımına ilave edilmek üzere hassas terazide seramik tozlar %5, %10, %15 ağırlık oranlarında tartıldıktan sonra reçinenin içine ilave edilerek mekanik karıştırıcı ile homojen hale getirilmiştir.

Cam elyaflı dokuma kumaşlar el yatırma yöntemi ile kat kat matris malzemesi ile birleştirilmiştir. Matris malzemesi olan epoksi reçine-seramik toz karışımı bir rulo yardımı ile cam elyaflara uygulanmıştır. Daha sonra üzerine bir kat daha cam elyafı konulup tekrar epoksi reçine- seramik toz karışımı uygulanmıştır. Bu şekilde 15 kat dokuma cam elyaftan oluşan kompozit malzeme oluşturulmuştur. Malzemeler 15 MPa basınçta ve 120 °C sıcaklıkta 3 saat boyunca preste kalmıştır. Elde edilen kompozit plakaların ölçüleri yaklaşık olarak 50cm x 50cm x 2.5mm'dir. Üretilen kompozit malzemelerin elyaf ağırlık oranını belirlemek için kalsinasyon deneyi, porozite miktarlarını belirleme, çentik darbe davranışlarının belirlenmesi için de Charpy çentik darbe deneyleri yapılmıştır. Her bir deney yönteminde 5 adet deney yapılmış ve ortalama değerler alınmıştır. Çalışma kapsamında yapılan deneyler ile ilgili ayrıntılı bilgiler aşağıda verilmiştir.

Kalsinasyon deneyi

Üretilen kompozit malzeme plakaların elyaf ağırlık oranlarının belirlenmesi için, TS 1177 EN ISO 1172 standardına göre uygun numuneler hazırlanarak, numunelerin kalsinasyon deneyleri sonucunda yüzde ağırlık oranları bulunmuştur.

Yoğunluk deneyi ve porozite değerlerinin belirlenmesi

Üretilen kompozit malzemelerin yoğunluk değerleri ASTM D 792 standardına göre belirlenmiştir. Kompozit malzemelerin yoğunluk değerlerini tespit ederken Precia marka yoğunluk ölçüm cihazı kullanılmıştır. Numunelerin porozite değerlerinin tespiti ASTM D 2734 standardına göre yapılmıştır.

Çentik darbe deneyi

Kompozit malzemelerden hazırlanan numunelerin charpy çentik darbe deneyleri ASTM D 6110 standardına göre oda sıcaklığında yapılmıştır. Aşağıdaki Şekil 1'de çentik darbe deneyinde kullanılan numunelerin ölçüleri ve deney cihazının resmi verilmiştir.

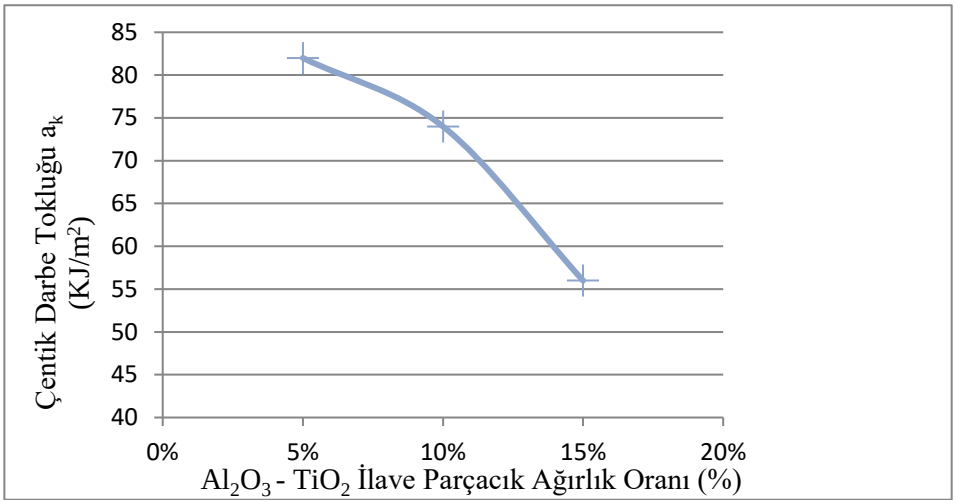
BULGULAR VE TARTIŞMA

Üretilen kompozit malzemenin kalsinasyon deneyi, yoğunluk deneyi ve porozite ölçüm değerlerinin tespiti ile darbe deneyi sonucunda elde edilen değerler aşağıdaki Tablo 2'de verilmiştir.

Üretilen kompozit malzemelerin özellikleri değerlendirildiğin de; epoksi reçine içine ilave edilen seramik toz takviyesi arttıkça üretilen kompozit malzemelerin kalınlıklarının arttığı, yoğunluk ve porozite değerlerinin yükseldiği tespit edilmiştir. Seramik toz takviyesi %5, %10, %15 olarak üretilen kompozit malzemelerin yüzde ağırlıkça elyaf oranlarının sırasıyla %72, %71,%70 olduğu, seramik toz ilavesi yüzdesi azaldıkça elyaf ağırlık oranının arttığı tespit edilmiştir. Kompozit malzemelerin yoğunluklarının 1.927-1.954-1.981 (gr/cm³) olduğu, en düşük yoğunluk miktarının seramik toz ilavesi yüzdesel olarak en az olan numunelerde meydana geldiği tespit edilmiştir. Kompozit malzemelerde porozite miktarının (%2.61-%2.74-%3.60) olduğu tespit edilmiştir. En yüksek porozite miktarının (%3.60) %15 seramik toz ilaveli numunelerde meydana geldiği bulunmuştur. Kompozit malzemelerde porozite miktarının yüksek olması genel olarak malzemenin mekaniksel özelliklerini olumsuz olarak etkilemektedir. Kompozit malzemelerin çentik darbe deneyleri sonucunda elde edilen çentik darbe tokluğu değerlerinin seramik toz ilavesi miktarına göre değişimi aşağıdaki Şekil 2' de verilmiştir.

Tablo 2. Üretilen kompozit malzemenin fiziksel ve mekaniksel özellikleri.

Kompozit malzemenin üretiminde kullanılan seramik tozlar ve özellikleri	Seramik Toz İlave Oranı (%)	Kalınlık (mm)	Numunenin Yoğunluğu (gr/cm³)	Porozite (%)	Elyaf Ağırlık Oranı (%)	Çentik Darbe Deneyi Kırılma Tokluğu ak (KJ/mm²)
Al_2O_3 – % 40 TiO_2 (-25+5 µm) (Fused and Crushed)	5	2.21	1.927	2.61	72	82
	10	2.23	1.954	2.74	71	74
	15	2,31	1.981	3.60	70	56



Şekil 2. Üretilen numunelerin çentik darbe deneyi çentik darbe tokluğu değerleri

Malzemelerin Charpy çentik darbe deneyi sonucunda elde edilen sonuçlarına göre; genel olarak kompozit malzemenin içine ilave edilen seramik toz takviye oranı arttıkça kompozit malzemenin çentik darbe tokluk değerlerinde azalma meydana gelmiştir.

SONUÇLAR

Bu çalışmada, cam elyaf takviyeli epoksi matrisli kompozit malzemelerde ilave parçacık olarak kullanılan Al_2O_3-%40 TiO_2 seramik tozlarının karışım oranlarının üretimi yapılan malzemenin darbe dayanımı özelliklerine etkisini incelemek için deneysel olarak yapılan çalışmaların sonucunda aşağıda verilen sonuçlar elde edilmiştir.

- Epoksi reçine içine ilave edilen seramik toz takviyesi arttıkça üretilen kompozit malzemelerin kalınlıklarının arttığı, yoğunluk ve porozite değerlerinin yükseldiği tespit edilmiştir.
- Kompozit malzemelerin charpy çentik darbe deneyi sonucunda elde edilen sonuçlarına göre; kompozit malzemenin içine ilave edilen seramik toz takviye oranı arttıkça kompozit malzemenin çentik darbe tokluk değerlerinde azalma meydana gelmiştir.

TEŞEKKÜR

Abstract

The determination of soil properties by remote and proximate measurement techniques is critical to the efficient use of an important resource such as water. In recent years, there has been an increasing interest in the determination of soil moisture content based on time series, especially with artificial neural networks and time series forecasting. Probabilistic methods, and particularly the development of energy-based models, offer a different perspective on this topic than the time series analytic techniques currently in use. In this study, we aimed to determine the soil moisture status of a soil sample with a given pH value directly using 2.4 GHz signal levels and energy-based models without using an in-situ probe. In particular, we found that density estimation and score matching methods can successfully find the soil moisture level. This method does not require a specific sensor; the amount of soil moisture can be reliably measured by the change in signal levels over time.

INTRODUCTION

Food security is crucial and strategically important for nations given the expected climate crisis, water scarcity, and population growth. With increasing temperatures, efficient use of water resources has become more important. However, smart irrigation methods are becoming increasingly important. Considering the expected climate crisis, water scarcity and population growth, food production is of critical and strategic importance for countries. It also causes the problem of shallow water-table accumulation. Especially in countries such as the Middle East and North Africa, uncertain rainfall regimes increase the dependence on irrigated agriculture. Because of the damage that excess water can cause, various drainage methods are applied. But excessive drainage can lead to water deficit, nutrient leaching and water use inefficiency due to poor irrigation systems, all leading to reduced yields and negative environmental and economic impacts. In addition to damages to the soil, uncertainty in water management also stresses plants, and the importance of water increases, especially during growth stages such as root development.

The risk of water scarcity is a threat that has a direct impact on food security. Depending on water management, smart irrigation systems in agricultural operations are important to manage these risks. Nowadays, in-situ and remote sensing technologies are often used in efficient irrigation techniques. A crucial component of agricultural enterprises and food security is irrigation that is applied at the appropriate time and in the necessary amount.

In arid regions, many factors affect irrigated agriculture, including water scarcity, urbanization, soil salinization and degradation, in addition to population growth and climate change. In order to determine the geographical water requirements, water management needs certain spatially distributed variables related to soil, vegetation, and meteorological characteristics. Remote sensing (RS) methods are widely used in many water management studies (He, Kimball et al. 2019, Masoud 2020). RS data with a variety of spatial, spectral and temporal resolutions enables the study of different land covers at various scales. However, instantaneous and site-specific application data is generally available for a fee. Such data processing procedures also impose a certain cost on agricultural production. Remote sensing also plays an important role in irrigation management, especially in the detection of evaporation. Here, it is required to collect data with temperature sensors as well as to use time-dependent data to anticipate the future. In the last 20 years, a considerable amount of model proposals and work has been done in this area. Salcode et al. Investigated the relationship between salinization and the use of different water sources (Pedrero Salcedo, Pérez Cutillas

et al. 2022). In particular, they showed that there is a link between thermal measurement results and soil salinity. Salcode's research has focused on greenhouse production. In another study, the salinity level and its effect on irrigated agriculture due to environmental factors in areas where mostly fruit is grown were examined (Salcedo, Cutillas et al. 2022). In yet another study, a model was proposed to detect salinity due to irrigation methods in semi-arid areas through the electrical conductivity of the soil (Aboelsoud, AbdelRahman et al. 2022). These techniques incorporate laboratory values from the field into statistical models that employ data from remote sensing. To track the impacts of irrigation in irrigated agricultural areas, numerous more studies (Mougenot, Pouget et al. 1993, Gorji, Sertel et al. 2017, Farah, Algouti et al. 2021), have been carried out. Soil salinization and increased sodicity are key factors affecting food safety.

In addition to remote sensing systems, water management and irrigation system research carried out with in-situ environmental measurements show a great momentum. The collection and processing of this data, especially with wireless sensor networks technology and Internet of Things approaches, is frequently used in agricultural activities for food production (Santos, Vicente et al. 2022). In similar studies, the main components are divided into two groups. Smart irrigation systems consist of controllers and sensors. By setting up a wireless sensor network, data collected in a purpose-built manner is routed to controllers for decision-making. Controllers usually act on the basis of soil moisture and ambient climatic conditions. Decision systems process data with machine learning statistical methods. In the Mediterranean and surrounding countries, proper and conscious irrigation is an important issue, especially in fruit cultivation. In a study with sensor networks (Hamouda, Sirera et al.), the distribution of water in the soil by micro-irrigation methods was investigated by establishing a moisture-based network. Another study focused on cost optimization for the solution of irrigation methods with the Internet of Things. With the help of simulation, it is aimed to use water efficiently by finding the most suitable path to be determined for irrigation (Khelifa, Amel et al. 2015).

In this study, soil water content detection is investigated using probabilistic and energy-based artificial intelligence models of time series data obtained directly from microwave signals instead of in-situ moisture sensors. The energy-based model method, which is gaining popularity these days, is suggested as a solution.

MATERIALS AND METHODS

Approaches applied in the determination of soil moisture can be categorized under two headings. Measurement of moisture and estimation of measured moisture in other non-measurable areas. Measuring soil moisture is today possible with remote and proximate sensors. As a product, many devices are available in the market. In this study, we aimed to detect moisture directly with the signals of devices communicating in the Bluetooth communication standard. Since these signals are obtained from a wireless device that is not specialized in any way for measuring moisture, the cost is much lower. In the processing and forecasting of time-dependent data, methods such as Long-Short Term Memory (LSTM) and Gated Recurrent Units (GRU), which have become standard today, are frequently used. These methods are used to predict the information measured by sensor data on a time-forward basis. Spatial extrapolation involves spreading data from multiple sensors over general surfaces using geostatistical methods.

Personal Area Networks

Bluetooth technology operates in the 2.4 GHz Industrial, Scientific and Medical (ISM) frequency band like other communication technologies based on the 802.15.4 standard, especially in short distance communication. Bluetooth Low Energy (BLE), a version developed in recent years for short-range communication in Internet of Things applications, is an ideal choice for power-sensitive sensor devices thanks to its low power consumption and low cost. BLE can be incorporated into a wide range of applications such as sensor-enabled environmental and healthcare monitoring (Al Mamun and Yuce 2019, Ghori, Wan et al. 2019, Wu, Wu et al. 2019), smart home and automation (Ali and Ali 2019), indoor localization (Nagarajan, Shanmugam et al. 2020), tagging and proximity-based services such as Near Field Communication (NFC) or Radio Frequency Identification (RFID) (Wang, Zhou et al. 2019). In BLE technology, in "Advertiser" mode, devices can announce data to their surroundings without establishing any connection. This process has very low power consumption. This means that BLE devices can operate for more than 5 years on coin-sized batteries. (Darroudi, Caldera-Sànchez et al. 2019). In BLE, there are three classes of devices with radio transmission power specified as 100mW (20dBm), 2.5mW (4dBm) and 1mW (0dBm). For Class 3 devices with 0dBm radio transmission power, the communication distance exceeds 10 meters and for 20dBm the communication distance exceeds 100 meters. Class 3 devices have a maximum output power of 1mW. The CC2541 System-on-Chip (SoC) BLE platform from Texas

Instruments (TI) was used during the experiments conducted in the paper. This platform has the capabilities of a small computer thanks to its 2.4-GHz RF transceiver, on-chip 8051 microcontroller, 256 KB programmable memory, 8KB RAM and peripherals. The TI CC2541 was preferred because it is a low-cost chip that is readily available in the market.

Probabilistic and Energy-Based Models

Energy-based models in machine learning are basically a form of Gaussian type Restricted Boltzmann Machines. They are generally described as non-normalized probabilistic models. This approach models distributions by associating non-normalized probability densities. An energy-based model is a probabilistic model governed by an energy function that describes the probability of a given state. Energy Based Models (EBMs) capture dependencies by associating a scalar energy (a measure of fitness) with each configuration of variables. Inference, i.e. making a prediction or decision, consists of determining the value of the observed variables and finding the values of the remaining variables that minimize energy. Learning is the process of finding an energy function that associates lower energies with correct values of the remaining variables and higher energies with incorrect values. The energy function, which maps an input-label pair to a scalar energy, also provides a way for the model to select and filter out parts of the input that are relevant to the classification at hand. To measure the quality of the energy functions, a loss function is used that minimizes the energy value during learning (Lecun, Chopra et al. 2006, Hinton 2012).

This inference/learning framework allows the design of many types of statistical models, both probabilistic and non-probabilistic, with a wide choice of energy functions and loss functions. Most probabilistic models can be viewed as special energy-based models where the energy function satisfies certain normalizability conditions and the loss function optimized through learning has a certain form.

Suppose we observe the values of a random vector defined as $\chi \epsilon \mathbb{R}^d$. Assume that this vector also has a probability density function denoted by $O_\theta(x)$. The probability function $O_\theta(x)$ can be expressed as a Boltzmann distribution as follows;

$$O_\theta(x) = \frac{\exp\left(-E_\theta(x)\right)}{Z(\theta)} \qquad (1)$$

Where E_θ is the defined energy function. The energy function maps a vector or data point defined as x $\in \chi$ to a scalar value. $Z(\theta)$ is the normalization constant referring to the input x. $Z(\theta)$ can be defined in the following form.

$$Z(\theta) = \int_x \exp\left(-E_\theta(x)\right) \qquad (2)$$

In expressions 1 and 2, θ represents the learnable parameters. An energy function is expected to assign low energy values to samples drawn from the data distribution and high values otherwise. Z(θ), defined as the normalization constant, is difficult to estimate. To overcome this difficulty, Markov Chain Monte Carlo (MCMC) sampling methods, which exploit Langevin dynamics and Gibbs sampling, are commonly used (Radford 2011). For the learning or inference process, loss functions are used to compare the expected results with randomly generated data. Based on these data, the probability density function and the energy function can be represented as O(Y, Z) and E(Y,Z), where Y denotes the observations and Z the transient generated values.

In this type of learning, Score matching is another approach used to learn non-normalized statistical models, such as energy-based ones. Based on minimizing the distance between the derivatives of the log-density functions of the data (a.k.a., scores) and the model distributions (Lim, Vollmer et al. 2022).

Data Collection

In this study, we used a soil sample with a pH value of 5.3 to determine soil water content. No special selection study was carried out for properties such as texture, hardness, clay content, etc. that may be present in the soil sample. However, the sample is a medium clay soil sample. We placed beacons with a Texas Instruments CC2541 BLE chip in the container where the soil sample was placed a depth of 10 cm in the soil and in a horizontal plane. Beacon devices have "inverted F" shaped antennas and produce an approximately spherical electromagnetic field. The BLE receiver device is the BLE receiver on the Raspberry Pi3 board. Received Signal Strength Indicator (RSSI) values of the beacons with MAC addresses were recorded over the Raspberry platform at 15 seconds intervals for eight weeks over the network. During this period, 200 ml of water with the same chemical properties was added to the soil sample on the same

day and time of the week. In addition, a hole with a diameter of 0.3 cm was drilled in the bottom of the container where the soil sample was kept, and the soil was allowed to drain the excess water into the plates underneath.

Models

In the process of forecasting time series, forecasts using modern Artificial Neural Networks (ANN) show a very superior performance. (Carvalho, Soares et al. 2019). ANN models can work with high dimensional data and multivariate data and provide adequate solutions for a variety of classical problems. This technology is preferred in many industrial applications such as sensing and predictive control. In many similar approaches, regressive models together with LSTM and GRU methods have been applied and used very successfully. The alternative to these classical models is based on forecasting time series using probabilistic methodsOne of these approaches is State-Space models. These models provide a framework for modeling and learning about trends in data and time series such as seasonality (Durbin and Koopman 2012, Seeger, Salinas et al. 2016). In the DeepState method, a recurrent neural network is used to parameterize a linear State-Space model. This parameterization allows the model to automatically extract features and learn complex temporal patterns. Thanks to the success of the method, it is one of the main models used in the GluonTS platform. This platform is mainly used for probabilistic time series applications (Alexandrov, Benidis et al. 2020).

RESULTS

In the first stage, we analyzed the data collected in this study by considering the days when water was added to the soil. When we look at the mean of these values, we observe that the amount of water in the soil has a pattern with the signals collected from the beacon. The graph of the average values obtained is shown in Figure 1.

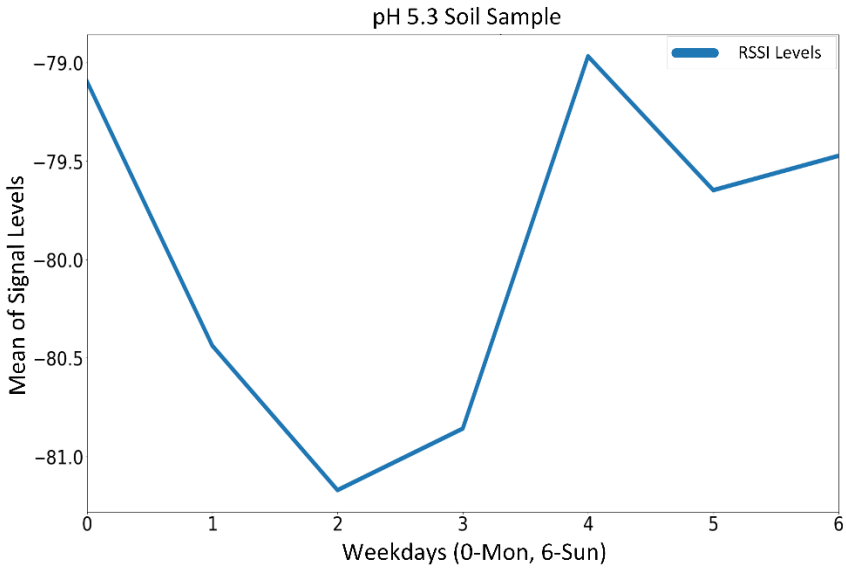

Figure 1. Means of signal levels according to the days water was added to the soil sample.

As seen in Figure 1, there is a change in the signals after the addition of water to the soil sample on the 1st day of the week. From there, we used this data to feed our DeepState model. We measured the Root Mean Square Error (RMSE) as a loss function during our model. The loss models used in such probabilistic models play an important role in determining the best prediction in the dataset. In the DeepState model, unlike other classical regression models based on classical and deep learning, targeted values are not used as direct input. The aim here is to find out how close the observed values and the values to be obtained are probabilistically. The graphs of the results we obtained with the DeepState model are shown in Figure 2.

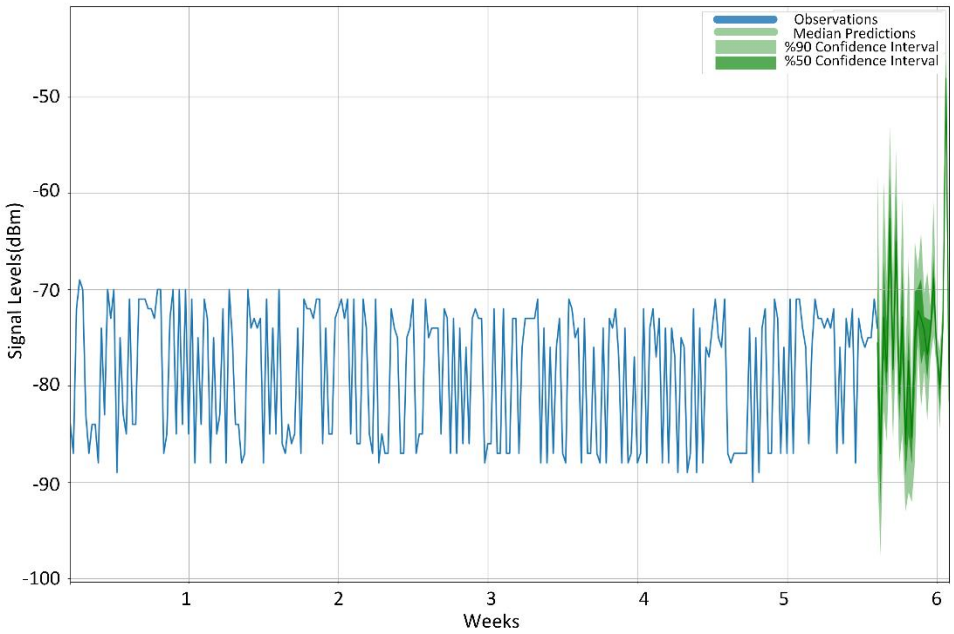

Figure 2. Estimation of measured signal levels from the soil sample with the DeepState model at 50% and 90% confidence intervals.

In some ways, the DeepState model is also an energy-based model. In this study, the probabilistic forecasting method is taken one step further and energy-based models are also used to predict moisture level. In EBM, firstly, the acquired microwave signal data is passed through an encoder and its size is changed. This procedure provides a method to be compared with randomly generated noise values. The methodology here is scoring. A scoring function was used to determine how close the measured data and the generated noise data were to each other, and this process was continued until the difference between them was minimal. In this process, an energy function and a simple artificial neural network were used to process the signal data for scoring control. The working principle of the system is shown in Figure 3.

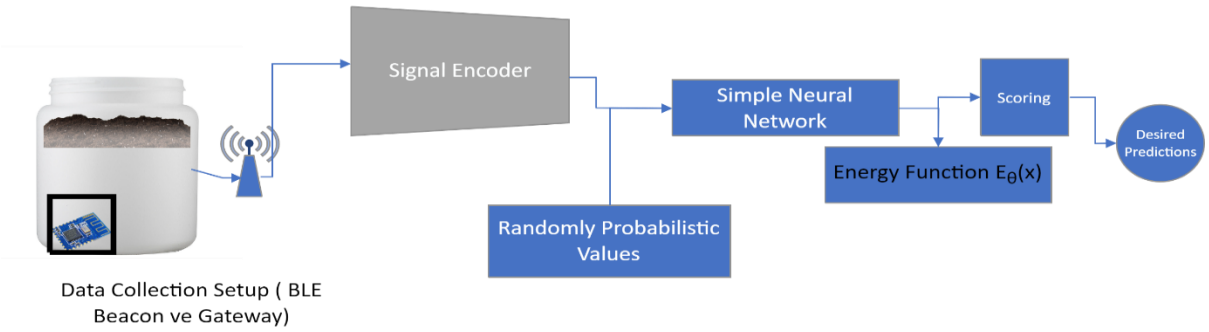

Figure 3. Schematic of the measurement experiment system in general. Operation of the energy-based model in particular.

A generative modeling approach was applied in the study. The aim is to define an energy-based model (EBM) that captures the dependencies between variables by assigning a scalar value to the realization of the observed variables. The function of the variable configuration with respect to a scalar value should assign low values to possible occurrences and high values to unexpected occurrences. One of the main objectives of applications working on such generative models is to find the appropriate generating function. The better the function, the more it will produce latent data that matches the observed values. It is the loss function that ensures the quality of the relationship between the observed values and the results obtained as a result of the learning process. The closer the value of the loss function is to 0, the more successful the learning process is. There are loss functions used in many Energy-based models (LeCun, Chopra et al. 2006). Score-matching algorithms are another way of finding the learnability parameters of energy functions expressed in θ (Hyvärinen and Dayan 2005). Score matching (SM) is an alternative to the maximum likelihood principle suitable for non-normalized probability density models whose partitioning

function is intractable. There are also different approaches to the SM method. In this study, four different score-matching loss functions found in the literature were used to find the soil moisture value. One of these is the Sliced Score Matching (SSM) method. This method, which is particularly applicable to high-dimensional data as opposed to low-dimensional datasets, uses a method of generating random vectors and then comparing them. It gives successful results in variation extraction in latent distributions and autoencoder applications (Song, Garg et al.). Another approach is the Deep Energy Estimator (DEEN) method. It aims to obtain a function for noise-reducing autoencoders that converts randomly generated noise data back to observed data (Saremi, Mehrjou et al. 2018). In this study, this method was found to be the most successful. The DEEN function can be described as follows.

$$E(x;\ \theta) = MLP(x;\theta) \qquad (3)$$

In equation 3, MLP refers to the output of a Multilayer Perceptron network with input x and learning (weight) parameters θ. The MLP function converts $\mathbb{R}^d$ inputs into $\mathbb{R}$ scalar values. The MLP function here is used as the layer that parameterizes the energy function defined in equation 3 using the score value denoted by $\psi\ (x;\ 0) = -\frac{\partial E(x;\theta)}{\partial x}$. The DEEN function was previously obtained in the Parzen density score comparison method (Vincent 2011) using a Gaussian kernel. The logarithmic value in the original function is replaced by a partial derivative and a σ hyper-parameter. Thus the function is expressed in the form:

$$\mathcal{L}_{DEEN}(\theta) = \mathop{\mathbb{E}}_{(x,\xi)\sim J} \left\| x - \xi + \sigma^2 \frac{\partial E(\xi;\theta)}{\partial \xi} \right\|^2 \qquad (4)$$

In equation 5 σ^2 is the smoothing parameter and $\frac{\partial E(\xi;\theta)}{\partial \xi}$ is the non-cyclic directed matching. x is the values close to the curve of possible desired values obtained with the energy function and ξ is the Gaussian "noise" added to the training data.

The best results obtained from the EBM experiments conducted in this study are shown in Figure 4. The results here are the outputs of the DEEN function and the energy-function of the spherical randomly generated data distribution. As can be seen in Figure 4, the data received from the beacons in the soil sample were converted from one-dimensional to two-dimensional with the help of an encoder and a visual presentation was created. It converts the time series value received from the encoder into a tensor object and increases the dimension to score matching for measurements. In the artificial neural network used in the study, after linear transformation of the input data, there is a SWISH activation function and a 0.5 dropout layer. Experiments with both the probabilistic model and the energy-based model lasted for 50 epochs. The loss function values obtained as a result of these processes are given in Table 1. Since the methods are different here, the types of loss functions that can be applied are different. However, DEEN loss function values gave very good results.

Table 1. Results obtained with both probabilistic and energy-based model.

Loss Functions	**RMSE**	**DSM**	**SSM**	**SSM-VR**	**DEEN**
Model					
Deep-State	9.484674	-	-	-	-
EBM	-	99.98	-0.06082	-0.0775	0.009947

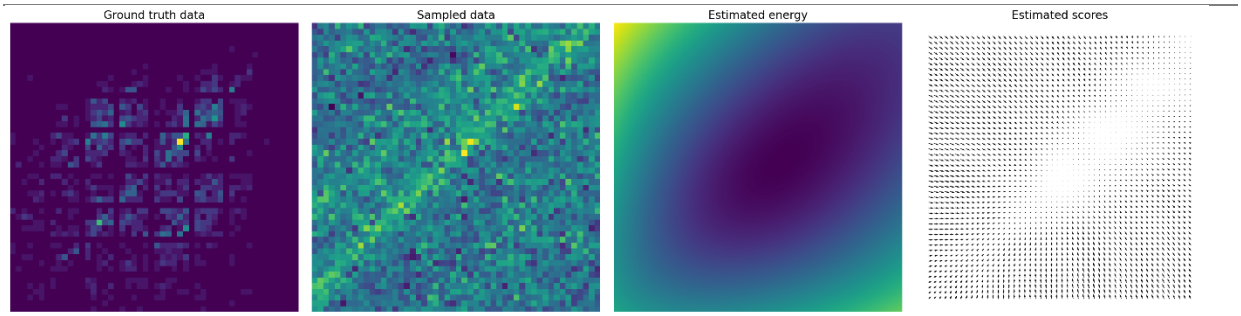

Figure 4. Estimated energy values and scores of the soil signal data obtained in the energy-based model with DEEN loss function.

As seen in Figure 4, the expected energy values and score values were obtained close to the distribution of signal values.

DISCUSSION

As a result of the experiments on the soil sample, it was observed that the soil moisture level could be successfully estimated with the help of the signal values obtained. Like other time-dependent approaches in the literature, the results of the methods applied here are satisfactory. Although the RMSE value measured with the DeepState model remains high compared to the other EBM experiment, it is at an acceptable level. However, especially the scoring model with the DEEN loss function gave very good results. The method applied here differs from other methods of determining moisture either remotely or by taking instantaneous measurements in the soil in that it requires monitoring of data collection over time. Naturally, the amount of moisture on the soil surface is not expected to change instantaneously depending on ambient conditions and soil water saturation. Considering that water loss is spread over a certain time interval, it has shown that the methods used here can also be used to determine the moisture level in a certain time interval.

The features of some of the studies that use remote and near sensing methods and machine learning methods are shown in the Table 2. However, these studies only include methods focused on moisture measurement. The study shows that 1mW BLE signals can also be used successfully in soil surface moisture measurement. The main advantage of this approach is that beacon costs are considerably lower than for specialized instruments. It will also ensure that device losses and failures in the field can be easily ignored. Components such as BLE/Zigbee that are readily available and generate signals are very low cost.

CONCLUSION

It is predicted that the estimation of water level will be more successful in general when the soil sample properties used in this study are diversified. It is possible to develop a more successful energy function approximation if the model is processed with soil samples that reflect the general characteristics of farmed open fields. It is also a method that can easily be used both in rural areas and in greenhouse areas close to cities with gateway devices with various microcontroller components. In particular, LoRaWAN will make it possible to monitor water levels using wide area communication systems such as LTE.

Abstract

Cyanides are fast-acting poisons, can be lethal if exposed in excess. In spite of fact, cyanides are discharged as effluents in large scale from industries every year.The presence of cyanide compounds, in wastewaters coming from various industries or from waste dams, causes many environmental problems. One of the cyanide compounds present in aqueous media is metal cyanide (Me-CN) complexes. Me-CN complexes have different decomposition properties. Me-CN complexes exist in two forms, WAD (weak acid dissociable) and SAD (strong acid dissociable), and they can decomposed at different rates depending on environmental conditions and convert to metal and cyanide. In addition to cyanide, metal cations in the structure of Me-CN complexes, also cause environmental problems. In this study, the behavior of Me-CN complexes in Chlorella vulgaris-dominated algal reactors operated with a continuous system was investigated. $Zn(CN)_4^{2-}$, $Cu(CN)_3^{2-}$ and $Fe(CN)_6^{4-}$ were added to these algal reactors. Chlorophyll-*a* concentrations in these reactors increased for 15-20 days, but then decreased. CN^- removal of 96%, 96% and 91% was obtained in $Zn(CN)_4^{2-}$, $Cu(CN)_3^{2-}$ and $Fe(CN)_6^{4-}$ reactors, respectively.

Keywords: Algae, cyanide, metal cyanide complexes, treatment.

INTRODUCTION

Cyanide is an important contaminant in wastewaters originated from various industries such as mining, mineral and electrochemical industries (Johnson et al., 2001). The wastewaters generated from some industries also contain significant quantities of heavy metals such as nickel, copper, zinc and iron besides cyanides (Aksu and Gülen, 2002; Johnson et al. 2001). Cyanide compounds in aqueous environments can be classified as free cyanide (CN^-, HCN), metal cyanide complexes and other compounds (CNS, CNO^-) of the reaction of cyanide complexes. Metal cyanide complexes including weak acid dissociable (WAD) and strong acid dissociable (SAD), have different dissociation properties. WADs are relatively unstable complexes of cyanide with transition metals such as Cu, Zn, Cd and Ni. Metal cyanide complexes, depending on their environmental conditions, can dissociate and transform free cyanide at various speeds. Especially, because of their higher dissociation constants, WAD metal cyanide complexes dissociate and give free cyanide ion during process. Therefore, the formation of metal cyanide complexes does not eliminate the toxicity of cyanide, these must be removed from the wastewaters prior to their discharge in the environment (Patil and Paknikar, 2000).

Cyanide and cyanide compounds can be treated by physical methods, adsorption, complexation methods, chemical and biological oxidation methods (Gürbüz et.al, 2009; Kitiş et.al, 2005; Rosenfeldt et al., 2006; Schwarzenbach et al., 2003; Tarlan et.al., 2006; Young and Jordan, 1995). Bio-oxidation of cyanide and cyanide compounds is possible by the appropriate microorganisms (Dash et al., 2009; Gürbüz et al, 2009; White et al, 2000). Algal treatment is one of the photosynthetic bio-processes and the most important advantage of this system is the removal of final products in cyanide oxidation (carbon and nitrogen forms) (Gürbüz et.al, 2009). Other advantages of these systems are uncomplicated application, low cost, high efficiency and to form harmless end products (Botz et al., 2005).

In phycoremediation, microalgae can remove or degrade various environmental contaminants, both organic and inorganic, in addition to the nutrients for their growth, such as nitrogen and phosphorus (Alazaiza et al., 2022). The application of microbial species in the formof bacteria, fungi, protozoa, algae and yeasts has gained considerable attention due to the robustness and environmentally friendliness of the process. These organisms use a variety of enzymatic pathways to destruct or convert cyanide to less hazardous products (Dwivedi and Dwivedi , 2021; Mekuto et al., 2016). Algae uses extracellular and intracellular enzymes to remove and to assimilate various organic and inorganic substances in liquid wastes. Nitrogen, phosphorus and trace metals are removed or assimilated for energy consumption and cell synthesis. Extracellular enzymes in the cell wall decompose complex molecules to small and soluble by-products. Decomposition products are taken into the cell and are used to convert into energy by intracellular enzymes (Gürbüz, 2004). Decomposition may be at different speeds for different substances. Rate of decomposition depends on type of the substance, conditions of the medium, algal biomass, adaptation of the algal biomass towards the substance and threshold level.

Photosynthetic bio-processes have many advantages such as easy application, low cost, harmless end products and high efficiency (Alazaiza et al., 2022). In cyanide oxidation the most important reason for the use of algae in biological treatment processes is the removal of final products (carbon and nitrogen forms) and heavy metals. Algae consume inorganic carbon and different nitrogen forms during photosynthesis under UV light and also heavy metals metabolically (Gürbüz et al., 2004; Akçil et al., 2003; Skowrońska, 2001; Arceivala et al., 1970; Wilde and Benemann, 1993; Vilchez et al., 1997). Especially green algae such as *Chlorella* and *Scenedesmus* remove NH_4^+ , NO_3^-, CO_3^{2-} easily during photosynthetic metabolic activities such as energy production and cell synthesis (Gürbüz et al., 2004; Akçil et al., 200; Gonzalez et al., 1997). Cyanate is also converted to NH_4^+ and HCO_3^- ions by algae metabolically (Equation 1, 2) (White et al., 2000).

$$CN^- + \tfrac{1}{2}O_2(aq) \xrightarrow{m/o} OCN^- \quad (1)$$

$$OCN^- + 3H_2O \xrightarrow{m/o} HCO_3^- + NH_4^+ + OH^- \text{ (pH 7-8.5)} \quad (2)$$

In this study, the behavior of Me-CN complexes ($Zn(CN)_4^{2-}$, $Cu(CN)_3^{2-}$ and $Fe(CN)_6^{4-}$) was investigated in the *Chlorella vulgaris* dominated algae reactor operated with a continuous system.

MATERIALS AND METHODS

Inocula

Green algae (especially *Chlorella vulgaris*) dominant mixed culturet was grown in plexyglass stock tanks which were fed with the inorganic nutrient medium. Feeding rate was adjusted such that the total solids retention times be 20 days in the tanks. The composition of the inorganic nutrient medium was as follows [3]: 5241.7 mg/L NH_4Cl; 4.9 mg/L KH_2PO_4 ; 5 mg/L K_2HPO_4 ; 5 mg/L $MgSO_4$.$7H_2O$; 3.357 mg/L $CaCl_2.2H_2O$; 1.6 mg/L $Fe(NH_4)_2(SO_4)_2.6H_2O$; 0.5 mg/L H_3BO_3; 0.4 mg/L $(NH_4)_6Mo_7O_{24}.4H_2O$; 0.2805 mg/L $MnSO_4.H_2O$; 0.2097 mg/L $ZnSO_4.7H_2O$; 0.071 mg/L $CoCl_2$; 0.01 mg/L $CuSO_4.5H_2O$; 2 mg/L Thiamine-HCl; 40.2 mg/L Tris base.

Setup

Experiments were conducted in a climate room in which temperature and humidity conditions kept constant at 22-25 ^{0}C and 60-70%, respectively. Lightening was supplied with two L 36W/77 Fluora model 1400 lumen and four 21 W/11-860 Dulux model 1155 lumen simulated daylight fluorescence lamps which were switched on and off with the help of a time-clock.

Me-CN Complex Removal System

The reactors were operated with a continuous system. In the continuous system, 20 mL of mixed liquid was discharged from two parallel reactors every day, and the nutrient solution and Me-CN complex were fed in the same volume to ensure the concentration of each component in it. These amounts are 0.85 mg/L.day

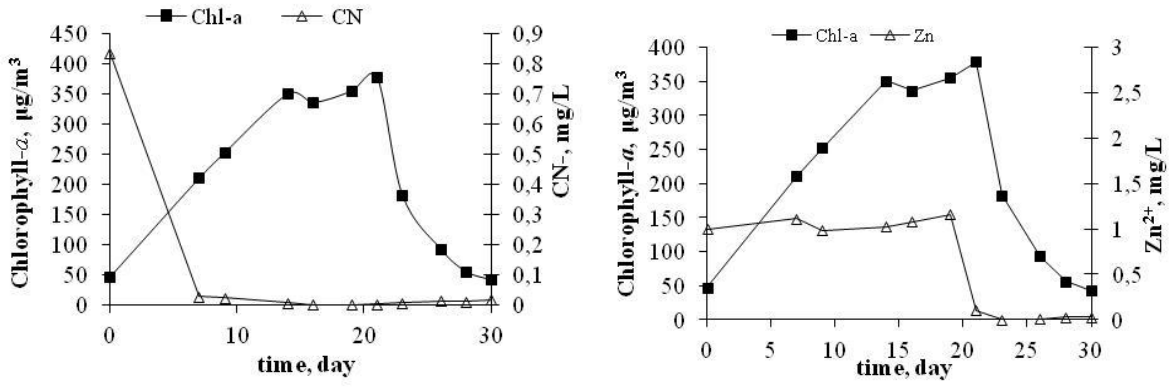
for $Zn(CN)_4^{2-}$, 0.71 mg/L.day for $Cu(CN)_3^{2-}$ and 1.06 mg/L for $Fe(CN)_6^{4-}$. Chlorophyll-*a*, CN^-, pH and heavy metal (Zn^{2+}, Cu^+ and Fe^{2+}) analyzes were performed on the samples taken from the reactors.

Analyses

Chlorophyll-*a* (Pigment Extraction and Spectrophotometric Determination of Chlorophyll Method (10200 H. Chlorophyll)) (APHA/AWWA/WEF, 2005), CN^- Skalar marka SAN $^{++}$ model analizör ile Low Power UV Digestion Metoduyla (TCN-LPUD) ölçülmüştür (EPA Metod 335.3, 1983). For spectrophotometric determinations HACH DR4000 Direct Reading UV-Vis. Spectrophotometer was used. pH was measured by HANNA pH 213 Microprocessor pH meter. Zn^{2+}, Cu^+, Fe^{2+} concentrations of the samples were determined by GBC-SenS AA Model Atomic Absorption Spectrophotometer with flame atomizer.

RESULTS AND DISCUSSION

For the removal of Me-CN complexes, six reactors operating with a continuous system were established. The reactors are identical in volume and operating conditions/medium. Me-CN complex was added to the reactors at regular intervals in addition to the algae culture and nutrient solution.
Two parallel reactors were used for each Me-CN complex. Chlorophyll-*a*, CN^- and heavy metal (Zn^{2+}, Cu^+ and Fe^{2+}) analyzes were performed on the samples taken from the reactors.
The pH was kept above 7 to avoid acidic conditions. Me-CN complex concentrations initially added to the reactors in the continuous system were 0.85 mg/L.day for $Zn(CN)_4^{2-}$, 0.71 mg/L.day for $Cu(CN)_3^{2-}$ and 1.06 mg/L.day for $Fe(CN)_6^{4-}$.
As seen in Figure 1-3, algal biomass increased up to 20 days in all three reactors and decreased after the 20th day. For 20 days, a total of 17 mg/L to the $Zn(CN)_4^{2-}$ reactor, 14.2 mg/L to the $Cu(CN)_3^{2-}$ reactor, 21.2 mg/L to the $Fe(CN)_6^{4-}$ reactor mg/L complex dosing was done.
CN^- concentrations are not very high in all three reactors (Figure 1-a, Figure 2-a, Figure 3-a). Me-CN complex was fed into the system continuously, but CN^- was consumed without accumulation in the reactor for up to 20 days. This 20-day period without accumulation is the time during which the algal biomass develops.
When the algal biomass starts to die from the 20th day, although CN^- concentrations seem to increase in the system, it is not significant since the concentrations are very low. Although there is continuous adding of Me-CN complex into the system, the lack of CN^- increase indicates that the complexes are removed as ions and/or as CN^- after decomposition.

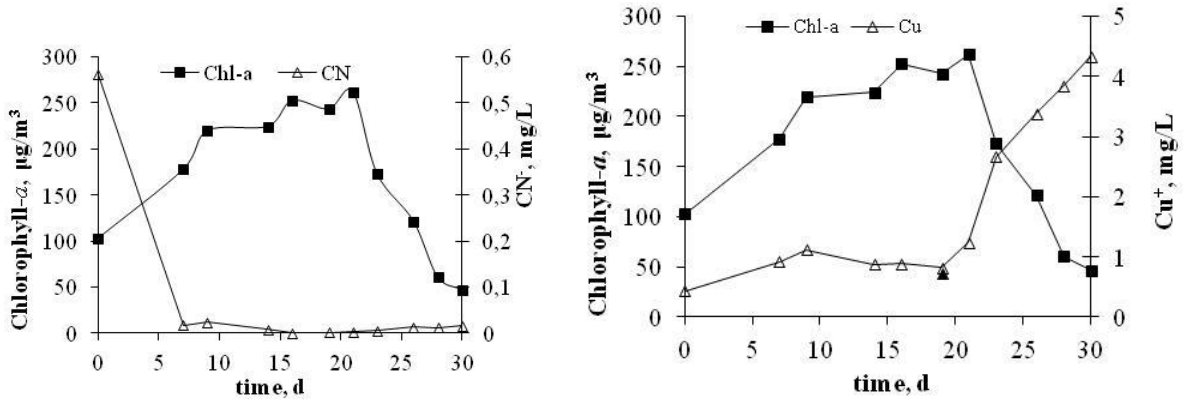


(a) (b)

Figure 1. Change of chlorophyll-*a*, CN^- (a) and Zn^{2+} (b) in $Zn(CN)_4^{2-}$ fed algae reactors.

Figure 1-b shows the change of Zn^{2+} concentrations over time. As the reactor is continuously fed $Zn(CN)_4^{2-}$, Zn^{2+} concentrations are expected to increase. In the first 20 days when chlorophyll-*a* concentrations increase, it is observed that Zn^{2+} concentrations do not increase and remain around 1 mg/L. It then appears that it begins to decline and is completely consumed.

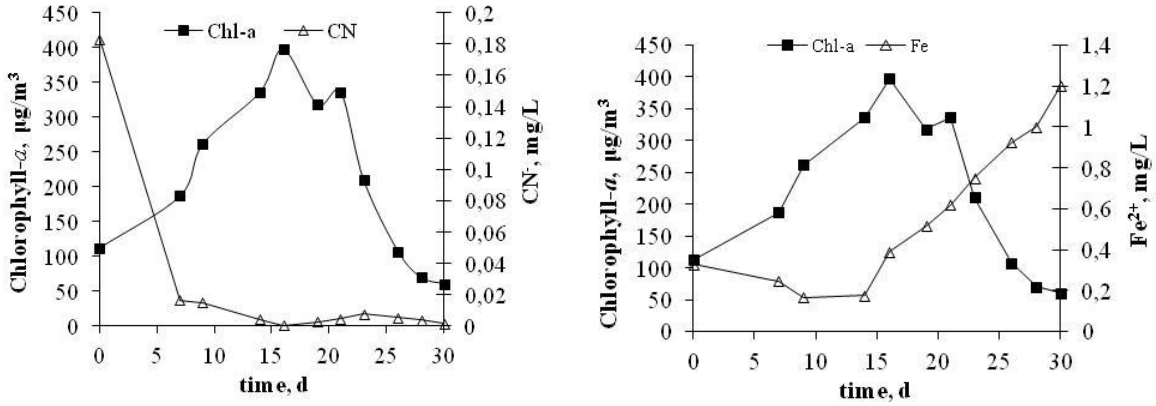
After 20 days, an increase in pH was observed in the reactor. It is thought that the increased OH^- ions due to the increase in pH cause the formation of $Zn(OH)_2$ precipitate with Zn^{2+} in very low concentration in the reactor.



(a) (b)

Figure 2. Change of chlorophyll-*a*, CN^- (a) and Cu^+ (b) in $Cu(CN)_3^{2-}$ fed algae reactors.

In Figure 2-b, when the change of Cu^+ concentrations over time is examined, it is observed that there is a slight increase in the first 8 days. After 8 days, although there is continuous adding into the reactor, no increase in concentration is observed, on the contrary, a decrease is observed.
This decrease continues until the algal biomass starts to die, that is, until the 20th day, after which the Cu^+ concentration starts to increase again and faster.
This is an indication that removal begins in the system with the growth of algae biomass after the metal adaptation phase, and Cu^+ accumulates in the system when it dies by completing its life cycle.
When evaluated together with the CN^- findings, it is understood that the complex is decomposed into Cu^+ and CN^- ions by the algae and each is metabolically consumed.



(a) (b)

Figure 3. Change of chlorophyll-*a*, CN^- (a) and Fe^{2+} (b) in $Fe(CN)_6^{4-}$fed algae reactors.

Since $Fe(CN)_6^{4-}$ is constantly added to the reactor, Fe in the structure of the complex increases the Fe^{2+} concentration in the reactor, but as seen in Figure 3-b, the Fe^{2+} concentration decreased during the 15-day period when the algae biomass developed.
From this time on, Fe^{2+} concentrations started to increase. Some metals such as Fe, Mn are required in low concentrations as micro-nutrients to perform basic metabolic activities. Fe plays a role in photosynthetic

electron transfer and nitrogen metabolism (Stengel et al., 2005). Since Fe^{2+} is used in algae metabolism, Fe^{2+} ions adding the reactor started to accumulate after 15 days when the microbial activity slowed down. However, it is seen that most of the approximately 8.5 mg/L Fe^{2+} given to the system for 30 days is consumed, and 1.2 mg/L Fe^{2+} remains in the system at the end of 30 days.

CONCLUSION

In this study, the behavior of $Zn(CN)_4^{2-}$, $Cu(CN)_3^{2-}$ and $Fe(CN)_6^{4-}$ metal cyanide complexes in algae reactors operated with continuous system was investigated. It was determined that CN^- could be removed with an efficiency of over 90% in all three reactors.
Zn^{2+} was completely removed in the reactors, and Cu^+ and Fe^{2+} started to accumulate in the reactors after 20 days when algae biomass started to decrease. While CN^- is removed with high efficiency, Cu^+ and Fe^{2+} accumulation shows that Me-CN complexes are removed by dissociation into CN^- and metal ions rather than ion removal.

Özet

Enzim biyokatalizörler, yüksek katalitik aktiviteleri, seçiciliği, düşük toksisitesi ve suda çözünür özellikleri nedeniyle kimya, biyokimya ve tıp gibi birçok alanlarda kullanılmaktadır. Daha hafif koşullar altında enzimler tarafından çeşitli reaksiyonlar katalize edilebilir ve enzimler, belirli substratlara veya fonksiyonel gruplara karşı aktivite göstermektedirler. Bu avantajlarından dolayı literatürde biyokatalizörlere sıklıkla rastlanmaktadır. Örneğin, yaban turpu peroksidaz (HRP) gibi peroksidaz enzimleri, aktif merkezlerinde demir (Fe^{+2}) iyonları içerir ve bu enzimler radikal reaksiyonlar ve polimerizasyonlar için kullanılmaktadır. Fakat, enzimler reaksiyon karışımından kolayca izole edilemez ve bu nedenle daha sonraki reaksiyonlar için enzimleri geri dönüştürmek hiç de kolay değildir. Bu sorunlar, daha büyük ölçekli uygulamalar için enzimlerin kullanımını sınırlar. Bu çalışmada; bu kısıtlamaları aradan kaldırmak için HRP methacryloyl (HRPMA) sentezlenerek kriyojel 2-hidroksi etil metakrilat (HEMA) kolon içerisine immobilize edilmiş (HEMA-Co-HRPMA) ve oda sıcaklığında, pH 6,5 koşulları altında ve %50 sulu aseton ortamında guaiacol polimerizasyonu gerçekleştirilmiştir. Enzimlerin immobilizasyonu, yeniden kullanılabilirlik, daha kararlı ve ekonomik katalizör sistemleri gibi avantajlar sağlamaktadır. HRPMA'nin kriyojel kolon içerisine immobilize edilmesi önemli ölçüde tekrar kullanım sağlamış ve guaiacol'ün polimerizasyonunda defalarca kullanımdan sonra bile yüksek katalitik aktivite göstermiştir. Sulu ortamda polimerizasyon, UV-Vis spektrometresi ile izlenmiş ve elde edilen ürün ^{1}H NMR spektrometresi ile karakterize edilmiştir. Aynı zamanda bazik ortamda guaiacolla birlikte HRPMA kriyojel kolondan geçirilerek guaiacol bazlı resveratrol polimerizasyonu da gerçekleştirilmiştir. Çalışmalarımız sonucunda tekrar kullanılabilen, kararlı ve ekonomik bir polimerizasyon sistemi geliştirilmiş ve bu sistem sayesinde guaiacol bazlı polimerler elde edilmiştir.

Anahtar Kelimeler: HRP, biyokataliz, guaiacol, polymerizasyon, kriyojel kolon.

Guaiacol-based polymerization through horseradish peroxidase (HRP)

Abstract

Enzyme biocatalysts are used in many fields such as chemistry, biochemistry, and medicine due to their high catalytic activity, selectivity, low toxicity and water-soluble properties. A variety of different reactions can be catalyzed by enzymes under milder conditions, and enzymes show activity against particular substrates or functional groups. Due to these advantages, biocatalysts are widely encountered in the literature. For example, peroxidase enzymes such as horseradish peroxidase (HRP) contain iron ions (Fe^{+2}) in their active centers and these enzymes are used in radical reactions and polymerizations. However, enzymes can not be easily isolated from the reaction mixture and therefore it is not easy to recycle enzymes for further reactions. These problems limit the use of enzymes for larger scale applications. In this study; To remove these limitations, HRP methacryloyl (HRPMA) was synthesized and cryogel 2-hydroxy ethyl methacrylate (HEMA) was immobilized into the column (HEMA-Co-HRPMA) and guaiacol polymerization was performed at room temperature, pH 6.5 conditions and 50% aqueous acetone medium. The immobilization of enzyme provides advantages such as reusability, more stable and economical catalyst systems. The immobilization of HRPMA into the cryogel column provided repeated use and showed high catalytic activity in the polymerization of guaiacol even after repeated use. The polymerization in the aqueous medium was monitored with UV-Vis spectrometry and the obtained product was characterized by ^{1}H NMR spectrometry. At the same time, guaiacol-based resveratrol polymerization was carried out by passing the HRPMA through the cryogel column with guaiacol in basic medium. As a result of our studies, a reusable, stable and economical polymerization system has been developed and guaiacol-based polymers have been obtained thanks to this system.

Keywords: HRP, biocatalysis, guaiacol, polymerization, cryogel column.

GİRİŞ

Günümüzde, yeni malzemelerin üretimi büyük ölçüde polimerlerin sentezine bağlıdır ve enzimlerin ilkel kullanımlarından biri, polimerlerin sentezindedir (Iwahara ve ark. 2000). Aslında, enzimatik polimer sentezi, toksik reaktifler (örneğin formaldehit) kullanılmadan hafif reaksiyon koşulları altında geleneksel yöntemlere göre daha fazla avantajlar sunar ve bu geleneksel yöntemlerle elde edilmesi mümkün olmayan yeni polimerik malzemelerin sentezini sağlayabilir (Göktürk 2020). Son yıllarda yaban turpu peroksidazın (HRP) katalizör olarak kullanıldığı polimerizasyon reaksiyonları ile ilgili çok sayıda araştırma yapılmış ve hala da yapılmaktadır (Veitch,2004).

Peroksidaz, elektron alıcısı olarak hidrojen peroksit kullanarak çok çeşitli organik ve inorganik substratların oksidasyonunu katalize eden heme içeren bir enzimdir (Nicell ve ark. 1994). Peroksidazlar tarafından katalize edilen aromatik substratların tek elektronlu oksidasyonu Chance-George mekanizması (Veitch, 2004) ile aşağıdaki gibi gösterilmektedir:

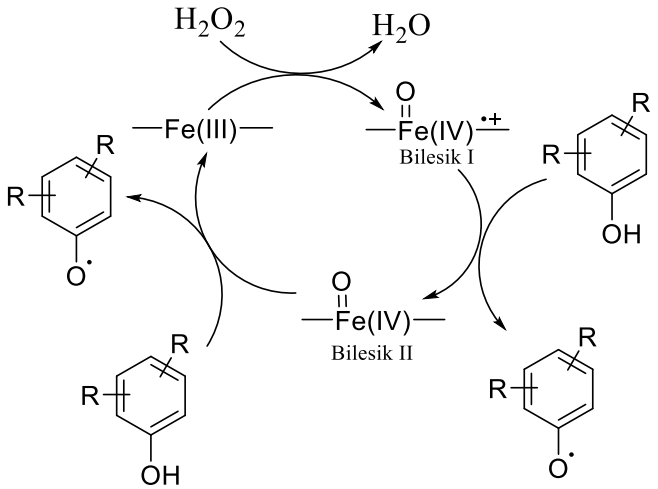
$$E + H_2O_2 \rightarrow E(I) + H_2O \quad (1)$$

$$E(I) + AH_2 \rightarrow E(II) + AH^{*} \quad (2)$$

$$E(II) + AH_2 \rightarrow E + AH^{*} + H_2O \quad (3)$$

$$E(II) + H_2O_2 \rightarrow E(III) + H_2O \quad (4)$$

Doğal enzim (E), peroksit (H_2O_2) tarafından kompleks bileşik I (E(I)) olarak adlandırılan aktif bir ara enzimatik forma oksitlenir. Kompleks bileşik I, organik substrat AH_2'yi oksitler ve sonuç olarak reaksiyon karışımında bir serbest radikal (AH*) üretilir. Enzim, kompleks bileşik II (E(II)) şekline geçer. Kompleks bileşik II, ikinci organik substratı bir serbest radikal ürüne oksitler ve enzim doğal haline geri döner. Genel peroksidaz reaksiyonu, denklem (1), (2) ve (3)'te gösterilen reaksiyonlardan oluşur ve bir katalitik döngü Şekil 1'de gösterilmektedir. Döngü sırasında oluşan serbest radikaller, enzimden poliaromatik ürünler oluşturmak üzere reaksiyona girdikleri çözeltiye yayılır. Bu poliaromatik bileşikler suda çözünmezler ve katı-sıvı işlemleriyle uzaklaştırılabilirler (Guzik ve ark. 2014).



Şekil 1. Peroksidazın katalitik döngüsü (Guzik ve ark. 2014)

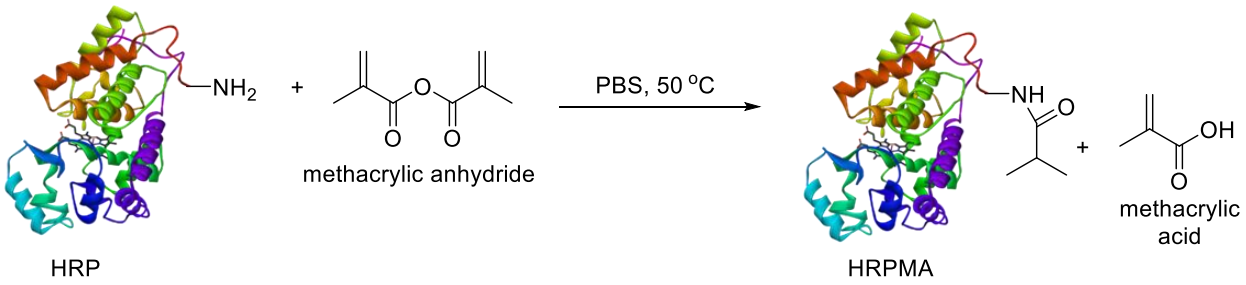
Peroksidaz enzimleri, genellikle yüksek reaksiyon sıcaklıklarında, asidik veya bazik koşullarda ve organik çözücülerde aktivitelerini kaybederler (Preethi ve ark. 2013). Bundan başka, enzimler reaksiyon karışımından kolayca izole edilemez ve bu nedenle daha sonraki reaksiyonlar için enzimleri geri dönüştürmek kolay değildir. Bu sorunlar, daha büyük ölçekli uygulamalarda enzimlerin kullanımını sınırlar (Mohamed ve ark. 2016). Bu kısıtlamaların üstesinden gelmek için enzimlerin immobilizasyonu geliştirilmiştir. İmmobilizasyon yönteminin temel özelliği, bir enzimi bir desteğe bağlamak ve hareketini sınırlamaktır. Enzimlerin immobilizasyonu, artan yeniden kullanılabilirlik ve daha kararlı ve ekonomik

katalizör sistemleri sağlar. İmmobilizasyon, enzimin reaksiyon ürününden ayrılmasını kolaylaştırır, bununla da ürünün protein kontaminasyonunu en aza indirir veya ortadan kaldırmaktadır (Lopes ve ark. 2014). İmmobilizasyon ayrıca, üretim maliyetinin düşürülmesiyle enzimin verimli bir şekilde geri kazanılmasınıve yeniden kullanılmasını kolaylaştırmaktadır (Sheldon 2007). Ayrıca, ısı veya organik çözücülerle denatürasyonu gibi depolama ve çalışma koşulları altında stabiliteyi arttırmaktadır. Gelişen stabilite ve tekrarlanan yeniden kullanım sayesinde enzim performansı, daha yüksek katalizör üretkenliklerine yansımaktadır. Bunu da belirtmek gerekir ki, enzim ve substrat arasındaki uygun olmayan konformasyon ve kütle transfer kısıtlamaları nedeniyle immobilizasyondan sonra birçok enzimin katalitik aktiviteleri kaybolmuştur. Enzimlerin verimli kullanılabilmesi için, katalitik aktiviteleri daha yüksek olan uygun bir immobilizasyon yönteminin bulunması hem ticari hem de bilimsel alanda büyük önem arz etmektedir. Bu çalışmada; HEMA-Co-HRPMA kriyojel kolon sentezlenmiş ve oda sıcaklığında, pH 6,5 koşulları altında guaiacol ve guaiacol bazlı resveratrol polimerizasyonu gerçekleştirilmiştir. Guaiacol, ligninden elde edilen bir fenol türevidir (Akkara ve ark. 1991, Hiroyuki ve ark. 2004). Guaiacol, vanilin üretimi için ve çeşitli moleküllerin sentezi için bir yapı taşı olarak kullanılmaktadır. Resveratrol ise güçlü bir antioksidandır, gıda takviyesi olarak da kullanılmaktadır. Resveratrolün vücudun yenilenmesinde önemli bir katkısı vardır. Resveratrol özellikle yaşlanma karşıtı bakımda önemli bir role sahip olup, cildin yaşlanma belirtilerini yavaşlatır. Bu nedenle, guaiacolun polimerizasyon eğilimini kriyojel kolona immobilize edilmiş HRP kullanarak göstermenin gerekli olduğu ve aynı zamanda, çalışmamızın gelecek çalışmalar için de bir yapı taşı olabileceği inancındayız.

MATERYAL VE METOD

Yapılan çalışmada, HRP ticari olarak Sigma'dan temin edilmiştir. Kolon sentezi için kullanılan HEMA Across'tan, Tetraetilmetilendiamin (TEMED) ve Amonyum persülfat (APS) Sigma'dan tedarik edilmiştir. Polimerize edilen guaiacol ticari olarak Sigma'dan, resveratrol tıbbi olarak eczaneden temin edilmiştir.

HRP'yi HEMA kriyojel kolona immobilize etmek için HRP'ye NH_2 ucundan metakrilik anhid bağlanmıştır. 50 °C'de metakrilasyon ile HRP metakriloil (HRPMA) ve metakrilik asit oluşmuştur. Reaksiyon şematik olarak Şekil 2'de gösterilmiştir.

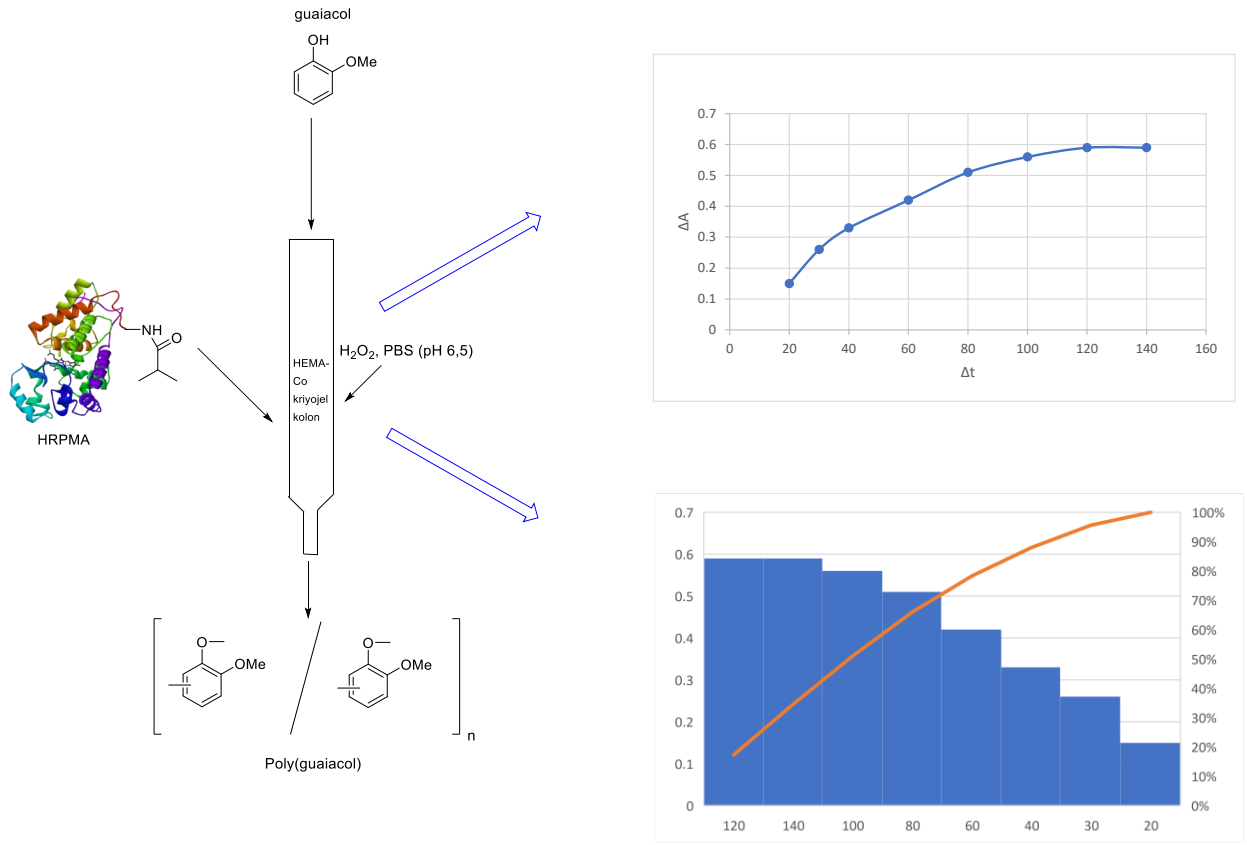


Şekil 2. HRPMA sentezi

HRPMA immobilizasyonu için HEMA kriyojel kolon (HEMA-Co-HRPMA) sentezlenmiştir. Bu amaçla, 337,5 µL HEMA monomeri ve 63,625 mg BIS 3,135 mL suda çözülerek 1,5 saat boyunca karıştırılmıştır. Hazırlanan stok çözeltiden 2,296 mL alınarak üzerine 506,25 µL HRP karışıma ilave edilmiş ve karıştırılmaya devam edilmiştir. Hazırlanan çözeltinin üzerine 664,75 µL saf su ilave edilerek hacim 3,5 mL'e tamamlanmıştır. Karışıma çapraz bağlayıcı olarak 3 µL TEMED, buz banyosu içerisinde polimerizasyon başlatıcısı olarak ise 30 µL APS çözeltisi 1 mL'de 100 mg olacak şekilde hazırlanarak ilave edilmiştir. Polimerizasyon başlayana kadar buz banyosunda tutulmuş ve daha sonra -20 °C'de 20 saat bekletilmiştir. Ardından sentezlenen kriyojel kolon, oda sıcaklığında 3-4 saat süreyle bekletilerek kriyojel oluşumu tamamlanmıştır. Sentezlenen kriyojel kolon 4 °C'de pH 6,5 fosfat tamponu içerisinde saklanmıştır.

Sentezlenen HEMA-Co-HRPMA kriyojel kolon, polimerize edilecek karışımın geçmesi için peristaltik pompaya takılmıştır. Oda sıcaklığında kolondan 10 mM fosfat tamponu (pH 6,5), 0,1 mM H_2O_2 koşulları altında ve %50 sulu aseton ortamında guaiacol devamlı olarak geçirilerek guaiacol polimerizasyonu (Şekil 3) gerçekleştirilmiştir.

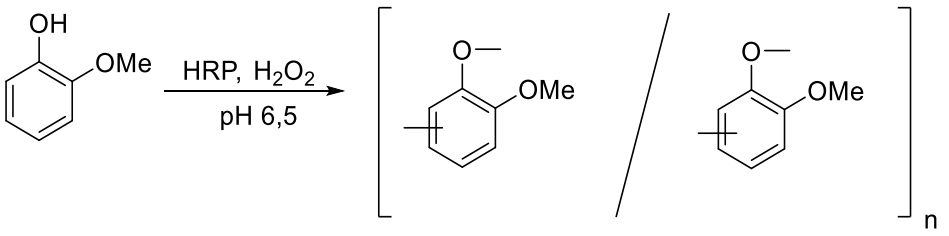
Aynı zamanda HEMA-Co-HRPMA kriyojel kolondan oda sıcaklığında 10 mM fosfat tamponu (pH 6,5), 0,1 mM H_2O_2 koşulları altında ve %50 sulu aseton ortamında 1:1 oranda guaiacol ve resveratrol karışımı devamlı olarak geçirilerek guaiacol bazlı resveratrol polimerizasyonu gerçekleştirilmiştir.



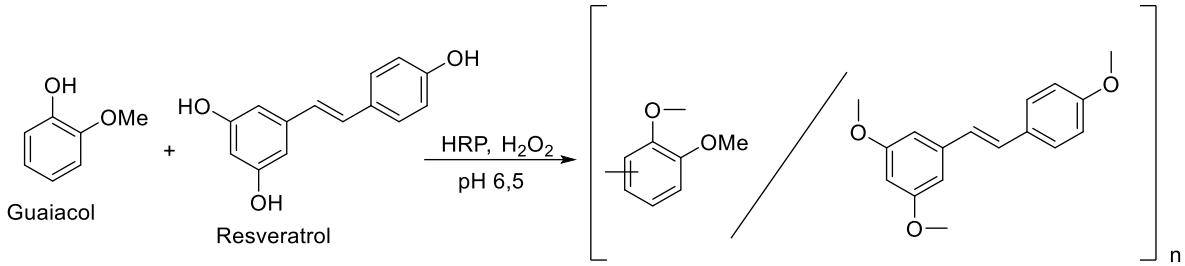
Şekil 3. HEMA-Co-HRPMA kolon aracılığıyla guaiacol polimerizasyonunun şematik gösterimi

BULGULAR ve TARTIŞMA

Çalışma kapsamında HRPMA kopolimerize HEMA kriyojel kolon kullanılarak guaiacol (Şekil 4) ve guaiacol bazlı resveratrol polimerizasyonu gerçekleştirilmiştir (Şekil 5). HRP'nin ısıtmaya duyarlı olması ve 60 °C civarında denatüre olması nedeniyle polimerizasyon oda sıcaklığında (25 °C) gerçekleştirilmiştir.

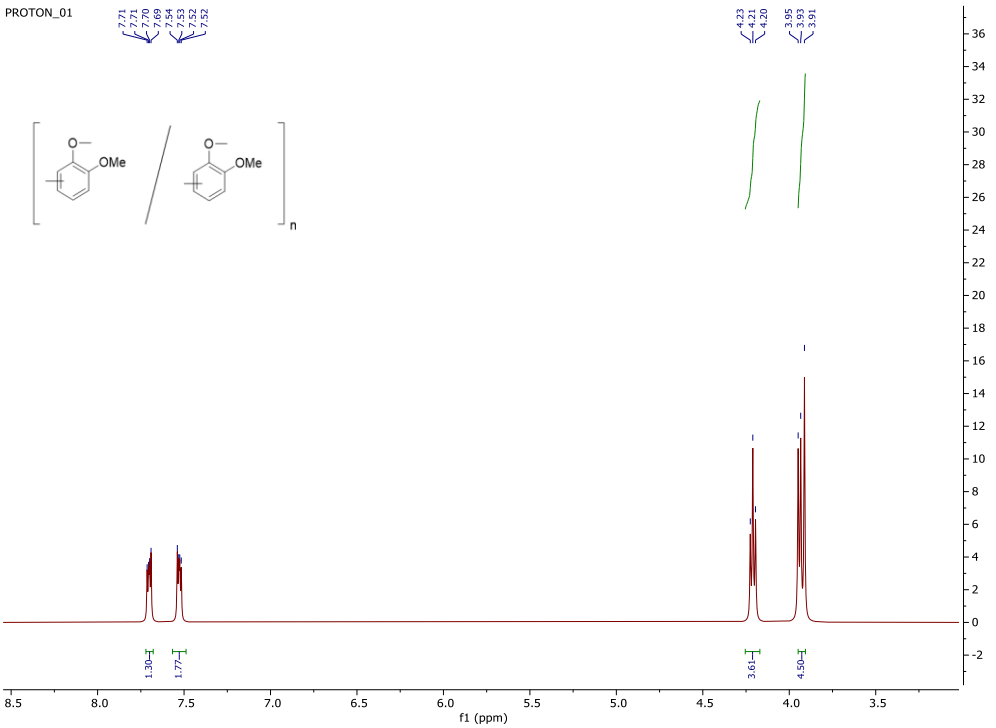


Şekil 4. HRP aracılığıyla guaiacol polimerizasyonu



Şekil 5. HRP aracılığıyla poli(guaiacol-resveratrol) sentezi

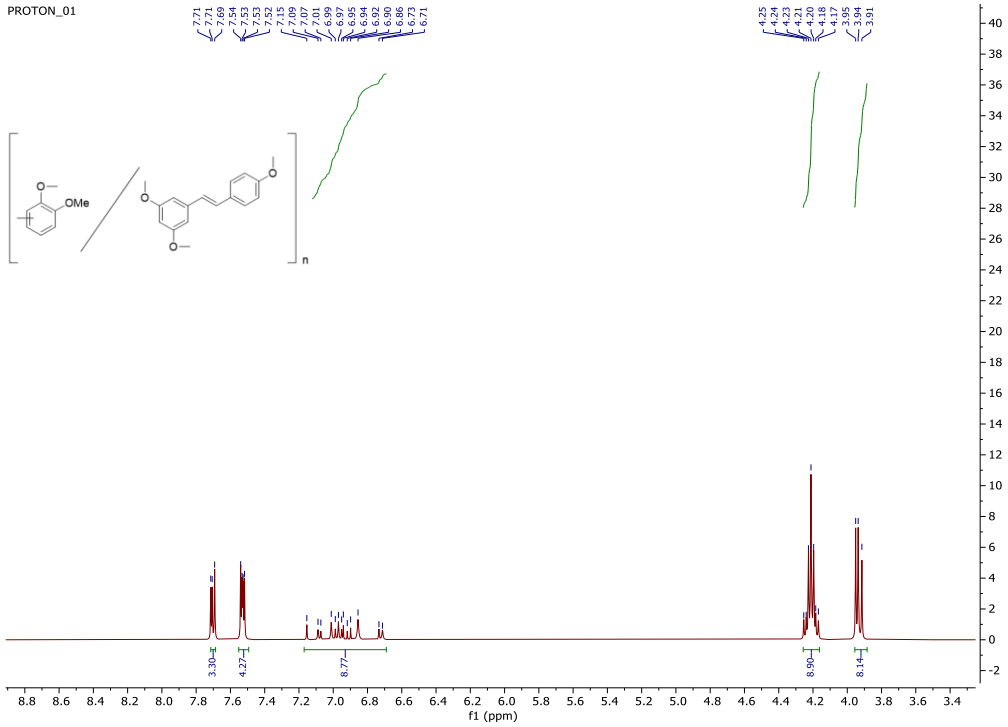
Nihai polimerlerin yapısı, ^{1}H NMR spektrumu (Şekil 6) ile karakterize edilmiştir.



Şekil 6. Poli(guaiacol)'ün ^{1}H NMR spektrumu

Monomer olarak guaiacol fenolik-OH'dan bağlandığı için elde edilen ürünün ^{1}H NMR spektrumunda fenolik –OH protonu gözlenmemiştir, bu da polimerizasyonun oluşumunu göstermektedir. Polimer yapısındaki metoksi grubunun metil proton sinyalleri tekli olarak gözlenmiştir. Ürünün aromatik protonları için beklenen kimyasal kaymalar 7,70, 7,51 ve 7,53 ppm'de gözlenmiş ve bu da poli(guaiacol) yapısını doğrulamıştır.

Poli(guaiacol-resveratrol)'ün ^{1}H NMR spektrumunda fenolik-OH gözlenmemiş olup, bu da guaiacolün resveratrola fenolik-OH üzerinden bağlandığını göstermektedir. ^{1}H NMR spektrumunda 7,71 – 7,69, 7, 7,17 – 6,69 ppm aralığında aromatic protonlar gözlenmiş ve 4,26 – 4,16 ppm aralığında ise metoksi grubun metil protonları gözlenmiştir (Şekil 7).



Şekil 7. Poli(guaiacol-resveratrol)'ün ^{1}H NMR spektrumu

SONUÇ

Çalışma kapsamında HRPMA kopolimerize HEMA kriyojel kolon sentezlenmiş guaiacol ve guaiacol bazlı resveratrol polimerizasyonunda kullanılmıştır. Bu yöntem pahalı bir enzim olan HRP'nin önemli ölçüde tekrarlanan kullanımını sağlamış ve guaiacolün polimerizasyonunda defalarca kullanımdan sonra bile yüksek katalitik aktivite gösterdiği gözlenmiştir. Üzerinde çalıştığımız yöntem, daha kararlı ve ekonomik katalizör sistemleri sağlamaktadır. Bu yüzdende, üzerinde çalıştığımız bu sistem, oksidatif polimerizasyonlar için verimli bir şekilde kullanılabilir olmaktadır.

Özet

Bu çalışmada Fe_3O_4 nanopartikülleri sentezlenmiş ve bir reaktör sistemi kurularak anaerobik çürüme ile biyokütleden metan gazı eldesi üzerine olan etkileri incelenmiştir. Önce manyetik Fe_3O_4 nanopartikülleri birlikte çökeltme yöntemi ile sentezlenmiş, daha sonra hazırlanan reaktörlere farklı dozlarda eklenerek oluşan metan gazı miktarı incelenmiştir. Çalışma sonucunda Fe_3O_4 nanopartiküllerinin biyogaz üretimine olumlu etki sağladığı görülmüştür.

Anahtar Kelimeler: anaerobik çürüme, nanopartikül, metan eldesi, Fe_3O_4

Analyze of the Effect of Magnetic Fe_3O_4 Nanoparticles on Biogas Production from Biomass by Anaerobic Decomposition

Abstract

In this study, Fe_3O_4 nanoparticles were synthesized and their effects on methane gas extraction from biomass by anaerobic decomposition were analyzed by setting a reactor system. First, magnetic Fe_3O_4 nanoparticles were synthesized by precipitation method, then the amount of methane gas formed by adding different doses to the prepared reactors was observed. As a result of the study, it was seen that Fe_3O_4 nanoparticles had a positive effect on biogas production.

Keywords: anaerobic decay, nanoparticle, metan production, Fe_3O_4

GİRİŞ

Yakın zamanda dünya çapında gerçekleşen pandemi nedeniyle yaşanan kapanma ve izolasyon uygulamaları ülkeleri kendi kaynaklarını daha çok kullanmaya yöneltmiştir. Ülkemizin enerjide dışa bağımlılığının yüksek olması nedeniyle yenilenebilir enerji kaynaklarının daha çok kullanılmasına dönük çalışmalar pandemi döneminden en az etkilenerek ve artarak devam etmiştir . Fosil yakıtların küresel ısınmaya ve çevre kirliliğine olan etkileri nedeniyle Birleşmiş Milletler İklim Değişikliği Çerçeve Sözleşmesi kapsamında ülkelere bu yakıtların kullanımında sınırlamaya gidilmesi hedeflenmektedir. Biyogaz fosil yakıt sınıfına girmeyen bir hidrokarbon yakıttır. Biyogaz; bitkisel, hayvansal ve endüstriyel atıkların anaerobik çürümesi ya da çürütülmesi sonucu meydana gelen, yoğunlukla metan ve karbondioksit gazlarından oluşan bir gaz karışımıdır. Fosil yakıtlar jeolojik olarak oluşmuş ve enerji kaynağı olarak dünya üzerinde kullanım ömrü sınırlı olduğu için alternatif kaynaklara yönelinmiştir. Biyogaz ise yenilenebilir enerji sınıfında yer almaktadır. Son yıllarda, metan üretimi ve proses stabilitesi için anaerobik çürütücülerde nanopartiküllerin eklenmesi büyük ilgi görmektedir (Bogoçlu ve Neşe, 2022). Nanopartiküllerin ayrıca anaerobik çürütücüde metan eldesi verimini arttırdığı belirlenmiştir (Noonari ve ark., 2019). 1 ila 100 nm arasında boyutlara sahip olan parçacıklar nanopartiküller olarak adlandırılır. Nano boyut, hücre zarlarına nüfuz etme kabiliyetini belirlediği için biyolojik bariyerler arasında geçişi, bağışıklık sistemi ile etkileşimi, alımını, absorpsiyonunu, dağılımını ve metabolizmasını kolaylaştırır (Abdelsalam ve ark., 2016). Hem yerli imkanlarla üretilebilecek yenilenebilir bir enerji kaynağı hem de çevre dostu olması nedeni ile biyogaz sentezlenmeye çalışılmıştır. Manyetik nanopartiküllerle hayvan dışkısından metan gazı elde edilmiş ve sonuçlar sunulmuştur. Öncelikle Fe_3O_4 manyetik nanopartikül sentezi yapılmıştır. Biyokütle olarak

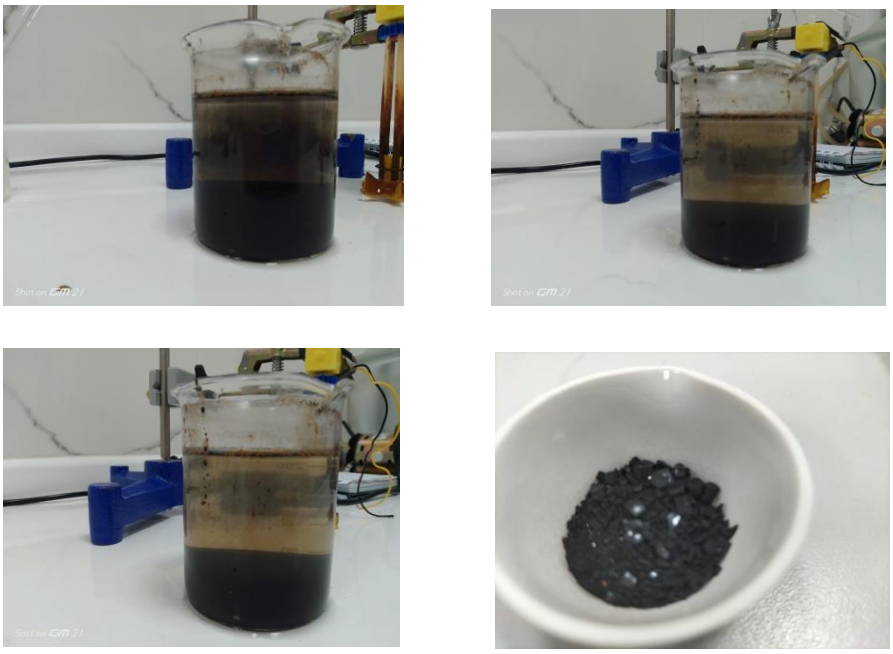
kullanılan hayvan dışkısının anaerobik çürütülmesi için bir reaktör tasarlanmış ve sentezlenen nanopartiküller kullanılarak metan gazı eldesine etkisi incelenmiştir.

MATERYAL VE METOT

a.Materyal Ve Metot

a.1. Manyetik Fe_3O_4 NP (nanopartikül) sentezi

Fe_3O_4 NP'ler birlikte çökeltme sentez yöntemi kullanılarak gerçekleştirilmiştir. 5 mL saf su içerisinde 2,78 g. $FeSO_4.7H_2O$ ve 20 mL saf su içerisinde 5,4 g. $FeCl_3$ 20 dakika boyunca homojenize edilmiş ve bu işlemin sonunda iki karışım bir araya getirilerek 5 dakika boyunca çalkalanmışır. Bu karışım üzerine 8,33 mL HCl ve 16 mL saf su eklenerek karıştırma işlemine devam edilmiştir. Manyetik karıştırıcıya alınan karışım renginin kahverengiden siyaha renge dönüşümü gerçekleşinceye kadar 0,7 M NH_4OH damla damla ilave edilmiştir. Çökeltme işlemi sonrası katı kısım süzülerek üst suyundan ayrılmış ve saf su ile 3 tekrarlı yıkanmıştır. Son olarak etüvde 105°C'de 24 saat boyunca kurumaya bırakılmıştır. Herhangi bir sorun olmaması için elde edilen parçacıklar falkon tüp içerisinde muhafaza edilmiştir.



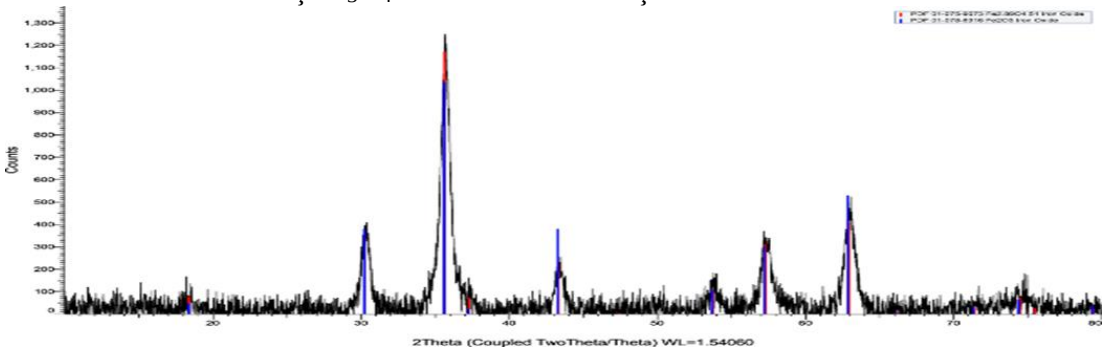
Resim 1,2,3 ve 4. Fe_3O_4 NP Sentez Aşamaları

a.2. Fe_3O_4 NP (Nanopartikül) Karakterizasyonu

Sentezlenen Fe_3O_4 NP'nin partikül şekil ve boyut karakterizasyonu SEM (MAIA3 XMU) ile gerçekleştirilmiştir. Fe_3O_4 nano taneciklerinin yaklaşık 40 nm gibi dar bir boyut dağılımı elde ettiği görülmüştür.

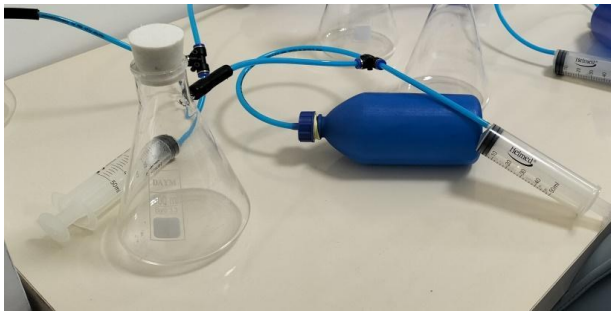
XRD analiz sonuçlarına göre, sentezlenen ürünün kimyasal formülünün Fe_3O_4 olduğu ve manyetik özelliğe sahip olduğu doğrulanmıştır.

Grafik 1. Sentezlenmiş Fe_3O_4 NP'nin XRD sonuçları



a.3. Laboratuvar ölçekli reaktörlerin kurulması ve işletimi

Reaktör için 500 mL hacimli nuçe erleni, deliksiz tıpa, pnömatik hortum, T tipi pnömatik konnektör, piset, alüminyum folyo ve 50 mL hacimli şırınga kullanılmıştır. İşleme başlamadan önce sistem içerisindeki hava vakumlanmıştır. Reaktör kapatıldıktan sonra nüce erleni ışık geçirgenliğini önlemek için alüminyum folyo ile sarılmıştır.



Resim 5. Reaktör düzeneği

Araştırma kapsamında büyükbaş hayvan dışkısı kullanılmış olup, kullanılan dışkı Kdz. Ereğli Kırmacı Mahallesinde büyükbaş hayvan besiciliği gerçekleştirilen bir ahırdan temin edilmiştir.

Temin edilen büyükbaş hayvan dışkısı bekletilmeden daha önceden hazırlanan reaktörlere konulmuştur. Her reaktör için 80 g. büyükbaş hayvan dışkısı, 50 mL su eklenmiştir. Bu işlemlerden sonra Fe_3O_4 nanoparçacıkları da ilave edilerek karışım köpürünceye kadar çalkalanmıştır. Reaktörler alüminyum folyo ile kaplandıktan sonra karanlık ortama bırakılmıştır. Karanlık ortamda her gün çalkalama işlemi gerçekleştirilmiş ve bu aşama 27 gün sürmüştür. Reaktörlerde kullanılan dozlar Tablo 1'de gösterilmiştir.

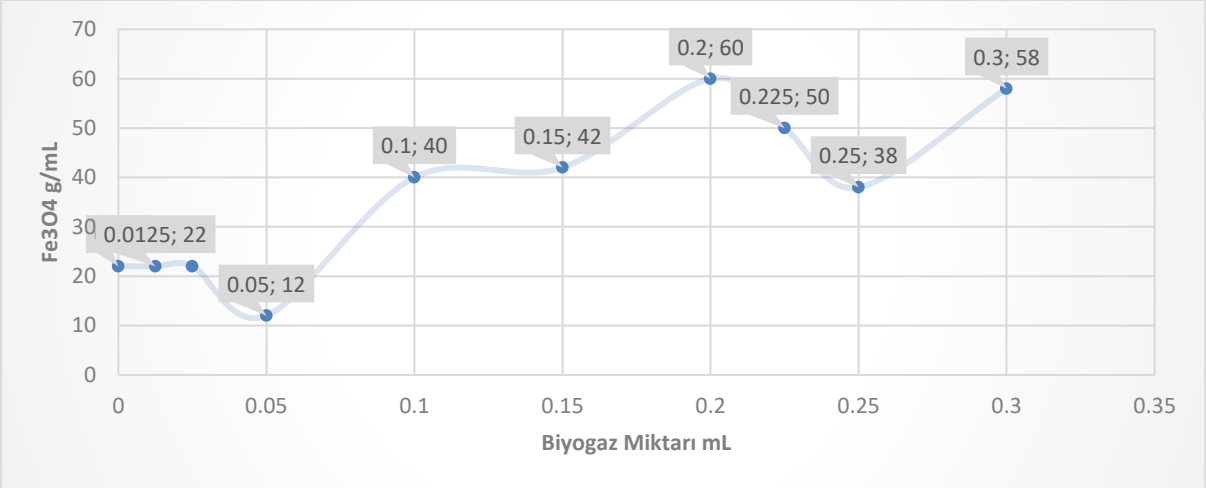
Tablo 1. Reaktör için kullanılan dozlar

Reaktör No	Eklenen Dışkı Miktarı	Eklenen Su Miktarı	Fe_3O_4 Konsantrasyonu g/L
Kontrol	80 g.	50 mL	0
2	80 g.	50 mL	0,0125
3	80 g.	50 mL	0,025
4	80 g.	50 mL	0,05
5	80 g.	50 mL	0,10
6	80 g.	50 mL	0,15
7	80 g.	50 mL	0,20
8	80 g.	50 mL	0,225
9	80 g.	50 mL	0,25
10	80 g.	50 mL	0,30

BULGULAR ve TARTIŞMA

27 gün sonunda reaktörler açılmış ve pisette toplanan hava şırıngaya gönderilerek hacim ölçümü gerçekleştirilmiştir. Kontrol reaktörü dahil 2. ve 3. Reaktörlerde çıkan gaz miktarının aynı olduğu (22 mL) tespit edilmiştir. 4 nolu reaktörde oluşan gaz miktarının en düşük (12 mL) 8 ve 10 nolu reaktörlerde oluşan gaz miktarının en yüksek (sırasıyla 60 mL, 58 mL) olduğu görülmüştür. Tek tekrarlı 10 reaktörden elde edilen veriler Grafik 2. de verilmiştir.

Grafik 2. Fe_3O_4konsantrasyonu / Biyogaz değişimi



Bu çalışma ülkemizin sahip olduğu biyokütleyi etkin ve verimli bir biçimde kullanılma yöntemi olarak değerlendirilmesi noktasında önemlidir. Kaldı ki Suanon ve diğerleri(2016), biyogaz üretim verimini arttırmak için 15 ◦C –40 ◦C arasında en iyi çoğalma yeteneğine sahip anaerobik çürütme işlemlerinde (37 ± 1 ◦C) iki ayrı demir nanopartikülü sıfır değerlikli demir (nZVI) ve manyetit (Fe_3O_4) kullanmışlardır. Sonuçta uygun şekilde demir nanopartikülleri kullanıldığında sadece biyogaz verimi artmayıp anaerobik çürütme işlem sırasında metallerin mobilizasyonunu da düzenleyip kontrol ettiği ve konu ile ilgili daha çok araştırmaya ihtiyaç duyulduğunu bildirmişler, Demir ve Ateş (2021) de yaptıkları çalışmada atık su arıtımı ve diğer alanlarda dahil olmak üzere çeşitli uygulamalarda manyetik demir oksidin kullanımına son zamanlarda daha fazla ilgi duyulduğu ve demir oksitin anaerobik çürütücüde biyogaz ve metan üretimini olumlu etkilediği sonucuna varmışlardır.

SONUÇ

Gerçekleştirilen bu araştırma sonucunda, Fe_3O_4 nanopartiküllerinin konsantrasyonu artması ile biyogaz artışı görülmüş ve Fe_3O_4 nanopartikülleri kullanılmayan kontrol düzeneğindeki biyogaz hacmi Fe_3O_4 nanopartikülleri kullanılan reaktörlere göre düşük kalmıştır. Manyetik demir oksit kullanımının biyogaz ve metan üretimine olumlu katkı yaptığı değerlendirilmiştir.

TEŞEKKÜR

Öğrencisi olduğum ve çalışmalarımı destekleyen Kdz. Ereğli Şahinde Hayrettin Yavuz Bilim ve Sanat Merkezi'ne teşekkür ederim.

Abstract

Fabulous handling and permanent accumulation of microplastics (MPs) in the ecosystems attitude a global threat to environmental and human health. The existing information of biotechnological, bioremediation and enzyme-mediated biodegradation approaches highlights the bacterial culture's potential regarding MPs elimination even though the most primary and secondary MPs are very slowly degraded like polypropylene (PP) MPs in general. Bacterial biodegradation of PP MPs is influenced by both the characteristics of the polymer, including chemical and physical properties, and environmental factors, such as light, heat, humidity, and the presence of chemicals. Considering the high molecular weight of MPs as a critical factor impeding their biodegradation, the physicochemical pre-treatments including chemical oxidizing agents, thermo-oxidation, ultraviolet irradiation (UV) and ultrasound (US) could also facilitate the biodegradation of long-chain MPs. The present study aimed to investigate the effect of *Bacillus cereus* (BC) isolates on the biodegradation of the PP MPs processing with UV and US pretreatment. Biodegradation studies were carried out for shake flask experiment were carried out by three approaches following UV, US, and UV+US pretreatment comparing the control group confirmed through weight loss of the PP MPs. The degradation of the PP MPs was observed in BC, BC+UV, BC+US in single approach, while in combined approach BC+UV+US recorded the highest degradation in the PP MPs. The growth of new functional groups is confirming the biofilm formation in the surface area of the PP MPs by isolates and proving their efficiency in degrade the microplastics. Further the collected weight loss data of the PP MPs were proceeded with first-order kinetic model for calculation of utilization constant rate (K) incorporated to the half-life ($T_{1/2}$) enhanced by US, UV and US+UV pretreatments. The FTIR Spectroscopy analyses were carried in the of PP MPs in the range of 700 to 4000 cm^{-1} frequency at the beginning and end of the experiment. In BC+UV+US treated PP MPs, sharp peak referring alcohol compounds from O–H stretching groups were identified in the wavelengths of 3600 cm^{-1} with a greater number of carbonyl, phenol, and hydroxyl groups which is increasing hydrophilicity of BC isolates and could enhance the degradation of plastics and reducing cytotoxicity. The highest growth was observed in growth profile of BC isolates in UV+US pretreated PP MPs.

Keywords: biodegradation, polypropylene, microplastics, ultrasound (US), ultraviolet radiation (UV), *Bacillus cereus*, growth kinetics, cytotoxicity

INTRODUCTION

Fabulous usage and continuous accumulation of microplastics (MPs) in the ecosystems attitude a global threat to environmental and human health. The existing information of biotechnological, biodegradation and enzyme-mediated biodegradation approaches highlights the bacterial culture's potential regarding MPs elimination. Bacterial biodegradation of MPs is influenced by both the characteristics of the polymer, including chemical and physical properties, and environmental factors, such as light, heat, humidity, and the presence of chemicals (Lawson Miri et al., 2022). The degradation of MPs must be cost-effective and resulting zero-waste to protect the ecosystem, and the present findings of MPs biodegradation studies might be the approach to degrade the MPs and cover the MPs pollution in aquatic environment (Zurier and Goddard 2021).

Plastics consumption is increasing in the many areas such as daily routines, human health applications and aesthetics. The foremost plastic particles in the form of MPs discharged into the environment are made up of polyethylene (PE), polypropylene (PP), polyvinylchloride (PVC), polystyrene (PS) and polyethylene terephthalate (PET) (Rana et al., 2022). MPs are impending pollutants of developing fretfulness because of their extensive amounts in all environmental ecosystems following atmospheric, terrestrial, and aquatic. They are described as plastic particles with a particle size of 1 μm–5 mm and are accessible in different primary and secondary types, sizes, shapes, and polymer compositions (Shabbir et al. 2020). It is stated that there are two main sources of MPs as primary and secondary MPs. The plastics produced by numerous narrow maintenance goods and aimed to be small are identified as primary MPs such as microbeads and

fiber pieces stemming from in-used clothing or splashing the textiles directly discharged into the ecosystem while secondary MPs are created from the breakup or withstanding of bigger plastics particles in the nature. There is no trustworthy quantitative data on the contribution of MPs from altered sources (Lawson Miri et al., 2022). At large, most artificial polymers like PE, PP, and PS are very deliberately degraded (Zhang et al. 2021), and the boosted alarm of MPs pollution in the atmospheric, terrestrial, and aquatic environment has outstretched the tendency to use the bioplastics such as polyhydroxybutyrate (PHB), polybutylene succinate (PBS), polyglycolide and polylactic acid (PLA). Consequently, these bioplastics could act as an alternative to reduce MPs pollution, but there are still limited data for the assessment of bio-based MPs requiring extensive investigation and a profounder understanding of their interaction with the nearby ecosystem (Lambert and Wagner 2017). MPs are supposed harmful to environment and humans due to their persistence and bioaccumulation properties because they contain other toxic substances like pigments, plasticizers, flame retardants during manufacturing or gathered pathogens, polycyclic aromatic hydrocarbons, and metals during their transports through the environment in addition to their toxic micro-size effects (Sun et al. 2022).

Once MPs are released or formed in the environment, they will endure withstanding, fate and transportation processes combining biological and physiochemical mechanisms, finally MPs transport from surface waters to sediments. Wastewater treatment plants (WWTPs) are the foremost paths for the extent of secondary MPs into the terrestrial, and aquatic environment when the treated water effluent is discharged into the surface waters and the sewage sludge applied to soils as fertilizer, correspondingly. To this point, water treatment methods involving absorption, adsorption, filtration, and chemical treatments are primarily used in addition to current methods for disposing of MPs (Sun et al. 2022). Bioremediation of MPs have been recently elicited to challenge the MPs pollution as an alternative method to minimize the presence of MPs in the environment. To address complex issues regarding the bioremediation of MP pollution (Hossain et al. 2022). It is obviously stated that the multi-disciplinary research strategies are necessary to assess, screen and characterization of efficient microorganisms such as bacteria and fungi using advanced assessment tool, and assessment of MPs toxicity.

Bioremediation is encouraging approach to prevent MPs pollution, and the degradation of polymer and MPs, including chemical, physical, and biological processes in the environment. The bacterial biodegradation of MPs includes following steps: i) initial degradation of polymers in lower size particles from large polymeric structures, ii) degradation of polymers to their oligomer, dimer and monomers and, iii) mineralization of MPs by bacterial biomass (Blair Espinoza, 2019).The MPs breakdown to carbon dioxide (complete mineralization) by several enzymes, and the transformation of produced intermediates to use as a source of energy and biomass production finally. However, the degradation of MPs generally occurs because of the frag mentation of plastic and the alteration of its chemical and physical properties, resulting in a molecular weight reduction of plastic material (Paço et al. 2017). Several types of mechanisms are available such as chemical (chemical hydrolysis and oxidation), physical (freeze-thawing, heating, and high pressure), photo-oxidation, and thermal. biodegradation of plastic involves the action of microbial (bacterial or fungus) enzymes for the scissoring of bioplastics into easily metabolizable dimers, oligomers, and monomers such as lipase hydroxylase, depolymerase and protease (Haider et al., 2019). In general, degradation can occur naturally by any means mentioned above. Once the product has been disintegrated, microorganisms feed on those products as a key carbon source for their growth and reproduction (Auta et al. 2018). Considering the high molecular weight of MPs as a critical factor impeding their biodegradation, the physicochemical pre-treatments including chemical oxidizing agents, thermo-oxidation, ultraviolet irradiation (UV) and ultrasound (US) could also facilitate the biodegradation of long-chain MPs (Chen et al. 2020). MPs are considered an emerging contaminant, as the MPs data from soil and water is lacking, limiting the understanding of their impact on the environment. Due to the shortage of quantitative data on micro- plastics, it is challenging to depict its ecotoxicological risks on the surrounding environment.

The present study provides the biodegradation recent the effect of Bacillus cereus (BC) isolates on the PP MPs processing with UV and US pretreatment. The results summarize the biodegradation of synthetic PP MPs with different pretreatment approaches following UV, US, and UV+US confirming the biofilm formation in the surface area of the PP MPs and enhancing the degradation of polymer and reducing cytotoxicity.

MATERIALS AND METHODS

Polypropylene (PP) were acquired from Sigma-Aldrich (USA), and supplied as spheroid pellets, 1–2.4 mm in diameter. PP pellets were mechanically cut, and the resulting fragments sieved to obtain microplastics particles (MPs) with a size range 250 μm < PP MPs < 1000 μm. These materials were treated using single ultraviolet radiation (UV, 254 nm UV-C 8 W), single ultrasound (US, 45 kHz, 100 W) treated) and their hybrid application, (UV+US) for 1 hour before the biodegradation studies.

In the biodegradation studies, marine originated *Bacillus cereus* bacteria strain was used to degrade PP at 35°C and pH of 7.5 for following scenarios: i) control studies illustrating only bacterial degradation (BC), ii) US-treated PP MPs bacterial degradation (BC+US), iii) UV-treated PP MPs bacterial degradation (BC+UV), and iv) US and UV treated PP MPs bacterial degradation (BC+US+UV) in order to show pretreatment effect on the bacterial degradation of PP MPs. In the microbial inoculum preparation and assay for PP microplastic biodegradation, Bacillus *cereus* bacteria as microplastic degraders were regrown as pure cultures on freshly prepared nutrient broth (NB) and were allowed to grow in a rotating shaker at 29 °C until cultures attained log for 18 hours. The cell densities of the inoculum were adjusted to 6.0×10^8 CFU/ml (implying the concentration of bacterial cells at the beginning of the experimental set-up). Ten percent of the log phase cultures (including 6.0×10^7 CFU/ml bacterial cell densities) were inoculated into centrifuge tube containing 50 ml of NB medium and 0.5 g of sterilized PP microplastics (250 μm < PP MPs < 1000 μm in diameter) for the biodegradation assay. For the control, un-inoculated BH broth supplemented with PP microplastics was maintained under similar conditions. The bacterial cell densities (CFU/ml), pH and weight of PPMPs were monitored every day for a period of 21 days. All experiments were performed in triplicates (Nanthini et al. 2021).

The PP MPs were recovered from the NB through filtration and sieving. The bacterial films colonizing the plastic particles were removed by washing (two-step washing, with 5 min at 5000 rpm by centrifugation for each step with 70% ethanol), and then dried in a hot-air oven at 50 °C overnight (Auta et al. 2018). The residual PP MPS weight was determined to measure the extent of degradation by using the analytical balance with a readability of 0.0001 g. The initial weights of the pre-incubated PP microplastic particles were also measured. The weight loss of the PP microplastics in percentage was determined using Eq. 1:

$$\% \text{ Weight loss } \frac{W_0 - W}{W_0} \times 100 \quad (1)$$

Where

W_0: the initial weight of the polymer (g) and

W: the residual weight of the polymer (g).

The data were further processed to determine the rate constant of PP MPs reduction by using the first-order kinetic model based on the initial and final weights along specific intervals using Eq. 2 (Alaribe and Agamuthu, 2015). is as follows:

$$K = -\frac{1}{t}\left(In\frac{W}{W_0}\right) \quad (2)$$

Where

K: the first-order rate constant for PP MPs uptake per day,

T: time in days,

W: the weight of residual PP microplastics (g) and

W_0: the initial weight of PP microplastics (g).

Then the generated first-order rate constant data (K) were incorporated to the calculation of the half-life ($T_{1/2}$) as per the Alaribe and Agamuthu (2015).

$$T_{1/2} = \frac{In(2)}{K} \quad (3)$$

The changes in the structure of the microplastic polymers with subsequent bacterial incubation were carried out by Fourier transform infrared spectrophotometer (FTIR- Shimadzu IRTracer-100) and attenuated total reflectance (ATR-Pike Tech). FTIR-ATR spectroscopy allowed to analyze solid or liquid samples to be

measured with minimum volume or weight without making KBr disk requirement easily and fast. The PP MPs samples were dried at 60 °C for 1 h to remove water moisture before the FTIR-ATR analyses. The prepared PP MPs samples were analyzed with FTIR-ATR with 4 cm^{-1} resolution between 4000 and 700 cm^{-1} wavelengths (Gedik et al. 2021).

The morphology of the degraded PP MPs was viewed after the experimental time. The morphological analysis of the resultant PP MPs samples that was carried out by SEM (SEM, Hitachi TM3030Plus Benchtop) and the chemical composition was determined by energy dispersive spectrum (EDS, Oxford Instruments Swift ED3000) using 20 kVA target voltage, 8.8 mm working distance and 500× magnification with Au coating (Demirel et al. 2022).

The cytotoxicity tests of the degraded PP MPs samples were analyzed with Microtox Model 500 (Azur Environmental Carlsbad, USA). The lyophilized *Vibrio fischeri* bacteria (NRRL number B-11177, Microtox Acute reagent, Modern Water, USA) with luminescence characteristics were used as test microorganism. The *Vibrio fischeri* bacteria were incubated with reconstitution solution (nontoxic ultra-pure water, Modern Water, USA) and osmatic adjuster solution (22% sodium chloride, Modern Water, USA) at 15 °C during 15 min in glass cells. Four serial dilutions of the sample were prepared with dilution solution (2% sodium chloride, Modern Water, USA), and the samples were tested with the bacteria to obtain lethal concentration required for 50% death of bacteria (LC_{50}) (Özmen et al. 2021).

RESULTS and DISCUSSION

The present study aimed to investigate the effect of *Bacillus cereus* (BC) isolates on the biodegradation of the PP MPs processing with UV and US pretreatment. The effect of pretreatment methods on PP MPs biodegradation was illustrated in the Figure 1 and the weight loss, the rate constant, and the half-life of PP MPs was summarized in the Table 1.

Biodegradation studies were carried out for shake flask experiment were carried out by three approaches following UV, US, and UV+US pretreatment comparing the control group confirmed through weight loss of the PP MPs. The highest degradation of PP MPs was observed in BC (5.41± 0.025%) in single approach, BC+US (4.01 ± 0.025%), and BC+UV (9.60 ± 0.025%) in dual approach, while in combined approach BC+US+UV recorded the highest degradation in both PP MPs (10.86 ± 0.025%) to further biodegradation experiment for 21 days. Likewise, BC+US+UV resulted highest daily reduction rate as 0.00590 day^{-1} to reduce weight of PP MPs while the rate constant was observed as 0.00490 day^{-1}, 0.00280 day^{-1}, and 0.00210 day^{-1} for BC+UV, BC+US, and BC, respectively. The half-life by four scenarios to reduce the PP MPs were 330.1(BC), 247.6 (BC+US), 141.5 (BC+UV) and 117.5 (BC+UV+US) days.

The results of biodegradation studies were expressed as average of three independent experiments with error bar using standard deviation (SD). Each experiment was performed with three parallels. Statistical significance of the difference of the weight loss of the PP microplastics among each trial was determined by analysis of variance (ANOVA) using two-way post hoc statistical test. To show reliability of measurement, p value obtained from two-way ANOVA test was given for each disinfection study. The results obtained from the study are given in Figure 1 and post hoc statistic test results of biodegradation study was summarized in Table 2.

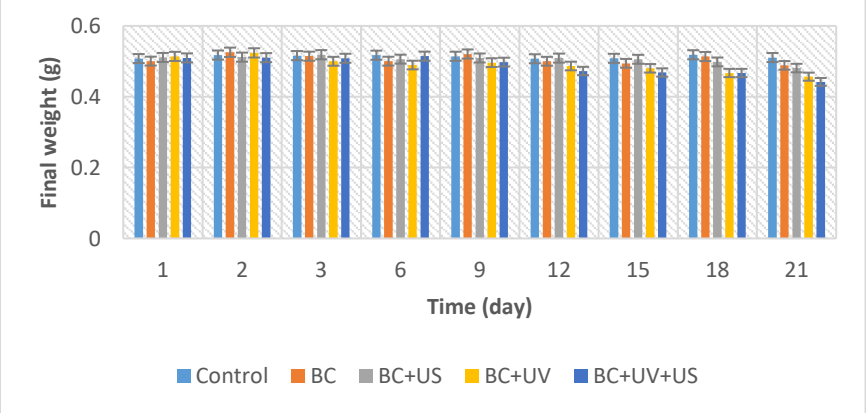

Figure 1. Weight loss of microbially treated PP MPs after incubation for 21days illustrating the effect of pretreatment methods on PP MPs biodegradation

Table 1. The results of biodegradation studies

Scenarios	Initial weight (g)	Final weight (g)	Weight loss (%)	Removal constant (K) day^{-1}	Half-life (days)
Control	0.50000	0.50000	-	-	∞
BC	0.50000	0.46891	5.41	0.00210	330.1
BC+US	0.50000	0.47585	4.01	0.00280	247.6
BC+UV	0.50000	0.44813	9.60	0.00490	141.5
BC+UV+US	0.50000	0.44187	10.86	0.00590	117.5

Auta et al. (2018) evaluated the growth response and mechanism of PP MPs degradation by *Bacillus sp. strain 27* and *Rhodococcus sp. strain 36* isolated from mangrove sediments upon exposure to PP MPs. They stated that both bacteria strains were able to utilise PP MPs for growth as confirmed by the reduction of the polymer mass reducing 6.4% by *Rhodococcus sp. strain 36* and 4.0% by *Bacillus sp. strain 27* after 40 days of incubation. PP biodegradation was further confirmed using Fourier-transform infrared spectroscopy and scanning electron microscopy analyses, which revealed structural and morphological changes in the PP microplastics with microbial treatment. These analyses showed that the isolates can colonise, modify and utilise PP microplastics as carbon source. In other study, Nanthini et al. (2021) investigated the microplastic degradation efficiency of bacterial isolates collected from Vaigai River, Madurai, India. The isolates were processed with proper methods and incorporated into the UV-treated polyethylene (PE) and polypropylene (PP) degradation. Based on preliminary screening, four bacterial isolates such as *Bacillus sp. (BS-1), Bacillus cereus (BC), Bacillus sp. (BS-2),* and *Bacillus paramycoides (BP)* were proceed to further degradation experiment for 21 days. The highest degradation of PP and PE were observed in BP ($78.99 \pm 0.005\%$), and BC ($63.08 \pm 0.009\%$) in single approach, while in combined approach BC and BP recorded the highest degradation in both PP ($78.62 \pm 2.16\%$), and PE ($72.50 \pm 20.53\%$). This result indicated that PP MPs biodegradation can be enhanced with further bacterial strains and mix culture studies in addition to UV and US pretreatments.

Table 2. ANOVA table and descriptive statistical values of the biodegradation studies

Anova: Two-Factor				
Summary	***Trial***	***Sum***	***Average***	***Variance***
Control	3	1.4871875	0.49572917	5.0814E-05
BC	3	1.40673066	0.46891022	4.5464E-05
BC+US	3	1.42755128	0.47585043	4.682E-05
BC+UV	3	1.34438776	0.44812925	4.1524E-05
BC+UV+US	3	1.32561945	0.44187315	4.0373E-05
Source of Variation	*SS*	*F*	*P-value**	*F crit*
Rows	0.00044921	2298.01382	9.1161E-12	4.45897011
Columns	0.00567223	14508.7002	1.8042E-15	3.83785335
Error	7.8191E-07	8	9.7738E-08	
Total	0.00612222	14		

*P value was calculated as 9.1161E-12 and 1.8042E-15 using two-way ANOVA test. This value showed that there is no significant difference of each measurement among each three independent biodegradation experiment of three treatment conditions because $p < 0.01$)

The FTIR spectra of the PP MPs, US-treated, UV-treated, and US+UV-treated PP MPs, with BC strain for a period of 6 days in aqueous media are shown in Figure 3 (a), (b), (c) and (d), respectively. The FTIR Spectroscopy analyses were carried in the of PP MPs in the range of 700 to 4000 cm^{-1} frequency at the beginning and end of the experiment. In BC+UV+US treated PP MPs, sharp peak referring alcohol compounds from O–H stretching groups were identified in the wavelengths of 3600 cm^{-1} with a greater number of carbonyl, phenol, and hydroxyl groups which is increasing hydrophilicity of BC isolates and could enhance the degradation of plastics and reducing cytotoxicity shown as Figure 2. The highest growth was observed in growth profile of BC isolates in UV+US pretreated PP MPs indicating in the Figure 4. Similarly, Auta et al. (2018) evaluated the PP MPs biodegradation using Fourier-transform infrared spectroscopy and scanning electron microscopy analyses, which revealed structural and morphological

changes in the PP MPs with microbial treatment. These analyses showed that the isolates can colonize, modify, and utilize PP MPs as carbon source.

Özet

İnsan vücudunun yakıt için oksijeni yakması iyi bir şey olsa da bu sürecin sonunda serbest radikallerle birlikte zararlı birleşikler de üretilir. Oksijen mitokondride yakılarak ATP üretilir. Çok fazla zararlı bileşik üretilirse mitokondri, daha fazla ATP üretmek için glutatyona ihtiyac duyar. Bu nedenle glutatyon vücut için çok önemli fonksiyona sahip birincil antioksidandır. Glutatyon peroksidaz (GPx), glutatyonun H_2O_2'e bağlanmasına, indirgeyerek suya dönüşmesine ve idrarla dışarı atılmasını sağlayan enzimdir. GPx, kararlı durum seviyesini sıkı bir şekilde düzenleyerek biyomolekülleri oksidatif hasardan korur. Bu sebeple çalışmada, antioksidan enzimin aktivitesini taklit edebilen, selenosistein ve glutatyon tabanlı monomer kullanarak polietilen glikol diakrilat (PEG-DA) eşliğinde GPx mimik selenoenzim tasarlanmıştır. GPx mimiğin NO substratlarından (minoksidil, dinitroarginin ve trinitrotoluen) nitrik oksit (NO) salınımı NOS-kit kullanarak ölçülmüştür. NO aktivitesi sırasıyla 0,0034 mU/mg, 0,0167 mU/mg, 0,0050 mU/mg, 0,0052mU/mg olarak bulunmuştur. Aynı zamanda mimik GPx ın antioksidan aktivitesi için Paglia ve Valentine tarafından sunulan spektrofotometri yöntemi uygulanmıştır (Sedaghatfard vd., t.y.). Yöntemin temeli, 340 nm'de NADPH absorpsiyonundaki azalmanın glutatyon peroksidaz aktivitesi ile orantılı olmasıdır. Çalışmanın sonuçları, minoksidil, dinitroarginin ve trinitrotoluenden NO salınımını ve ayrıca H_2O_2'nin indirgenmesini katalize eden bir mimik enzim olduğunu ve bu yönde yapılacak çalışmalarda kullanılabileceğini ortaya koymuştur.

Anahtar Kelimeler: mimik GPx, antioksidan, NOS kit, NO

Development and effectiveness of mimic GPx as an antioxidant enzyme

Abstract

While it's good that the human body burns oxygen for fuel, this process produces harmful compounds along with free radicals at the end of the process. Oxygen is burned in the mitochondria to produce ATP. When too many harmful compounds are produced, the mitochondria need glutathione to produce more ATP. Therefore, glutathione is the primary antioxidant with very important functions for the body. Glutathione peroxidase (GPx) is the enzyme that binds glutathione to H2O2, converts it to water by reducing it and is excreted in the urine. GPx tightly regulates the steady-state level, protecting biomolecules from oxidative damage. For this reason, in this study, GPx mimic selenoenzyme was designed in the presence of polyethylene glycol diacrylate (PEG-DA), using selenocysteine and glutathione-based monomer, which can mimic the activity of the antioxidant enzyme. Nitric oxide release from NO substrates (minoxidil, dinitroarginine, and trinitrotoluene) of the GPx mimic was measured using the NOS-kit. NO activity was found as 0.0034 mU/mg, 0.0167 mU/mg, 0.0050 mU/mg, and 0.0052mU/mg, respectively. At the same time, the spectrophotometry method presented by Paglia and Valentine was applied for the antioxidant activity of mimic GPx (Sedaghatfard et al., n.y.). The basis of the method is that the decrease in NADPH absorption at 340 nm is proportional to glutathione peroxidase activity. The results of the study revealed that it is a mimic enzyme that catalyzes the release of NO from minoxidil, dinitroarginine and trinitrotoluene, as well as the reduction of H_2O_2, and can be used in studies in this direction.

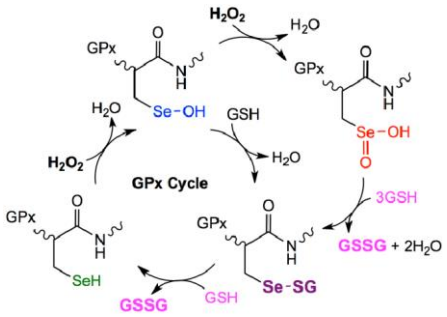
Keywords: mimic GPx, antioxidant, NOS kit, NO

Giriş

Tiyol kofaktörleri ile hidroperoksitlerin indirgenmesini katalize ederek hücrenin membran bütünlüğünü sağlayan ve biyomoleküllerde oksidatif hasarı önleyerek antioksidan aktivite sergileyen glutatyon peroksidaz (GPx), iyodotironin deiyodinaz ve tioredoksin redüktaz gibi üç ana memeli selenoenzimden biridir. Bu selenoproteinlerin her üçü de redoks aktif selenyum parçası içermektedir. Proteinlerde bu parça 21. amino asit olan selenosisteindir (Sec). Aktif bölgede Sec kalıntısının varlığı katalitik avantaj sağlamaktadır. Yapılarında bu kadar benzerlik olsa da, substrat özgüllüğü, katalitik mekanizmaları ve kofaktör sistemleri farklılık göstermektedir (Bhabak & Mugesh, 2010). Tripeptit glutatyon (GSH), peroksidazda monotiyol kofaktör olarak, aynı zamanda aktif bölgedeki selenolü reaktif oksijen türleri tarafından gerçekleştirilen inaktivasyondan korumaktadır (Sarma & Mugesh, 2008).

GSH'nin varlığında, GPx'deki Sec parçası, genellikle selenol halinde bulunmaktadır. Hem glutatyondaki tiyol grubu hem de glutatyon peroksitdeki selenol grubu hidroperoksitlerle reaksiyona girebilmesine rağmen, peroksit substratları ile enzimde bulunan selenol kısmı reaksiyona girmektedir. Çünkü Sec kalıntısı triptofan (Trp) ve glutamin (Gln) ile birlikte üçlü halde yer almaktadır. Sec, Trp ve Gln kalıntıları selenyumlu GPx'lerde birlikte bulunmaktadırlar. Sec'in Trp kısmının indol halkası ve Gln kısmının amido grubu ile hidrojen bağı hem selenol grubunu stabilize etmekte hem de Sec'in hidroperoksitlere karşı reaktivitesini de arttırmaktadır. Bu nedenle; peroksidazlardaki hemede bulunan demirin ana işlevi, antioksidan aktivitesi ile ilişkili olmasa da GPx'deki selenyumun reaktivitesi ile karşılaştırılabilinmektedir.

GPx'in katalitik döngüsünü ele alırsak, selenolün (E-SeH) oksidasyonu ile selenenik asit (E-SeOH) üretilmektedir. Yeni E-SeOH elektrofiliktir, dolayısıyla GSH ile reaksiyona kolay bir şekilde girerek selenenil sülfiti (E-SeSG) üretmektedir. Son çalışmalar, selenenil sülfitlerin selenollere indirgenmesinin büyük enerji bariyerlerini aşması gerektiğinden, (E-SeH) formunu yeniden oluşturmak için -Se-S- bağına ikinci bir GSH saldırısının olduğunu göstermektedir. GSH, karşılık gelen disülfide (GSSG) oksitlenirken, hidrojen peroksit suya indirgenmektedir. Ortamda bulunan peroksit derişimi GSH den fazla olduğunda, selenik asitteki selenyum merkezi (E-SeOH), seleninik asit (E-SeO_2H) üretmek için daha fazla oksidasyona uğramaktadır (**Şekil 1**) (Bhabak & Mugesh, 2010).

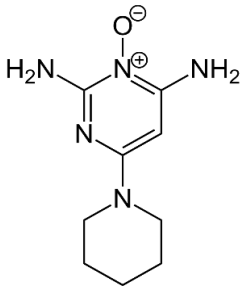


Şekil 1. GPx katalitik aktivitesi (Bhabak & Mugesh, 2010)

Literatür araştırmalarında, GPx benzeri aktivitesi bulunan selenyum bileşiklerinin, tiyoller ve peroksitlerle reaksiyon tepkimeleri iki kategoriye ayrılmaktadır. İlk kategoride, bileşikler fazla miktarda tiyol ile reaktif selenol üretmekteler. Bu reaksiyonlar bir veya iki aşamalı şekilde gözlemlenmektedir. Daha sonra peroksitlerle reaksiyona girerek gelen selenenik asitler üretilmektedir. Üretilen selenenik asitler, tiyollerle daha fazla reaksiyona girerek selenolleri yeniden oluşturmakta olup ikinci sınıf bileşikler diğerinin aksine herhangi bir selenol üretmemektedirler. Selenyum bileşikleri sadece tiyollerin varlığında SeII–SeIV redoks döngüleri yoluyla peroksitleri indirgemektedir (Bhabak & Mugesh, 2008).

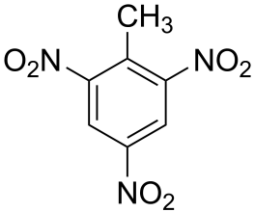
Bu çalışmada; substrat olarak kullanılan Minoksidil (2,6-diamino-4-[l-piperidinil] pirimidin-1-Noksit) (Şekil 2), hem sistemik olarak uygulandığında genel hipertrikozu, hem de topikal olarak uygulandığında lokalize saçın yeniden büyümesini indükleme kabiliyetine sahip bir anti-hipertansif ajan olarak iyi bilinmektedir (Harding vd., 1992). Minoksidilin nasıl saç büyüttüğünün mekanizmaları kesin olarak ortaya konamamıştır. Minoksidil bir potasyum kanal agonistidir. Aynı zamanda yapısına bakılarak bilindik vazodilatör otakoid olan NO agonisti olduğu da düşünülmektedir. Bu, minoksidilin vazodilatör etkisini

açıklar, saç büyümesi damarların genişlemesine bağlı olabilir. 10-1000 pM arasında değişen derişimlerde minoksidilin, DNA sentezinin inhibisyonuna neden olduğu bulunmuştur (Aldhalimi vd., 2014). Literatür araştırmalarında Minoksidil'in NOS aktivitesi ile ilgili çalışmalar bulunmamaktadır.



Şekil 2. Minoksidil

2,4,6-Trinitrotoluen (TNT) (Şekil 3), 20. yüzyılın başından beri askeri patlayıcı olarak kullanılmaktadır. İşçilerin TNT'yi solunumu sonrası karaciğer, hematopoietik sistem, göz ve kardiyovasküler sistemde toksisiteye neden olduğu gösterilmektedir (Sun vd., 2005). Ayrıca; TNT'nin, süperoksit (O_2S) ve hidrojen peroksit (H_2O_2) gibi reaktif oksijen türleri (ROS) üreten bir redoks indirgemesinden geçtiği bildirilmektedir. Son çalışmalar, normal katalitik yoldan elektronları uzaklaştırarak eNOS ve nNOS'un enzim aktivitesi üzerinde güçlü bir inhibitör etkiye sahip olduğunu ve dolayısıyla kan basıncını yükselttiğini ve bunun da NO üretiminde bir azalmaya neden olduğunu göstermektedir.

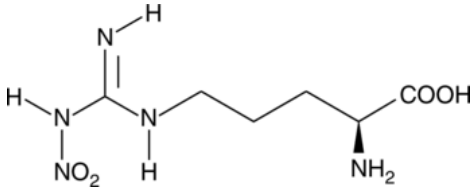


Şekil 3. 2,4,6-Trinitrotoluen

Kumagai ve arkadaşları çalışmalarında, TNT'nin NADPH'ye göre rekabetçi bir inhibitör ve L-arginine göre rekabetçi olmayan bir inhibitör olduğunu belirtmişlerdir. Aynı zamanda nNOS, mRNA seviyelerinde önemli bir artışla birlikte hücre içi bir H_2O_2 oluşumuna neden olmaktadır. TNT varlığında nNOS aktivitesi IC50 de ölçüm yapılarak 12.04 ppm bulmuşlardır (Kumagai vd., 2004).

Literatür araştırmalarında dinitroarjininle ilgili çalışma bulunmadığı için sunulan çalışmada alınan sonuçlar nitroarjininle ilgili değerlerle kıyaslanmıştır.

Serfőző ve arkadaşları çalışmalarında, 50 ppm'e kadar NG-nitro-L-argininin (L-NNA) **(Şekil 4)** NOS aktivitesini inhibe ettiğini ve inhibisyonun yaklaşık %15 aktivitede doygunluğa eriştiğini sunmuşlardır. 5-200 ppm derişim aralığında L-NNA uygulaması sırasında, NOx seviyelerindeki azalma yüzdesinin, NOS aktivitesi kadar olmadığı gözlenmiştir (Serfőző vd., 2012).



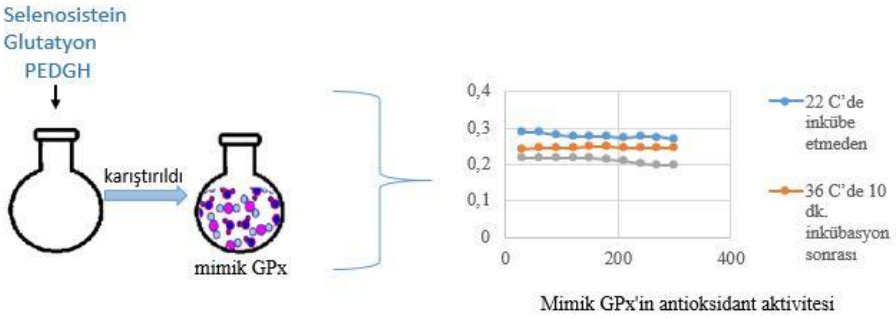
Şekil 4. NG-nitro-L-arginin (L-NNA)

NO, NO sentaz (NOS) tarafından sentezlenmektedir. Endotel hücrelerinde üretilen bu gaz, kan basıncının düzenlenmesinde, trombosit agregasyonunun inhibisyonunda, düz kas hareketinin inhibisyonunda rol oynar. NOS, L-argininin NO ve L-sitrüline oksidasyonunu katalize eden hemeproteinlerdir (Baldelli vd., 2019).

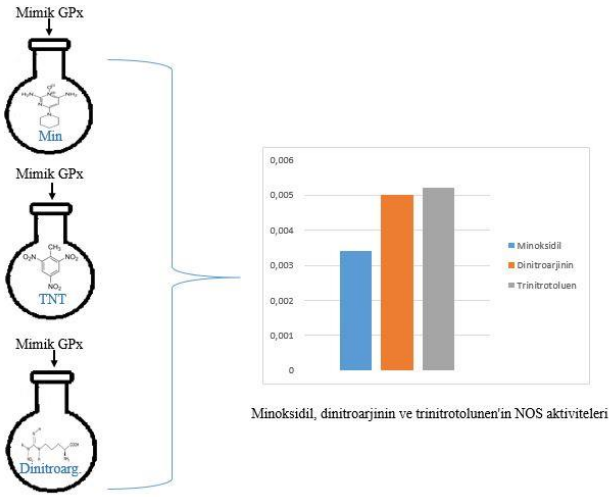
MATERYAL VE METOD

Mevcut çalışma boyunca glutatyon (yerel kaynaklardan), polietilen glikol diakrilat (PEG-DA) (yerel kaynaklardan), selenosistein (yerel kaynaklardan), minoksidil (yerel kaynaklardan), dinitroarjinin (yerel kaynaklardan), trinitrotoluen (yerel kaynaklardan), NO kolorimetrik test kiti (Biovision, NOS kit), dimetil sülfoksit (yerel kaynaklardan DMSO), nikotinamid adenin dinukleotid fosfat hidrat (NADPH, Sigma-Aldrich), hidrojen peroksid (yerel kaynaklardan) kullanılmıştır. Karakterizasyon ve deneysel işlemlerde, absorbans spektrumlar bir miroplaka okuyucu ile kaydedilmiştir.

Bu çalışmada; antioksidan enzimin aktivitesini taklit edebilen, selenosistein ve glutatyon tabanlı monomer kullanarak PEG-DA eşliğinde GPx mimik tasarlanmıştır **(Şekil 5).** NO aktivitesi, GPx katalitik etkisi ile minoxidil, dinitroarginin ve trinitrotoluenden parçalanıp NO salınım sonrası NOS-kiti ile absorbans grafiği çizilerek elde edilmiştir **(Şekil 6).**



Şekil 5. Mimik GPx'in antioksidant aktivitesi



Şekil 6. Minoksidil, dinitroarginin ve trinitrotolen'in NOS aktiviteleri

BULGULAR ve TARTIŞMA

Örnek hazırlığı

Selenosistein ve glutatyon tabanlı monomer kullanarak PEG-DA eşliğinde GPx mimik hazırlanmıştır. NO substratları olarak kullanılan minoksidil, dinitroarjinin (200 ppm, DMSO) ve trinitrotoluenin 400 µl'sine 100 µl mimik GPx ilave edilerek elde edilen karışım 12 saat boyunca 70°C'de karıştırılmıştır.

Nitrik Oksit Sentaz Aktivite kit hazırlığı

NO sentazlar (EC 1.14.13.39, NOS), L-argininden NO üretimini katalize eden bir enzim ailesidir. BioVision'ın NO sentaz Aktivite Test Kiti, çeşitli numunelerde NOS aktivitesini test etmek için doğru ve kullanışlı bir yöntem olarak karşımıza çıkmaktadır. Bu analizde, NOS tarafından üretilen NO bir dizi reaksiyona girmektedir. 540 nm'de güçlü bir absorbansa sahip renkli bir ürün oluşturmak için Griess Reaktif 1 ve 2 ile reaksiyona girmektedir. Bu yöntem ile basit, hassas ve yüksek verimli ve çok düşük NOS aktivitesi tayin edilebilinmektedir.

Reaksiyon Karışımı

Analiz sırasında, seyreltilmiş NOS kofaktör 1-10 µl, NOS kofaktör 2 -20 µl, NOS substratı-5 µl, nitrat redüktaz-5 µl olarak her kuyu için toplamda 40 µl olacak şekilde reaksiyon karışımı hazırlanmıştır. Kuyulardakı 40 µl reaksiyon karışımı üzerine 25 µl örnek ilave edilerek 1 saat 37°C'de inkübe edilmiştir. Daha sonra kuyulara 95 µl kitin içeriğinde bulunan tampon ile 5 µl hızlandırıcı ilave edilmiş ve 10 dk. oda sıcaklığında bekletilmiştir. Son olarak, 50 µl Griess reaktivi 1 ve Griess reaktivi 2 eklenerek oluşan karışımın santrifüj sonrası mikroplaka okuyucuda ΔA540 nm uygulanarak absorbans değeri alınmıştır.

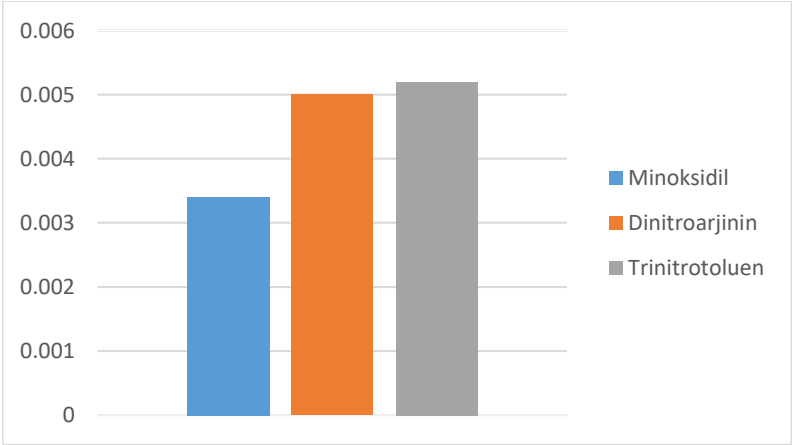
Numune NO Sentaz Spesifik Aktivitesi = **B/ T x C** = pmol/dak/µg = µU/µg = mU/mg

B, Standart Eğriden (pmol) numune kuyusundaki Nitrit miktarıdır. T, reaksiyon süresi (dk.), protein miktarıdır (µg). Bir birim NOS aktivitesi ise 37°C'de 1.0 µmol NO/dk elde etmek için gereken enzim miktarı olarak tanımlanmaktadır.

Literatür çalışmalarında, minoksidil, dinitroarjinin ve trinitrotoluen NOS inhibitörü olarak bilinmektedir. Bu çalışma sonucunda, NO sentazların mimik GPx varlığında her üç yapıdan nitro grubu ayırdığı ve bu nedenle NOS aktivite gösterdiği gözlenmiştir. NOS aktiviteleri, minoksidil 0,0034 mU/mg, dinitroarjinin 0,0050 mU/mg, trinitrotolun 0,0052mU/mg olarak bulunmuş (**Şekil 7)** ve yapısında bulunan nitro grupların sayısına uygun olarak aktivite değerlerinde yükselme tesbit edilmiştir (**Tablo 1**).

Tablo 1. NOS aktiviteleri

y=0,0234x	Abs.1	Abs.2	Abs.3	Ortalama	Derişim(x),ug/ml	NOS akt.mU/mg
Minoxidil	0,123	0,139	0,1	0,1207	5,16	0,0034
Dinitroarjinin	0,136	0,216	0,174	0,1753	7,49	0,0050
Trinitrotoluen	0,180	0,187	0,183	0,184	7,86	0,0052



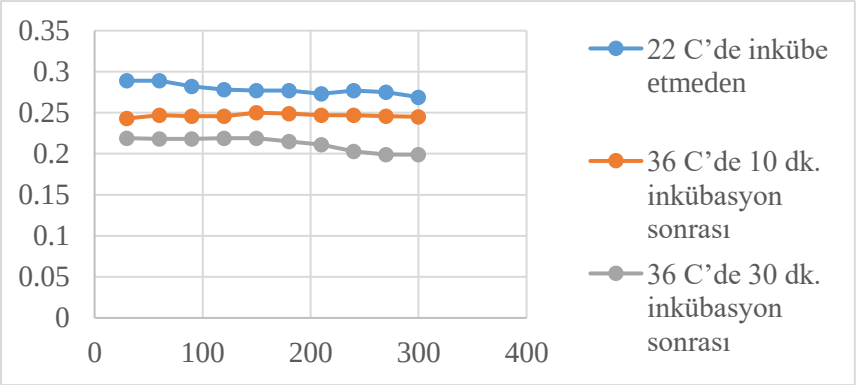
Şekil 7. Minoksidil, dinitroarjinin ve trinitrotolunen'in NOS aktiviteleri

GPx antioksidant aktivite tayini

Mimik GPx'ın antioksidan aktivite tayini için Paglia ve Valentine tarafından sunulan spektrofotometri yöntemi uygulanmıştır (Cichoski vd., 2012). Mimik GPx, NADPH ve H_2O_2 reaksiyon karışımının önce 22 C'de inkübe edilmeden, 36 C'de 10 dk. inkübasyon sonrası ve 36 C'de 30 dk. inkübasyon sonrası 340 nm'de ölçümü yapılmıştır (**Şekil 8).** Sonuç olarak; sırasıyla bu ölçümler 0,166 abs/dk, 0,144 abs/dk, 0,127 abs/dk olarak gözlemlenerek NADPH'nın neredeyse tamamının oksitlendiği, reaksiyon hızlarının sıfıra yaklaştığı ve bu şekilde antioksidant aktivite sergilediği tespit edilmiştir (**Tablo 2)** (Sedaghatfard vd., t.y.).

Tablo 2. Mimik GPx'in antioksidant aktivitesi

Ölçüm aralığı (san)	22 C'de inkübe etmeden	36 C'de 10 dk. inkübasyon sonrası	36 C'de 30 dk. inkübasyon sonrası
30	0,289	1,243	0,219
60	0,289	1,247	0,218
90	0,282	1,246	0,218
120	0,278	1,246	0,219
150	0,277	1,250	0,219
180	0,277	1,249	0,215
210	0,273	1,247	0,211
240	0,277	1,247	0,203
270	0,275	1,246	0,199
300	0,269	1,245	0,199



Şekil 8. Mimik GPx'in antioksidant aktivitesi

SONUÇ

Çalışmanın sonuçları, tasarlanmış olan mimik GPx'in, minoksidil, dinitroarginin ve trinitrotoluen ile NO salınımını ve ayrıca H_2O_2'nin indirgenmesini katalize eden antioksidant mimik enzim olduğunu göstermiştir.

Özet

Bu çalışmada L tipi yanaşma yapısının deprem etkisi altındaki tasarımı Kıyı ve Liman Yapıları, Demiryolları, Hava Meydanları İnşaatlarına İlişkin Deprem Teknik Yönetmeliği (TKLYDY) (2008) ve Türkiye Kıyı ve Liman Yapıları Deprem Yönetmeliği (TKLYDY) (2020)'ne göre yapılmıştır. Tasarım sonucunda kaymaya ve devrilmeye karşı güvenlik katsayıları elde edilmiştir. Hesaplamalarda seçilen deprem sınıfları D1-DD3'tür. Farklı su derinliği ve farklı zemin sınıfları için yapı stabiliteleri belirlenmiştir. Zemin sınıfı ve yapı yüksekliğinin stabilite katsayılarına etkisinin önemli olduğu görülmüştür. Her iki yönetmelik karşılaştırıldığında, TKLYDY (2020)'ye göre elde edilen stabilite katsayılarının bir miktar daha yüksek olduğu görülmüştür.

Anahtar Kelimeler: Yanaşma yapıları, deprem, stabilite

Design of L Type Berthing Structures Considering Turkish Coastal and Harbor Structures Earthquake Technical Regulations (2008 and 2020)

Abstract

In this study, the design of the L-type berthing structure under the influence of earthquake was made considering the Earthquake Technical Regulation on Coastal and Harbor Structures, Railways, Airport Constructions (ETRCHS) (2008) and Turkish Coastal and Harbor Structures Earthquake Regulation (TCHSER) (2020). As a result of the design, safety coefficients against sliding and overturning were obtained. Earthquake classes selected in the calculations are D1-DD3. Structural stabilities were determined for different water depths and different soil classes. It has been observed that the effect of soil class and building height on the stability coefficients is significant. When both regulations are compared, it is seen that the stability coefficients obtained according to TCHSER (2020) are slightly higher.

Key Words: Quay walls, earthquake, stability

GİRİŞ

Yanaşma yerleri limanlarda gemilerin yükleme-boşaltma yapmaları amacıyla kıyıya dik ya da kıyıya parallel inşa edilen yapılardır. Yanaşma yapısı kıyıya paralel inşa edilirse rıhtım, kıyıya dik inşa edilirse iskele olarak adlandırılır. Genel olarak rıhtımlar ağırlık tipi yanaşma yapıları olarak inşa edilirler.

Rıhtımlar öngörülen servis ömürleri içinde yapılacağı bölgenin depremselliği göz önüne alınarak tasarımının yapılması gerekmektedir. Depremler, oluşma olasılığı düşük olmasına ragmen yapılar üzerinde ciddi hasarlara sebep olabilmektedir. Rıhtım yapıları tasarlanırken deprem etkisi altında tasarımı Deprem Teknik Şartnamesi esas alınarak yapılmalıdır.

Türkiye Kıyı ve Liman Yapıları Deprem Teknik Şartnamesinin amacı, yeni yapılacak kıyı ve liman yapılarının deprem etkisi altında tasarımı ile mevcut yapıların performanslarının değerlendirilmesi ve güçlendirme tasarımı için gerekli kuralları ve minimum koşulları belirlemektir. Türkiye Kıyı ve Liman Yapıları Deprem Teknik Şartnamesi (TKLYDY) yılında "Performansa Dayalı Tasarım" metoduna hazırlanarak yayınlanmış ve aynı şartname 2020 yılında güncellenmiştir. Bu çalışmada bir L tipi yanaşma yapısının TKLYDY (2008) ve TKLYDY (2020)'ne göre tasarlanması durumunda oluşan güvenlik durumları incelenmiştir.

MATERYAL VE METOD

TKLYDY, 2008-TKLYDY, 2020 ARASINDAKİ FARKLILIKLAR

Bu bölümde TKLYDY (2008) ve TKLYDY (2020) arasındaki farklılıklar tablo halinde karşılaştırmalı olarak verilmektedir (Tablo 1 ve Tablo 2). TKLYDY (2008)'de 3 farklı deprem düzeyi tanımlanmaktadır. Ancak yeni şartname TKLYDY (2020)'de 4 farklı deprem yer hareketi düzeyi tanımlanmaktadır. Ayrıca Tablo 1 ve Tablo 2 karşılaştırıldığında TKLYDY (2008)'de D1 deprem düzeyi için verilen tanım TKLYDY (2020)'de DD-2 deprem yer hareketi düzeyi için, TKLYDY (2008)'de D3 deprem düzeyi için verilen tanım TKLYDY (2020)'de DD-1 deprem yer hareketi düzeyi için verilmektedir.

Deprem Yer Hareketi Düzeyleri Arasındaki Farklılıklar

Tablo 1. TKLYDY (2008) deprem düzeyleri

D1	Yapıların servis ömürleri boyunca meydana gelebilme olasılığı fazla olan, göreli olarak sık ancak şiddeti çok yüksek olmayan deprem yer hareketlerini ifade etmektedir. 50 yılda aşılma olasılığı %50, buna karşı gelen dönüş periyodu ise 72 yıldır.
D2	Yapıların servis ömürleri boyunca meydana gelebilme olasılığı çok fazla olmayan, seyrek ancak şiddetli deprem yer hareketini ifade etmektedir. 50 yılda aşılma olasılığı %10, buna karşı gelen dönüş periyodu ise 475 yıldır.
D3	Yapıların maruz kalabileceği en şiddetli deprem yer hareketini ifade etmektedir. 50 yılda aşılma olasılığı %2, buna karşı gelen dönüş periyodu ise 2475 yıldır.

Tablo 2. TKLYDY (2020) deprem yer hareketi düzeyleri

DD-1	Spektral büyüklüklerin 50 yılda aşılma olasılığının %2 ve buna karşı gelen tekrarlanma periyodunun 2475 yıl olduğu çok seyrek deprem yer hareketini nitelemektedir.
DD-2	Spektral büyüklüklerin 50 yılda aşılma olasılığının %10 ve buna karşı gelen tekrarlanma periyodunun 475 yıl olduğu seyrek deprem yer hareketini nitelemektedir.
DD-2a	Spektral büyüklüklerin 50 yılda aşılma olasılığının %30 ve buna karşı gelen tekrarlanma periyodunun 144 yıl olduğu sıkça deprem yer hareketini nitelemektedir.
DD-3	Spektral büyüklüklerin 50 yılda aşılma olasılığının %50 ve buna karşı gelen tekrarlanma periyodunun 72 yıl olduğu sık deprem yer hareketini nitelemektedir.

Spektral İvme Değerleri Arasındaki Farklılıklar

Yapıya bulunduğu konuma ve zemin koşullarına göre deprem etkisinin hesaplanmasında kullanılan spektral ivme değerlerinin elde edilişi Tablo 3'te verilmiştir. S_s spektral ivme katsayı değerleri yapının bulunduğu koordinatlara bağlı olarak Türkiye Deprem Tehlike Haritaları kapsamında AFAD'ın internet adresinden girilen koordinatlar sonucu elde edilmektedir.

Yerel zemin sınıflarına bağlı olarak yerel zemin etki katsayıları F_a ve F_s **TKLYDY** (2008) ve **TKLYDY** (2020)'de sırasıyla Tablo 4 ve Tablo 5'de verilmiştir. Tablolarda spektral ivme katsayılarının ara değerleri için doğrusal enterpolasyon yapılabilir.

Tablo 3. Spektral ivme değerleri hesaplamasındaki farklılıklar

TKLYDY (2008)	TKLYDY (2020)
$S_{MS} = F_a \times S_S$	$S_{DS} = F_S \times S_S$
S_S: Kısa periyot spektral ivme katsayısı S_1: 1.0 saniye periyot için spektral ivme katsayısı	

Tablo 4. Kısa periyot zemin katsayısı F_α

Zemin Sınıfı	Kısa periyod spektral ivmesi (g)[a]				
	$S_S \leq 0.25$	$S_S = 0.50$	$S_S = 0.75$	$S_S = 1.0$	$S_S \geq 1.25$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0

Yerel Zemin Sınıfı	Kısa periyot bölgesi için yerel zemin etki katsayısı F_S					
	$S_S \leq 0.25$	$S_S = 0.50$	$S_S = 0.75$	$S_S = 1.00$	$S_S = 1.25$	$S_S \geq 1.50$
ZA	0.8	0.8	0.8	0.8	0.8	0.8
ZB	0.9	0.9	0.9	0.9	0.9	0.9
ZC	1.3	1.3	1.2	1.2	1.2	1.2
ZD	1.6	1.4	1.2	1.1	1.0	1.0
ZE	2.4	1.7	1.3	1.1	0.9	0.8

Statik-Eşdeğer Deprem Katsayısı Hesaplanmasındaki Farklılıklar

TKLYDY (2008) ve TKLYDY (2020) deprem teknik şartnamelerine göre statik-eşdeğer deprem katsayıları hesaplamaları arasındaki farklılık Tablo 6.'da görülmektedir. Tasarımı yapılacak yapının deprem yer hareketi düzeyine göre statik-eşdeğer deprem katsayıları hesaplama biçimleri arasındaki farklılıklar görülmektedir.

Tablo 6. Statik-eşdeğer deprem katsayısı hesaplamasındaki farklılıklar

TKLYDY (2008)	
D1	$k_h = (2/3) \times A_{10}$
D2	$k_h = A_{20}$ $(A_{20} \leq 0.20)$ $k_h = (1/3) \times (A_{20})^{(1/3)}$ $(A_{20} > 0.20)$
TKLYDY (2020)	
DD-2a DD-3	$k_h = 0.267 S_{DS}$

Performans Düzeyleri Arasındaki Farklılıklar

TKLYDY (2008) ve TKLYDY (2020) deprem teknik şartnamelerinde verilen performans düzeyleri Tablo 7'de görülmektedir.

Tablo 7. Performans düzeyleri arasındaki farklılıklar

Performans Düzeyleri

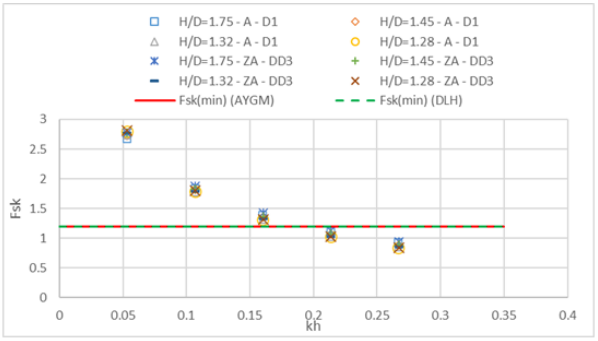
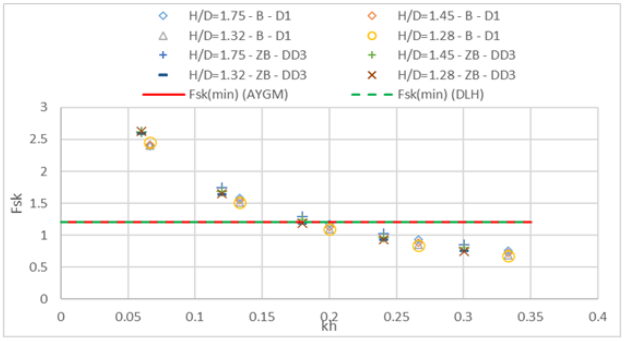
BULGULAR ve TARTIŞMA

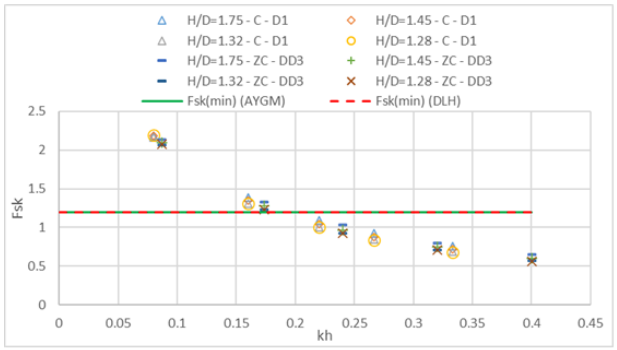
Yapılan çalışmada farklı zemin sınıflarına göre her iki yönetmelik için D1 ve DD3 deprem düzeyinde B/H=1.5 koşulundaki farklı yüksekliklere sahip L tipi yanaşma yapısı için kaymaya karşı güvenlik katsayıları hesaplanarak farklı deprem katsayılarına göre dayanımları belirlenmiştir. Şekil 1'de, farklı zemin sınıfları için B/H=1.5 koşulunda kaymaya karşı güvenlik katsayıları gösterilmiştir. A ve ZA zemin sınıfında aynı koşullar altında yapı k_h=0.198 değerine kadar devrilmeye karşı stabilitesini korumaktadır. B ve ZB zemin sınıfı için her iki yönetmeliğe ait hesap yöntemine göre yaklaşık olarak kh=0.198 değerine kadar devrilmeye karşı stabilitesini korumaktadır. C ve ZC zemin sınıfında k_h=0.198, D ve ZD zemin sınıfında k_h=0.198 değerine kadar kaymaya karşı yapı stabilitesine korurken, E-ZE zemin sınıfında ise k_h=0.198 değerine kadar kaymaya karşı stabil kalmaktadır. Yapı yüksekliğinin artmasının özellikle düşük k_h değerinde güvenlik katsayısı üzerinde etkisi olmasına rağmen, k_h değerinin artmasıyla birlikte yapı yüksekliğinin artmasının kaymaya karşı stabilite üzerinde anlamlı bir etkisi görülmemiştir. Ayrıca, TKLYDY (2020) yönetmeliği esaslarına göre yapılan hesaplamalarda güvenlik katsayıları, TKLYDY (2008) yönetmeliği esaslarına göre yapılan hesaplamalarla elde edilen güvenlik katsayılarına göre bir miktar yüksek çıksa bile, her iki yönetmeliğe ait hesaplama yöntemlerine göre elde edilen güvenlik katsayılarında anlamlı bir değişiklik görülmemiştir.



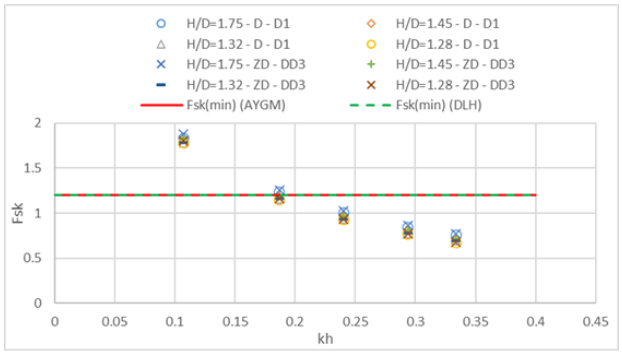
a) A-ZA zemin sınıfı



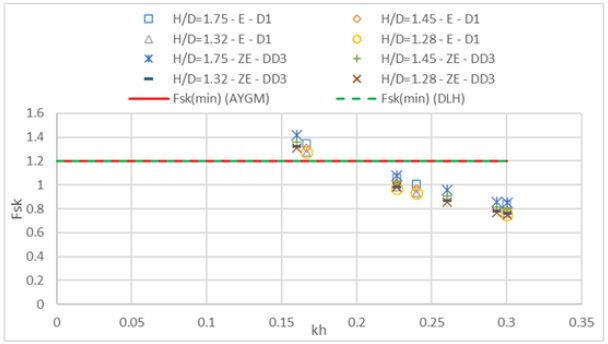
b) B-ZB zemin sınıfı



c) C-ZC zemin sınıfı



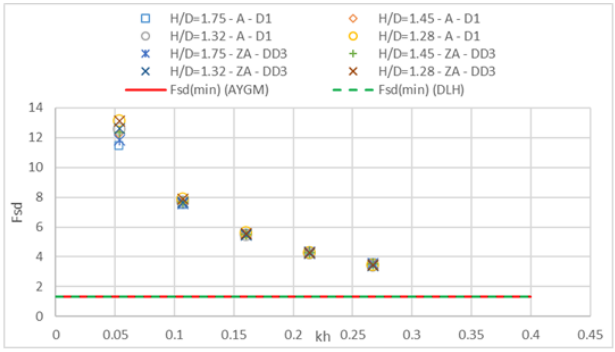
d) D-ZD zemin sınıfı



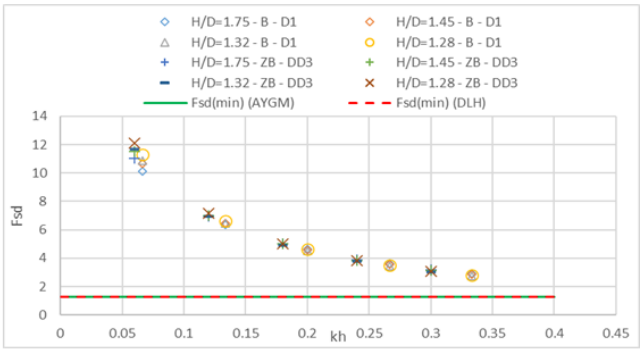
e) E-ZE zemin sınıfı

Şekil 1. Farklı zemin sınıfları için B/H=1.5 koşulunda kaymaya karşı güvenlik katsayıları

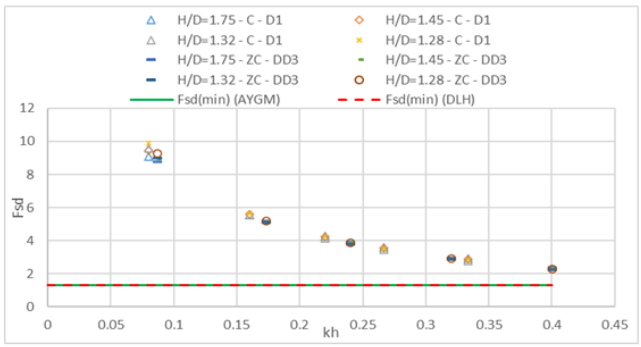
Şekil 2'de farklı zemin sınıflarına göre her iki yönetmelik için D1 ve DD3 deprem düzeyinde B/H=2 koşulundaki farklı yüksekliklere sahip L tipi yanaşma yapısı için devrilmeye karşı güvenlik katsayılarını göstermektedir. A ve ZA zemin sınıfında aynı koşullar altında yapı kh=0.594 değerine kadar devrilmeye karşı stabilitesini korumaktadır. B ve ZB zemin sınıfı için her iki yönetmeliğe ait hesap yöntemine göre k_h=0.594 değerine kadar devrilmeye karşı stabilitesini korumaktadır. C ve ZC zemin sınıfında k_h=0.594, D ve ZD zemin sınıfında k_h=0.594 ve E-ZE zemin sınıfında ise k_h=0.594 değerine kadar devrilmeye karşı stabilite hesabı yapılmaktadır. k_h=0.594 değerinden sonra hesaplanan k_h değerlerine karşılık gelen devrilmeye karşı güvenlik katsayıları hesaplanamamaktadır. Yapı yüksekliğinin artmasının özellikle düşük k_h değerinde güvenlik katsayısı üzerinde etkisi olmasına rağmen, kh değerinin artmasıyla birlikte yapı yüksekliğinin artmasının devrilmeye karşı stabilite üzerinde anlamlı bir etkisi görülmemiştir.



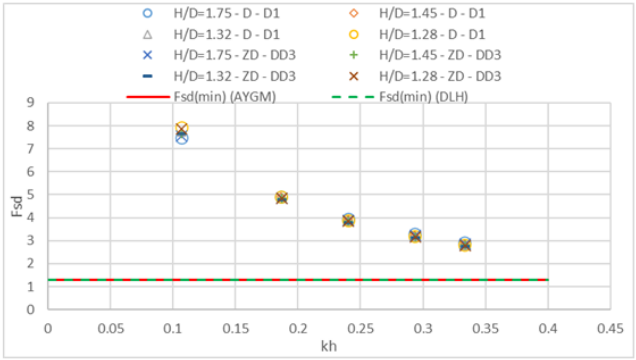
a) A-ZA zemin sınıfı



b) B-ZB zemin sınıfı



c) C-ZC zemin sınıfı



d) D-ZD zemin sınıfı

Şekil 2. Farklı zemin sınıfları için B/H=1.5 koşulunda devrilmeye karşı güvenlik katsayıları

SONUÇ

Bu çalışmada, L tipi yanaşma yapısının deprem etkisi altında kıyı ve liman yapılarının tasarımı için TKLYDY (2008) ve TKLYDY (2020) tarafından verilen esaslara uygun olarak kaymaya ve dönmeye karşı stabilite hesapları yapılmıştır. Hesaplamalarda D1 ve DD3 deprem düzeyleri göz önüne alınmıştır. Tasarım sonucunda elde edilen devrilme (F_{sd}) ve kayma (F_{sk}) güvenlik katsayıları, şartnamelerde yer alan minimum değerler ile karşılaştırılmıştır. Bu karşılaştırma sonucunda tasarlanan yapının stabilitesi belirlenmiştir. TKLYDY (2020) deprem teknik şartnamesine göre tasarlanan yapılar, TKLYDY (2008)'e göre tasarlanan yapılardan daha stabil olarak elde edilmiştir. Ayrıca her iki şartname için yapının inşa edileceği derinliğin arttırılması ile stabilite değerlerinde azalış meydana gelmiştir. Zemin koşullarının stabiliteye etkisinin olduğu görülmüştür. Zemin sınıfı A-ZA için stabilite katsayıları en yüksek iken, E-ZE sınıfında en düşük değerler elde edilmiştir.

Abstract
In this study, the mathematical modelling of freeze-dried cockles were examined. Cockles are edible marine bivalve mollusks widely available on the Aegean coasts of Turkey and exported a lot. Cockles were subjected to ultrasonic pre-treatments to examine their effect on the drying rate. It was kept in the ultrasonic bath for 1 minute and 5 minutes and the results were compared with the unpretreated samples. The experimental drying data is fitted into Aghbashlo et al., Jena & Das, Lewis, Parabolic, and Wang & Singh drying models and the data-model compatibilities were compared. For unpretreated samples is Aghbashlo et al. model is the most suitable model. The R^2 value is 0.999955 and the χ^2 value is 0.000006. For ultrasonic samples, Jena & Das model is the most suitable model. The most suitable model for drying cockles in the freeze drying unpretreated, US 1 min and US 5 min samples was determined as Jena & Das model with the highest R^2, lowest χ^2, and RMSE. It was observed that the R^2 values of all the models applied varied between 0.970081 and 0.999955 and the χ^2 values varied between 0.000051 and 0.000303.
Keywords: Cockle, freeze drying, mathematical modeling, *Tapes philippinarum*

INTRODUCTION

One of the many methods applied to preserve food products for a long time is the drying method. Drying is a method of removing the water contained in the product from the product. Drying is also used in many industries such as medicine, pharmaceutical, paint, agriculture, furniture, and paper. Drying methods are divided into two groups traditional drying and modern drying technologies. It is difficult to obtain quality products with traditional drying methods (Alhammadiy, 2002). In the freeze-drying process, the water in the product is first frozen, then the frozen water is removed from the product by sublimation. Many products can be stored for a long time until they are used by preserving their initial physical, chemical, and biological properties. Products dried by freeze-drying preserve their nutritional and vitamin value, aroma, smell, color, and shape (Suicmez, 2014).

Cockle (*Tapes philippinarum)* which is shown in Figure 1 used in this study is a widely available bivalve mollusk in the Aegean coasts of Turkey. That mollusk whose dimensions reach 60 mm, but commercial sizes range from 30 to 50 mm, can survive in oxygen-poor and highly polluted waters. Cockles are abundant in the Adriatic Sea, the Mediterranean Sea, the Black Sea, the North Sea, and the Caspian Sea (Celik, 2004). Cockle is a food item that is loved and consumed and can be considered a luxury. These creatures, which have become important commercial products and are sought after by the Mediterranean countries, are exported to Turkey as fresh and chilled (Ariani et al., 2022).

There are many different drying studies related to food in the literature, especially many animal and agricultural products are dried by freeze drying, which is a new technology. It was studied freeze drying and mathematical modeling of turkey meat (Sadikoglu et al., 2016). It was studied the effects of freeze drying process parameters on chicken breast meat (Arroqui et al., 2009). It was worked microwave freeze drying characteristics of beef (Shi and Wang, 2007). It was investigated freeze-drying of jellyfish and the effect of temperature (Alhamid et al., 2012). It was worked on freeze drying of seahorse, analysis of drying kinetics and mathematical modeling (Wu et al., 2019). It was studied comparative of drying methods which oven dried, sun dried, vacuum dried, and freeze dried on chemical constituents of Malaysian red seaweed (Lee et al., 2015).

Figure 1 Fresh sample of cockle

Although there are many studies on the drying of many animal and agricultural products, there are not much information in the literature on freeze drying of cockles. In this study, the effect of cockles on drying rate of different pretreatments and the most suitable mathematical model for drying kinetics were determined.

MATERIALS AND METHODS

Sample Preparation

Cockles used in this study were purchased frozen from a local market in Istanbul, Turkey in May 2022. Unpretreated cockle samples were separated from their shells and for each drying the samples were weighed 7 ± 0.05 grams on a Radwag AS 220.R2 digital balance (Radwag, Radom, Poland). Then, it was dried in a KH-45 hot air drying oven (Kenton, Guangzhou, China) at 105 °C for 3 hours. After drying, the weight of the sample was measured again. The moisture content of the unpretreated sample was 84.42% on wet basis and 5.4180 kg water/kg dry matter. The same procedures were repeated for the samples that were pretreated for 1 minute and 5 minutes in an ultrasonic bath (US) (Isolab, Germany). The moisture content of the sample, which was pretreated for 1 minute in an ultrasonic bath, was found to be 85.53% on wet basis and 5.9114 kg water/kg dry matter. The moisture content of the sample, which was pretreated for 5 minutes in an ultrasonic bath, was found to be 86.27% on wet basis and 6.2821 kg water/kg dry matter.

After determining the moisture content, samples were prepared as 7 ± 0.05 g and placed in Labart LFD-10N (ART Laborteknik, İstanbul, Turkey) freeze-dryer. During freeze drying, the vacuum of the dryer was closed every 60 minutes, and the samples were weighed in less than 2 minutes and the products were put back into the freeze dryer and vacuum opened. The samples were freeze-dried until they reached 5% moisture. The completely dried image of the samples is shown in Figure 2.

Figure 2. Dried samples of cockle

Mathematical Modeling

To investigate this process moisture content, and the moisture ratio calculations are performed with the following equations (1), (2) and (3).

$$M = {}^{m_w}/_{m_d} \quad (1)$$

where moisture content (M) is calculated by the ratio of water content in the material (kg) to the dry matter content (kg).

$$MR = \frac{M_t - M_e}{M_i - M_e} \quad (2)$$

where M_t is the moisture content at a specific time, M_e is the moisture content at equilibrium, and M_i is the moisture content of the material initially. Since M_e value is rather small compared to M_t and M_i, the simplified equation, equation (3), is used for moisture rate calculations.

$$MR = \frac{M_t}{M_i} \quad (3)$$

In this research, mathematical modeling of cockles are done using different models as shown in Table 1.

Table 1. Drying models and equations

Model	**Equation**
Aghbashlo et al.	$MR = \exp(-k_1 t/(1+k_2 t))$
Lewis	$MR = \exp(-kt)$
Jena & Das	$MR = a.\exp(-kt + b\sqrt{t}) + c$
Parabolic	$MR = a+bt+ct^2$
Wang & Singh	$MR = 1+at + bt^2$

In Table 1, a, b, and c are the drying exponent coefficients that are defined for each equation separately: k, k_1, and k_2 are the drying coefficients that are defined equations separately and the t stands for time in minute.

To find the best suitable model coefficient of determination (R^2), root-mean-square error (RMSE), and reduced chi-squared (χ^2) statistic are used. Required parameters for given models are estimated using the non-linear regression method with Statistica (Statistica, 2016). Equations for these methods are given below in equations (5), (6), and (7) respectively as follows.

$$R^2 = 1 - \frac{\sum_{i=1}^{n}\left(MR_{exp,i} - MR_{pre,i}\right)^2}{\sum_{i=1}^{n}\left(MR_{exp,i} - \left(\frac{1}{n}\right)MR_{exp,i}\right)^2} \quad (5)$$

$$RMSE = \left(\frac{1}{n}\sum_{i=1}^{n}\left(MR_{exp,i} - MR_{pre,i}\right)^2\right)^{1/2} \quad (6)$$

$$X^2 = \frac{\sum_{i=1}^{n}\left(MR_{exp,i} - MR_{pre,i}\right)^2}{n - z} \quad (7)$$

where MR_{exp} is the experimental moisture ratio values, MR_{pre} is the predicted moisture ratio values, n is the total number of the experiments, and z is the number of the constants in the given model. In the selection of best fitted model, R^2 values are expected to be closer to 1. On the other hand, RMSE and χ^2 values are expected to be closer to 0 (Kipcak et al., 2019).

RESULT AND DISCUSSION

The most suitable model was chosen with non-linear regression by Statistica software. Experimental moisture ratios with respect to drying time were fitted into Aghbashlo et al., Jena & Das, Lewis, Parabolic, and Wang & Singh drying models. In Table 2, statistical results of drying process at unpretreated and ultrasonic pretreatments are given.

Tablo 2. Mathematical and statical parameters for drying model at different pretreatments

Model	Parameter	Unpretreated	US 1 min	US 5 min
Aghbashlo et al.	k_1	0.008181	0.006888	0.005952
	k_2	0.000379	0.000088	-0.000005
	R^2	0.999955	0.990575	0.973177
	χ^2	0.000006	0.001317	0.004087
	RMSE	0.002061	0.032006	0.056378
Jena & Das	a	0.625122	0.542986	0.606186
	k	0.006874	0.006322	0.005553
	b	-0.009458	-0.013188	-0.017651
	c	0.470490	0.699118	0.650577
	R^2	0.999732	0.999364	0.998577
	χ^2	0.000051	0.000124	0.000303
	RMSE	0.005050	0.008312	0.012985
Lewis	k	0.007645	0.006764	0.005959
	R^2	0.999137	0.990521	0.973177
	χ^2	0.000094	0.001159	0.003576
	RMSE	0.009055	0.032097	0.056378
Parabolic	a	0.949191	1.017227	1.085680
	b	-0.005170	-0.005106	-0.005313
	c	0.000007	0.000007	0.000007
	R^2	0.985575	0.978739	0.980501
	χ^2	0.002193	0.003466	0.003466
	RMSE	0.037022	0.048070	0.048068
Wang & Singh	a	-0.005618	-0.004972	-0.004644
	b	0.000008	0.000006	0.000006
	R^2	0.980780	0.978280	0.970081
	χ^2	0.002435	0.003035	0.004558
	RMSE	0.042734	0.048586	0.059543

Among all models, the highest R^2 and lowest χ^2 and RMSE values are in the unpretreated sample. Aghbashlo et al. model is the most suitable model for unpretreated sample. In Aghbashlo et al. model is observed the R^2 value is 0.999955, χ^2 value is 0.000006 and RMSE value is 0.002061. Jena & Das model is the most suitable model for US 1 min and US 5 min pretreated samples. In Jena & Das model is observed the R^2 values are 0.999364 and 0.998577, χ^2 values are 0.000124 and 0.000303, RMSE values are 0.008312 and 0.012985 for US 1 min and US 5 min unpretreated samples.

Jena & Das model was chosen as the most suitable model for drying of cockle in the freeze drying at unpretreated and ultrasonic pretreatments. The highest values of R^2 as 0.999732, 0.999364, and 0.998577; the lowest values of χ^2 0.000051, 0.000124 and 0.000303, and the lowest values of RMSE as 0.005050, 0.008312, and 0.012985 are obtained for Jena & Das model at unpretreated, US 1 min and US 5 min samples, respectively.

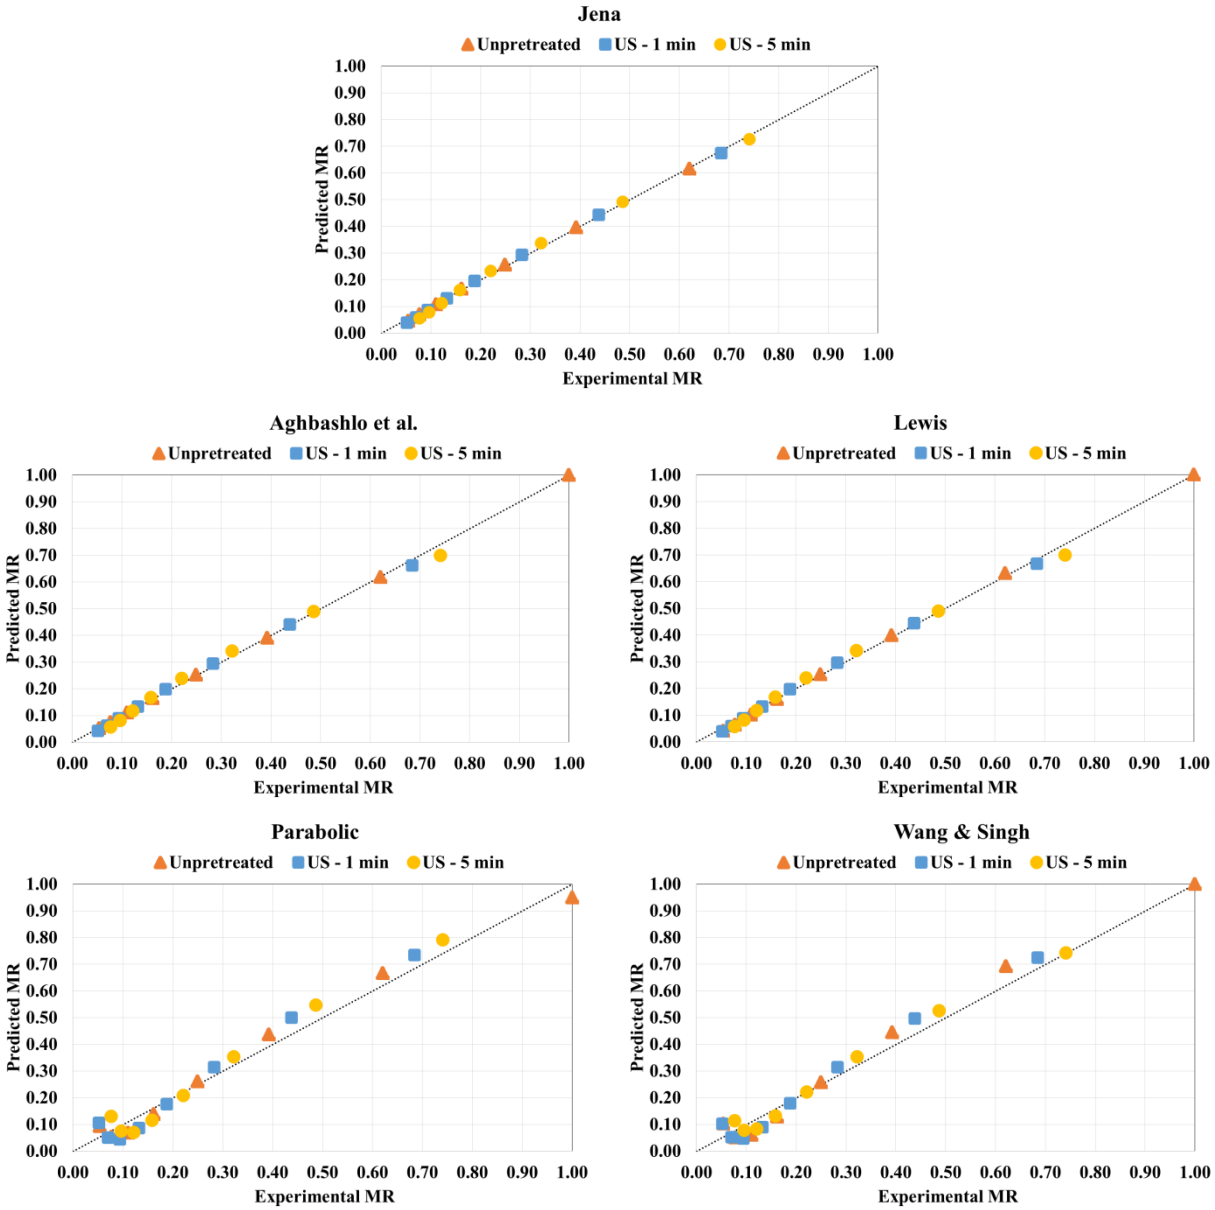

Figure 3. Experimental and predicted moisture ratios for cockle using the model of Jena & Das, Aghbashlo et al, Lewis, Parabolic and Wang & Singh.

From Figure 3, a graphical representation of statistical evaluations can be observed. If the data plotted is very near the straight line, it can be said that experimental data and predicted data are in good agreement. When we consider both Table 2 and the following figures, it can be seen that Jena & Das model is the most fitted model for drying of cockle.

CONCLUSION

This study is performed to investigate the mathematical modeling of cockle. When the unpretreated, US 1 min, and US 5 min pretreated samples were compared, the highest drying rate was determined as the sample unpretreated. Different mathematical drying models are applied to determine the drying process of cockle. The models results of unpretreated sample are given in the table. The most suitable model is Aghbashlo et al. model, the unsuitable model is the Wang & Singh model. The most suitable model for the drying process of the US 1 min and US 5 min sample is the Jena & Das model. In Wang and Singh and Parabolic models, it was determined that the R^2 values of the US 1 min and US 5 min sample were low and the data were far on the straight line. The Jena & Das drying model was chosen as the most suitable model for the freeze-drying process of unpretreated, US 1 min and US 5 min pretreated samples of cockle. Experimental and predicted moisture ratio graphics of the applied models was drawn and data distributions was observed.

Özet

Bu çalışmada 3-metilsalisilaldehitten yola çıkarak elde edilen schiff bazı bileşiklerinin biyolojik aktiviteleri incelendi. 3-metilsalisilaldehitin, 2-amino-4-klorbenzonitril, metil-3-aminotiyofen-2-karboksilat ve 2-amino-4-nitrofenol ile tepkimesi sonucu karşılık gelen (*E*)-4-klor-2-((2-hidroksi-3-metilbenziliden)amino)benzonitril (**I**), metil (*E*)-3-((2-hidroksi-3-metilbenziliden)amino)tiyofen-2-karboksilat (**II**), (*E*)-2-((2-hidroksi-3-metilbenziliden)amino)-4-nitrofenol (**III**) Schiff bazları elde edildi. Antioksidan aktivitesi incelenirken DPPH• radikal giderme, ABTS+• katyon radikal giderme metodları kullanıldı. Antibakteriyel çalışmalar ise Disk difüzyon ve Mikrodilüsyon metodları kullanılarak yapıldı. Örneklerin antioksidan özellikleri incelendiğinde III bileşiğinin I ve II bileşiklerinden daha etkili olduğu belirlendi. Antibakteriyel çalışmalarda Gram-negatif bakterilerde II bileşiğinin daha etkili olduğu, gram-pozitif bakterilerde ise I bileşiğinin daha etkili olduğu belirlendi.

Anahtar Kelimeler: Salisiladehit, Schiff bazı, antioksidan, antibakteriyel

Investigation of antioxidant and antimicrobial properties of substituted benzaldehyde derivative Schiff base compounds.

Abstract

In this study, the biological activities of Schiff base compounds obtained from 3-methylsalicylaldehyde were investigated. Reaction of 3-methylsalicylaldehyde with 2-amino-4-chlorobenzonitrile, methyl-3-aminothiophene-2-carboxylate and 2-amino-4-nitrophenol, corresponding (E)-4-chlor-2-((2-hydroxy- 3-methylbenzylidene)amino)benzonitrile (I), methyl (E)-3-((2-hydroxy-3-methylbenzylidene)amino)thiophene-2-carboxylate (II), (E)-2-((2-hydroxy) -3-methylbenzylidene)amino)-4-nitrophenol (III) Schiff bases were obtained. While examining the antioxidant activity, DPPH• radical removal, ABTS+• cation radical removal methods were used. Antibacterial studies were performed using Disk diffusion and Microdilution methods. When the antioxidant properties of the samples were examined, it was determined that compound III was more effective than compounds I and II. In antibacterial studies, it was determined that compound II was more effective in gram-negative bacteria, and compound I was more effective in gram-positive bacteria.

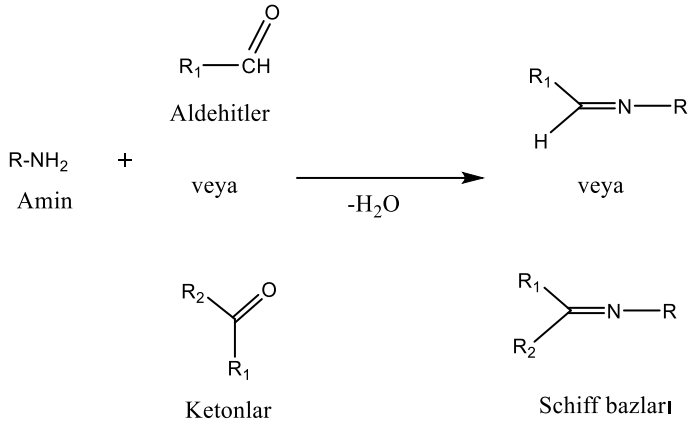
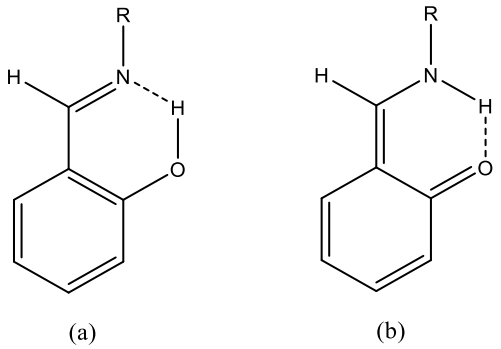
GİRİŞ

Yaklaşık 150 yıl önce ilk kez Hugo Schiff tarafından sentezlenen, aldehit ve ketonların birincil aminlerle kondenzasyon tepkimesi sonucu oluşan Schiff bazları, uzun yıllardır incelenmektedir (Schiff, 1916) (Şekil 1). Farklı yapılarda bulunabilen Schiff bazlarından, 2-Hidroksi Schiff bazları oldukça ilgi çekmektedir. Bunlar molekül içi hidrojen bağı meydana getiren ve farklı tautomerik yapılara sahip olabilen moleküllerdir.



Şekil 1. Schiff bazlarının genel yapısı

Tautomerizm bir moleküler yapı içerisindeki atomların farklı düzende yerleşmiş olmalarına rağmen, birbirlerine dönüşüp dengeye gelebilen izomerlere denir. 2-Hidroksi Schiff bazlarının genellikle enol-imin (O-H) ve keto-amin (N-H) olarak iki farklı yapısı bulunur. Bu yapılarda, hidroksi O atomu ile imin N atomu arasında molekül içi O-H...N hidrojen bağı var ise enol-imin ve N-H...O tipi molekül içi hidrojen bağı varsa keto-amin formu olduğunu gösterir (Tanak ve ark., 2012). Enol-imin yapısında C-O atomları birbirlerine tek bağ ile bağlı iken C=N çift bağa sahiptir, keto-amin yapısında ise C=O atomları birbirlerine çift bağ ile bağlanmışken C-N tek bağ ile bağlanmıştır (Allen ve ark., 2004) (Şekil 2).



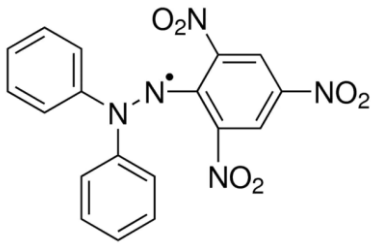
Şekil 2. 2-Hidroksi Schiff bazlarının tautomerik yapıları (a) enol-imin (b) keto-amin

Schiff bazları antiviral (Kumar ve ark., 2010), antitüberküler (Pahlavani ve Kargar, 2021), antikanser (Liao ve ark., 2005), antioksidan (Bakır ve Lawag, 2020), anti-HIV (Sriram ve ark., 2006), antiinflamatuvar ajanlar (Shehry ve ark., 2019) ve antikonvülsan (Beraldo ve ark., 2002) gibi geniş biyolojik aktivite özellikleri göstermektedir. Bazı Salisilaldehit türevi Schiff bazlarının Antibakteriyel özellikleri incelenmiştir ve önemli aktiviteye sahip oldukları belirtilmiştir (Mele ve ark., 2008). Ayrıca antifungal ve antibakteriyel etki gösterdikleri de tespit edilmiştir (Shi ve ark., 2007).

Antioksidanlar, serbest radikallerin oluşumunu engelleyerek veya mevcut radikalleri süpürerek hücrenin zarar görmesini engelleyen ve yapısında genellikle fenolik fonksiyonel grup taşıyan moleküllerdir (Kahkönen ve ark., 1999). Antioksidanların insan sağlığındaki yerini belirleyen en önemli faktörler, onların kimyasal yapıları, çözünürlükleri, yapı/aktivite ilişkileri ve doğal kaynaklardan elde edilebilmeleridir (Kaur ve Kapoor, 2001). Antioksidanların önemlerinin anlaşılması ile bu konuda yapılan çalışmaların sayısı gün geçtikçe artış göstermiştir.

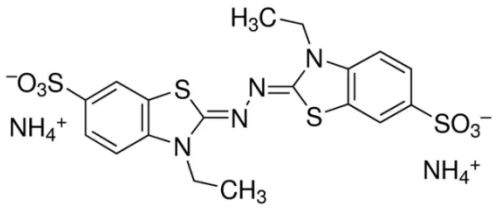
DPPH• yöntemi antioksidan aktivite ölçümünde en çok kullanılan spektrofotometrik yöntemlerden biridir (Sharma ve Bhat, 2009). DPPH• testi, radikal bileşiğin üretilmesinin gerekmemesi nedeniyle, antioksidanların aktivitesini değerlendirmek için geçerli, ucuz, hızlı, doğru, kolay ve ekonomik bir yöntem olarak kabul edilir (Ayaz Seyhan, 2017). Bu yöntemin avantajı, DPPH• reaktifi en zayıf antioksidanlar da dahil olmak üzere karışımdaki tüm maddelerle etkileşebilmesi ve hem lipofilik, hem de hidrofilik antioksidanlarla reaksiyona girebilmesidir (Kedare ve Singh, 2011). DPPH• testinin sonuçları birçok

şekilde sunulmuştur. Çalışmaların çoğu, sonuçları ilk DPPH• derişimini % 50 oranında azaltmak için gerekli olan antioksidan miktarı olarak tanımlanan IC50 değeri olarak ifade edilmektedir (Deng ve ark., 2011)(Scherer ve Godoy, 2009).



Şekil 3. 2,2-Difenil-1-pikrilhidrazil (DPPH) yapısı

Troloks eşiti antioksidan kapasite yöntemi ilk defa Miller ve arkadaşları tarafından raporlanmış (Miller ve ark., 1993) olup sonrasında Re ve arkadaşları tarafından da geliştirilmiştir (Re ve ark., 1999). TEAC analizi 2,2'-azinobis (3-etil-bezotiazolin 6 sulfonat) (ABTS) radikal katyonunun antioksidanlar tarafından absorbansının engellenmesi temeline dayanır.

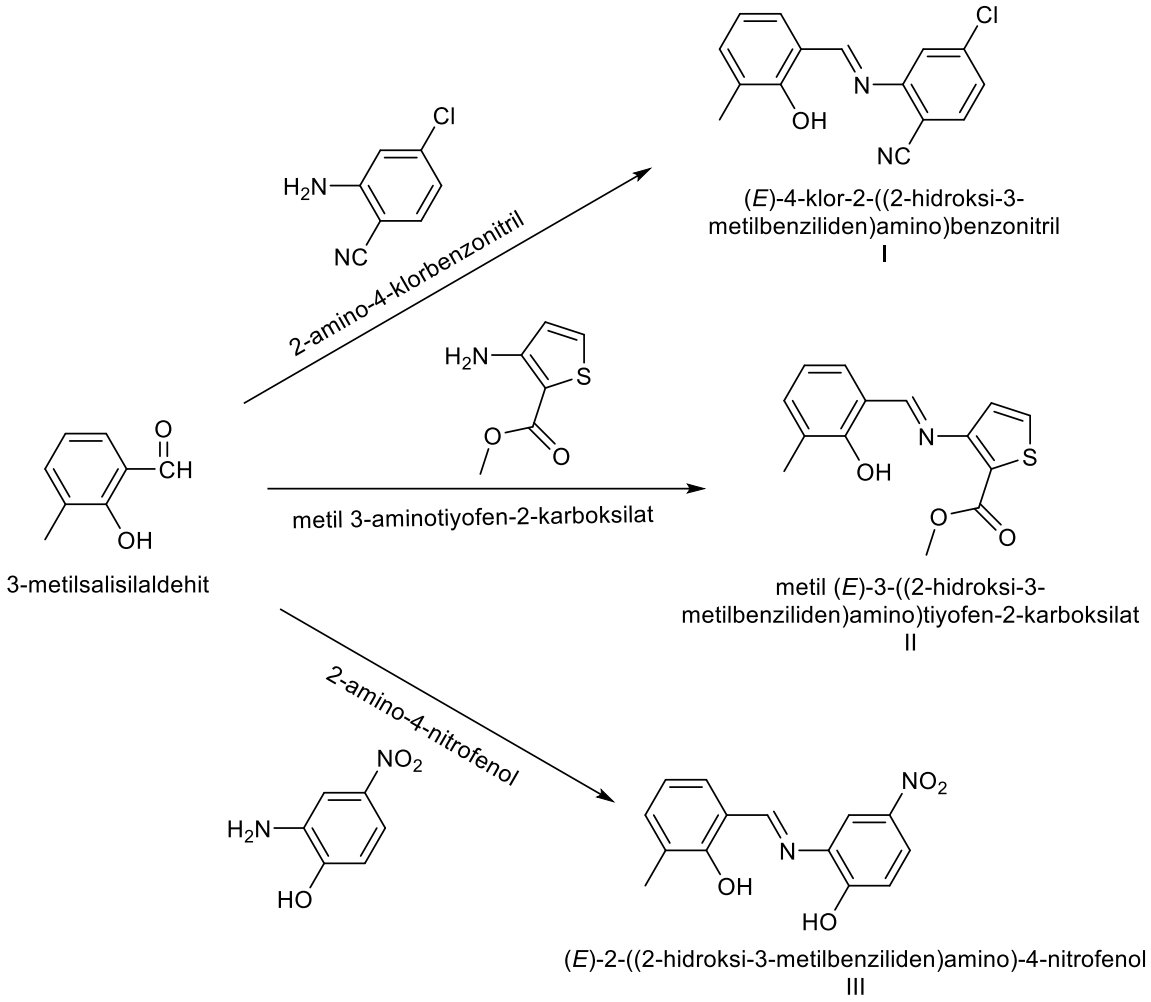


Şekil 4. 2,2'-azinobis (3-etil-bezotiazolin 6 sulfonat) (ABTS) yapısı

MATERYAL VE METOT

Sentez

3-metilsalisilaldehitin (0.02 mmol), 2-amino-4-klorbenzonitril (0.02 mmol), metil-3-aminotiyofen-2-karboksilat (0.02 mmol) ve 2-amino-4-nitrofenol (0.02 mmol) ile etil alkol içerisinde (20 mL) geri soğutucu altında altı saat kaynatılması ile (*E*)-4-klor-2-((2-hidroksi-3-metilbenziliden)amino)benzonitril (**I**), metil (*E*)-3-((2-hidroksi-3-metilbenziliden)amino)tiyofen-2-karboksilat (**II**), (*E*)-2-((2-hidroksi-3-metilbenziliden)amino)-4-nitrofenol (**III**) Schiff bazları elde edildi. Sentezlenen bileşikler Şekil 5 'te verilmiştir.



Şekil 5. Sentezlenen Schiff bazlarının kimyasal yapısı

Serbest Radikal Giderme Aktivitesi Tayini

Örneklerin etanol çözeltilerinin serbest radikal giderme aktivitesi DPPH$^{\cdot}$ (1,1-difenil-2-pikril-hidrazil) metodu kullanılarak tayin edildi (Blois, 1958). 96 kuyucuklu plakada 150 µL farklı konsantrasyonlardaki örnekler veya standartlar (BHA, TBHQ ve E vitamini), 50 µL 0.1 mM DPPH (etanolde) homojen karıştırıldı. Örnekler oda sıcaklığında, karanlıkta 30 dk bekletildi. Her bir karışımın absorbans değerleri 517 nm' de BIOTEK (Epoch2) mikroplaka okuyucusu kullanılarak ölçüldü ve sonuçlar IC_{50} (µg/mL) değerleri hesaplanarak belirlendi.

ABTS$^{\cdot+}$ Radikali Giderme Aktivitesi Tayini

Örneklerin etanol çözeltilerinin ABTS$^{\cdot+}$ radikal giderme aktivitesi ABTS-K_2SO_8 (2,2´-azinobis-(3-etilbenzotiazolin-6-sulfonik asit)-potasyum persulfat) metodu kullanılarak tayin edildi (Dechayont ve ark., 2017; Re ve ark., 1999). 7 mM ABTS ve 2.45 mM K_2SO_8 (2:1) karıştırıldı ve 12-16 saat oda sıcaklığında, karanlıkta bekletildi. Karışımın absorbans değeri 0.700±0.020 olacak şekilde 1:33 (v/v) etanolle seyreltildi. 96 kuyucuklu plakada 20 µL farklı konsantrasyonlardaki örnekler veya standartlar (BHA, TBHQ ve E vitamini), 180 µL ABTS$^{\cdot+}$ çözeltisi homojen karıştırıldı. Her bir karışımın absorbans değeri 6 dk sonra 734 nm' de BIOTEK (Epoch2) mikroplaka okuyucusu kullanılarak ölçüldü ve sonuçlar IC_{50} (µg/mL) değerleri hesaplanarak belirlendi.

Antibakteriyel Aktivite Yöntemleri

Antibakteriyel aktivitelerde gram negatif bakteriler olarak *Escherichia coli* (ATCC 25922), *Psedomonas aeruginosa* (ATCC 15442), *Klebsiella pneumoniae* (ATCC 10031), *Salmonella enterica* (ATCC 13311) ve gram pozitif bakteriler olarak ise *Enterococcus faecalis* (ATCC 29212), *Bacillus cereus* (CCM 99), *Staphylococcus aureus* (ATCC 25213), *Lysteria monocytogenes* kullanıldı.

Disk Difüzyon Metodu

Örneklerin etanol çözeltilerinin antibakteriyel aktivitesi disk difüzyon metodu ile belirlendi (Reller ve ark., 2009). 5 mL steril serum fizyolojik (%0.85 NaCl) çözeltisine bir miktar bakteri eklendi ve McFarland 0.5 değerine ayarlandı. Steril petrilere 25 mL MHA (Muller Hinton Agar) ilave edildi. McFarland 0.5 değeri ayarlanan bakteri çözeltisi agar üzerine sürüldü. 50 µL örnekler ve antibiyotikler (1000 µg/mL) disklere emdirildi ve diskler agar üzerine yerleştirildi. 37 ºC' de 16-18 saat inkübasyona bırakıldı. İnhibisyon bölgeleri mm olarak belirlendi. Pozitif kontrol olarak amoksisilin ve tetrasiklin antibiyotikleri, negatif kontrol olarak ise ekstraktların ve antibiyotiklerin çözücüleri kullanıldı.

Mikrodilüsyon Metodu

Örneklerin etanol çözeltilerinin antibakteriyel aktivitesi mikrodilüsyon metodu ile belirlendi (Andrews, 2001). Katyonlu MHB için 100 mL MHB üzerine 400 µL $MgCl_2$ (2 mg/mL) ve 1 mL $CaCl_2$ (2 mg/mL) karıştırıldı. 5 mL steril serum fizyolojik (% 0.85 NaCl) çözeltisine bir miktar bakteri eklendi ve McFarland 0.5 değerine ayarlandı ve 1 mL alınarak 9 mL katyonlu MHB ile karıştırıldı. Steril 96-kuyucuklu plakadaki her bir kuyuya 100 µL katyonlu MHB (Mueller Hinton II Broth) ilave edildi. 100 µL örnekler (1024 µg/mL) ve antibiyotikler (amoksisilin (2048 µg/mL) ve tetrasiklin (1024 µg/mL)) ilk kuyuya eklendi, karıştırıldı ve 100 µL alınarak ikinci kuyuya eklendi. Bu işlem 12. kuyuya kadar devam etti ve son olarak 12. kuyudan alınan 100 µL çözelti atıldı. 5 µL bakteri çözeltisi bütün kuyulara eklendi. +4 ºC buzdolabında 2 saat bekletildi ve sonra 37 ºC' de 16-18 saat inkübasyona bırakıldı. Minimum inhibisyon konsantrasyonu (MİK) µg/mL olarak belirlendi.

BULGULAR ve TARTIŞMA

Örneklerin serbest radikal giderme aktivite sonuçları ve $ABTS^{\cdot+}$ radikal giderme aktivite sonuçları Tablo 1' de gösterildi.

Tablo 1. Antioksidan Aktivite Sonuçları

Örnekler	Antioksidan Aktivite	
	Serbest Radikal Giderme Aktivitesi	$ABTS^{\cdot+}$ Radikali Giderme Aktivitesi
	IC_{50} (µg/mL)	**IC_{50} (µg/mL)**
I	31.64±0.93	113.66±0.51
II	15.26±0.54	114.19±0.86
III	2.17±0.08	15.28±0.99

Özet
Sikloidal dişli kutuları, hassas hareket kontrolü için tasarlanmış dişli mekanizmalarıdır. Geniş dişli oranı aralığı, yüksek verim ve küçük boyutlar gibi avantajlarının yanı sıra aynı anda birden fazla dişin temas halinde olması sebebiyle de yüksek yük taşıma kapasitesine sahiptirler. Çalışma prensibinden ötürü çok sayıda bileşen, birbirleri ile sürekli temas halindedirler. Bu sebeple sürtünme, sikloid dişli kutusunun verimi üzerinde önemli bir etkiye sahiptir. Bu çalışmada sikloid dişli kutusunda birbirleri ile sürekli temasta bulunan bileşenler arasındaki sürtünmenin, verim üzerindeki etkisi hareket analizi yardımı ile incelenmiştir. Çalışma kapsamında bir sikloidal dişli kutusunun tasarımı yapılmış ve daha sonra Solidedge parametrik katı modelleme yazılımının hareket analizi modülünde sistemin hareket analizi gerçekleştirilmiştir. Elde edilen veriler neticesinde sürtünme katsayısının verim üzerindeki etkisi yorumlanmıştır.

Anahtar Kelimeler: Sikloidal dişli, hareket analizi, verim, sürtünme

Cycloid gearbox design and motion analysis

Abstract
Cycloidal gearboxes are gear mechanisms designed for precise motion control. In addition to their advantages such as wide gear ratio range, high efficiency, and small dimensions, they have also high load carrying capacity due to more than one tooth is in contact at the same time. Due to its working principle, many components are in contact with each other consistently. Therefore, friction has a significant effect on the efficiency of the cycloid gearbox. In this study, the effect of friction between the components in contact with each other in the cycloid gearbox on the efficiency was investigated with the help of motion analysis. Within the scope of the study, a cycloidal gearbox was designed and then the dynamic analysis of the system was performed in the motion analysis module of Solidedge parametric solid modeling software. As a result of the data obtained, the effect of the friction coefficient on the efficiency was interpreted.

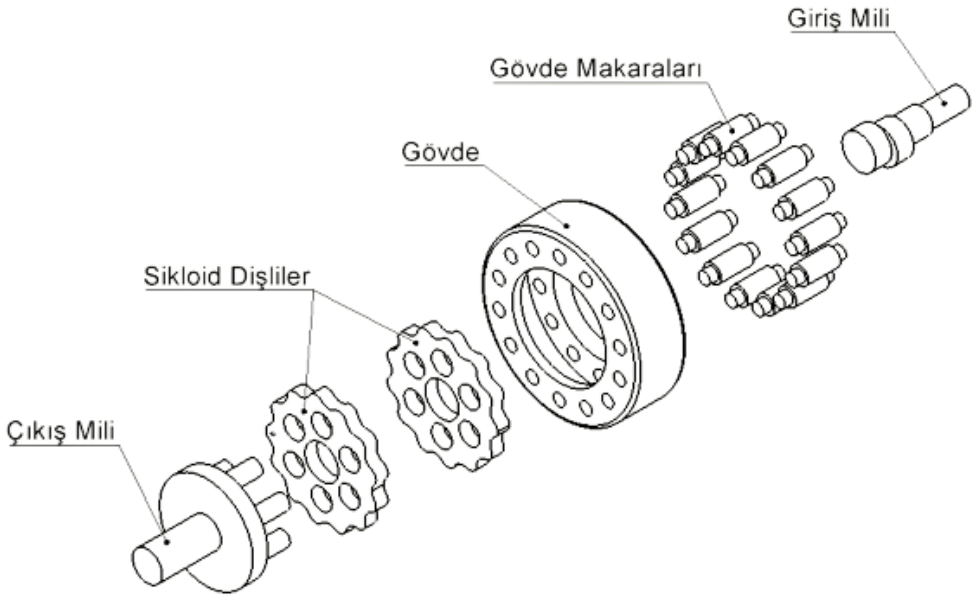
Keywords: Cycloid gear, motion analysis, efficiency, friction

GİRİŞ

Günümüz endüstrisinde güç iletimi için kullanılan dişli kutularında verim, yük kapasitesi, iletim hassasiyeti ve boyutlar önemli kriterler olarak karşımıza çıkmaktadır. Sikloidal dişli kutuları, sahip olduğu birçok avantaj sayesinde konveyör, gıda makineleri, uydu pozisyonlanama, robot makineleri, karıştırıcılar, geri dönüşüm makineleri, otomotiv ve çelik fabrikaları gibi çok geniş uygulama alanlarına sahiptir. Mevcut özellikleri ile de kullanım alanları giderek yaygınlaşmaktadır.

Giriş mili, sikloid dişliler, gövde, gövde pimleri ve çıkış mili dişli kutusunun temel bileşenlerini oluşturmaktadır ve Şekil 1'de gösterilmiştir. Sikloid dişli kutusunun çalışmasında ilk olarak giriş mili, sikloid dişlileri eksantrik olarak tahrik etmektedir. Dişliler eksantrik hareketten dolayı bir dönme hareketi kazanmaktadır. Gövde üzerinde ise gövde makaraları yer almakta ve bu makaralar bir iç sikloid dişli görevi üstlenmektedirler. Sikloid dişliler ile bu makaralar ile eşlenik olarak çalışmaktadır. Dönme hareketi kazanan sikloid dişliler, gövde makaraları içerisinde giriş milinin tersi yönünde yuvarlanmaya başlarlar. Çıkış makaraları ise çıkış milinin üzerindeki yer almaktadır ve sikloid dişliler üzerinde yer alan açıklıklara konumlandırılmışlardır. Sikloid dişliler, yuvarlanma hareketini çıkış makaralarına aktararak çıkış milinin

dönmesini sağlamaktadır. Sikloid dişlilerin yaptığı eksantrik yuvarlanma hareketi sayesinde giriş mili ve çıkış milinin hızları arasında dişli kutunun çevrim oranı katı kadar bir fark oluşmaktadır.



Şekil 1. Sikloid dişli kutusu temel elemanları

Sikloidal dişli ve dişli kutusu günümüzde birçok araştırmaya konu olmuştur. Diş profillerinin geometrisi, çalışma toleransları, dişli boşlukları, temas analizleri, üretim yöntemleri, oluşan kuvvetler ve yük dağılımı, kinematik ve verimlilik inceleme yapılan konular arasındadır. Özellikle verimlilik, sikloidal dişli kutusunun tasarlanmasında çok önemli bir yönü temsil eder. Verimliliğin matematiksel modellemesi üzerinde çalışan ilk araştırmacı ise Kudrijavcev'dir. Planet aktarımlar ile ilgili kitabında sikloid redüktörler için önemli bir bölüm ayırmıştır (Kudrijavcev, 1966). Daha sonra bu matematiksel modelin deneyler ile doğrulaması yapılmıştır (Blagojevic, 2012). Malhotra, Kudrijavcev'in matematiksel modelini temel alarak sikloid dişlinin her bir gövde ve çıkış makarasındaki kayıplarını ayrı ayrı dikkate alan yeni bir matematiksel model geliştirmiştir (Malhotra, 1983). İlerleyen yıllarda ise Malhotra'nın verimliliği belirleme yönteminin deneysel doğrulaması gerçekleştirilmiştir (Mihailidis ve ark., 2014). Gorla ve arkadaşları, yenilikçi bir redüktör tasarımı ile deneysel ve teorik sonuçları kıyaslamıştır. Elde edilen sonuçlardan ise yeni bir matematiksel model oluşturulmuştur (Gorla ve ark., 2008). Yakın dönem çalışmalarda verimlilik için çeşitli testler gerçekleştirilmiştir. Verimlilik ile ilgili çalışmalardan bir tanesi verimin giriş torkuna etkisidir (Kosse, 2007). Bir diğer çalışma konusu ise sürtünmenin sikloid redüktörlerin verimliliği üzerindeki etkisidir (Blagojevic, 2012). Geometrik tasarım parametrelerinin de verim üzerindeki etkisi araştırılmıştır (Mackic, 2013).

Literatürde sikloid dişli kutuları ile ilgili dişli profilinin geometrisi, oluşan kuvvetler ve stresler, kinematik, üretim teknikleri, üretim hataları, yüzey kalitesi, profil toleransı, temas analizi, tasarım optimizasyonu, verim ve verimi etkileyen faktörler gibi birçok konuda çalışmaların yapıldığı görülmüştür. Bu çalışmada ise, sürtünme katsayısındaki değişimin verim üzerindeki etkisi hareket analizi yazılımı Solidedge Motion ile incelenmiştir.

GEOMETRİ ve TASARIM

Sikloid dişli aktarımları, planet dişli mekanizmalarının bir türüdür. Dış dişli olarak sikloid dişli kullanılırken, iç dişli olarak gövde pimleri kullanılmaktadır. Genelde tasarımsal olarak gövde pimleri sayısı z_2, sikloid dişlinin diş sayısı z_1'in bir fazlasıdır. Dişli kutusunun çevrim oranı Denklem 1 ile hesaplanır.

$$i = \frac{z_1}{z_2 - z_1}$$

Burada i dişli kutusunun çevrim oranını ifade etmektedir. Sikloid eğrisinin episikloid, hiposikloid ve ortosikloid gibi farklı türleri bulunmaktadır. Sikloid dişlilerin geometrisi için

kullanılan eğri ise kısaltılmış episikloid eğrisidir. Episikloid eğri büyük bir çember etrafında kayma olmaksızın yuvarlanan küçük bir çemberin üzerindeki bir noktanın oluşturduğu yoldur. Sikloid dişli profili oluşturulurken ilk olarak teorik profil oluşturulur. Dişlinin teorik profilini oluşturan ifade ise Denklem 2'de verilmiştir. (Alipiev, 1988)

$$x_t = \frac{m}{2}[(z_1+1)\,sin\,\theta - \,(1-x)sin(z_1+1)\,\theta]$$

$$y_t = \frac{m}{2}[(z_1+1)\,cos\,\theta - (1-x)\,cos(z_1+1)\,\theta]$$

Burada x_t ve y_t teorik profilin koordinatlarını, m dişli modülünü, x profil düzeltme faktörünü ve θ ise profili oluşturan açıyı temsil etmektedir. Gerçek profil, teorik profile eşit uzaklıktaki bir profilidir. Teorik profilin modifikasyonu ile elde edilen ve gerçek profili veren ifade Denklem 3'te verilmiştir (Alipiev, 1988).

$$x_w = \frac{m}{2}[(z_1+1)\,sin\,\theta - (1-x)\,sin(z_1+1)\,\theta \; + \; \frac{2\,r_M^*\,[(1-x)\,sin(z_1+1)\,\theta \; - sin\,\theta]}{\sqrt{1-2(1-x)\,cos\,z_1\,\theta+(1-x)^2}}]$$

$$y_w = \frac{m}{2}[(z_1+1)\,cos\,\theta - (1-x)\,cos(z_1+1)\,\theta + \; \frac{2\,r_M^*\,[(1-x)\,cos(z_1+1)\,\theta \; - cos\,\theta]}{\sqrt{1-2(1-x)\,sin\,z_1\,\theta+(1-x)^2}}]$$

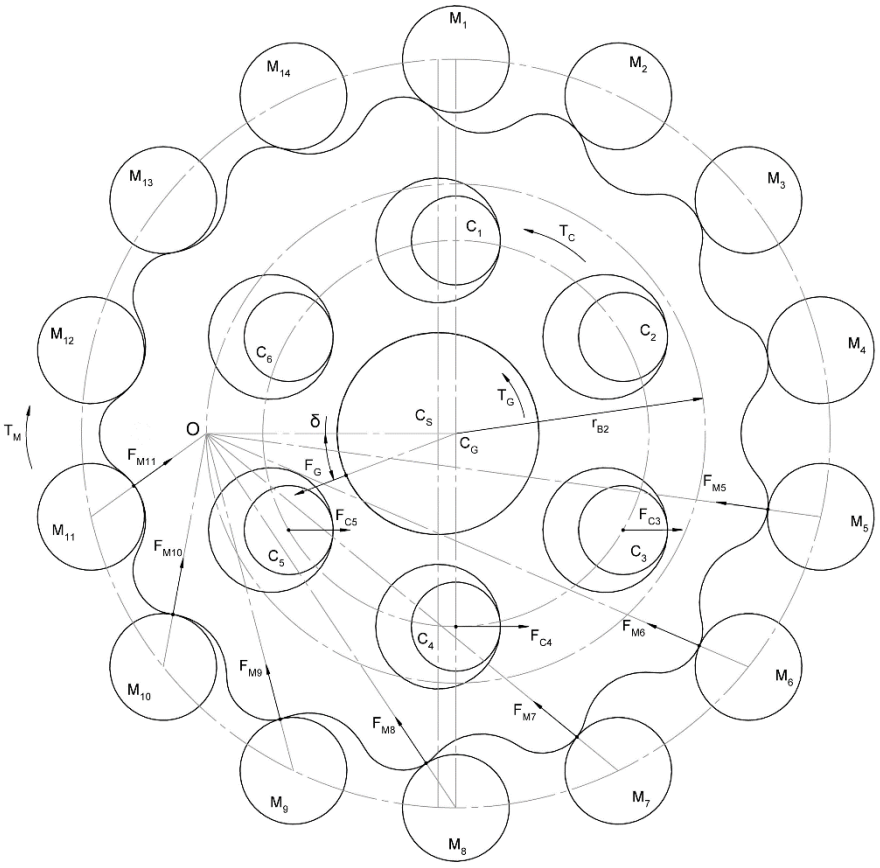
Denklemde geçen r_M^* gövde pimi yarıçapı düzeltme katsayısını ifade etmektedir ve genellikle $r_M^* = 1$ olarak alınır. Dişli kutusunun tasarımında ilk olarak aktarım oranı belirlenir. Daha sonra aktarılacak momentin büyüklüğüne göre modüle karar verilir. Bir sonraki adımda ise eksen kaçıklığı ve profil düzeltme faktörü hesaplanır. Düşük bir profil düzeltme faktörü daha büyük bir hareket aktarımı açısı ve daha verimli bir hareket iletimi sağlamaktadır. Bunun yanında yüksek bir profil düzeltme faktörü dişlinin giderek yuvarlak bir şekle yaklaşması sebebiyle titreşimleri azaltmaktadır. Temel faktörler belirlendikten sonra dişlinin boyutlandırılması yapılır. Aşağıdaki Tablo 1'de tasarımı yapılan ve tasarım için kullanılan parametreler verilmiştir:

Tablo 1. Tasarım Parametreleri

Tanım	Sembol	Değer	Birim
Dişli Modülü	m	9	mm
Dişli Diş Sayısı	z_1	13	-
Gövde Makarası Sayısı	z_2	14	-
Gövde Makaralarının Çapı	d_M	18	mm
Gövde Makaralarının Yerleşim Yarıçapı	r_2	58,5	mm
Profil Düzeltme Faktörü	x	0,333	-
Eksen Kaçıklığı (Eksantriklik)	e	3	mm
Çıkış Makaralarının Yerleşim Yarıçapı	r_C	32,5	mm
Çıkış Makaralarının Çapı	d_P	15	mm
Sikloid Dişli Çıkış Deliklerinin Yarıçapı	r_S	21	mm

KUVVETLER ve VERİM

Sikloid dişli kutularının verimlilik analizi oldukça karmaşık bir problemdir. Bu konu üzerine birçok çalışma yapılmıştır. Mevcut çalışmaların çoğunluğu diş profilinden kaynaklanan kayıplara odaklanmıştır. Verimin belirlenebilmesi için öncelikli olarak oluşan kuvvetlerin belirlenmesi gerekmektedir. Dişli kutusundaki temaslar sonucu tepki kuvvetleri oluşmaktadır. Kuvvetlerin etkisi ile sürtünmeler oluşmakta ve bu bölgelerde güç kayıpları meydana gelmektedir. Dişli kutusunda en kritik öneme sahip parça sikloid dişlidir. Çünkü sikloid dişli, gövde makaraları, giriş mili ve çıkış makaraları ile sürekli temas halindedir. Temaslar sonucu oluşan bu tepki kuvvetleri Şekil 2'de gösterilmiştir.



Şekil 1. Sikloid dişli kutusunda oluşan kuvvetler

Şekilde gösterilen F_G sikloid dişli ile giriş mili arasındaki tepki kuvvetini, F_M sikloid dişli ile gövde makaraları arasındaki tepki kuvvetini ve F_C ise sikloid dişli ile çıkış mili pimleri arasındaki tepki kuvvetini simgelemektedir. Dişli kutusunun verimi ise teorik olarak Denklem 4'te verilen genel ifade ile hesaplanır:

$$n = \frac{P - K_T}{P}$$

Bu denklemde geçen P giriş gücünü, K_T ise dişli kutusundaki toplam güç kaybını ifade etmektedir. Dişli kutusundaki kayıplar yüke bağlı ve yükten bağımsız olmak üzere iki gruba ayrılmaktadır. Yükten bağımsız kayıplar, sızdırmazlık ve yataklama elemanlarından gibi bileşenlerden kaynaklanan kayıplardır. Bu kayıpların genel verim üzerindeki etkisi düşüktür ve çalışma kapsamında ihmal edilmiştir. Yüke bağlı kayıplar ise temas bölgelerindeki kuvvetler ve sürtünme katsayısına bağlı olarak değişmektedir ve Denklem 5 ile ifade edilmiştir.

$$K_T = K_1 + K_2 + K_3$$

Bu ifadede yer alan K_1 giriş mili ile sikloid dişli arasındaki güç kaybını, K_2 sikloid dişli ile çıkış mili üzerinde yer alan pimler arasındaki güç kaybını ve K_3 ise sikloid dişli ile gövde makaraları arasındaki güç kayıplarını simgelemektedir. K_1 güç kaybı Denklem 6 ile hesaplanır: (Gorla ve ark., 2008)

$$K_1 = \mu \,.F_G.r_G.(w_{in} - w_{out})$$

İfadede yer alan μ sürtünme katsayısını, r_G sikloid dişli göbek yarıçapını, w_{in} ve w_{out} ise eksantrik rulman iç ve dış bileziklerinin açısal hızını ifade etmektedir. Dişli kutusunda bu bölgede rulman kullanılması sebebiyle güç kaybı düşüktür ve toplam verim üzerindeki etkisi azdır. Bu sebeple analizlerde rulman modeli kullanılmamış ve buradaki sürtünme kaybı ihmal edilmiştir.

Dişli pozisyonuna göre gövde ve çıkış pimlerinde baskı kuvvetlerinden dolayı yarısı yük taşırken, diğer yarısında ise yüke maruz kalmaz. Çıkış pimlerinde oluşan K_2 güç kaybı ise Denklem 7 ile ifade edilir (Mihailidis ve ark., 2014).

$$K_2 = \sum_{i=1}^{q} \mu \,.\, F_{C_i}.\, v_C$$

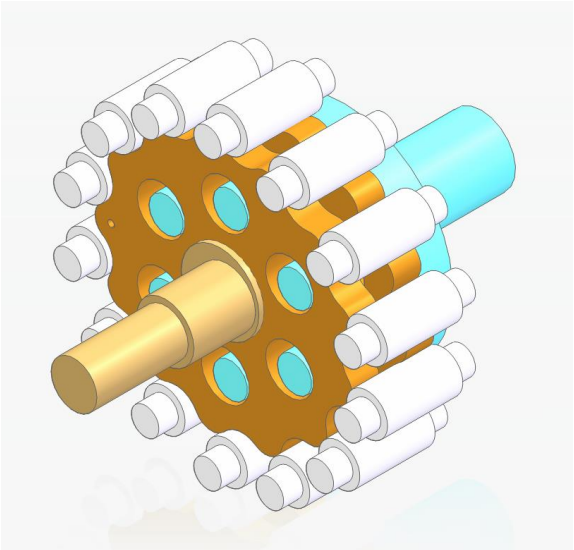
Burada yer alan q çıkış makarası sayısını, v_C ise çıkış pimleri ile sikloid dişli arasındaki bağıl hızı ifade etmektedir. K_3 güç kaybı ise Denklem 8 ile hesaplanır (Mihailidis ve ark., 2014).

$$K_3 = \sum_{j=1}^{z_2} \mu \,.\, F_{M_j}.\, v_S$$

Bu ifadede yer alan v_S sikloid dişli ile gövde makaraları arasındaki bağıl hızı simgelemektedir.

ANALİZ

Dişli kutusunun hareket analizi, Solidedge Motion yazılımı ile yapılmıştır. Tasarımı yapılan dişli kutusunun analizde kullanılabilmesi için bileşenler üzerinde sadeleştirme yapılmıştır ve temel bileşenler dışındaki bileşenler analizlere dâhil edilmemiştir. Analizlerde bileşenler, bileşenler arası ilişkiler, dişli kutusu için giriş ve çıkış sınır şartları tanımlanmıştır. Tasarımı yapılan ve analizlerde kullanılan sistem Şekil 3'te gösterilmiştir. Analizler farklı sürtünme katsayıları için tekrarlanmıştır. Ve kullanılan sürtünme katsayıları Tablo 2'de gösterilmiştir.



Şekil 3. Analizi gerçekleştirilen sistemin 3 boyutlu modeli

Tablo 2. Analizlerde Kullanılan Sürtünme Katsayıları

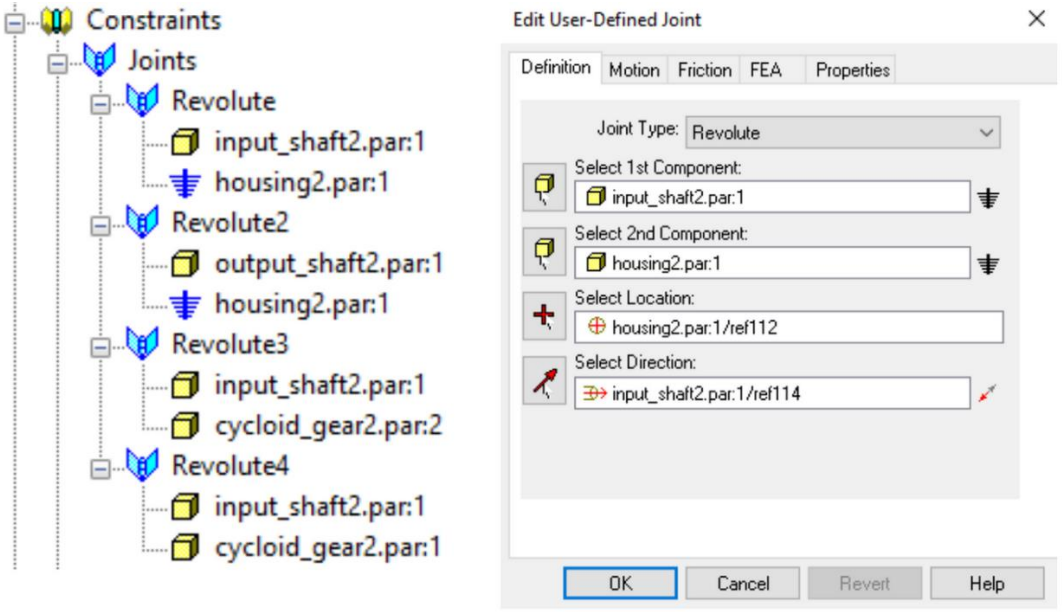
Analiz No	Analiz 1	Analiz 2	Analiz 3	Analiz 4	Analiz 5
Sürtünme Katsayısı	0	0,05	0,1	0,15	0,2

Analizde ilk adım olarak hareketli ve sabit parçalar belirlenmiştir. Gövde ve gövde pimleri sabit parçalar olarak belirlenirken, dişliler ve miller hareketli parçalar olarak tanımlanmıştır. İkinci adım olarak ise kısıtlamalar başlığının altındaki bağlantılar bölümünde (joints) hareketli parçalar ile sabit parçalar arasındaki bağlantılar tanımlanmıştır. Tanımlanan bağlantılar aşağıda belirtilmiştir.

- Giriş milinin gövde ile eş eksenli olması ve bu eksende dönme hareketi yapabilmesi,
- Çıkış milinin gövde ile eş eksenli olması ve bu eksende dönme hareketi yapabilmesi,
- İlk sikloid dişlinin, giriş milinin ilk eksantrik kısmı ile eş eksenli olması ve bu eksende dönme hareketi yapabilmesi,
- İkinci sikloid dişlinin, giriş milinin diğer eksantrik kısmı ile eş eksenli olması ve bu eksende dönme hareketi yapabilmesidir.

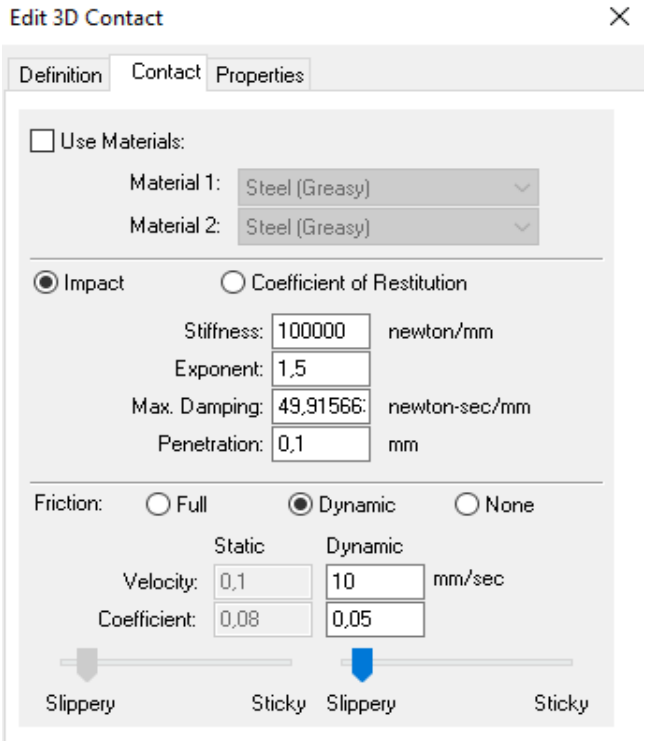
Bağlantı detaylarında ise bağlantı türü döner bağlantı (revolute) seçilmiştir. Bağlantı elemanlarının malzemeleri çelik olarak tanımlanmış ve bu bağlantılardaki sürtünmeler ihmal edilmiştir. Çünkü gerçek

çalışma koşullarında bu hareketler rulmanlar üzerinde gerçekleşmektedir. Burada gerçekleşen kayıplar dişli kutusundaki toplam kayıpların küçük bir bölümünü oluşturmaktadır. Yazılımda oluşturulan bağlantılar ve bağlantı detayları Şekil 4'te verilmiştir:



Şekil 4. Bağlantılar ve bağlantı detayları

Üçüncü adım olarak kısıtlamalar başlığı altındaki temaslar bölümünde (contacts), hareket halinde birbirleri ile temas kuran parçaların ilişkileri tanımlanmıştır. Dişli kutusunun çalışması esnasında sikloid dişli, gövde pimleri ve çıkış mili ile sürekli temas kurmaktadır. Yazılımda gövde makaraları-sikloid dişli ve çıkış pimleri-sikloid dişli arasındaki temaslar tanımlanmıştır. Dişli kutusundaki kayıpların en önemli bölümü bu temas bölgelerinde oluşan kayıplardır. Bu bölgelerdeki sürtünme katsayıları değiştirilerek analizler tekrarlanmıştır. Çıkan sonuçlarda sürtünme etkisinin kayıpları nasıl etkilediğini gözlemlenmiştir. Temas detaylarında dişli kutusunun belirli bir hızda çalışma hali düşünülerek statik sürtünme ihmal edilmiş ve dinamik sürtünme aktif edilmiştir. Temas detayları ise Resim 5'te gösterilmiştir.

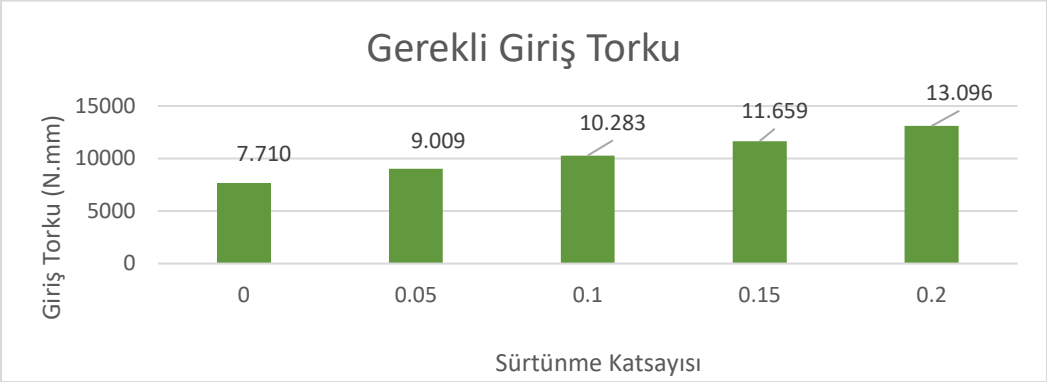


Şekil 5. Temas detayları

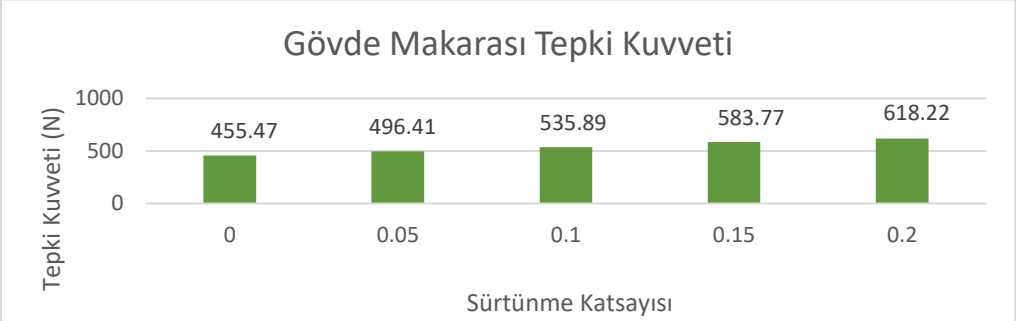
Dördüncü adım olarak dişli kutusuna hareket kaynağı tanımlanmıştır. Hareket kaynağı olarak giriş mili referans gösterilmiş ve 780°/s olarak saat yönünün tersine olacak şekilde sabit hız tanımlanmıştır. Beşinci adım olarak sistemin verimini ölçebilmek için sisteme bir yük uygulanmıştır. Yük olarak kuvvetler (forces) başlığının altında bulunan sadece eylem sekmesinden (action only) çıkış miline 100 N.m moment uygulanmıştır. Bu sayede sistemin bu yükü çevirebilmesi için gerekli olan giriş torku büyüklüğü hesaplatılmıştır. Son olarak sistemin analizleri yapılmış ve sonuçların çıktısı alınmıştır.

BULGULAR ve TARTIŞMA

İlk çıktı olarak çevrim oranının kontrolü için çıkış milinin hız çıktısı alınmıştır ve 10 rpm olarak elde edilmiştir. Elde edilen diğer çıktılar ise sistem için gerekli tork grafiği ve gövde makaralarında oluşan tepki kuvvetleridir. Bu çıktılar ise Şekil 6 ve 7'de gösterilmiştir:



Şekil 6. Sürtünme katsayısı ve giriş torku ilişkisi



Şekil 7. Sürtünme katsayısı ve giriş momenti ilişkisi

Sikloidal dişli kutularındaki kayıpların en önemli sebebi ise sürtünmedir. Bu çalışmada bir sikloidal dişli kutu tasarımı yapılmış ve bu dişli kutusunun farklı sürtünme değerleri altındaki verimi Solidedge Motion yazılımı ile analiz edilmiştir. Analizlerde giriş hızı ve çıkış torku sabit tutularak sistemi hareket ettirebilmek için gerekli olan tork değeri (giriş tork değeri), çıkış mili hızı ve gövde makaralarında oluşan tepki kuvvetleri çıktı olarak alınmıştır. Aşağıdaki Tablo 3'te analizler sonucu elde edilen verim değerleri paylaşılmıştır.

Tablo 3. Analizler Sonucu Elde Edilen Verim Değerleri

Sürtünme Katsayısı	0	0,05	0,1	0,15	0,2
Hesaplanan Verim (%)	99,7	85,4	74,8	66,0	58,7

SONUÇ

Analiz sonuçlarından da görüldüğü gibi sürtünme katsayısındaki artış dişli kutusunun veriminde önemli bir kayba neden olmaktadır. Sürtünme katsayısındaki artış aynı zamanda temas bölgelerinde oluşan tepki kuvvetlerini de artırmaktadır. Tepki kuvvetlerindeki artış, elemanlar üzerinde oluşan gerilmenin de artmasına sebep olmaktadır. Elde edilen verim kaybı değerlerinin, literatürdeki çalışmalar ve bazı firmaların katalog değerleri ile paralellik gösterdiği gözlemlenmiştir.

Abstract

2-[(1-acetyl-3-ethyl-4,5-dihydro-1*H*-1,2,4-triazol-5-one-4-yl)-azomethine]-phenyl furan-2-carboxylate was synthesized by the reaction of 2-formylphenyl furan-2-carboxylate with 3-ethyl-4-amino-4,5-dihydro-1*H*-1,2,4-triazol-5-one in excellent yields. Theoretically spectral values of 2-[(1-acetyl-3-ethyl-4,5-dihydro-1*H*-1,2,4-triazol-5-one-4-yl)-azomethine]-phenyl furan-2-carboxylate were calculated. The geometries of the studied molecules were plotted using the GaussView 5.0 computer program. ^{1}H-NMR and ^{13}C-NMR values were calculated theoretically in gas phase and DMSO solvent according to the GIAO method. ^{1}H-NMR and ^{13}C-NMR values were calculated experimentally in DMSO solvent only. Theoretically calculated IR values of titled compound were calculated using of B3LYP/6-311G(d,p) basis sets in gas phase and are multiplied with appropriate scale factors and the values obtained according to B3LYP method is formed using theoretical infrared spectrum. Veda4f program was used to define the calculated IR values. The obtained values were compared with experimental values. The calculated and experimental results were exhibited a very good agreement. Also, electronic properties of the related molecule such as energy gap ($\Delta E=E_{LUMO}-E_{HOMO}$), chemical potential ($\mu$), electrophilic index ($\omega$), ionization potential (IP), electron affinity (EA), electronegativity (χ), molecular softness (S), molecular hardness (η) were obtained with same basis set.

Keywords: Furan-2-carboxylate, Gaussian 09W, Electronic, Spectroscopic.

INTRODUCTION

Schiff base compounds are used as starting materials in the synthesis of important drugs, such as antibiotics and antiallergic, antiphlogistic, and antitumor substances (Barton &Ollis, 1979; Ingold, 1969; Layer, 1963; Taggi et.al., 2002). Schiff bases are also becoming increasingly important in the dye and plastic industries as well as for the liquidecrystal technology and mechanistic investigation of drugs used in pharmacology, biochemistry and physiology (Sheikhshoaie & Sharif, 2006). In the past years, by increasing development of computational chemistry, theoretically properties of Schiff bases were investigated (Beytur et al., 2020; Uğurlu and Beytur 2020, Uğurlu 2020). Quantum chemical calculation methods have widely been used to theoretically predict the structural, spectroscopic, thermodynamic and electronic properties of molecular systems. The quantum chemical calculation methods provide support for experimental structural and spectroscopic studies (Yüksek et.al., 2005a; Yüksek et.al., 2005b; Yüksek et.al., 2008a; Yüksek et.al., 2008b; Turhan Irak and Beytur, 2019). Experimental data of 2-[(1-acetyl-3-ethyl-4,5-dihydro-1*H*-1,2,4-triazol-5-one-4-yl)-azomethine]-phenyl furan-2-carboxylate were described in the literature (Gürbüz et al., 2020). In the present paper, theoretical values of compound were calculated theoretically on the computer. Molecule was optimized by using the B3LYP 6311G (d,p) method and basis set (Frisch et al., 2009; Wolinski, Hilton & Pulay, 1990). Starting from this optimized structure with ^{1}H-NMR and ^{13}C-NMR spectral data according to GIAO (Wolinski et al., 1990) method was calculated using the method of Gaussian G09W program package in DMSO. Theoretically and experimentally values (Gürbüz et al., 2020) were plotted according to exp =a +b. δ calc Eq. a and b constants regression coefficients with a standard error values were found using the SigmaPlot program. The correlation graphs for chemical shifts drawn with ^{1}H-NMR(DMSO) and ^{13}C-NMR(DMSO) spectral data of the molecule. Theoretically calculated IR data are multiplied with appropriate adjustment factors (Merrick et.al., 2007) and the data obtained

according to DFT method are formed using theoretical infrared spectrum. The identification of calculated IR data was used in veda4f program (Jamróz, 2004). Additionally, the HOMO (the highest occupied molecular orbitals)-LUMO (lowest unoccupied molecular orbitals) energy of this compound was found by using same basis sets.

MATERIALS AND METHODS

The quantum chemical calculations were carried out with Density Functional Theory (DFT) method using 6311G (d,p) basis set at the Gaussian 09W program package on a computing system (Frisch et al., 2009). Firstly, the compound was optimized by using the B3LYP 6311G (d,p) basis set (Frisch et al., 2009; Wolinski, Hilton & Pulay, 1990). Thus, the most stable geometrical comformer of compound was obtained. Then, ^{1}H-NMR and ^{13}C-NMR isotropic shift values were calculated with method of GIAO (Wolinski et al., 1990). The veda4f program was used in defining IR data (Jamróz, 2004). Otherwise, the HOMO-LUMO energy of compound were calculated theoretically on the computer.

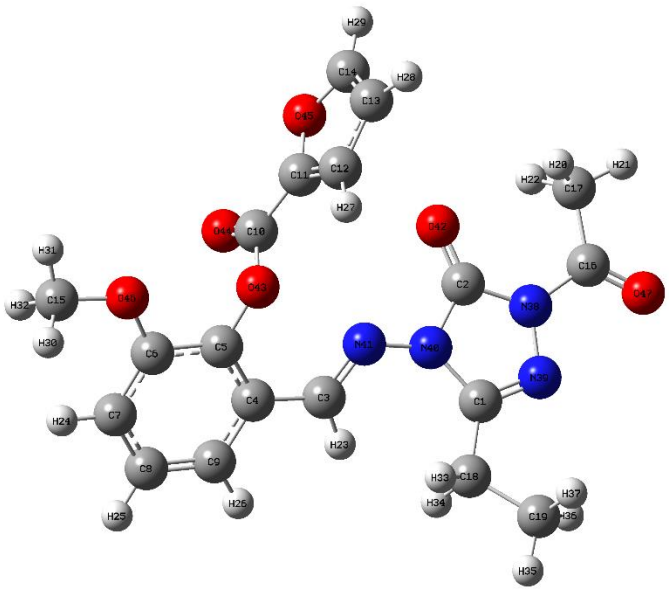

Figure 1. The optimized structure of the molecule with DFT/B3LYP/6311G(d,p) level

RESULTS and DISCUSSION

NMR Spectral Analysis

In the study, ^{1}H-NMR and ^{13}C-NMR chemical shift values of 2-[(1-acetyl-3-ethyl-4,5-dihydro-1*H*-1,2,4-triazol-5-one-4-yl)-azomethine]-phenyl furan-2-carboxylate are obtained from optimized structures with minimum energy. Chemical shift values of the titled compounds were obtained by using the optimized structure of B3LYP method using Gauge-Independent Atomic Orbital (GIAO) NMR approach using 6-311G(d,p) base set in DMSO solvent phase (Table 1). ^{13}C-NMR and ^{1}H-NMR chemical shift values were calculated regression analysis by using the least squares method with experimental data (Gürbüz et al., 2020). The obtained R^2 values were found to be nearly 1 especially in ^{13}C-NMR and ^{1}H-NMR data (Figure 2).

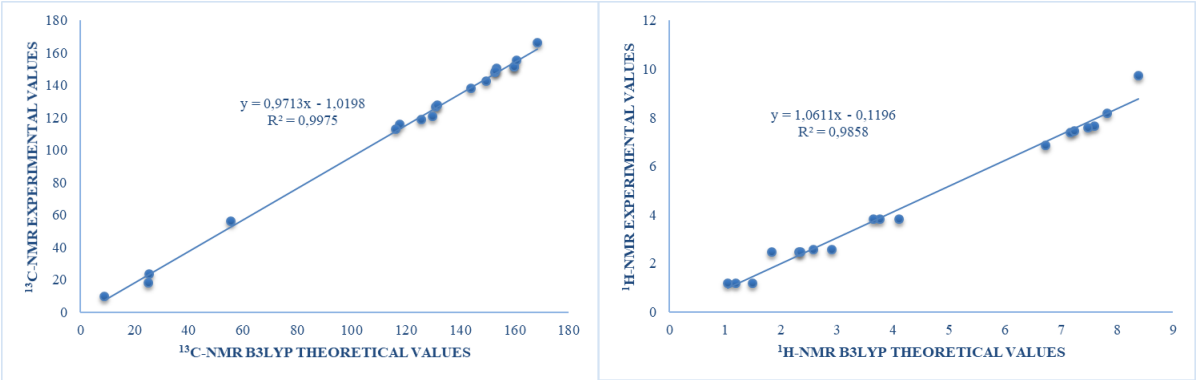

Figure 2. Regression analysis of the theoretical values calculated with experimental data of ^{13}C-NMR and ^{1}H-NMR chemical shift values by B3LYP method and 6-311G(d.p) basis set

The vibration frequency of the compound

Theoretically IR values were calculated with the veda4f program. Theoretically calculated IR data are multiplied with appropriate adjustment factor 0.9617 for DFT/6311G(d,p) basis set. The negative frequency in the data was not found (Table 2). This result shows that the structure of compound was shown to be stable. IR spectrum were drawn with obtained values according to DFT method (Figure 3). Theoretical IR values were compared with experimental IR counterparts (Gürbüz et al., 2020). The result of this compare were found corresponding with each other of values. Experimental carbonyl peak (C=O) (Gürbüz et al., 2020) was found in 1694, 1747 cm^{-1} and theoretical (C=O) peak was found in 1732, 1741 cm^{-1} for 6311G(d,p).

Electronic Properties

In these chemical reactions, The electronic properties were calculated by applying the 6-311G(d,p) polarized basis set and the B3LYP method to the molecule (Fukui, 1982) (Figure 4). From the calculated HOMO-LUMO energies, electronic parameters values were determined (Table 3).

CONCLUSION

In the paper, 2-[(1-acetyl-3-ethyl-4,5-dihydro-1*H*-1,2,4-triazol-5-one-4-yl)-azomethine]-phenyl furan-2-carboxylate was optimized by using Gaussian G09W software. The optimized titled compound was obtained in DMSO solvent by using B3LYP method with 6-311G(d,p) basis level. The ^{1}H and ^{13}C NMR chemical shift values were calculated at the same level by using Gauge-Independent Atomic Orbital method. It has been seen that the theoretical values and the experimental values are compatible. The harmonic vibrational frequencies were calculated by using B3LYP method with the 6-311G(d,p) basis set. It has been seen that the theoretical values and the experimental values are compatible. Finally, The electronic properties were calculated by applying the 6-311G(d,p) polarized basis set and the B3LYP method to the molecule from the calculated HOMO-LUMO energies. An accurate estimate of the zero-point vibrational energy and entropy is multiplied by the data.

Abstract
The temperatures of the products that need to be transported in certain temperature ranges in cold chain logistics require traceability throughout the entire process until they reach the consumers. This study aims to investigate the improvements in cold chain processes, especially for dairy companies, to determine the applicable ones and to perform an example improvement with an application.
In this project, firstly, the previous works carried out within the scope of providing instant tracking, traceability, and control in IoT-based cold chain processes in the literature were examined. In unconscious chain processes, the internet of things, whose importance has increased significantly with Industry 4.0 studies all over the world, aims to ensure real-time control of information, monitoring, and planning of the process by minimizing human error.
In this study, the contributions of Internet of Things (IoT) technology to the storage of cold food products as they are produced until they reach the end user are discussed by making use of literature research. The efficiency of IoT applications along with lean manufacturing techniques has been examined. According to these studies, it has been determined that integrating lean production and IoT components and their use in the process significantly increases efficiency. In addition, a sample study was designed using the Arduino platform.
Keywords: Cold Chain, Internet of Things (IoT), Process Improvement, Lean Manufacturing Techniques, Logistics

Özet
Soğuk zincir lojistiğinde, belirli sıcaklık aralıklarında taşınması gereken ürünlerin sıcaklıkları, tüketicilere ulaşana kadar olan tüm süreç boyunca izlenebilirliği zorunlu kılmaktadır. Bu çalışmanın amacı, soğuk zincir süreçlerini özellikle günlük ürünleri üreten işletmeler için iyileştirmeleri araştırarak uygulanabilir olanları belirlemek ve bir uygulama ile örnek iyileştirme gerçekleştirmektir. Projede öncelikle literatürde var olan IoT tabanlı soğuk zincir süreçlerinde anlık takibin izlenebilirliğin ve kontrolün sağlanması kapsamında daha önce yapılmış çalışmalar incelenmiştir. Soğuk zincir süreçlerinde özellikle tüm dünyada Endüstri 4.0 çalışmaları ile birlikte önemi artan nesnelerin interneti, insan hatasını en aza indirerek, bilginin gerçek zamanlı kontrolünü, sürecin takibini ve planlanmasının sağlanmasını amaçlamaktadır.
Bu çalışmada, literatür araştırmasından faydalanılarak, Nesnelerin İnterneti (IoT) teknolojisinin soğuk gıda ürünlerinin son kullanıcıya ulaşana dek üretildiği şekilde saklanmasında sağladığı katkılar ele alınmıştır. Yalın üretim teknikleri ile birlikte IoT uygulamalarının verimliliği incelenmiştir. Bu çalışmalara göre yalın üretim ve IoT bileşenlerinin entegre edilerek süreçte kullanılmasının verimi önemli bir şekilde artırdığı saptanmıştır. Ayrıca Arduino platformu kullanılarak örnek bir çalışma kurgulanmıştır.
Anahtar kelimeler: Soğuk Zincir, Nesnelerin İnterneti (IoT), Süreç İyileştirme, Yalın Üretim Teknikleri, Lojistik

INTRODUCTION

Temperature-sensitive products need to be well preserved against decomposition and negative heat conditions which causes perishing as a result. Exceeding the temperature limitations stated for perishable items, causes the start of microbiological development, a significant drop in food quality, spoiling, and an increase in the risk of food poisoning. "In the complex food transportation system, the earlier an undetected problem is introduced into the system, the higher the risk (as measured by exposure likelihood and impact); that is, a problem that is introduced at an earlier stage in the supply chain can spread out to many distributors, retailers and then to consumers just because of the structure of the system. For example, [in 1994], an estimated quarter of a million Americans got gastroenteritis after eating Schwan's ice cream the

largest outbreak of Salmonella poisoning in the United States ever traced to a single source." (Ackerley et al., 2010)

Exposure and failures must be eliminated. Instead of focusing on manufacturing processes, storage sequences and distribution cycles should be fixed and enhanced by using some specific items which are used for WSN and can last for longer durations, cooling adjustments, and achieving lower costs. "Process improvement methods are a group of activities that complement each other and provide performance improvement for those who manage and those who are managed. It is applied to realize the problems that may arise in the processes and to find solutions." (Kovancı, 1999)

Exposure and failures must be eliminated. Instead of focusing on manufacturing processes, storage sequences and distribution cycles should be fixed and enhanced by using an Arduino model which is implemented into both of them, cooling adjustments will be made and lean manufacturing techniques will be taken into consideration. As a result, efficient management and lower costs will be achieved in the dairy product industry. One of the most notable advantages of adopting IoT in this study is instant temperature monitoring. While the IoT measures temperature and humidity in real time, the second system is activated when a temporary breaking is detected during vehicle movement and also before the breakage. Drivers in vehicles receive notifications and warnings during a crisis, and they may examine the data at any moment from the app. Similarly, warnings are issued to the necessary employees in the factory while tracking the products throughout the process, and they can manage the process quickly and manually if they desire, using a simple interface.

This is the goal of the solution. **"**Food safety and shelf life are greatly influenced by the proper establishment of the cold chain and its ability to continue without breaking. As a result, temperature monitoring throughout the chain is critical." (İpekçi and Tanyaş, 2021)

It aims for successful and efficient deliveries which benefit both company and its customers. While customers are getting good quality products, the company minimizes its expenses on cooling processes with the supply of IoT systems. It provides surveillance for any changes during storing phase which also negates any loss on products. "Activating product supply and delivering goods and services to the end user with the lowest cost and efficient applications are important ways to achieve sustainable business processes." (Seuring and Müller, 2008). "Sustainable cold chain management is to ensure that temperature-sensitive foods move through the supply chain in the appropriate temperature range and to deliver the highest quality and nutritional value to the consumer with the least use of resources. In this context, preventing breaks in the cold chain will contribute to social, environmental, and economic sustainability dimensions." (Türk and Öztek, 2021)

The history of the problem is all about external factors which decrease the quality of the products. Taking precautions and producing solutions to this situation helps to resolve these external factors. Implementing IoT system, using lean manufacturing techniques. A system that is designed to allow both employees and officials to monitor the products. In this project, an Arduino-based system will be installed and the data will be kept on the MongoDbCompass application. ESP32 card and temperature sensor will be used. The event stream will be done via Node-Red Dashboard and Ardutooth mobile application. It will send real-time data to the application at certain intervals of temperature values and humidity. It will have LED indicators and will give a warning under certain conditions. The system can be controlled via the application. When the system is below a certain temperature, the backup system will be activated and the cooling process will continue temporarily. In this way, the break in the cold chain will be prevented. In short, the process will be followed from beginning to end. A prototype model will be created on the Arduino IDE Compiler program to test the components.

In the study, a solution for the implementation process is presented with the reasons why Lean Production was chosen. The first part of this study contains the research purpose, literature review, and an example project, the second part contains the material and method, the third part contains the project studies and application, and the fourth part contains the study's findings and results.

Research Objective

In the Cold Chain process, from the collecting of raw materials to the delivery of the product to the ultimate customer, precise and immediate assessment of food safety-related criteria is very critical including stock

control, sales/distribution, warehouse management, transportation control, load/vehicle planning, and so on. The optimization of operational tasks requires proper planning.

Real-time monitoring of data from sensors on the product, packaging, vehicle, or facility in cold chain logistics (CCL) enables the identification of product spoiling incidents, which is critical for food and liquids. For example, sensors can continuously monitor temperature and humidity within warehouses or cold stores to ensure the freshness of perishable products (fruits, vegetables, frozen food), and actuators can adjust these values to improve food preservation (Borgia, 2014)

CCL monitoring has been done using a variety of technologies and methodologies over the years. For a variety of temperature-sensitive items, CCL uses Radio Frequency Identification (RFID) solutions. However, by offering real-time traceability and visibility of physical assets, the introduction of wireless sensor networks (WSN), RFID, and the internet of things (IoT) paradigms might provide a wonderful opportunity to be conscious of CCL.

The monitoring and recording of location, amount, temperature, pH, water ratio, and other unique factors in the process from the purchase of the product's raw material to its consumption are known as traceability in cold chains. Perishable product tracking technologies include barcodes, RFID, GPS, vehicle tracking systems, and microelectromechanical systems. Virtualization allows for the monitoring of cold chain processes using Internet of Things technology. It helps the organization/company deal with perishable items, fluctuating demand, food safety, and sustainability concerns. "The Internet of Things enables cold chain logistics operators to remotely monitor, control, plan, and optimize business activities in real-time. (Badia-Melis et al., 2015)

This research intends to develop an IoT-enabled CCL management system that can help both logistics providers and clients make better decisions by optimizing operational procedures, lowering costs, and decreasing risks through real-time and continuous monitoring. On the other hand, minor problems and some constraints can be occurred as:

- IoT systems can lose their power on the cold chain and making it impossible to track current conditions for ice creams.
- IoT system can be set up around WSN and according to the majority of pallets used for storing, that will require more budget to function which is not ideal.
- Some human errors most likely may happen. For instance; being careless on the system, not following the transferred data, or responding too late.
- Refrigeration service may be temporarily disrupted both in the warehouse and CCL.

To solve this, the precautions mentioned below should be considered:

- If a system failure happens, a notification will send to the driver and operation center, making the driver to reach out the closest assistance point to get assistance. If this happens in a warehouse, maintenance staff will arrive and fix the problem.
- Sensors should be obtained for cheaper prices, but if this condition is not met, pallet adjustments can be done.
- Employers can provide training and declaration to keep employees in line.
- If it is a temporary error though, backup generators will activate.

While the temperature at production plants can be easily controlled and monitored, refrigerated vehicles can be a critical link in the network.

These vehicles must meet certain thermal requirements, primarily related to insulation and refrigeration capabilities, but this does not guarantee product integrity due to the unpredictable conditions that may arise during transportation, potentially causing a significant change in product temperature. This work, however, is not easy since the items are frequently packed in small containers that, owing to cost and logistical constraints,

The majority of delivery businesses convey temperature-sensitive items in specialized vehicles, such as adiabatic boxes, with data loggers or smart sensors monitoring the air temperature within these vehicles.

Literature Survey

Food spoilage according to their limited shelf life, biological products are sensitive to temperature. It is very important to manage the ambient temperature appropriately throughout the entire logistics process. As a result, every connection, such as storage, loading, shipping, and packaging, becomes more complex, and the requirement for temperature-sensitive commodities to be controlled via cold chain logistics (CCL) has become a major issue for researchers, government agencies, and enterprises. (Ruiz-Garcia and Lunadei, 2010)

Inadequate refrigerated warehouses, product reception, storage areas, and pre-cooling areas, irregularity in terms of insufficient volume, lack of equipment, insufficient knowledge of the personnel, disruption of regular controls, temperature rise by keeping the doors open for a long time during loading and unloading of products, power cuts. Failure to integrate the system due to reasons such as problems in planning, insufficient cooling, and suppliers are the factors that cause the cold chain to break. (Türk and Öztek, 2021)

Their speed lowers to zero at areas such as warehouses, transfer centers, markets, and sales points, as well as the items they frequently use along their route. The moments of shifting between these stations and vehicles are when the cold chain is most likely to be interrupted. The greater the number of these points in the chain, the more likely product qualities may deteriorate. (İpekçi and Tanyaş, 2021)

Sustainable cold chain management is to ensure that temperature-sensitive foods move through the supply chain in the appropriate temperature range and deliver the highest quality and nutritional value to the consumer with the least use of resources. (Türk and Öztek, 2021)

The notion of "cold traceability" has recently been applied to the quality control of perishable items, which often necessitates the use of thermometers, temperature recorders, temperature indicators, and time-temperature integrators. (Montanari, 2008)

The monitoring and recording of location, quantity, temperature, pH, water ratio, and other unique factors in the process from the purchase of the product's raw material to its consumption are known as traceability in cold chain logistics. Perishable product tracking technologies include barcodes, RFID, GPS, vehicle tracking systems, and micro-electromechanical systems. (Talay-Değirmenci et al., 2017)

The logistics activities of perishable products, especially food, can be monitored, controlled, planned, and optimized remotely and in real time over the Internet, based on virtual objects instead of on-site observation. (Verdouw et al., 2016)

The Internet of Things enables cold chain logistics operators to monitor, control, plan and optimize business processes remotely, in real-time. (Badia-Melis et al., 2015)

Over the internet, virtual objects can be utilized to remotely coordinate and control corporate activities. (Verdouw et al., 2016)

In international maritime transports, temperature values can be followed instantly thanks to the internet of things. With the additions, it is possible to monitor when the container lids are opened and closed, along with location, oxygen, carbon dioxide, and humidity monitoring in addition to instantaneous temperature monitoring (Ravi-Shankar, 2018).

It has been observed that the rate of companies that do not have any long or short-term strategy regarding IoT technologies is only 5%. As a result of this breakdown in the sector, it is important to reveal the foundations of these products, the number of which is increasing day by day, and to determine the tendency and trends that will shed light on new product design processes. (Coşkun and Özbük, 2020)

In industry, IoT is used for real-time optimization and control of production and supply chain networks, logistics management, task planning, monitoring of production line and machinery status, and detection of risky situations. (Resch & Blecker, 2012; Hipp et al., 2012).

Real-time analysis of data from sensors on the product, packaging, vehicle, or facility enables the identification of product spoiling events that are critical for food and liquids in cold chain logistics. To retain the freshness of perishable products (fruits, vegetables, frozen food), sensors can continually monitor the humidity and temperature within warehouses or cold stores, for example, and actuators can modify these values to maximize food preservation. (Borgia, 2014)

With the internet of things, many environment-specific features such as temperature, speed, location, wind speed, pressure, vibration, pH level, humidity, dust in the air, and electric current level can be transmitted between network elements. (Farooq et al., 2015)

To discern between data and messages that must be broadcast to the network, examples of self-managed IoT system design have been established. (Weyns et al., 2018)

In addition, according to the collected data, it may be possible to automatically implement some of the previously planned decision mechanisms within the network. (Çeken and Abdurahman, 2019)

The objects in the IoT are commanded by transmitting the appropriate orders to the operators (actuators) in the sensing layer, which controls the data supplied by the sensors inside the IoT network. (El-Shweky et al., 2018).

The Microsoft "Azure IoT Edge" platform is one of the most recent advancements in cloud computing, which is required to run the massive data generated by IoT. This platform allows users to take advantage of cloud computing services without having to connect to the cloud. (James, 2019).

Different layer patterns have been proposed since it is feasible for an IoT system to serve multiple functions during design. Specifications and properties of physical items included in the IoT, functional setup and organization principles, operational methods, and data formats are the primary aspects that need to be described in the design. Different layer patterns have been proposed since it is feasible for an IoT system to serve multiple functions during design. Specifications and properties of physical items included in the IoT, functional setup and organization principles, operational methods, and data formats are the primary aspects that need to be described in the design. (Vashi et al., 2017).

The swift execution of all tracking procedures with sensors incorporated in the IoT system simplifies both the installation and pricing of the sales mechanism. Seasonal densities can be reduced and efficiency achieved with the broad usage of IoT in these centers combined with cloud computing. (Kong et al., 2018).

Smart gadgets in the workplace will reduce human mistakes and allow decision support systems to analyze real-time data. RFID, which is among the sub-technologies used for the formation of the Internet of Things network, is created with a tag, reader, antenna, and microchip. Utilizing electronic tags and radio frequency signals, the data of physical products are transmitted to the reader and from there to the microchip and other elements of the IoT network. (Atzori et al., 2010)

In NFC, on the other hand, two objects are communicated at a distance of around 10 cm. WSN is a network structure that can enable sensors and actuators to connect directly to the Internet. (Patel and Patel, 2016)

In the network structure that makes up the internet of things, it is feasible to produce identification information by connecting all of the items in question to the internet, as well as tracking and controlling their position and status. Sensor devices such as RFID, which are described in the network structure, and technologies such as the global positioning system (GPS) are utilized to allow these objects to communicate data. In this approach, a network may be built that can share real-time data about physical conditions between items and users. (Wei and Lv, 2019)

For many years, RFID technology has been employed in various industries for inventory control throughout the supply and distribution chain. The Internet of Things, in combination with real-time information processing technology based on RFID and Wireless Sensor Networks (WSN), provides many benefits in supply chain management and logistics process operations. Smart retail, smart inventory management, smart storage, and smart transportation are among the benefits it delivers, and all of these activities are governed by a smart central management system. (Saygin et al., 2007).

The Internet of Things can reflect the business intelligence brought by the data it receives. Within each layer, there are sub-technologies utilized. In the sensing layer, data related to physical conditions such as temperature, humidity, and pressure are read by RFID and other sensor devices and converted into digital data. At the network layer, this data is distributed to the relevant places and a network is created that can carry big data at any scale. (Ma, 2011).

CCLs have been monitored using a variety of technologies and approaches over the years. For temperature-sensitive products such as pharmaceuticals and food, CCL services used RFID applications (Chung, 2012). Using the WSN, RFID, and IoT paradigms, real-time traceability, and visibility of physical assets may be achieved, providing an excellent opportunity to be aware of CCL. (Porkodi and Bhuvaneswari, 2014).

In the global market, It is critical to have the appropriate product in the correct place and time as significant as low costs. Businesses need to develop traceability of flows in the supply network and understand the management tools required to provide network logistics. Traceability is important in logistics processes, especially in cold chain logistics processes; where it is necessary to control the temperature in the transport or production stages, add preservatives to maintain the quality and quantity of the product at the required level at the end of the supply chain is needed.

Smart gadgets in the facility will eliminate human mistakes and allow decision support systems to review data in real time. While the Industrial Internet of Things (IIoT) data flow finds meaning in a variety of applications that make our daily lives and work lives easier, It will have several beneficial implications on topics such as improving manufacturing quality, lowering expenses, energy efficiency, performance and creating competitive products by combining Industry. The world economy's impressive growth has resulted in a rise in the supply chain, which requires logistics services to be effective, flexible, and sensitive, particularly for temperature-sensitive products that must be monitored and maintained throughout the cold chain in the face of uncertainty. Logistics organizations must have access to the appropriate information technology to achieve this. With the use of the Internet, an effective information flow environment is provided between the customer and the logistics provider; However, the current information and product flow rift in logistics service create a barrier in acquiring real-time information regarding temperature-sensitive goods, making logistics management more challenging for decision-makers. Advances in the IoT offer prospective solutions in the field of monitoring, management, and real-time visibility in cold chain industries and information sharing with appropriate intelligence levels. In this study, The use of IoT-enabled cold chain logistics is demonstrated, which aids decision-making by monitoring and regulating the cold chain's real-time ambient temperature and calculating the shelf life of temperature-sensitive products in the cold chain.

In this study, it is planned to pay attention to keeping these isolated, which are the products of the relevant factory, at the most appropriate temperature, during the solution process planned to be carried out in the continuation of the study.

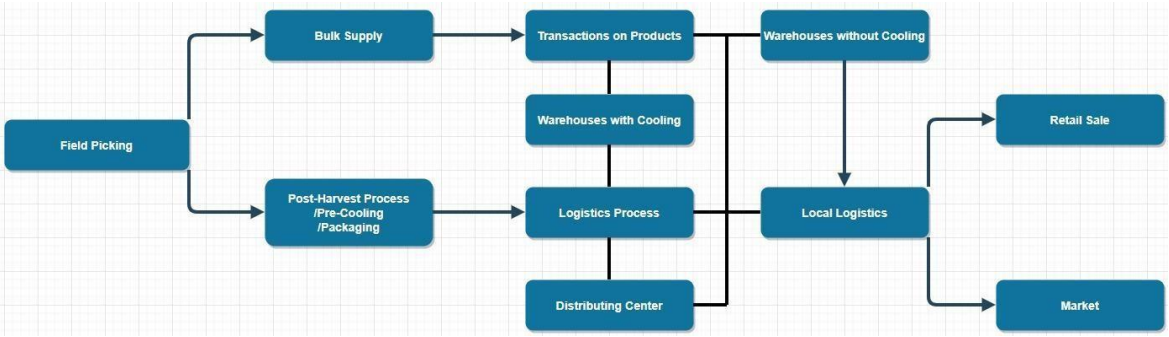

Figure 1. Cold Chain Management Diagram (İpekçi and Tanyaş, 2021)

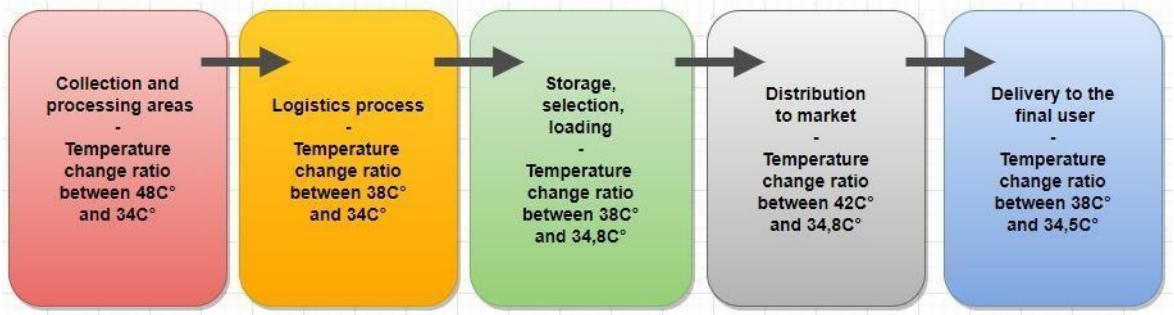

Figure 2. Process Management and In-Process in Cold Chain Transportation Temperature Change Over Time. (İpekçi and Tanyaş, 2021)

The pressure created by temperature values, which is an important issue in terms of cold chain logistics, is observed and the importance of cold chain logistics applications is revealed. Accordingly, in the chain process in question, the temperature change experienced by food products is explained with numerical values. While the temperature pressure that the food is exposed to in this chain stage can cause rapid damage

to the food, the cold chain logistics management ensures that the most positive results are obtained from this process. (İpekçi and Tanyaş, 2021)

CONCLUSION

In cold chain logistic management, the temperatures of the products that need to be transported in certain temperature ranges should be kept under regular and proper control until they reach the consumers. Temperature control; food safety is a requirement for processes such as preventing food losses. Having the right product in the right place at the right time is just as crucial in the global market as low costs. Traceability is vital for logistical procedures, but traceability across the whole chain is especially important for the proper setup and continuation of the cold chain. Specifically, traceability of perishable food goods in cold chain logistics operations from raw materials acquisition to consumption, avoidance of food degradation, quality preservation, and protection of low-quality products. It is critical in terms of preventing the consumption of spoiled goods in the supply chain. The Internet of Things is providing possible solutions in the realm of cold chain monitoring, management, and real-time visibility and information exchange.

This research shows how IoT access to the cold chain may help monitor and regulate the temperature of the cold chain's environmental real-time, as well as enhance temperature-sensitive items and the overall cold chain process. In the study, tracking ice cream, one of the cold chain products, with the Internet of Things and its application areas are discussed in a conceptual framework. In this study, the importance of cold chain logistics involving perishable products is stated, and the contribution of internet of things technology to the performance of cold chain logistics is explained.

The study aims to make process improvements by using lean manufacturing techniques and to point out the importance of IoT in both CC and CCL. Due to longer shipping times and increased expenses, logistics companies are looking for new ways to ensure the quality of their products. The Internet of Things is transforming the efficiency and power of long-distance perishable supply chains. The cold chain system is getting smarter as digital software solutions and monitoring devices provide live data on temperature and location, maintain the required temperature and reduce chain-related problems before they occur.

To explain the results of the Internet of Things applications in the cold chain processes, revealing the difference of the study from the studies that have been researched and the important improvements that will be provided by the Industrial Engineering applications. In the study, to better understand the problems that the study provides solutions for and the feasibility and efficiency of the solutions, SWOT analyses related to Cold Chain Processes in Turkey and other countries were examined, these sources were interpreted and the SWOT analysis of these study was obtained.

In the continuation of the study, the solution in the implementation process was presented with the reasons why Lean Production was chosen. As a result of the literature review, it has been observed in the "Tire Süt" Factory and many related studies that this study can bring great improvements to the factories in many areas. By adopting a sustainable strategy and controlling cold chain operations properly and efficiently, it is feasible to slow down and avoid changes in products. This has been observed by the usage of Lean Manufacturing Techniques.

Moreover, the study also shows that cold chain food preservation processes can be applied in Turkey with the Internet of Things throughout the entire chain. This project offers long-term sustainability due to the lifetime of the WSN system. To improve the project more on the next step, implementation of operations research will be applied.

Abstract

Fruit production is one of the main agricultural activities, but due to their perishable nature and other influencing factors, significant losses and waste in the fresh and processing industries are becoming serious nutritional, economical, and environmental problems. This study aims to evaluate the potential of pomegranate, mandarin, and banana peel waste for application for sustainable production of the cereal-based product. Fruits samples were collected from local farmers, in Albania, and their peel was sun-dried and blended to a powder (PP). The cereal base products (pancake) were prepared without PP, which served as control, also supplemented with 3% (PP3), 5% (PP5), and 8 % (PP8), all samples were semi-vacuum packed. The moisture, water activity, colour (CIE L*a*b*) value, protein, fat, carbohydrates, and vitamin C of products were determined at the time of preparation, after 1 day, 2 days, 3 days, and 5 days. Methanolic extracts were prepared for the evaluation of total polyphenols, flavonoids, and antioxidant activity assessed with two tests ABTS (2,2′-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) and DPPH (2,2-diphenyl-1-picrylhydrazyl), respectively for the peel powder, control samples, and product prepared in different formulation with PP. For the sensory characteristics was used a 9-point hedonic scale. The results showed that products containing PP had more than 3-fold higher of total bioactive compounds and antioxidant activity, compared to control samples. The sensory characteristics (appearance, flavour, aroma, gumminess, texture, and overall quality) resulted in higher points for the formulation PP3 for the mandarin peel used, PP5 for the pomegranate peel used, and PP8 for the banana peel used. An extended shelf life was noted in all cases of PP addition, compared to the control sample. From the study, we may conclude that the application of PP of pomegranate, mandarin, and banana can serve as a good approach for the sustainable production of value-added products. Further studies would be extended in the investigation of the potential of other fruits and vegetable by-products for application in the food industry.

Keywords: Fruits peel waste, Added-value products, Sustainable production, Pomegranate, Mandarin, Banana.

INTRODUCTION

Fruit production is one of the main agricultural activities. They are considered an important part of a good diet and can be consumed fresh and are usually processed into bottled fruits, juices, jams, marmalades, jellies, bars, pickles, dried or crystallized fruits, etc (UNIDO, 2004). However, due to their perishable nature and other influencing factors, significant losses and waste in the fresh produce and processing industries are becoming serious nutritional, economical, and environmental problems. Fruits wastes are considered by-products of the fruits processing industry including core, seeds, pomace, and peels, which if not further processed, due to the amounts of water and easily fermentable form can cause odour, harbourage for insects, soil, and environmental pollution (Shalini and Gupta, 2010). The processing of fruits produces peels, which are estimated to be 46% of the pomegranate fruit mass (Suryawanshi et al., 2009), 50% of the citrus fruit mass (Rudra et al., 2015), and 40% of banana (Jalal et a., 2018).

During the last decades to solve the above-mentioned concerns, many efforts have been improved the management and utilization of fruit and vegetable wastes. Moreover, besides the environmental and economic aspects, their valorization has been seen as beneficial even for health. This is linked to the richness of by-products from fruit and vegetable with bioactive compounds and antioxidant potential (Duda-Chodak and Tarko, 2007). Drying has always been of great importance to the preservation of

agricultural products and by-products. Thus, drying fruit peel and transforming them into a powder ingredient offer opportunities for value addition into novel products, at the same time reducing waste from the fruit processing operations. Furthermore, the interest of customers in consuming healthy food is increased recently, along with the popularity of functional foods, a concept for food products enriched with fruit peels possessing natural sources of antioxidants (Babiker et al., 2013; Altunkaya et al., 2013). It has been reported that the pomegranate peel contains 249.4 mg/g of phenolic compounds, which is 10-fold higher compared to the edible part (24.4 mg/g). Even in citrus peel, the phenolic compounds are 15% higher than in the edible part (Rudra et al., 2015). Banana fruit peel is considered a rich source of flavonoids and phenolic components (Chauhan et al., 2016).

Thus, this study aims to exploit the potential of pomegranate, mandarin, and banana peel powder for the sustainable production of value-added pancake products, in terms of nutritional value, sensory properties, and antioxidant activity.

MATERIALS AND METHODS

At least 3 kg of fresh fruits pomegranate (*Punica granatum L.*), common mandarin (*Citrus reticulata*,) and banana (*Musa paradaisica* L.), and all ingredients used in this study for the pancake preparation were purchased from local markets in Albania. Before processing, fruits were thoroughly washed in tap water and rinsed, manually cut into small pieces, and sun-dried (till moisture < 5%). The dried peels were powdered in a blender and then sieved to a fine powder, and stored in a cool and dark place. The pancakes were prepared by mixing thoroughly all ingredients (Table 1), till a homogeneous mixture. Then equal portions of 30 g were manually placed on a preheated pan until the pancake turned brown (~3 min). The control sample (Pc) had only white wheat flour, while in the formulations were added pomegranate, mandarin, and banana peel powder (PP) was substituted in different proportions (3, 5, and 8 g/100 g of wheat flour). After baking and cooling, each pancake sample was packaged in a partial vacuum using commercial multi-layer film bags and kept till all analyses were performed.

Table 1. The codes of study samples (fruits peel powder and pancakes)

Pancake control (Pc)*	Peel powder (PP)	Pomegranate Peel Powder (P)-Pancake (PPP)	Mandarin Peel Powder (M)-Pancake (MPP)	Banana Peel Powder (B)-Pancake (BPP)
white wheat flour (36%), brown sugar (5.8%), salt (0.04%), baking soda (0.55%), olive oil (3.6%), egg (14.2%) water (40%)	3%	PPP3	MPP3	BPP3
	5%	PPP5	MPP5	BPP5
	8%	PPP8	MPP8	BPP8

**Here the % are expressed in terms of total mass preparation*

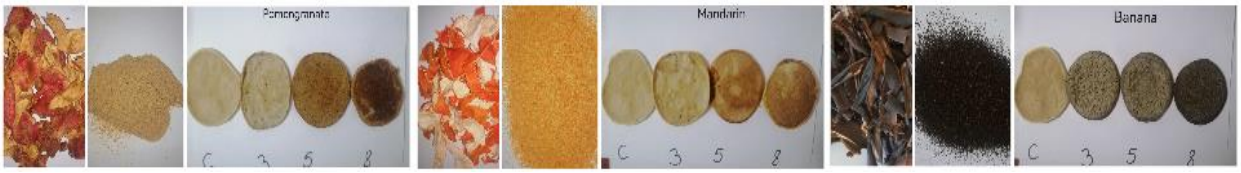

Figure 1. Study samples: fruits peel dried and powder, pancakes control and in different formulations

The total content of protein, fat, ash, total acidity (TA), and vitamin C was determined according to AOAC (2016), and all the results were expressed as g/100 g. Energy values were calculated using the Atwater factor of 4 Kcal/g for protein and carbohydrate and 9 Kcal/g for fat. Moisture content was determined using an advanced moisture analyser Ohaus, where 0.5±0.002 g of sample was uniformly distributed on an aluminum plate. The measurement of pH was performed with a Benchtop pH meter, having an accuracy of 0.001 pH, and previously calibrated with 4.00 and 7.00 pH buffer solutions. Determination of protein was done according to the Kjeldahl method, after distillation and titration, the nitrogen was multiplied with a 5.7 factor. Fat was determined by the Soxhlet extraction method with ethyl ether. Ash was determined gravimetrically, after incineration in a muffle furnace at 600°C. The carbohydrates were calculated by difference: [100 - (protein + fat + ash + water)]. The water activity (aw) was measured at 25°C using a water activity meter Retronic, calibrated with proper standards (1.000 aw). The colour value was determined using a portable colorimeter NH310 with CIE parameters L*, a*, b*. Extracts were prepared using 0.5±0.002 g of sample, mixing with 10 mL of acidified methanol (80% MeOH, containing 1% HCl), and subsequent steps vertexing (5 min) centrifugation (at 20 °C, 4500 rpm, 15 min), supernatant collection

and filtration. The process was performed in triplicate. The determination of total polyphenols was done according to the Folin-Ciocalteu method, the absorbance was read in triplicate against blank with a Libra S22 spectrophotometer at a wavelength of 765 nm, and results were expressed as mg of gallic acid equivalents (GAE) per 100 g of fresh weight (fw) of the sample. The flavonoids were determined by the aluminum chloride colorimetric method, the absorbance was read in triplicate against blank at 510 nm, and the results were expressed as mg of catechin equivalents (CE) per 100 g of fresh weight (fw) of the sample. The antioxidant activity was assessed with two tests ABTS (2,2′-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) and DPPH (2,2-diphenyl-1-picrylhydrazyl), and expressed as % of inhibition. All measurements were performed in triplicate for the peel powder of pomegranate (PPP), mandarin (MPP), banana (BPP), pancake control sample (Pc), and product prepared in different formulations with PP3, PP5, and PP8. For the sensory characteristics (appearance, flavour, aroma, gumminess, texture, and overall quality) evaluation involved 10 non-trained participants, according to a 9-point hedonic scale (1 - dislike extremely, 2 - dislike very much, 3 - dislike moderately, 4 - dislike slightly, 5 - neither like nor dislike, 6 - like slightly, 7 - like moderately, 8 - like very much and 9 - like extremely).

All measurements were performed at least in triplicate and were conducted at the time of preparation, after 1 day, 2 days, 3 days, and 5 days, to evaluate the effect of PP in the pancake during storage. The results were reported as mean and standard deviation.

RESULTS and DISCUSSION

The results for nutritional values of fruit peel powder and pancakes prepared for this study are presented in Table 2 and Figure 2-6.

Table 2. The nutritional composition values of fruits peel and pancakes (control and with different formulations, results expressed g/100 g fw of sample)

Sample	Energy (kcal)	Moisture (g)	Protein (g)	Fat (g)	Carbohydrates (g)	Ash (g)	Vit C (mg)

BPP5	250	44.1±0.01	5.06±0.21	10.6±0.05	39.0±0.21	1.31±0.01	16.1±0.3
BPP8	255	43.0±0.3	5.12±0.8	10.7±0.04	39.6±0.03	1.58±0.05	25.1±0.11

The energy value for pancakes resulted from 245 to 266 kcal/100, and from the addition of PP it increased to 8% compared to the control. Consuming pancakes supplemented with PP, as a breakfast meal can contribute to meeting the energy required for moderate morning activities by adult males and females. The moisture content in fruit peel powder varied from 2.50 to 4.00 g/100 g, while in the pancake 43.0-51.8 g/100 g, where Pc had the highest moisture content, and by the addition of PP decrease the moisture content to 17% compared to the control. Also, the aw measured (Figure 2), resulted higher in Pc of 0.889, and get lower in the formulation with PP till a value of 0.782 (BPP8), and during storage, an increase from 1-13%

happened. Based on moisture values and water activity values is noted the beneficial effect of PP addition, nevertheless, these levels can still be attractive for microorganism development, thus making pancakes suitable for a short period of storage. The protein content in fruit peel powder varied from 3.95 to 7.70 g/100 g, while in the pancake 4.68-5.4 g/100 g, where Pc had the lowest protein content, and by the addition of PP increase of protein content occurred till 13% compared to control. These findings may let us suggesting the utilization of peel from fruits is nutritionally advantageous, especially linked with decreasing resources of protein animal-based, and substituting with plant-based protein resources. Regarding the fat content there not noted big differences among fruit peel powder (10.44-10.74 g/100 g), also slight differences were found in the pancake 10.0-11.1 g/100 g, where Pc had the lowest fat content, and the addition of PP increased fat content till 9% compared to control pancake. Fruits peel powder resulted in a high content of ash (10.34-13.42 g/100 g fw of the sample), which contributed to increasing the ash content in pancake supplemented with PP to 59% compared to Pc. Also, vitamin C content was found in higher values in pancakes with added PP.

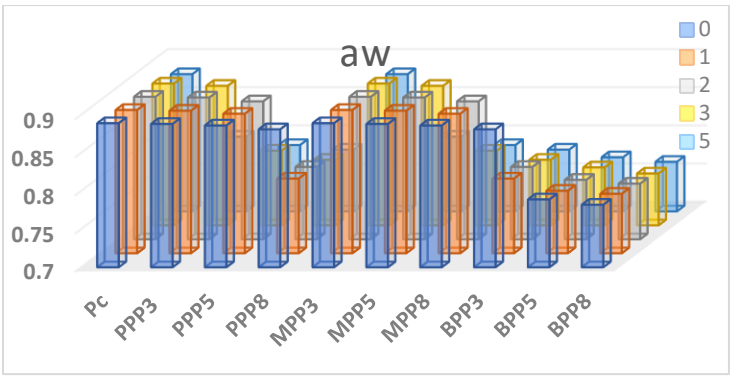

Figure 2. Water activity of pancakes at time of production (day 0) and after 1-5 days of storage

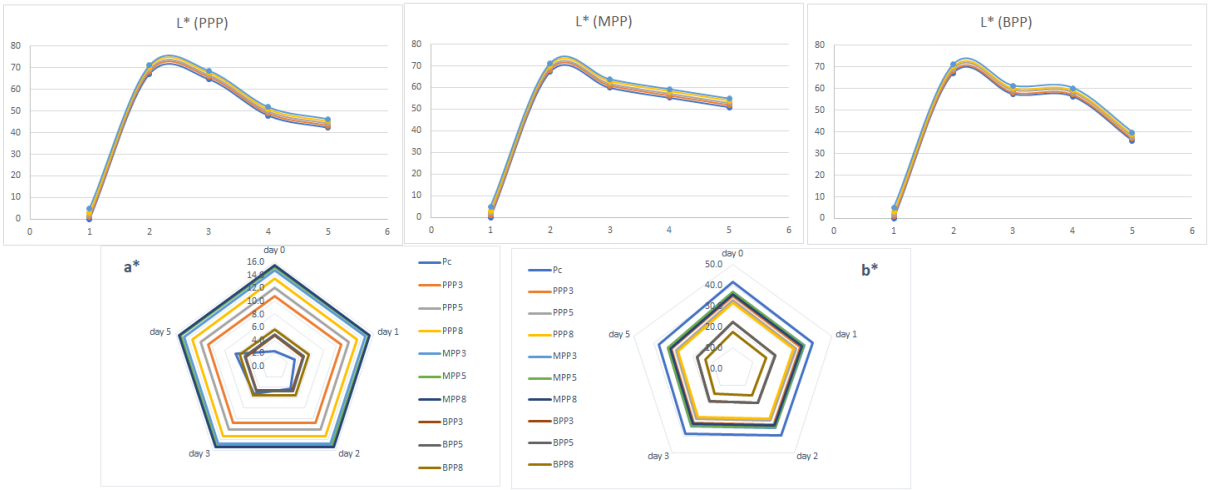

Figure 3. Colour values CIE L*a*b* of pancakes at time of production (day 0) and after 1-5 days of storage

From total colour (Figure 3) measurement, resulted in positive values for L * representing brightness, a* for red (+) to green (−), and b* for yellow (+) to blue (−). It was found that L* values were higher in the Pc sample compared to the samples with added PP, and values get lower as more % of PP increased, while during storage was noted an increase. Whereas, a* value gets higher depending on the amount of PP added in pancakes, and during storage slight changes occurred. The value b* followed the same pattern as the L* value.

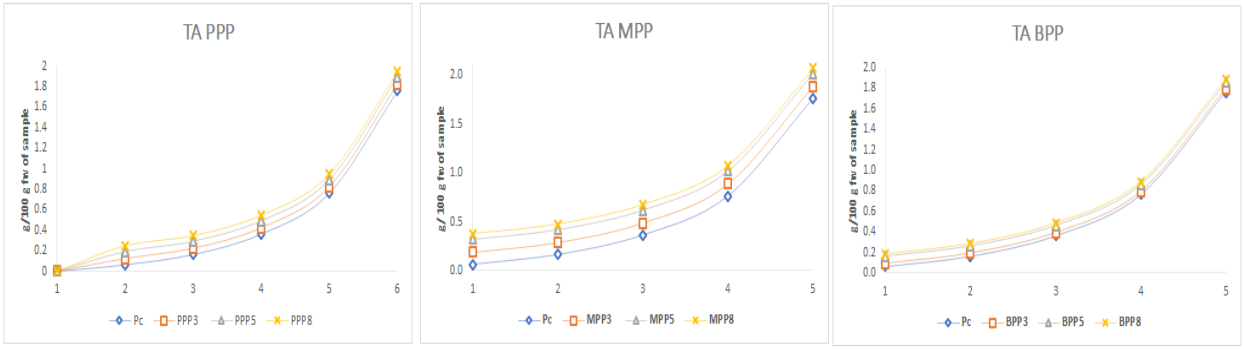

Figure 4. Total acidity of pancakes samples and changes during storage

Total acidity (Figure 4) and pH values found in the fruit peel powder and pancakes ranged from 0.03 to 5.03 g/100 g fw of sample and 3.50-8.90. Banana peel had the lowest value for acidity and corresponding pancake products, and the highest value of TA had the mandarin peel and its corresponding products.

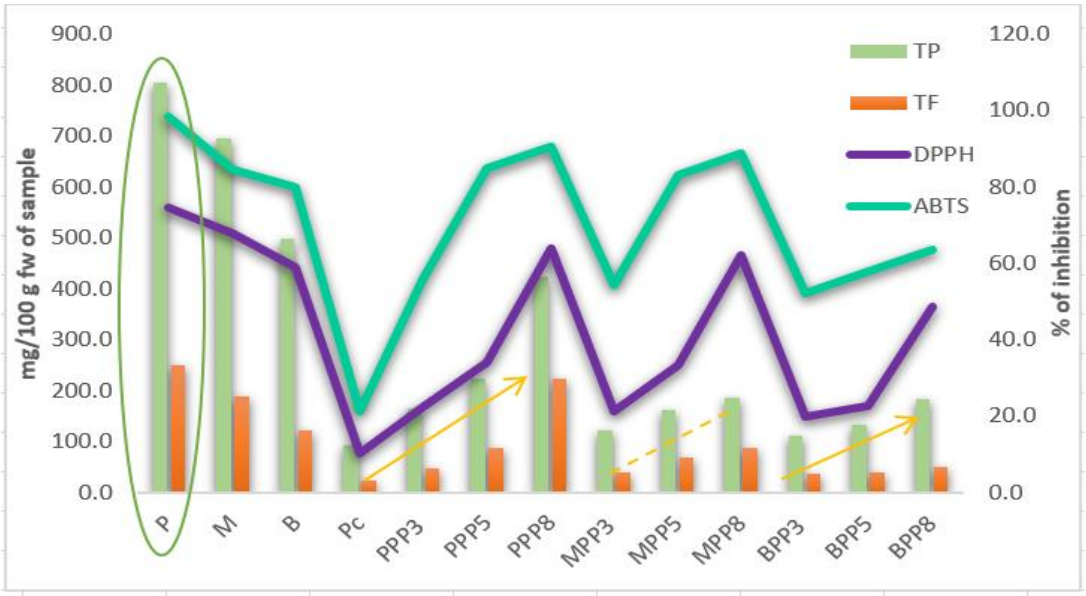

Figure 5. Total bioactive compounds and antioxidant activity fruits peel powder and pancakes

Figure 5 presents the values of total polyphenols, flavonoids, and antioxidant activity. Results showed that PP is a powerful source of polyphenols (496.8-803 mg GAE/ 100 g fw of the sample); flavonoids (122.0-249.0 mg CE/ 100 g fw of the sample), and antioxidants 58.9-74.5 % (DPPH test) and 79.8-98.2 % of inhibition (ABTS test). The values resulted higher according to the trend pomegranate > mandarin > banana peel powder. Their content increased considerably the bioactive compounds and antioxidant activity in the pancake depending on the amount added (PP3< PP5 <PP8). The values for polyphenols content compared to the Pc sample increased to 4.5-fold; for flavonoids to 9.7-fold, and antioxidant activity to 6.3-fold (DPPH test) and 4.3-fold (ABTS test).

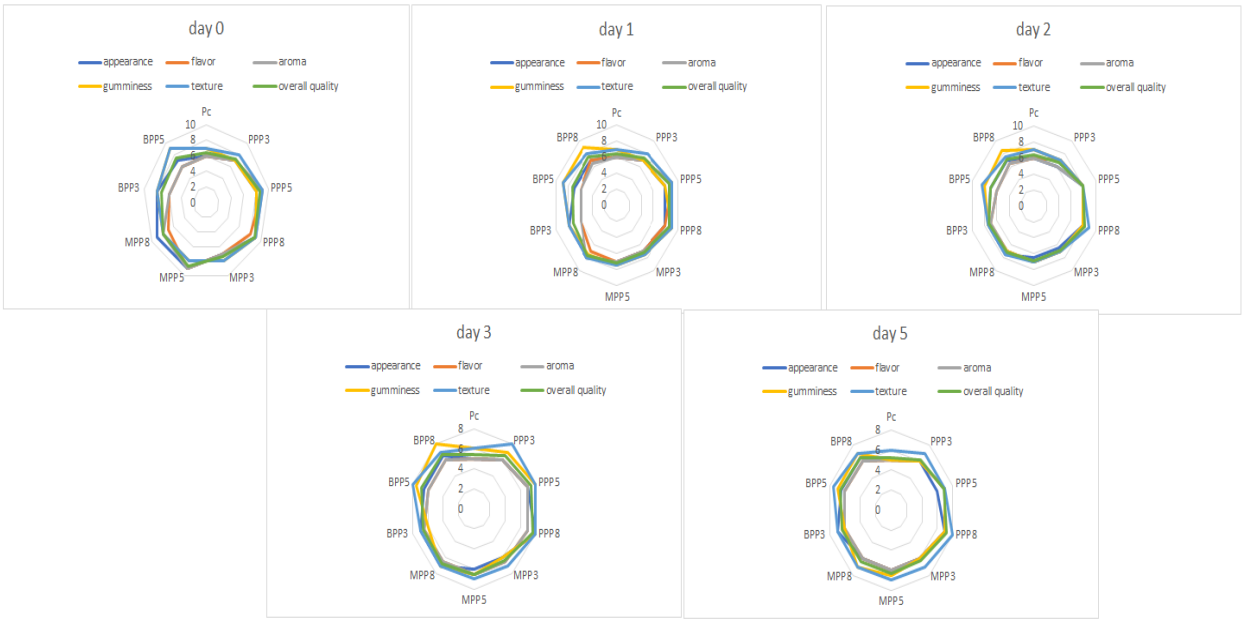

Figure 6. Sensory properties of pancakes at time of production (day 0) and after 1-5 days of storage

Based on sensory properties valuation based on a 9-point hedonic scale, the mean scores for the samples showed various degrees of likeness by the assessors, indicating that the pancakes were acceptable regardless of the degree of substitution showing the beneficial influence of fruit peel powder added. The highest mean score of overall quality reached sample MPP3, PPP5, and BPP8. The banana peel powder had the lowest score compared to PPP and MPP, but higher compared to Pc. The addition of PP increased the scores for appearance, flavour, aroma, gumminess, and texture in the range of 22 to 33% and overall acceptability to 27% higher. Even during storage samples tend to retain higher scores depending on the amount of added PP, when compared to Pc.

CONCLUSION

The study showed that for all selected fruits peel powder used, had beneficial effects on nutritional value, colour, water activity, sensory properties, and antioxidants content in pancakes with different formulations. Among fruits, the pomegranate-formulated pancakes resulted with higher values generally in all parameters, followed by mandarin peel powder and last banana. The results showed that products containing PP had more than 3-fold higher of total bioactive compounds and antioxidant activity, compared to control samples. The sensory characteristics (appearance, flavour, aroma, gumminess, texture, and overall quality) resulted in higher points for the formulation PP3 for the mandarin peel used, PP5 for the pomegranate peel used, and PP8 for the banana peel used. An extended shelf life was noted in all cases of PP addition, compared to the control sample. From this study, we may conclude that the production of nutrient-rich and acceptable pancakes formulated with peel powder from pomegranate, mandarin, and banana fruits, can serve as a good approach for the sustainable production of value-added products. Further studies would be extended in the investigation of the potential of other fruits and vegetable by-products for application in the food industry, and other sectors of interest.

Abstract

In this study, the behavior of the steel structures under realistic earthquake excitations with the use of tuned liquid dampers is investigated experimentally. In the present study, the tuned liquid damper is designed in such a way that the natural frequency of the damper is equal to the first natural frequency of the structure. In order to experimentally demonstrate the effect of a TLD, a physical TLD model was created and the scaled model was subjected to an earthquake input effect with the help of a shaking table. In the study a twenty storey building is modeled and the restoring force measured from the tank is applied to the top floor. The experiments are coupled with the building simulation and it is calculated that the tuned liquid damper lowered the lateral displacement of the structure up to 10% with respect to the case where no dampers are installed.

Keywords: Tuned liquid damper, Building vibrations, Passive control

Introduction

In modern era, due to civilization, additional to flood, earthquakes are the leading natural phenomena which might lead to disasters. The modern buildings are designed in such a way that they withstand to these natural events and save lives. When it comes to safety in living areas, dynamic behavior of the buildings needs to be examined. The dynamic loadings can have fatal effects such as earth quakes or can be uncomfortable due to wind loadings, road vibrations etc. Many different studies, both theoretical and experimental, have been carried out on the examination and control of building dynamics. These studies can be divided into active control applications performed by applying an external energy to the system and passive applications performed by the internal energy of the system.

The model, called a tuned liquid damper (TLD), which dampens the structure vibrations by using the movements of the shallow water dynamics, can be shown as an example of passive control applications. The first study that could be shown in this area examined how building vibrations change under the influence of wind.(V.J. Modi and M.L. Seto, 1997) While some of the studies carried out on tunable liquid dampers are dealing with the dynamics of the structure (degree of freedom, building parameters, type of structure, etc.) (Adrian Y. J. Et al. 1997; H. R. Lee and K. W. Min, 2011) another group of researchers examined what would happen if the types of TLDs changed (Dorothy Reed et al., 1998, Fabio Casciati et al., 2003; J.A. Hamelin et al., 2013). TLDs can vary in the shape of the container they are in, there are two types which are studied more frequently in the literature are the rectangular prisms and the cylindrical containers. In addition to this approach, the relatively large volumes of TLDs prompted researchers to examine the impact of multiple small TLDs rather than a single large structure (Fei Zhu et al., 2017). In addition to building safety, developments in different areas where liquid sloshing is used have also been implemented. In TLDs', sloshing is desired and the resulting force is used as a restoring effect, however especially in transportation of flammable liquids need to be surpassed in terms of sloshing in order to avoid sudden ignition. Buffer systems in LPG tanker trucks, the liquid sloshing needs to be prevented, have been investigated by Hamelin et al. (J.A. Hamelin et al., 2013).

Building Model

There are many different building models for different purposes developed in building dynamic control applications. These models can be simply listed as energy optimization, heat management, and strength control or vibration analysis. The building vibrations examined in this study benefit from the building models created in the literature. When the effects from the ground (earthquake, road vibrations, etc.) are examined, we come across 3 main building models. The first of these examines the situation where the disturbing effect from the ground occurs on a single axis (Ş. Çetin, 2010), another model considers the case of examining the effect on more than one axis (for example, examining earthquakes as north-south, east-west) (Satyam Paul et al.,2016). On the other hand, the building model is presented in more than one axis and in a way that includes the interaction of the building with the soil mechanics (Erkan Çelebi and A.Necmettin Gündüz, 2005). In this study, a building model will be created by taking the n-storey building model in Figure 1 as a reference, so that the disturbing entrance will be examined on a single axis as used in the study of Cetin (Şaban Çetin, 2010).

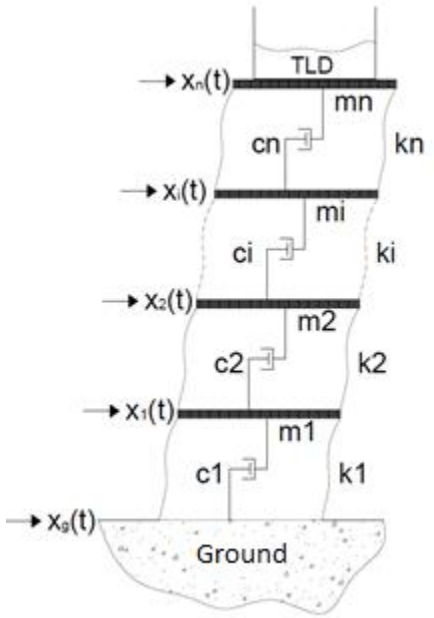

Figure 1 Building Model

The equations of motion of the building model for a 20-storey building were obtained using the Euler-Lagrange method. Obtained equations are expressed in matrix format as in Equation 1.

$$M_s\ddot{x}(t) + C_s\dot{x}(t) + K_s x(t) = M_s L\ddot{x}_g(t) - Hf(t) \quad (1)$$

Here M_s, C_s, K_s are the mass, damping coefficient and spring coefficient matrices of the floors, respectively, L and H are the location matrices of the disturbing input and the force, $\ddot{x}_g(t)$the disturbance input, $f(t)$ the force consisting of the tuned liquid damper and $\ddot{x}(t)$, $\dot{x}(t)$, $x(t)$ represent the acceleration, velocity and displacement matrices of the floors, respectively.

Experimental Setup

The experiments are carried out in Yıldız Technical University Machinery Faculty Machine Theory, System Dynamics and Control Laboratory. The test setup consisting of a control computer (HP Compaq 6000 Pro MT), electronic control unit (dSPACE-CP1103), power supplies (SANTECH 33010, Yıldırım Elektronik CY-306) and shaking table (0.1-10 Hz). The schematic representation of the setup is shown in Figure 2.

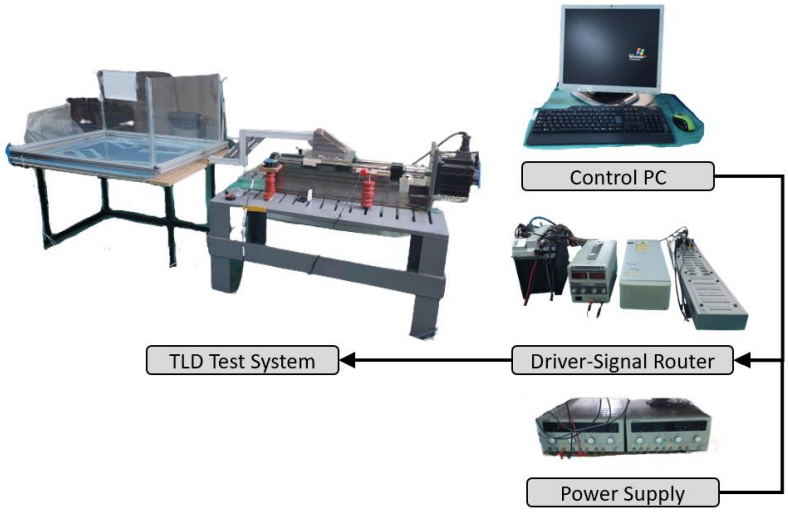

Figure 2 Setup of test system

Experimental Study

It is not always possible to use models in real scales in experimental studies where structures are enormous. By developing a scaling method that the researchers could carry out in the laboratory environment, they carried out the examinations with models in smaller sizes. In this study, suitable TLD for the building model has been experimentally investigated by using 1:5 scaling (Fatih Goktepe et al., 2019). The disruptive effect was chosen as the scaled version of the 1999 Kocaeli earthquake. The scaled acceleration data of the Kocaeli earthquake is shown in Figure 3.

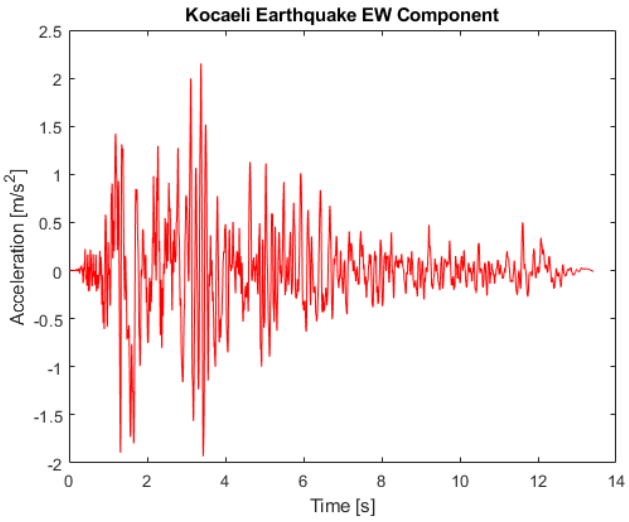

Figure 3 1:5 Scaled Kocaeli eartquake data

In this study the TLD is designed in accordance with the 1st natural frequency of the structure model and connected to the shake table. The disturbance input expressed in Figure 3 was modeled in the control computer and simulated on the shaking table by means of the electronic control unit. The reaction forces generated by the TLD were measured with the load cells attached to the TLD system. The equation of

motion is expressed in Equation 1, and modeled using Matlab-Simulink®. The displacements of the model, both uncontrolled and under TLD force were examined and compared in Figure 4.

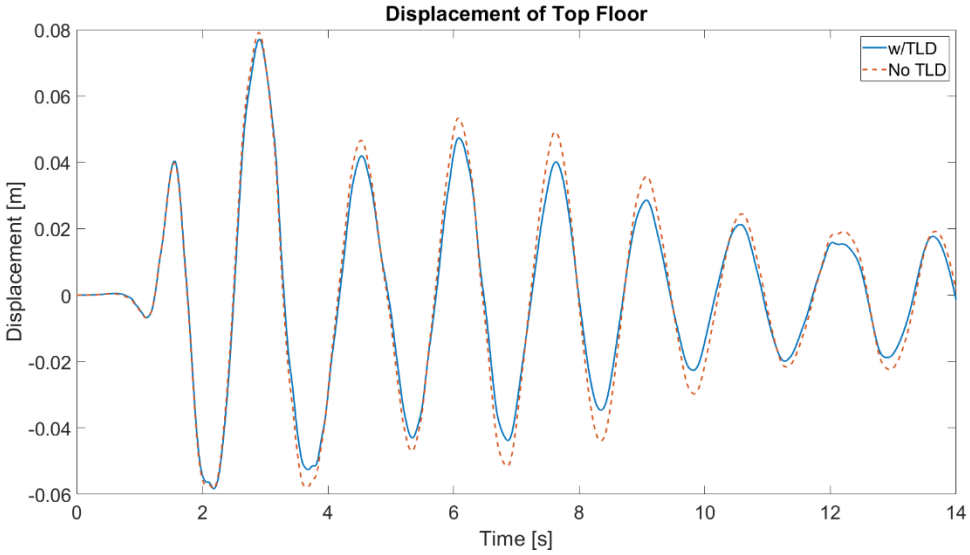

Figure 4 Displacement of Top Floor

After examining the displacements, Power spectral density (PSD) diagrams of both the uncontrolled model and the TLD model were extracted and compared in order to examine the effect of the TLD model in the frequency domain (see Figure 5).

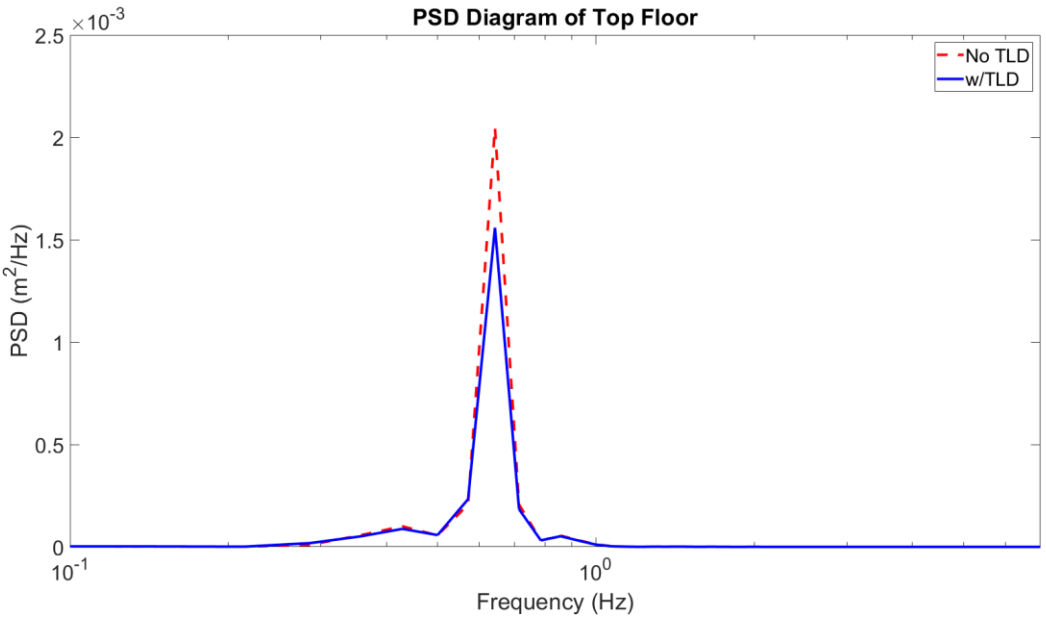

Figure 5 PSD Diagram

Results and Discussion

In this study a hybrid simulation is performed to simulate the restoring effect of a TLD installed to a 20 storey steel structure. The dynamic loading is chosen as the Kocaeli 99 earthquake data and the displacements and power spectrum densities are compared. It is observed that the displacement value at the top floor decreased with approximately 10% when the TLD is installed compared to the bare case. Additionally the density of the power spectrum lowered $0.5x10^{-3}$ (m^2/Hz) in the frequency domain with TLD compared to the bare case. These results show that the TLD, which is a passive control method, fulfills its task and has a restoring effect on building dynamics, shifts the frequency and lowers the displacement.

Conclusion

TLDs are passive in damping components that can be used in structure dynamics which has significant effects both in time and frequency domains. In the continuation of the study, higher damping ratios can be achieved by establishing a more optimal TLD design. Differences under the same conditions can be shown for different types by changing the TLD structure. By changing the fluid structure, a semi-active control application such as MR damper can be also studied.

Özet
Sisplatin birçok kanser türü tedavisinde sıklıkla kullanılan kemoterapötik ilaçlardan biridir. Tedavi sırasında yaklaşık her üç hastadan birinde görülebilen akut böbrek hasarı, sisplatin kullanımını kısıtlayan en önemli yan etkidir. Sisplatine bağlı böbrek hasarı mekanizmalarını aydınlatmak amacıyla ve bu hasarı önlemeye veya azaltmaya yönelik birçok preklinik çalışma yapılmıştır. Ayrıca çok az sayıda insanlarda yapılmış klinik çalışmalar da bulunmaktadır. Sisplatin oksidatif stres, enflamasyon ve apoptozis aracılığıyla nefrotoksisiteyi indüklemektedir. Literatürde kersetin, ginseng, ginkgo biloba, kurkumin ve diğer birçok bitkisel kökenli ürünlerin uygulanması ile sisplatine bağlı nefrotoksisitenin azaltıldığını veya önlendiğini gösteren çalışmalar bulunmaktadır. Ayrıca antioksidan etkileri bilinen askorbik asit, asetilsistein, selenyum, tokoferol gibi ilaçların uygulanması veya enflamasyon önleyici etkileri sayesinde golimumab, infliksimab, selekoksib gibi ilaçların da nefroproteksiyon sağladığı gösterilmiştir. Sisplatin ile ilgili hasarı azaltmaya veya önlemeye yönelik pek çok preklinik çalışma yapılmış olmasına rağmen günümüzde bu hasarı önlemeye yönelik rutin uygulamalar hala yetersizdir ve daha çok veriye gereksinim bulunmaktadır. Bu derlemede sisplatine bağlı nefrotoksisite üzerinde nefroprotektif etkileri gösterilen ajanları sunmayı amaçladık. Sisplatin kaynaklı gerçekleşen böbrek hasarı doza bağımlıdır ve bu hasara karşı önlem amacıyla sisplatin daha düşük dozlarda kullanılmaktadır. Bu durum da antikanser etkinin daha az olması ile sonuçlanabilmektedir. Çünkü sisplatinin terapötik etkisi dozu ile doğru orantılıdır. Sonuç olarak, sisplatine bağlı hasarı önleyici yeni tedavilerin geliştirilmesi, sisplatinin daha yüksek dozlarda kullanılarak kanser tedavisinin hem etkili hem de güvenli olmasını sağlayacaktır.
Anahtar Kelimeler: Sisplatin, Böbrek hasarı, Nefroproteksiyon

Protective agents in cisplatin induced kidney damage

Abstract
Cisplatin is one of the chemotherapeutic drugs frequently used in the treatment of many types of cancer. Acute kidney injury, which can be seen in approximately one out of every three patients during treatment, is the most important side effect limiting the use of cisplatin. Many preclinical studies have been conducted to elucidate the mechanisms of cisplatin-induced kidney damage and to prevent or reduce this damage. There are also very few human clinical studies. Cisplatin induces nephrotoxicity through oxidative stress, inflammation and apoptosis. In the literature, there are studies demonstrating that the administration of quercetin, ginseng, ginkgo biloba, curcumin and many other herbal products reduces or prevents cisplatin-induced nephrotoxicity. In addition, it has been shown that the administration of drugs such as ascorbic acid, acetylcysteine, selenium, tocopherol, which are known to have antioxidant effects provide nephroprotection and drugs such as golimumab, infliximab, celecoxib also provide nephroprotection due to their anti-inflammatory effects. Although many preclinical studies have been conducted to reduce or prevent damage related to cisplatin, routine applications to prevent this damage are still insufficient and more data are needed. In this review, we aimed to present agents with nephroprotective effects on cisplatin-induced nephrotoxicity. Cisplatin-induced kidney damage is dose-dependent and lower doses of cisplatin are used as a precaution against this damage. This may result in less anticancer effect. Because the therapeutic effect of cisplatin is directly proportional to its dose. In conclusion, the development of new treatments to prevent cisplatin-induced damage will enable cancer treatment to be both effective and safe by using higher doses of cisplatin.

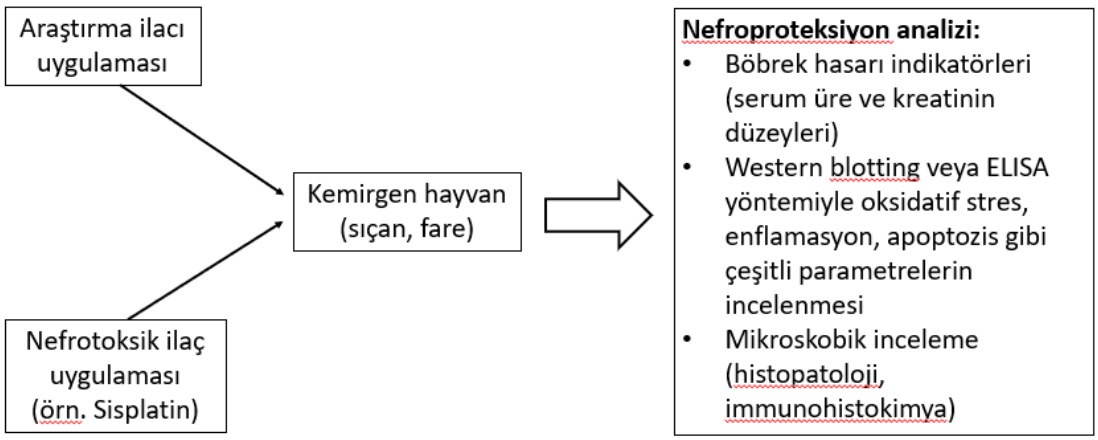
Keywords: Cisplatin, Kidney damage, Nephroprotection

GİRİŞ

Birçok kanser türü tedavisinde sıklıkla kullanılan sisplatin tedavisi sırasında %25-35 sıklıkla nefrotoksisite gelişmektedir (dos Santos ve ark., 2012). İlaca bağlı oluşan akut böbrek hasarı sisplatin kullanımını kısıtlayıcı önemli bir faktördür (Arany ve Safirstein, 2003). Sisplatin tedavisi sırasında böbrek koruyucu önlem olarak daha düşük dozlarda sisplatin kullanılması gerekmektedir (Sharp ve Siskind, 2017). Bu durum da sisplatin etkililiği doza bağımlı olduğu için ilacın daha yüksek dozlara çıkılarak daha etkili bir antikanser tedaviye engel olmaktadır. Ayrıca tek yüksek doz yerine birkaç düşük dozda uygulama akut hasarı önlemede etkili olabilmektedir ancak daha sık uygulama enflamasyonda ilerleyici artışla fibrozis ile sonuçlanmaktadır (Sharp ve ark., 2016). Yaklaşık her üç hastadan birinde görülebilen akut böbrek hasarı mekanizmalarını aydınlatmak amacıyla ve bu hasarı önlemeye veya azaltmaya yönelik birçok preklinik çalışma yapılmıştır. Bu derlemede preklinik çalışmalarda sisplatin ile indüklenen nefrotoksisite üzerinde koruyucu etkileri gösterilen ajanları sunmayı amaçladık.

Böbrek koruyucu ajanlar

Sisplatine bağlı böbrek hasarını azaltmak veya önlemek amacıyla hayvanlarda birçok ajan denenmiş olmasına rağmen insanlarda rutin tedavi protokolüne girmiş bir ilaç henüz bulunmamaktadır. Klinik öncesi çalışmalarda sisplatinin tek doz enjeksiyonu ile nefrotoksisite gelişen hayvanlarda çeşitli ajanlar sisplatin tedavi koluna eklenerek böbrek hasarını önleyip önlemediği araştırılmıştır (Şekil 1). Preklinik çalışmalarda böbrek koruyucu etkileri gösterilmiş ajanlar aşağıda özetlenmiştir.



Şekil 1. Preklinik nefrotoksisite çalışmaları

Kersetin

Kersetin birçok meyve, sebze ve tahılda bol miktarda bulunan doğal bir polifenolik flavonoid bileşiktir ve anti-karsinojenik, antibakteriyel, antiviral, anti-enflamatuvar gibi birçok farmakolojik etkisi gösterilmiştir (Batiha ve ark., 2020). Sıçanlara 9 gün boyunca periton içine (i.p.) 50 mg/kg kersetin uygulanması, 4 mg/kg sisplatin i.p. ile oluşan böbrek hasarını azaltmıştır. Sisplatin ile böbrek dokusunda düzeyleri anlamlı olarak artan malondialdehit (MDA) ve H_2O_2 düzeyleri tedaviye kersetin eklenmesi ile azalmıştır. Sisplatin uygulaması ile azalan peroksidaz aktivitesi ile GSH (indirgenmiş glutatyon) / GSSG (oksitlenmiş glutatyon) oranı ise kersetin eklenmesi ile artmıştır. Ayrıca kersetin uygulaması, sisplatine bağlı artış görülen TNF (Tümör Nekroz Faktörü)-alfa, NF-κB (Nükleer Faktör-κ B), İntraselüler Adezyon Molekülü-1 (ICAM-1), Vasküler Hücre Adezyon Molekülü-1 (VCAM-1), myeloperoksidaz (MPO), indüklenebilir NOS (iNOS), kaspaz 3 gibi parametrelerin tümünde azalma sağlamıştır. Kersetin bu koruyucu etkileri gösterirken sisplatine bağlı tümör hacmindeki küçülmeyi de etkilememiştir (Sanchez-Gonzalez ve ark., 2011). Bu bulgular kersetinin oksidatif stresi ve enflamasyonu azaltarak böbrek koruyucu etki gösterdiğini desteklemektedir. 1,2-dimetil hidrazin ile kolon kanseri indüklenmiş Sprague-Dawley sıçanlarda, kersetin hem sisplatinin antikanser etkinliğini artırmış hem de sisplatine bağlı böbrek hasarı indikatörlerinde iyileşme sağlamıştır (Li ve ark., 2016).

Ginseng

Panax ginseng olarak da bilinen ginseng bitkisinden elde edilen ginsengin kırmızı ginseng, beyaz ginseng, siyah ginseng gibi farklı işlenme tekniklerine göre isimlendirilmiş farklı alt tipleri bulunmaktadır. Triterpen saponinler olan glisenositlerin ise Rb1, Rb3, Re, Rg1, Rg3, Rh, Rk gibi türleri bulunmaktadır (Wan ve ark., 2021). Panax ginseng ve ginsenositleri kemoterapi ile ilişkili nefrotoksisite, hepatotoksisite, kardiyotoksisite gibi yan etkileri önleme amacıyla klinik öncesi çalışmalarda denenmiştir. Sıçanlara ardışık 28 gün boyunca 100, 300 ve 500 mg/kg enjekte edilen kırmızı ginseng, 5 mg/kg sisplatin uygulamasına bağlı böbrekte MDA, GSH ve süperoksit dismutaz (SOD) düzeylerinde iyileşme sağlamıştır. Ayrıca aynı çalışmada ginseng uygulamasına bağlı apoptoz gelişiminin önlendiği böbrek dokusunda p53 ekspresyonun azalması ve TUNEL pozitif epitelyal hücre yüzdesinin azalması ile gösterilmiştir. İlave olarak TNF-alfa, Hem Oksijenaz-1 (HO-1) ve Nitrik Oksit Sentaz-2 (NOS-2) immun boyama görüntüleri kontrol grubu ile benzerdi (Kim ve ark., 2014). Ginsenositler ile yapılmış çalışmalarda ise gerek in vivo sıçan ve fare çalışmalarında gerekse LLC-PK1 (*Lewis lung carcinoma-porcine kidney-1*) ve HEK293 (*Human embryonic kidney 293 cells*) gibi insan hücre kültürlerinde Rh2 (Qi ve ark., 2019), Rk1 (Hu ve ark. 2020), Rh4 ve Rk3 (Baek ve ark., 2006) ginsenositlerin antioksidan veya antiapoptotik etkiler ile böbrek koruyucu etkiler gösterdiği tespit edilmiştir.

Gingko biloba

Geleneksel Çin tıbbında asırlardır kullanılan ginkgo bilobanın günümüzde hafif demans durumunda kognitif bozukluk ve yaşam kalitesini iyileştirmek için kullanımı Avrupa İlaç Ajansı (*European Medicines Agency, EMA*) tarafından onaylanmıştır. Ginkgo biloba bitkisinin yapraklarından elde edilen ekstraktın serbest radikal süpürücü, antioksidan, anti-enflamatuvar ve antiapoptotik etkileri gösterilmiştir (Chan ve ark., 2007). Bu yararlı etkileri sayesinde ginkgo biloba ekstraktının sisplatin kullanımına bağlı böbrek hasarına karşı proteksiyon sağlayacağı hipotezi ile ilgili çeşitli çalışmalar yürütülmüştür. Sıçanlarda yapılan çalışmalarda ginkgo biloba ekstraktının sisplatin kaynaklı nefrotoksisiteye karşı antioksidan ve anti-enflamatuvar etkiler ile (Song ve ark., 2013) ve renal interstisyel fibrozisi azaltarak (Wei ve ark., 2022) koruyucu etki sağladığı gösterilmiştir. Song ve ark. (2013) oksidatif stres parametreleri olarak SOD, katalaz (CAT), glutatyon peroksidaz (GPx), GSH / GSSG oranını, enflamasyon parametresi olarak NF-κB'yi kullanmışlardır.

Kurkumin

Kurkumin (*Curcurmin*) *Curcuma longa* adlı bitkiden izole edilen polifenolik bir bileşiktir ve özellikle Uzakdoğu mutfağında baharat olarak kullanılan zerdeçalin ana bileşenidir (Rezaee ve ark. 2017). Antioksidan, anti-enflamatuvar, antitümör, immun düzenleyici etkileri bilinen kurkuminin ilaç ile ilişkili böbrek hasarına karşı nefroprotektif etkisini göstermeyi amaçlayan birçok preklinik çalışma yapılmıştır. 2001 yılında gerçekleştirilen bir çalışmada (Antunes ve ark., 2001) Wistar sıçanlara sisplatin enjeksiyonundan 24 saat ve 10 dk önce toplam 2 doz oral gavaj ile kurkumin veya selenyum uygulanması ile böbrek proteksiyonu sağlanamadığı gösterilse de daha sonra gerçekleştirilen çalışmalarda olumlu sonuçlar elde edilmiştir. Bu çalışmada olumlu fayda gösterilememesinin nedeni kurkumin dozunun yetersizliği ve gavaj sonrası kurkumin absorpsiyonunun yetersizliği olabilir. Başka bir çalışmada Wistar sıçanlara 5 gün boyunca 15, 30 ve 60 mg/kg dozlarında oral kurkumin uygulanması i.p. sisplatin uygulamasına bağlı böbrek hasarında doza bağımlı bir şekilde iyileşme sağlamıştır. Sisplatin ile artan renal nitrit ve MDA düzeyleri kurkumin ile anlamlı olarak azalmış ve sisplatin ile azalan GSH, SOD ve CAT düzeyleri anlamlı olarak artmıştır. Ayrıca sisplatine bağlı artan serum TNF-α düzeyleri kurkumin ile anlamlı olarak azalmıştır (Kuhad ve ark., 2007). Farelerde yapılan bir çalışmada da benzer koruyucu etkiler gösterilmiş, kullanılan doz ve uygulama şekli ve zamanlaması farklı olmuştur. Sisplatin 20 mg/kg i.p. uygulamasından hemen sonra 100 mg/kg kurkumin i.p. olarak enjekte edilmiştir. Böbrek fonksiyonu değerlendirmesi 72 saat sonra yapılmıştır (Ueki ve ark., 2013). Serum TNF-α düzeylerindeki iyileşmeye ilave olarak böbrek TNF-α, MCP-1, ICAM-1 düzeylerinde de normalizasyon sağlanmıştır. 2017 yılında gerçekleştirilen bir çalışmada sisplatin öncesi kurkumin uygulaması (tedavi-öncesi, *pre-treatment*), sisplatin uygulaması sonrası kurkumin uygulaması (tedavi-sonrası, *post-treatment*) ile karşılaştırılmıştır. Tedavi-öncesi kurkumin uygulaması sisplatin enjeksiyonuna bağlı artan TNF-α, IL-6, IL-8 düzeylerini anlamlı olarak azaltmış, sisplatine bağlı azalmış IL-10 düzeyini ise anlamlı olarak artırmıştır. Ancak tedavi-sonrası kolunda kurkumin uygulaması ile proteksiyon gösterilememiştir (Kumar ve ark. 2017). Bu veriler bir ajanın koruyucu etki göstermesi için uygulanma zamanının ne kadar önemli olduğunu göstermektedir.

Askorbik asit ve α-Tokoferol

C vitamini olan askorbik asit ve E vitamini olan α-tokoferolün güçlü antioksidan özellikleri bilinmektedir (Frei B, 1994). Sisplatin aracılı böbrek hasarında oksidatif stres önemli mekanizmalardan biri olduğu için askorbik asit ve α-tokoferolün protektif etkilerini göstermeyi amaçlayan preklinik çalışmalar yapılmıştır. Sisplatin enjekte edilen farelerde azalan renal SOD, CAT ve GPx düzeyleri askorbik asit ve α-tokoferol uygulaması ile anlamlı olarak artmıştır. Askorbik asit ve α-tokoferolün güçlü antioksidan etkileri sayesinde sağlanan böbrek koruyucu etkileri histopatolojik veriler ile de teyit edilmiştir (Ajith ve ark., 2007).

N-Asetilsistein (NAC)

NAC glutatyon yolağı ve L-sistein prekürsörüdür ve serbest radikal süpürücü özelliğe sahiptir (Zafarullah ve ark., 2003). Bu özelliği sayesinde ilaca bağlı organ hasarında NACın koruyucu etkiler sağlayacağı öngörülmüş ve preklinik çalışmalar yapılmıştır. Sıçanlarda sisplatin ile indüklenen nefrotoksisitede NAC oksidatif stresi, p38 MAP kinaz aktivasyonunu, kaspaz 3 bölünmesini önleyerek iyileşme sağlamıştır (Luo ve ark., 2008). Ayrıca NACın sisplatin aracılı apoptozu kaspaz 3 ve 9 düzeylerini azaltarak önlediği gösterilmiştir (Wu ve ark., 2005). Başka bir çalışmada enflamasyonun sisplatin aracılı böbrek hasarına kısıtlı etki yaptığı, NACın böbrek hasarı indikatörleri olan BUN ve kreatinin düzeylerini kontrol düzeylerine düşürdüğü gösterilmiştir (Güntürk ve ark., 2019).

Selenyum (Se)

Se tahıllar ve sebzeler dahil olmak üzere diyet kaynaklarından elde edilen ve insanlar için gerekli olan bir eser elementtir. Vücutta bağışıklık fonksiyonları ve antioksidan savunma gibi çok sayıda süreçte rol oynar (Tapiero ve ark., 2003). Dişi Wistar sıçanlarda tek doz sisplatin enjeksiyonu ile oluşan böbrek hasarında Se ve yüksek doz E vitamini kombinasyonu uygulaması ile iyileşme sağlanmıştır. Böbrek dokusunda azalan antioksidan enzimler ve artan MDA düzeyleri anlamlı olarak iyileşmiştir (Naziroğlu ve ark., 2004). Se eksikliği glutatyon peroksidaz aktivitesini azaltır ve oksidatif stres ile sonuçlanmaktadır. Se eksikliği veya oral Se uygulamasının sisplatin kaynaklı nefrotoksisiteyi nasıl etkilediğini araştıran bir çalışmada erkek Wistar sıçanlar 4 hafta boyunca Se eksikliği olan veya kontrol diyeti ile beslenmiştir. Se eksikliği, sisplatin kaynaklı nefrotoksisiteyi şiddetlendirirken tedaviye Se eklenmesi sisplatine bağlı nefrotoksisite parametrelerinde iyileşme sağlamış, ancak böbrek fonksiyonunu önemli ölçüde iyileştirmemiştir. Bu bulgular Se eksikliğinin oksidatif stresi ve sisplatin ile ilişkili nefrotoksisiteyi artırdığını ancak oral Se tedavisinin sıçanlarda nefrotoksisiteye karşı kısmen koruyucu olduğunu göstermiştir (Fujieda ve ark., 2006).

Diğer ilaçlar

Hayvan nefrotoksisite modellerinde antioksidan veya antienflamatuvar özellikleri bilinen diğer birçok ilaç böbrek hasarını önlemek amacıyla değerlendirilmiştir. Sisplatin aracılı nefrotoksisitede önemli mekanizmalardan biri de enflamasyon olduğu için non-steroid anti-inflamatuvar (NSAİ) ilaçlar gibi klasik NSAİ ilaçların yanında COX-2 inhibitörü olan selekoksib ve infliksimab, golimumab gibi TNF-α inhibitörü biyolojik ilaçlar da araştırılmıştır.

Non-selektif COX inhibitörü diklofenak hücre kültürü çalışmalarında A549/DDP hücrelerinde ilaç ile ilişkili doku hasarını artırıcı etki gösterirken COX-2 inhibitörü selekoksib iyileştirici etki göstermiştir (Okamoto ve ark., 2021a). Başka bir hücre kültürü çalışmasında A549/DDP hücreleri transplante edilen ksenograft fare modelinde selekoksib böbrek hasarında iyileşme sağlamıştır (Okamoto ve ark., 2021b). Aynı çalışmada her ne kadar diklofenak ile ilgili hasar artırıcı etki gösterilmese de insanlarda yapılan bir çalışmada düzenli NSAİ ilaç kullanan kanser hastalarında sisplatin ilişkili nefrotoksisite riskinin anlamlı olarak arttığı gösterilmiştir (Kidera ve ark., 2014). Ayrıca NSAİ ilaç kullanımı sisplatin kullanan hastalarda nefrotoksisite gelişimi için önemli bir risk faktörü olarak kabul edilmektedir (Okamoto ve ark., 2020a). Selekoksibi de içeren 17 NSAİ ilacın karşılaştırıldığı bir çalışmada hücre kültürü çalışmaları verilerine göre Wistar sıçanlarda kullanılmak üzere selekoksib ve flurbiprofen seçilmiştir. Sıçanlarda sisplatin ile ilişkili böbrek hasarı selekoksib ile anlamlı olarak iyileşirken, flurbiprofen ile anlamlı olarak kötüleşmiştir (Okamoto ve ark., 2020b). Antioksidan ve antienflamatuvar mekanizmalar ile sağlanan selekoksib uygulamasına bağlı böbrek koruyucu etkiler çeşitli çalışmalarda gösterilmiştir (Jia ve ark., 2011; Suddek ve ark., 2011).

TNF-α düzeyleri sisplatin ile ilişkili böbrek hasarında anlamlı olarak artmaktadır ve TNF-α'nın böbrek hasarında önemli rol oynadığı düşünülmektedir. Bu hipotezi destekleyen şekilde, TNF-α inhibitörleri olan

infliksimab (Cure ve ark. 2014) ve golimumab (Pavitrakar ve ark., 2022) uygulanması sıçanlarda ilaç uygulamasına bağlı böbrek hasarında anlamlı iyileşme sağlamıştır. Golimumab ile yapılan çalışmada karşılaştırma kolunda pentoksifilin kullanılmıştır ve golimumab oksidatif stres ve enflamasyon parametrelerinde iyileşme sağlayarak böbrek koruyucu etki göstermiştir.

SONUÇ

Sisplatin kaynaklı gerçekleşen böbrek hasarı doza bağımlıdır ve bu hasara karşı önlem amacıyla sisplatin daha düşük dozlarda kullanılmaktadır. Sisplatinin terapötik etkisi doz ile doğru orantılı olduğu için bu durum antikanser etkisinin daha az olmasına neden olmaktadır. Sonuç olarak sisplatine bağlı hasarı önleyici yeni tedavilerin geliştirilmesi, sisplatinin daha yüksek dozlarda kullanılabilmesine imkan sağlayacaktır. Sisplatin ile indüklenen nefrotoksisiteyi azaltmaya veya önlemeye yönelik pek çok preklinik çalışma yapılmış olmasına rağmen günümüzde bu hasarı önlemeye yönelik rutin uygulamalar hala yetersizdir ve daha çok çalışma yapılmasına gereksinim bulunmaktadır.

Abstract

In this research carried out in Harşit Stream, it was aimed to reveal the length-weight and length-length relationship equations of 78 *Vimba vimba* individuals. As a result of the fieldwork carried out in May 2021, 29 female and 49 male individuals were sampled. Total, fork and standard lengths of each individual were measured and weights were weighed. Length-weight relationship was using the $W=aL^b$ equation and length-length conversions were determined using the y=a+bx equation. The total lengths are between 10.8 and 17.3 cm in the general population, and the weights are between 10.090 and 46.130 g. The equations for the length-weight relationship are $W=0.011L^{2.872}$ ($R^2=0.880$), $W=0.008L^{2.977}$ ($R^2=0.912$), $W=0.013L^{2.795}$ ($R^2=0.858$) for the general population, female and male individuals, respectively. As a result of the statistical analysis, it was determined that the b value was not significantly different from 3 and that the Harşit Stream *Vimba vimba* individuals showed isometric growth (b=3, P>0.05). The R^2 value obtained from the relations between total length-fork length, total length-standard length, fork length-standard lengths were greater than 81% (P<0.001). In this study, the length-weight and length-length relationship equations of individuals of the *Vimba vimba* species in the Harşit Stream population were determined for the first time.

Keywords: Length-weight relationship, length-length relationship, Harşit Çayı, Vimba bream

INTRODUCTION

Length–weight relationships (LWRs) have an important role for fisheries management and population dynamics (Erzini, 1994). Until the early 1960s, LWRs were calculated using log-transformed mean weights of fishes in different length group (Nomura, 1962). However, in recent years, scientific pocket calculators, mainframe computers and statistical programs made it easy to use data on individual fishes and to compare statistically linear "predictive" regressions trough covariance analysis (Haimovici & Velasco, 2000).

The weight of the fish from its length and life cycle of the populations from different habitats can be obtained from LWR related parameters. Ecological differences have an important role in morphology of fishes. Also, LWRs allow the transformations of growth-in-length equations to growth in-weight, for use in stock assessment models and commonly used in the ecosystem modelling approaches (Pauly et al., 2000; Christensen & Walters, 2004); LWRs allow life history and interspecific comparisons of fishes, or between fish populations from different habitats and/or regions (Petrakis & Stergiou, 1995; Goncalves et al., 1997; Binohlan & Pauly, 1998). Like other morphometric measurements, LWRs may change during the life history traits of fishes like metamorphosis, growth and beginning of maturity (Le Cren, 1951). LLRs are important in comparing growth studies using different length types for fisheries management (Moutopoulos & Stregiou, 2002).

In this study we report on length-weight and length-length relationships for *Vimba vimba* from the Harşit Stream. *Vimba vimba* (Linnaeus, 1758) is known as a benthopelagic species distributed in the freshwater, brackish (Riede, 2004). Vimba bream inhabits brackish estuaries, large to medium rivers and some large subalpine lakes (Kottelat and Freyhof, 2007). There are previous studies on the length-weight relationship of the species (Tarkan et al., 2006; Okgerman et al., 2011; Namin et al., 2013; İlhan and Sarı, 2015). There is no previous study of the LWRs and LLRs of *Vimba vimba* in Harşit Stream, Turkey. Thus, the LWRs and LLRs of this species are not yet well known. The main objective of this study was to determine the LWRs and LLRs of *Vimba vimba* in Harşit Stream.

MATERIALS AND METHODS

A total of 78 fish specimens were caught with electroshocker from Harşit Stream in Torul District of Gümüşhane Province in May 2021. The sampled fish were then fixed in 70% alcohol solution and transported to the Ondokuz Mayis University, Faculty of Science, Ichthyology Research Laboratory. Sampled fish were identified to species following Çiçek et al. (2020), Fricke et al. (2022). Total length (TL), fork length (FL) and standard length (SL) were measured to the nearest ±0.1 cm, individual total weight (W) was recorded to the nearest ±0.01 g. Conversions among length measures were accomplished using linear regression models; length-length relationships were determined by the least squares method (Sokal and Rohlf, 1981). The following relationships were established using linear regression analysis. The sexes of the fish were determined by macroscopic examination of the gonads. Whether there is a difference between male and female individuals in terms of total length and weight was tested with the independent-t test.

The following formula was used to calculate the length-weight relationship (Bagenal and Tesch, 1978).

$$W=aTL^{b} \quad (1)$$

Where, W= weight of fish in grams, a= intercept (constant), TL= total length of fish in centimeters and b= regression coefficient of slope. The relationship parameters a and b were determined with the Log W= Log a + b Log TL linear regression equation, and whether the b value was different from 3 was determined by the t-test, and the growth pattern of the species was revealed (Zar, 1999). In addition, the confidence interval (95%CI) of the b value was determined. Length-weight and length-length relationships were calculated separately for female, male and all individuals. Statistics were performed using SPSS package program and Minitab.

RESULTS and DISCUSSION

The average total lengths and weights of the *Vimba vimba* individuals sampled from Harşit Stream were determinated as 13.090±1.172 cm, 17.961±5.682 g, respectively. The descriptive statistics calculated separately for all population, female and male were offered in Table 1. When male and female individuals of *Vimba vimba* were compared in terms of total length (Mann-Whitney U test; P=0.873) and weight (Mann-Whitney U test; P=0.411), it was determined that there was no statistically significant difference between sexes.

Table 1. Descriptive statistics for *Vimba vimba* inhabiting Harşit Stream (SE:Standard Error, StDev:standard deviation, Min: Minimum, Max:Maximum)

	Variable	N	Mean	SE Mean	StDev	Min.	Max.
All	TL	78	13.090	0.133	1.172	10.800	17.300
	FL	78	11.747	0.117	1.038	10.200	15.400
	SL	78	10.301	0.114	1.009	8.700	13.900
	W	78	17.961	0.643	5.682	10.090	46.130
Female	TL	29	13.200	0.260	1.399	11.500	17.300
	FL	29	11.814	0.222	1.197	10.300	15.400
	SL	29	10.403	0.225	1.213	9.200	13.900
	W	29	18.32	1.41	7.57	12.18	46.13
Male	TL	49	13.024	0.146	1.025	10.800	15.700
	FL	49	11.708	0.135	0.942	10.200	13.900
	SL	49	10.241	0.125	0.875	8.700	12.700
	W	49	17.748	0.610	4.270	10.090	30.690

The length-length relationships between total length, fork length, and standard length and also the estimated parameters of the length-length relationship and the coefficient of determination r^2 of *Vimba vimba* are presented in Table 2. All LLRs were highly significant with $r^2>0.80$ ($P<0.001$).

Table 2. Length-length relationships for *Vimba vimba* caught in the Harşit Stream (n = number of individuals, r^2 = coefficient of determination)

Sex	Equation	n	a	b	r^2	P
All	TL = a + b FL	78	0.485	1.073	90.1	<0.001
	TL = a + b SL	78	2.085	1.068	84.4	<0.001
	FL = a + b SL	78	2.157	0.930	81.7	<0.001
Female	TL = a + b FL	29	-0.342	1.146	96.1	<0.001
	TL = a + b SL	29	2.448	1.033	80.3	<0.001
	FL = a + b SL	29	2.448	0.900	83.2	<0.001
Male	TL = a + b FL	49	1.301	1.001	84.8	<0.001
	TL = a + b SL	49	1.688	1.106	89.1	<0.001
	FL = a + b SL	49	1.783	0.969	81.0	<0.001

It was determined that there is a strong correlation between the length and weight values of *V.vimba* individuals distributed in the Harşit Stream ($P<0.001$, $r^2>0.85$, Table 3). The total length and weight are in a harmony with each other. The b value obtained from the length-weight relationship equation of *V.vimba* inhabiting Harşit Stream is 2.872, 2.977, and 2.795 for the all population, females and males, respectively.

Table 3. Length-weight relationship parameters of *Vimba vimba* inhabiting Harşit Stream

	LWR Parameters			r^2	P Value
	a	b	% 95 confidence interval		
All	0.011	2.872	2.631-3.113	0.880	<0.001
Female	0.008	2.977	2.612-3.342	0.912	<0.001
Male	0.013	2.795	2.461-3.129	0.858	<0.001

It was determined that the b value calculated for general population, females, and males the was not significantly different from 3 (one sample t test, $P>0.05$). Analyses showed that Vimba bream has isometric growths for all population, female and male (Figure 1).

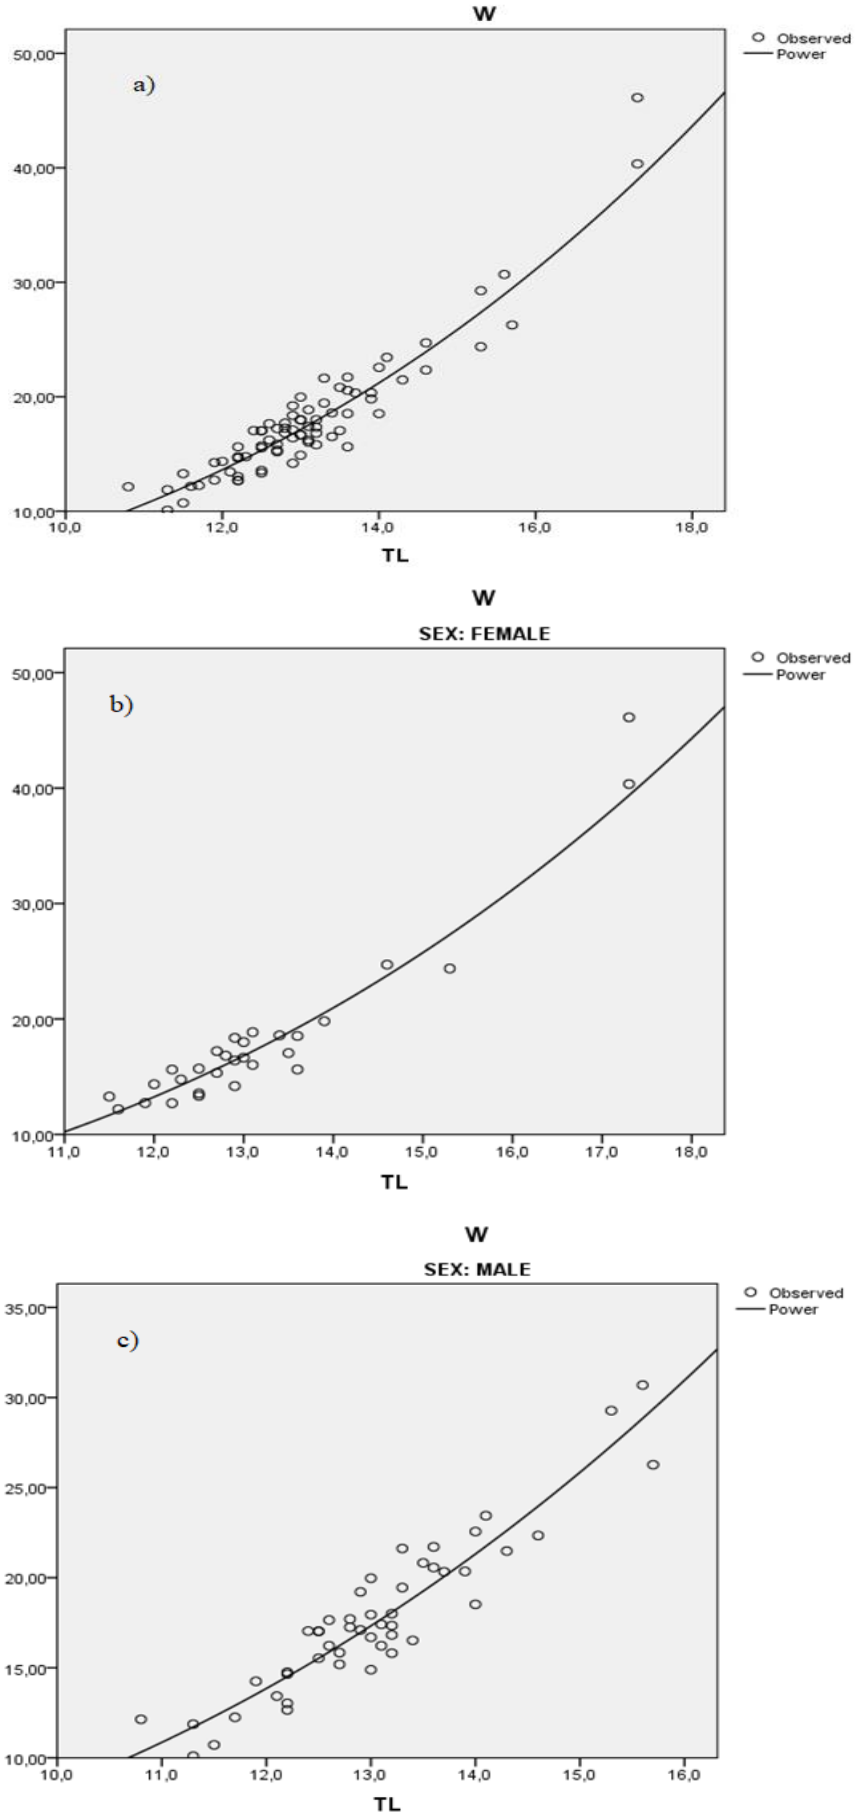

Figure 1: Length-weight relationship graphs for *V.vimba* population in Harşit Stream a) general population b) female individuals c) female individuals

The results obtained from the researches carried out on the length-weight relationship of the *Vimba vimba* are presented in the Table 4. Parameters of the length-weight relationship in fishes can be affected by such factors as area, habitat, sex, seasonal variations, feeding habits, gonad maturity and length ranges of the individual caught (Tesch, 1971). In this study, Vimba bream has isometric growth for Harşit Stream. The growth types were reported by İlhan et al. (2012); *V. vimba* showed isometric growth, Okgerman et al. (2011), İlhan and Sarı (2015); *V. vimba* showed positive allometric growth.

* Calculated by FL, [a] Female, [b] Male

CONCLUSION

The purpose of the length–weight relationships and length-length relationships given here was to contribute to the knowledge of the LWRs and LLRs of *Vimba vimba*. It is thought that this work will be helpful in future ecological studies in the region.

Özet
Transistör, mikroçip ve bilgisayarın icadı sonrasında internet ve yazılım teknolojilerindeki gelişmeler askeri alanlardan üretim endüstrisine, bankalardan finansal teknoloji şirketlerine ve perakende başta olmak üzere tüm sektörlerde yeni ödeme sistemleri, dijital ürünler, abonelik sistemleri, ön ödemeli kartlar, dijital cüzdanlar ve dijital para transferi gibi yeni alışveriş alışkanlıklarına dönüşen teknolojik ve sosyolojik bir devrim yaşanmaktadır. Kısaca blockchain teknolojisiyle, donanım bağımsız, merkezi olmayan sistemler üzerinden, dijital para ve yeni ödeme sistemleri günümüzün ve geleceğin en önemli gelişmeleri arasında yer almaktadır. Bu çalışmada perakende sektöründe dijital dönüşümün getirdiği yeni teknolojiler ve tüketici davranışları araştırılmıştır. Ayrıca Mobiliva Mobil Bilişim Hizmetleri San. Tic. Ltd. Şti. bu kapsamda OTS (Online Ticketing System) çözümüyle; markalar, fiziki ve online satış noktaları, yazar kasa/android pos firmalarıyla bir ekosistem inşa ederek tüketicilerin dönüştüğü tüm ürün ve ödeme sistemleri alanlarında çalışmalar yapmaktadır.
Anahtar Kelimeler: İnovasyon, dijital dönüşüm, perakende teknolojisi, tüketici davranışı

The effects of digital transformation on financial technologies and changing consumer behavior

Abstract
After the invention of the transistor, microchip and computer, developments in internet and software technologies have emerged. There is a technological and sociological revolution that transforms into new shopping habits such as new payment systems, digital products, subscription systems, prepaid cards, digital wallets and digital money transfer in all sectors, from the military to the manufacturing industry, from banks to financial technology companies and retail. Briefly, with blockchain technology, hardware-independent, decentralized systems, digital money and new payment systems are among the most important developments of today and the future. In this study, new technologies and consumer behaviors brought by digital transformation in the retail sector were investigated. In addition, Mobiliva Mobil Bilişim Hizmetleri Ind. Trade. Co. Ltd. developed in this context OTS (Online Ticketing System) solution; by building an ecosystem with brands, physical and online sales points, cash register/android pos companies, it works in all product and payment systems areas where consumers are transformed.
Keywords: Innovation, digital transformation, retail technology, consumer behavior

GİRİŞ

Dönüşüm kavramı, iş dünyası kapsamında insanın ilk başta aklına; sistemleri, makineleri, robotları, değişen yeni iş modellerini, gelecek meslekleri, yeni ürünleri ve yeni pazarları getirmektedir. Aslında dönüşen, dönüştüren ve değişmek isteyen ürün veya hizmet değil, insandır! Hiçbir şey zamanı geldiği için meydana gelmemektedir.

Sanayi, iş dünyası, üniversiteler, girişimler veya teknolojilerin dönüşümün zamanı geldiği için değil, insanın bu dönüşümü kendisinde ve kitlelerde hissettiği için gerçekleşmektedir. Yani dönüşüm, bir ürün gibi periyodik zaman dilimi içerisinde ar-ge yapılarak değil, toplumların veya bireylerin yaşamlarında refah gelişimine göre şartların oluşması ile olgunlaşmaktadır. İnsanlık bilgiye ulaştıkça ve paylaştıkça, kitlelerin iş ve sosyal hayatlarındaki değişime olan ihtiyaç dönüşümü meydana getirmektedir.

Dönüşümün en etkin ve ilk rolü; teknik ve toplumsal verilerin izlenmesi, toplanması ve analiz edilerek yeniliğe dönüştürülmesidir. Kişileri, toplumları, kültürleri, sistemleri, canlı ve cansız varlıklar arasındaki sistematiği izleyen kişi: dönüşümü benimseyen şeklinde tanımlanabilir. Bu rol için iki taraf bulunmaktadır. Dönüşümcü tüketici ve dönüşümcü girişimciler. Dönüşümü benimseyen tüketici kitlesi, yeniliklere açık bir zihin ile dönüşmeyi beklemektedir. Onları en çok etkileyen şey arkadaşları, yakınları ve sosyal medya platformlarıdır. Dönüşümü benimseyen üretici kitlesi ise günümüzün dijital girişimcileri olarak adlandırılmaktadır. Onlar ise kariyerinin geleceğini kurumsal markalar altında çalışmak yerine kendi girişimlerine odaklanan yeni nesil dijital girişimcilerdir.

Bu dönüşüm ve değişim devriminin stratejisinde, insanların dünya vatandaşı olma ve daha sosyal ve refah içinde yaşaması hedeflenmektedir. Akıllı şehirlerde yaşam, nesnelerin interneti (IoT), yapay zekâ, fabrikaların yeniden modellenmesi ve dijital fabrikalara dönüştürülmesi, kas gücü ile yapılan işlerin robotlar tarafından yapılması, insanların daha esnek ve zihin üzerine işlerde çalışması üzerine yapılan stratejiler bu devrimin en önemli rolleri arasındadır.

“Gerçeklik, dönüşüm girişimlerini yönlendirme konusunda, bizim kolektif yeteneğimizin çok önündedir. Kurumların karşı karşıya kaldığı zorluklara ayak uydurmak için gerekenler; yeni dönüşüm zihinleri, yeni davranışlar ve yeni alışkanlıklardır.

İş, daha bağlantılı bir kültür elde etmeleri için onları yönlendirmeye ve gerekli yetenekleri geliştirmeye geldiğinde, kurumların çoğu geride kalmaktadır. Değişim karşısında gelişmek için daha büyük bir esneklik gerekir. Farklı ve büyük düşünmenin dönüşüm başarısını gerçekleştirmenin tartışılmaz önkoşulları olduğuna ve bu düşüncenin CEO ile başlaması gerektiğine dair hiç şüphe yoktur.” (Mattone ve Vaidya, 2019)

Dönüşümün teknolojik tarafı son yirmi yıl içerisinde internetin yaygınlaşması ve geliştirilmesi ile endüstride başlamıştır. O dönemde dijital dönüşüm; günümüzün akıllı şehirleri, yapay zekâ algoritmaları, nesnelerin interneti gibi sosyal hayatımızın teknolojik tarafı yerine, endüstrinin etkin olduğu dönemlerde fabrikaların dijital dönüşümü ile hayatımıza girmiştir. Dijital dönüşüm bir süreç iken günümüzde bir devrime dönüşmüştür. Bu sebeple üretim işletmelerinde proses departmanlarının uzun vadeli stratejilerinden, CEO’ların ajanda stratejisine ve konferans konuşmalarına kadar yükselmiştir.

Dönüşümün iş dünyası kapsamında dijital dönüşüm ayağının CEO pozisyonuna kadar yükselmesi gibi, diğer bir önemli konu ise ülke yöneticilerinin vatandaşları için bu dönüşüm stratejilerine uygun şartları sağlamalarıdır. Tüm vatandaşları kapsayan eğitim, teknoloji, altyapı ve ekonomi yatırımlarını yapmaları başlıca görevleri arasındadır. Çok daha önemli olan küresel strateji ise teknolojik yatırımlar ile birlikte kültürel dönüşüm yatırımları yapmak olacaktır. Türkiye’nin sanayide dijital dönüşüm, Almanya’nın endüstri 4.0, Japonya’nın toplum 5.0 ve İngiltere’nin Catapult stratejileri günümüzde küresel iş dünyasının tasarlanması ve yeni dijital ekonominin yönetilmesi için lanse edildiler. Bu devrimsel stratejiler, günümüzün teknoloji hızıyla bakıldığında ve yaşanmış endüstri devrimleri ile kıyaslandığında en fazla çeyrek asırlık stratejiler olduğu görünmektedir. İnsanın kültürel dönüşümüne yapılan yatırımlar ise hem asırlar boyunca ülkenin ve diğer dünya ülkelerinin gelişimine katkı sağlayacak hem de gelişmiş ülkelerin lanse ettiği devrimlere hazırlıklı olmanızı sağlayacaktır.

GELİŞEN TEKNOLOJİ İLE DEĞİŞEN TÜKETİCİ DAVRANIŞLARI

Dünya tarihinde en etkin teknoloji girişimlerinin belki de birincisi; savaşlarda bomba, mermi yolu, nişan alma, sıcaklık, nem, rüzgâr yönü-hızı ve barut tipi seçimi gibi faktörlerin hesaplanması için bir hesaplama cihazına (bilgisayara) olan ihtiyaç ile oluşmuştur. Dolayısıyla savaşlar bilim ve teknolojiyi harekete geçirmiştir. Çaresizlik inovasyonu, ülkelerin hayatta kalma mücadelesi sebebiyle ilk olarak savaşlarda meydana gelmiştir. Amerikan Savaş Bakanlığı’nın elektronik bilgisayara fon sağlama kararı 9 Nisan 1943’te çıkmıştır. “ENIAC, Electronic Numerical Integrator and Computer. ENIAC öncelikle füze hedeflerini belirlemek için diferansiyel denklemleri çözmek üzere tasarlanmış olsa da, Mauchly bunun programlanabilir bir cihaz olduğunu ve başka görevler de yapabildiğini yani genel amaçlı bir bilgisayar olduğunu yazdı.” (Isaacson, 2017) Charles Babbage, sofistike bir bilgisayara dair ilk makaleyi 1837 yılında yayınlamıştır. Dolayısıyla yüz yıl sonra ilk elektrikli bilgisayar olan ENIAC çalışmaya başlamıştır. Günümüzde ise bilgisayarlar Mauchly’nin ifade ettiği gibi çok amaçlı ve her sektörde farklı amaçlar ile kullanılan yüz yılın en önemli icadı olarak yerini korumaktadır.

“İnternet, bilgisayar sistemlerini birbirine bağlayan elektronik iletişim ağıdır. TDK, internet sözcüğüne karşılık olarak Genel Ağ’ı önermiştir. İnternet, çok protokollü bir ağ olup birbirine bağlı bilgisayar ağlarının

tümü olarak da tanımlanabilir. Binlerce akademik ve ticari ağ ile devlet ve serbest bilgisayar ağının birbirine bağlanmasıyla oluşmuştur. Bilgisayarlar arasında bilgi çeşitli protokollere göre paketler hâlinde transfer edilir. İnternet üzerinde elektronik posta ve birbirine bağlı sayfalar gibi çok çeşitli bilgiler ve hizmetler vardır. İnternetin kökeni, hataya dayanıklı, sağlam ve özel bir bilgisayar ağı kurmak isteyen Amerika Birleşik Devletleri hükûmeti tarafından 1960 yılındaki araştırmalara dayanır. 1980'lerde Ulusal Bilim Vakfı tarafından yeni bir ABD omurgasının finansmanı için toplanan özel fonlar, dünya çapında katılım ve birçok özel ağın birleşmesine neden olmuştur. 1990'larda uluslararası bir ağın yaygınlaşması ile internet, modern insan hayatının temelinde yer almıştır." (Wikipedia, 2022) Dünya tarihinin en etkin teknoloji girişimlerinden birincisi bilgisayarın icadı olarak kabul edilirken, ikincisi ise bu akıllı cihazların birbiriyle ve diğer sistemlerle iletişimde olup, veri alışverişi yapmasını sağlayan, yeteneklerini geliştiren, en önemlisi askeri amaçla üretilen bilgisayarların dünyada tüm sektörlerde kişisel, ticari ya da farklı amaçlarla kullanılmasını sağlayan en önemli teknoloji ise internettir. Bilgisayar ve internet teknolojilerinin birlikte hareket etmesiyle 1990 ve 2000 yılları arasında web 1.0 dünyası meydana gelmiştir. Web platform sahiplerinin ve webmasterların bireysel yetenekleri kadar eklenen içeriklerden kullanıcıların faydalandığı bir dönem başlamıştır. Daha doğrusu bu dönem içerik okuma, dinleme, izleme ve oyunlarla tek taraflı bir içerik tüketme davranışı olarak kabul edilmektedir. 2000-2010 yılları arasında ise web 2.0 ile kullanıcıların tüketici rolüne ek olarak üretici rolü eklenerek; bağlantı kurmak, paylaşmak, kitlesel sosyal gruplar kurmak gibi insanların gerçek hayatlarına bir de sosyal alanlar eklenmiştir. Bu da internet teknolojilerinin daha popüler ve ilgi çekici bir ortam olarak tanınmasını sağlamıştır. 2010-2020 yıllarında ise platform sahipleri ve son kullanıcılara ek olarak; yazılımlar, sistemler, akıllı cihazlar (IoT) ve veri temelli yapay zekâ, makine öğrenmesi ve derin öğrenme gibi teknolojiler katılarak insan-robot iş birliği dünyası oluşmuştur. Bu dönemde dijital pazarlama ve dijital reklamcılık alanının veri temelli dönüşümü sayesinde e-ticaretin gelişmesi sağlanarak kişiselleştirilmiş ürünler ve kişiselleştirilmiş alışveriş alışkanlıklarıyla yeni bir toplumsal dönüşüm sağlanarak web 3.0 dünyası tasarlanmıştır. 2010-2020 yılları bilgisayar vb. donanımlarının, internet teknolojilerinin, yazılım yeteneklerinin çok hızlı büyüdüğü ve yaygınlaştığı bir dönem olarak; bankacılık, sanayi ve girişimcilik alanlarında yeni gelişmelerin öncüsü olmuştur. Özellikle 2011 yılında Almanya tarafından lanse edilen Endüstri 4.0 felsefesi tüm dünyada yeni bir üretim yaklaşımıyla; big data, IoT, 3d printer, otomasyon, simülasyon, dijital ikizler, siber güvenlik, robot-otonom, bulut, uçtan uca yazılım entegrasyonları, AR/VR teknolojileri başta olmak üzere üretim teknolojileri alanında bir devrim yaşanmıştır. Üretim endüstrisinde yaşanan bu gelişmeler tüketiciler için yeni ürünlere dönüşerek tüketicilere yeni alışveriş alışkanlıkları, yeni ihtiyaçlar, sektörler ve yeni dijital ekonomi ortamı oluşturmuştur.

2020-2030 yıllarında ise web 4.0 dünyasıyla Merkezi Olmayan Sistemler, Bulut ve Sanallaştırma Teknolojileri, Süper App'ler, IoT Cihazları, AR/VR Teknolojileri, Yeni Ödeme Sistemleri ve Elektronik Para Fintech'leri, Yapay Zekâ teknolojileri, Yüksek Hızda İnternet, yazılım-programlama ve algoritma teknolojileriyle toplumlarda sanal-etkileşim dönemi meydana gelecektir. Tüm bu sektörel gelişmelerin internet teknolojileri kapsamında değerlendirilmesinin amacı; mobilite teknolojilerinin yaygınlaşması, yüksek hızda internetin tüm lokasyonlara hızla dağıtılması, veri temelli donanımların ve sistemlerin geliştirilmesi, iletişim ve etkileşim teknolojilerinin tüm sektörlerde çözüm üreten bir araç olmasıdır.

AR/VR teknolojileriyle alışveriş, özellikle giyim ve eğitim sektörlerinde ürün ve hizmetlerin kullanımı hızla artmaktadır. Bir mobil uygulama ya da AR/VR gözlüğü ile tüketici AR/VR teknolojisi üzerinden evine koltuk takımı seçimi yapabilmektedir. Doktorlar bu teknoloji ile sanallaştırılmış tıp eğitimlerine katılabilmektedir. Öğrencilerin atölye, laboratuvar vb. yetenek merkezlerinden alanında uzman kişilerle meta dünyalarda eşzamanlı gerçek dünya ile ayırt edilemeyecek seviyede eğitimlere katılabilirler.

Bulut teknoloji ile verilerin fiziksel sunucularda saklama zorunluluğu ortadan kalkarak hem bu kapsamda maliyetler düşürüldü hem de kişilerin ya da kurumların verilere ulaşma esnekliği artırılmıştır. Bulut sunucularda işlenmek üzere saklanan/depolanan verilerin bir girişimci ya da tasarımcı ile bilgilere dönüştürülmesi yeteneği kazanılmıştır. Çok daha önemlisi lokasyon bağımsız çalışan grupların, geniş katılımcı sayısı olan departmanların birlikte eşzamanlı çalışabilmelerini sağlayan, işlerini daha planlı organize edebilmelerini sağlayan platformlar iş dünyasına kazandırılmıştır.

Bir IoT projesiyle özellikle fabrikalar ve akıllı şehirde birçok sistem, teçhizat ya da makine uzaktan, lokasyon bağımsız, personel ihtiyacı olmadan, veri analizi ile tahminleme yapılarak arızaların önceden öğrenilmesini sağlamaktadır. Periyodik bakımların zaman aralıkları daha verimli yönetilmektedir.

Simülasyon ve dijital ikiz teknolojileri bir ürün veya projenin önceden ikizinin tasarlanmasını sağlayarak tüm sorunların önceden görünmesini sağlamaktadır. Tasarım aşamasında maliyetleri düşürdüğü gibi test

senaryolarının daha verimli yönetilmesine yardımcı olmaktadır. Bütüncül yaklaşımlarla önceden tasarlanan dijital ikizler ya da simülasyonlar kullanıcı deneyimi kapsamında da çok büyük etkiler sağlamaktadır. Simülasyon, dijital ikizler ve oyun teknolojileri alanındaki gelişmeler, dijitalleşen iş dünyası ve sosyal platformlarda zaman geçiren kullanıcılara yeni bir deneyim sunmak için meta dünyalara dönüşmektedir. Sosyal medya platformlarında geçirilen süreleri, içerikleri ve iletişim deneyimini geliştirerek, gerçeğe yakın AR/VR teknolojilerle meta dünyalara geçiş başlamaktadır. Mark Zuckerberg Facebook ve Instagram platformlarında edindiği veriler ve tecrübelerle bu teknolojiye öncülük ederek şirketinin ismini "Meta" olarak değiştirip metaverse teknolojilerine yatırım yapan ilk şirketlerden birisi olmuştur. Günümüzde bu teknoloji ile ilgili en büyük sorun kullanıcılara konforlu ve maliyeti uygun AR/VR gözlüklerinin geliştirilememesidir. Microsoft da Covid 19 pandemisiyle uzaktan eğitim ve uzaktan çalışma faaliyetlerinde büyük rolü olan Teams online toplantı programıyla metaverse çalışmalarını entegre yürütmektedir. Toplantıları daha verimli bir hale getirmek amacıyla, kişilerin odak sorunlarını çözmek ve içerikleri daha verimli paylaşmalarını sağlamak için 3 boyutlu sanal toplantı odaları tasarlanmaktadırlar.

Son yıllarda oyun sektöründeki teknolojik gelişmeler, büyümeler ve özellikle oyun geliştirme şirketlerinin satın alınması metaverse endüstrisinin geliştirilmesi paralelinde yaşanan gelişmelerdir. Özellikle uzun yıllardır oyun sektöründe oyun içinde ve oyun platformlarında kullanılan dijital oyun paraları günümüzdeki kripto paraların test ortamları olmuştur. Bu testler başarıyla tamamlandığından dijital paralar kullanıcılar için hem yeni bir deneyim hem de yeni bir devrimin öncüsü olacaktır. Günümüzün gerçek ve meta dünyalarında olan diğer iki önemli teknoloji ise NFT ve blockchain teknolojisidir. NFT, Non-Fungible Token: takan edilemeyen, bir eşi veya benzeri olmayan dijital varlık anlamına gelmektedir. Ülkemizde Türk Dil Kurumu NFT ifadesinin Türkçe karşılığı olarak "Nitelikli Fikrî Tapu" kavramını kabul etmektedir. Öncelikle oyun sektörü ve sonrasında metaverse ile hayatımıza giren NFT'ler aslında dijital varlıklar, yani kişiselleştirilmiş ürünlerdir. Tüketicilere özel kişiselleştirilmiş ürünler her zaman dikkat çekici olmuştur. NFT'lerin kişiye özel ve tek bir sahibinin olmasının yanı sıra dijital bir varlık olması sosyal medya gibi dijital platformlarda tüketiciler için çok daha fazla dikkat çekici bir üründür. Geçmiş yıllardaki ünlü ressamların tablolarını satın alan bir nesilden, NFT satın alan bir nesile dönüşen bir yolculuk başlamıştır. NFT'lerin temel teknolojisini oluşturan ve değişen tüketici davranışları kapsamında, insan hayatında sorunları çözen, yeni inovatif teknolojilere öncülük eden asıl teknoloji blockchain teknolojisidir. Blockchain kısaca, kriptografi kullanılarak birbirine bağlanarak güvenli hale getirilen merkezi olmayan kayıt defterleridir.

Blockchain teknolojisiyle günümüzde yapılan ve gelecekte yapılabilecekler;

- Kimlik yönetimi
- Kripto belgeleme ve arşivleme
- Kripto para
- İzlenebilirlik ve varlık takip sistemleri
- Tedarik zinciri
- Oy kullanıma
- Noterde yapılan işlemler; alım-satım ve aracılık hizmetleri
- Kamu daireleri abonelik ve vatandaşlık sistemleri
- Kripto sözleşmeler
- Hisse senetleri ve borsalar
- Para Transferi

Blockchain teknolojisi merkezi olmayan organizasyonların ve sistemlerin gelişmesine öncülük etmektedir. Merkezi olmayan daha şeffaf ve güvenli, kriptolama teknolojileri kullanılarak yapılan bu strateji; para, veri, bilgi, değerli belgeler ve aracılık hizmetleri gibi kişiler ve kurumlar için önemli olan tüm aksiyonlar için geliştirilmiştir. Merkezi olmayan bu sistemler günümüzde dijital cüzdanların hızla iş ve sosyal hayatın içerisine girişini sağlamıştır. Belirli alanlarda, bankalarda ya da hesaplarda bekletilen fiziki-dijital paranın; merkezi olmayan, daha şeffaf, birden fazla platformda veya ürün için kullanılmak üzere dijital cüzdanlar üzerinden hem paranın dolaşım hızı hem de kullanım kolaylığı sağlanmıştır. Dolaysıyla dijital paranın ve yeni ödeme sistemlerinin gelişmesine katkı sağlanmıştır.

Yeni Ödeme Yöntemleri;

- Nakit Paradan Dijital Paraya Geçiş (Elektronik Para)
- Şimdi Al Sonra Öde
- Kredi / Banka Kartları
- Hediye Kartı ve Sanal Kartlar
- Kripto Para Cüzdanı ve E-cüzdan
- Yerel Ödeme Kartı
- İnternet ve Mobil Bankacılık
- Açık ve Servis Bankacılığı
- Ön Ödemeli Kart ve Bakiye Harcama
- Fatura Ödeme
- Finansal Mobil Uygulamalar
- QR Kod İle Alışveriş
- Para Transferi
- Taksit
- Otomatik ve Temassız Ödeme

Yeni ödeme yöntemleri ve elektronik para sistemlerinin çalışması için her geçen gün Ödeme ve Elektronik Para Kuruluşları/Girişimleri sektörde yerini hızla almaktadır. Sosyal alanlarda bu değimi benimseyen tüketicilerin ihtiyaçlarına teknoloji ile cevap verilmesi bankaların bazı işlerinin Fintech şirketlerine geçtiği görünmektedir. Ayrıca istihdam da bu yönde değişmektedir. Dijitalleşen para sistemleri ve paranın kendisinin günümüzdeki diğer bir avantajı ise dijital hesaplarda olan paranın kullanım/harcama öncesi yatırım araçlarına dönüştürülmesidir. İş ve sosyal hayatta finansal teknolojiler kapsamında bir ürün ya da hizmeti üretmenin ve tüketmenin hızının artması dönüşümü benimseyen tüm paydaşlar için yeni gelişmelere de sebep olmuştur. Örneğin yeni dijital ve paylaşım ekonomisi alanlarında araç kiralama ve paylaşma, scooter gibi ekonomik araçların mobil app üzerinden hızla kiralanıp kullanılabilmesi, taksilerde nakit yerine pos cihazları üzerinden ödemelerin alınabilmesi, hatta kredi kartı dışında alışveriş ve yemek kartları ile sosyal hayatta yeni ödeme alışkanlıkları oluşmaktadır. Bu sebeple tüketicilerin satın alma ihtiyaçları teknolojiyle, inovasyonla ve toplumsal dönüşümle değişmektedir.

Satın alma davranışlarını etkileyen temel faktörler;

- Bireysel ihtiyaçlar
- Marka ve kullanıcı yorumu etkisi
- Sosyo-kültürel etkiler
- Psikolojik etkiler
- Ekonomik durum
- Duygusal değişim
- Finansal teknolojik gelişmeler

Dijital dönüşüm son yılların en önemli teknoloji üretme ve tüketme misyonlarının başında gelmektedir. Finans ise toplumların inovasyonla kalkınma paradigmaları paralelinde teknoloji ile yönetilmeye, üretilmeye ve akıllı teknolojiler ile yoğun kullanılan bir alan olup, finansal teknolojilerin doğmasına, gelişmesine ve tüketiciler için dönüşmesine sebep olmaktadır. Ana ödeme aracı nakit paranın yanında şu an en çok kullanılan yöntem kredi kartları, cüzdan ve ön ödemeli kart kullanımı hızla gelişmektedir. Covid-19 pandemisi sonrasında tüm dünyada yaşanan enflasyon sebebiyle cüzdan ya da ön ödemeli kartlar ile uygun fiyatlı satış yapan markaları tercih eden kullanıcılar hızla alışveriş alışkanlıklarını değiştirdiği gözlemlenmektedir. Bu sebeple yukarıdaki yedi temel satın alma davranışın arasında en etkin olan finansal

teknolojik gelişmelerdir. Teknoloji kullanıcılarının yaş ortalaması da bu gelişmeler sebebiyle artmaktadır. Fabrikalarda robotik, otomasyon ve otonom teknolojilerin gelişmesi ve hızla yaygınlaşması, emeklilik yaşlarının 2048 yılına kadar kademeli bir şekilde yükseltilerek 65'e çıkarılması gibi faktörler taksi şoförlerinin yaş ortalamasını 45+ olarak artırmıştır. Günümüzde 45-65 yaş arasındaki taksi şoförleri cep telefonlarından taksi yönetim uygulamalarını kullanarak hızla bu alana uyum sağlamaktadırlar. Süper App'ler günümüzün en popüler teknolojileri arasında yer almaktadır. Yemek, fatura ödeme, para transferi, ulaşım hizmetleri, özellikle ödeme yetenekleriyle birden fazla finansal çözümü kullanıcılarına sunmaktadır. Hem finansal teknolojilerde hem de sosyolojik olarak dönüşen toplumlarda e-ticaret de bu oranda gelişerek ticarete çeşitlilik, zenginlik ve müşteri memnuniyetini sağlamaktadır.

E-ticaret, pazaryerleri, kurye-kargo taşımacılığı ve perakende sektörleri de finansal teknolojiler ile hızla dönüşmek, gelişmek ve büyümektedir. "2021 yılında ödeme yöntemleri bazında toplam e-ticaret hacminin %37'sini 144 milyar TL ile Havale/EFT diğer ödemeler oluştururken, %3'ünü 11 milyar TL ile kapıda ödeme, %60'ını 227 milyar TL ile kartlı işlemler oluşturmaktadır." (Eticaret.gov.tr, 2022) Tüketicilerin temel, zorunlu ve kişiselleştirilmiş alışveriş ihtiyaçlarına cevap veren e-ticaret sektörü; kargo ve kurye hizmetleri, dijital ürünler/hizmetler, kullanıcılara özel abonelik sistemleri, VR/AR teknolojileri ve dijital cüzdanlar başta olmak üzere tüm yeni ödeme sistemleriyle finansal teknolojiler alanında gelişmelere öncülük etmektedir. E-ticaret kavramı tüketiciler için ilk akla her ne kadar alışveriş alışkanlıklarını getirse de; nakitsiz ödeme, donanım bağımsız ödeme, para transferi, fatura ödeme, sigorta, kasko, bakiye yükleme, QR ödeme, ön ödemeli kart harcamaları, şimdi al sonra öde başta olmak üzere tüketicilerin birçok yeni alışveriş alışkanlıklarına çözümler üreten bir platformdur. E-ticaret alanında gerçekleştirilen bu yeni teknolojiler ve tüketici davranışlarındaki değişim, perakende alanlarının da gelişmesine öncülük etmektedir. Gömülü finans teknolojileri, yani geleneksel bankalardan bankacılık ürün ve hizmetlerini alarak, kendi inovatif yeteneklerini yazılım-programlama teknolojileriyle entegre ederek sektöre inovatif çözümler üreten Fintech şirketlerinin kullandığı bir teknoloji yöntemidir. Gömülü finans teknolojileri, e-ticaret ve fiziki alışveriş ortamlarında kullanıcılara yeni ödeme yöntemleri ve yeni alışveriş alışkanlıkları sunarak bankaların birtakım iş alanlarını Fintech girişimlerine geçmesini sağlamıştır. Bankacılık sektörü, dijitalleşme ve dijital dönüşüm gibi teknolojilerin ilk test edilerek kullanıcılar tarafından benimsendiği sektörlerin başında gelmektedir. Bu kapsamda hem finansal teknolojilerin çalıştırılması hem de yaygınlaşması kapsamında Fintech şirketlerinin açılması ve hızla sayılarının artmasına bankacılık sektörü öncülük etmektedir. Bankalar, ürün ve hizmetlerini dışarıya açarak yeni Fintech şirketlerin kurulmasını sağladığı gibi kendisine ait yeni spin-off ya da şirketler kurarak da sektörde büyük bir rol üstlenmektedir.

Sektörler dönüşüyor, teknolojiler gelişiyor, tüketici alışkanlıkları da bu paralelde değişmektedir. Perakende sektöründe donanım ve yazılım teknolojileri alanındaki gelişmelere odaklanan Mobiliva Mobil Bilişim Hizmetleri San. Tic. Ltd. Şti. 2009 yılından günümüze markalaştırdığı ve sektörde %85 pazar payı ile ilgili tüm paydaşları bir araya getirerek gömülü dijital ürün ve finans teknolojisiyle ürün tedarik eden yazılımı OTSPlatform çözümüyle sektörde hizmet vermektedir.

Mobiliva yerinde ar-ge merkezi olup perakende sektöründe OTSPlatform, mesajlaşma sektöründe ise JetSMS markalarıyla faaliyetlerini sürdürmektedir. OTSPlatform; Yazar kasa, Android Pos ve Web API donanımları-yazılımları ile entegre olan bir middleware'dir. Dijital Ürün Kodları, Oyun Kodları, GSM Ürünleri, Finansal Hizmetler ve Ek Garanti olmak üzere beş kategoride dijital ürünler tedarik etmektedir. Perakende sektörünün en etkin yazar kasa yazılım firmaları ile iş ortaklığı yaparak 45 bin yazar kasada, 25 bin zincirinde çalışmaktadır. 2022 yılı sonu itibariyle gıda zincirlerinin yanı sıra giyim sektöründe de lider markalarla finansal hizmetler ve dijital ürün kodları ürünleriyle hizmet vermeye başlamıştır.

OTSPlatform'un yazar kasa donanımlarına kazandırdığı yetenekler, ürünler ve çözümler;

- Dijital Ürün Kodları
- Oyun Kodları
- GSM Operatör Ürünleri
- Ön Ödemeli Kartlara Bakiye Yükleme
- QR Kod İle Kasadan Ödeme
- Fatura Tahsilatı
- Para Transferi

- E-ticaret - Drop Shipping (Uzaktan Satış)
- Ön Ödemeli Kart Dağıtımı ve Merchandising
- Fiziki Satış Noktalarına Kargo Teslim Yönetimi
- JetSMS+ Kasadan İzin Yönetimi (Kampanya Modülü)

OTS (Online Ticketing System), son kullanıcıların bireysel perakende ihtiyaçları, sosyo-kültürel etkiler, diğer kullanıcılardan etkilenen psikolojik durumlar, ekonomik şartlar ve özellikle finansal gömülü teknolojilerin gelişmesi gibi faktörlerle iş-yaşam dengesi misyonuyla ürün ve hizmetler üretmektedir. OTS, perakende donanım ve yazılım firmalarıyla iş ortaklığı yaparak tüm perakende sektörüne özel bir ekosistem inşa etmiştir. Bu perakende ekosistemini değişen tüketici davranışları için orkestre ederek inovasyonla belirlenmiş stratejilerle misyonuna devam edecektir.

DEĞERLENDİRME VE SONUÇLAR

Toplumların karakteristik özellikleri ve misyonlarını başarma stratejileri toplumun entelektüel sermayelerine ve nitelikli genç nüfusuna bağlıdır. Bu sebeple nitelikli insan kaynağına yatırım yaparak entelektüel sermaye ve beceriler desteklenmelidir. Toplumların yaşam kalitesini artırmak ve üretim-tüketim becerilerini iyileştirmek kapsamında yazılım ve programlama teknolojileri büyük bir öneme sahiptir. Mobiliva, %100 Türk Sermayesi ile kurulmuştur. Mobiliva ve sektöre çözümler üreten Türk Yazılım Mühendisleriyle küresel olarak üretim ekonomisi ve sosyal hayatımızda hiç olmadığı kadar büyük bir devrimin bir parçası olarak perakende sektörüne özel çözümler sunmaktadırlar.

Mobiliva'nın perakende sektörü ve topluma katkı sunma misyonu ve ilkeler;

- Siber ve fiziki dünyanın birlikte uyum içinde devamlılığını sağlamak
- Akıllı ve yeni nesil perakende ürünlerini toplum refahı için geliştirmek
- İş Ortaklığı modeliyle tüm paydaşlarının yetenekleriyle inovasyondan güç almak
- Donanım ve yazılımları güçlü kodlama yetenekleriyle birleştirerek son kullanıcıya kişiselleştirilmiş ürün ve hizmetler sunmak.

Mobiliva yukarıdaki ilkeleriyle birlikte gerçekleşen ve devam eden toplumsal ve perakende dönüşümü kapsamında mühendislik, teknoloji, inovasyon ve girişimcilik değerlerinin birlikte çalışmasıyla üretilen katma değerli fikirlerin, teknolojilerin ve akademik çalışmalarla desteklenmesiyle de toplumlardaki değişimi hızlandırma amacıyla çalışmaktadır.

Abstract

Pyrazole derivatives have noteworthy attention in optoelectronic field since they demonstrate distinctive properties in semiconducting devices such as organic light emitting diodes (OLEDs), nonlinear optical (NLO) and solar cells. organic field effect transistors (OFETs). Therefore, to investigate the charge transport properties of the molecules, we utilised the information of 3D molecular structure of the molecules and their reorganization energies by considering the crystallographic studies and quantum chemical calculation methods. According to our results, we found that our molecules can be used for p-type semiconducting materials with the high charge transport rate and they ensure the good method to create new pyrazole molecules for high device performance. in optoelectronic field.

Keywords: Crystallography, reorganization energy, 3D molecular structure.

INTRODUCTION

Organic semiconductors are best canditate materials for organic field-effect transistors (OFETs), organic light-emitting diodes (OLEDs), and organic photovoltaic cells (OPVCs) since they have enormous properties such as mechanical flexibility, light weight, bulk chemical synthesis and low-cost organic electronic devices [1–4]. Ability to adjust the properties of the organic semiconductors including mostly π-conjugated molecules through the chemical tailoring of the molecular structure is their most important advantage for application of the optoelectronic devices[5–8].

In this study, pyrazole derivatives which have noteworthy attention in optoelectronic field since they demonstrate distinctive properties in semiconducting devices were investigated in terms of the charge transport feature by using the crystallographic data including the charge pathway channels of the molecules in solid phase and quantum chemical calculations including the claculation of reorganization energy. Pyrazole derivatives generally have been used as hole transport materials. We have found that, our pyrazole molecules show hole tranport properties with the lower reorganization energy than that of similar molecules in literature. According to our results, we found that our molecules can be used for p-type semiconducting materials with the high charge transport rate and they ensure the good method to create new pyrazole molecules for high device performance. in optoelectronic field.

MATERIALS AND METHODS

Theoretical Studies

The pyrazole molecules were optimized in neutral and charged states and calculated hole and electron reorganization energies of the molecules through Density Functionality Theory in the Gaussian software.

Crystallography

Single crystal structures of the pyrazole derivatives were determined by Rigaku Oxford XCalibur diffractometer including EOS CCD detector with MoK_α radiation (λ = 0.7107 Å) at room temperature, Structure solution and refinement process for both compounds were analysed by considering direct methods with SHELXT and SHELXL respectively in OLEX2 software [9-10].

Table 1. Crystallographic details for the molecules.

Name	AB1	AB2
Empirical formula	$C_{11}H_{10}Br_2N_2$	$C_{11}H_8Br_2N_4O_4$
Formula weight	330.03	420.02
Temperature (K)	297(2)	296(2)
Crystal system	monoclinic	triclinic
Space group	C2/c	P-1

RESULTS and DISCUSSION

The single x-ray diffraction analysis (SCXRD) was performed to analyze charge transport properties of the pyrazole molecules by utilising their 3D molecular structures and packing arrangements in solid phase. Thermal ellipsoid views of the both molecules are presented in Figure 1.

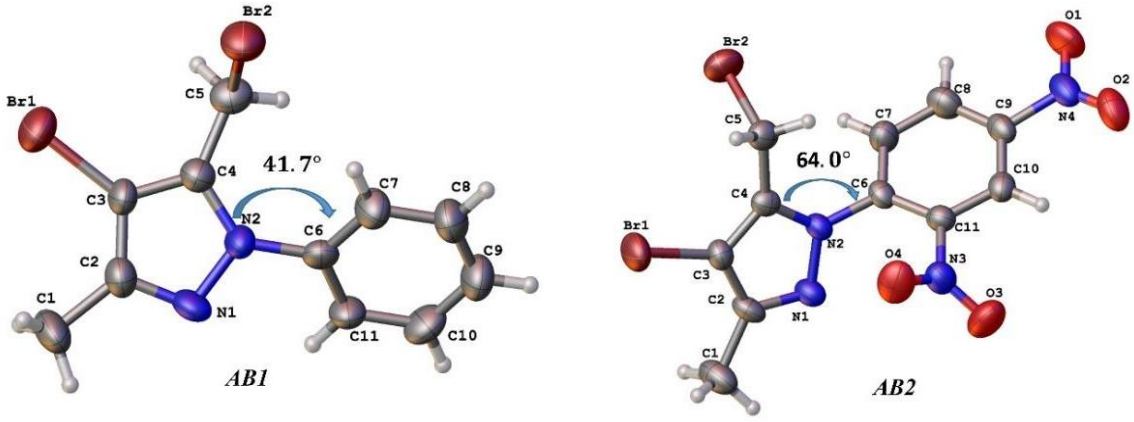

Figure 1. The thermal ellipsoids views of the molecules with 50% possibility.

The reorganization energies of the molecules are given in the Table 2.

Table 2. The value of reorganization energies determining the charge transfer property of the molecules.

Molecule	λ_{hole} (eV)	$\lambda_{electron}$ (eV)
AB1	0.44	0.48
AB2	0.26	0.34

The reorganization energy for hole of **AB1** and **AB2** are 0.44 eV and 0.26 eV, respectively, The higher reorganization energy is confirmed by a larger geometrical relaxation with respect to the neutral geometry (Table 4 and Table 5). The calculated results show that the incorporation of the NO_2 groups result in different charge transport property because of discrepancy between the reorganization energies for both compounds.
For the investigated molecules, the hole reorganization energies is smaller than those of electron since the bond-length changes upon reduction are significantly larger than those upon oxidation. In addition, the outcomes obtained from the calculation of the hole and electron reorganization energies of the molecules listed in Table 2 confirm this result. According to Marcus Electron Theory, low reorganization energy is desired property for high charge transport rate. As a result, it can be said that both compounds have hole transport property rather than electron.

CONCLUSION

The crystallographic study and quantum chemical calculations were applied to predict the charge transport property of the molecules. According to results, the hole reorganization energies of the molecules are smaller than that of electron indicating that they can be used as *p*-type semiconductors. Since AB2 exhibits lower hole reogranization energy than that of AB1, the charge transfer rate can be predicted high for AB2. Therefore, both molecules are suggested to be quite suitable for p type semiconducting materials with small reorganization energy and preferred stacking modes in solid phase.

Investigation of the properties of the sheet metal produced with the domestically developed hot forming die

Abstract
In the automotive industry, issues such as reducing vehicle weight and saving fuel are gaining importance day by day. In this direction, new solutions are being researched in new sheet and sheet metal forming technologies. It can be said that the hot forming method is a method that will meet the needs in this field. The dies used in the hot forming method are imported from abroad. Within the scope of the study, die design was carried out in order to ensure the domestic production of hot forming dies. Investigations were made on the sheets produced with the designed die. Tensile and microhardness tests were applied to the formed sheet metal parts. In addition, microstructure studies were also carried out. Obtained results were analyzed and compared with standard values. The mechanical condition of the parts produced with the die produced was examined and their suitability was checked.

GİRİŞ

Günümüzde araç ağırlıklarının azaltılması, güvenilirliğin arttırılması ve çevreye verilen zararın minimumda tutulması otomotiv sektöründe önem arz etmektedir. Hedeflere ulaşma yolunda ise daha kolay ve uygun maliyetli yöntemlerin kullanılması beklenmektedir. Otomotiv sektöründe kullanıcı taleplerinin karşılanması amacıyla uygulanan işlemler araç ağırlıklarının artmasına neden olmaktadır. Ağırlıkta meydana gelen artış doğru orantılı olarak yakıt tüketimini arttırmakta ve böylece çevreye zarar verilmektedir. Bu doğrultuda otomotiv endüstrisinde yeni arayışlar bulunmaktadır (Eşiyok, 2015). Üretim sürecinde kullanılan kalıplarda meydana getirilen yenilikler, yeni gelişmelerin gerçeğe dönüşmesindeki en temel adım olarak düşünülebilmektedir. Bu nedenle sac metal şekillendirme teknolojilerinde araştırmalar yapılmaktadır. Yüksek mukavemetli çelikler ile sıcak şekillendirme yönteminin kullanılması, parçaların yüksek dayanımlı ve hafif olarak üretilebilmesi açısından tercih edilmektedir (Görgülüarslan & Güler, 2015).

İstenilen özelliklerin sağlanması amacıyla yüksek mukavemetli çelikler kullanılmaktadır. Ancak, bu kullanım geri yaylanma (springback) gibi üretimde önemli problemleri beraberinde getirmektedir (Turetta, Bruschi, & Ghiotti, 2006). Kalıp üreticilerinin karşılaştığı en önemli problemlerden biri geri yaylanma olarak bilinmektedir. Bu doğrultuda kalıp imalatçıları alternatif arayışlar içerisine girmiştir. Sıcak

şekillendirme ihtiyacı karşılayacak bir yöntem olarak otomotiv sektöründe sıklıkla tercih edilmektedir (Eşiyok, 2015; Turetta et al., 2006).

Sıcak şekil verme yöntemi malzemeyi belirli bir sıcaklık üzerine ısıtma ve hızlıca soğutulma adımlarını kapsamaktadır. Proseste sac metal ilk olarak östenitleşme sıcaklığının üzerinde bir sıcaklığa ısıtılmaktadır. Ardından, kalıp içerisinde şekil verme işlemi gerçekleştirilmektedir. Aynı anda martenzit yapı elde edilmesi amacıyla sac metal hızlı bir şekilde soğutulmaktadır. Sıcak şekillendirme işleminde soğuk şekillendirmeden farklı olarak, malzemenin yüksek sıcaklıklardaki davranışı hakkında bilgiye ihtiyaç duyulmaktadır. Bu durum üretimde kullanılacak kalıp için de geçerli olmaktadır (Görgülüarslan & Güler, 2015; Lee, Kim, & Han, 2009; Li & Luo, 2021).

Sıcak şekillendirme kalıplarının aşınmaya karşı dayanım, yüksek tokluk, homojen sertleşebilme kabiliyeti, yüksek sıcaklıklara dayanım, ısıl gerilmelerden kaynaklanan yorulmaya karşı yüksek dayanıklılık gibi özelliklere sahip olması gerekmektedir (Abachi, Akkök, & Gökler, 2010; Üllen & Baba, 2020). Soğuk şekillendirme kalıpları ile kıyaslandığında daha karmaşık bir yapıya sahip olan sıcak şekillendirme kalıpları yüksek termal yük altında çalışmakta ve parça malzeme özellikleri kalıp ile sağlanmaktadır (Eşiyok, 2015). Bu durum kullanılan kalıbın üretim üzerindeki önemini göstermektedir.

Bu çalışmada sıcak şekillendirme prosesi için üretilen kalıp kullanımı ile elde edilen ürün incelenmiştir. Sıcak şekillendirme kalıpları genellikle yurt dışından alınmaktadır. Çalışma ile kalıbın üretilebilirliği araştırılmıştır. Kalıptan elde edilen sac metalin mekanik özellikleri standarttaki özellikleri ile kıyaslanmıştır. Böylece üretilen kalıp ile standarttaki değerlerin yakalanıp yakalanamadığı ortaya koyulmuştur.

MATERYAL VE METOD

Çalışma kapsamında sıcak şekillendirme işlemi modelleri, analizler ve uygulamalar konusunda yapılan çalışmalarda kullanılan yöntemler, model tanımlamaları, parametreleri incelenmiştir. Tasarım ve analiz çalışmaları kapsamında model oluşturma, simülasyon ve tasarım doğrulama değerlendirmeleri ile ilgili çalışmalar gerçekleştirilmiştir. Fırın sıcaklık değerleri, fırında kalma süresi, fırın çıkışında parça transfer süresi, parçanın kalıba giriş sıcaklığı, deformasyon süresi, kalıp yüzey sıcaklığı, soğutma suyu sıcaklığı, soğuma zamanı (cooling time), parçanın kalıptan çıkış sıcaklığı gibi sıcak şekillendirme proses parametreleri ve parametrelerin etkileri incelenmiş sıcak şekillendirme süreci tanımlamaları ve model oluşturma çalışmaları yapılmıştır. Optimum proses değerlerinin elde edilmesi için tasarım optimizasyon modeli belirlenmiştir. Belirlenen proses yapısına uygun yüzey modellemesi gerçekleştirilmiştir. Simülasyon çalışmasına uygun tasarımlar yapılmaktadır. Amaç 3 boyutlu tasarım ortamında kalıptan çıkacak sacı görmektir. Yapılan simülasyonlar ve yüzey çalışmaları sonucunda, kalıpta kullanılabilmesi için yüzey çalışmaları gerçekleştirilmiş, kalıp tasarımında kullanılmıştır.

Kalıbı üretilecek parçanın şekillendirilebilirlik analizleri (simülasyon) gerçekleştirilmiştir. Kalıp çeliklerinde olması gereken soğutma kanallarının çapları, birbirleri ve kalıp çelikleri ile parça formuna bağlı mesafeleri ilgili bilgisayar destekli mühendislik yazılımları yardımıyla simülasyonu gerçekleştirilmiş ve deneysel tasarım çalışmaları uygulanmıştır. Sıcak şekillendirme çalışmasında sac malzeme olarak, fırınlanmaya ve soğutmaya dayanıklı SCHG20B-45 kullanılmıştır. İmal edilecek kalıbın içerisine, özel fırınlarda ısıtılmış sac girişi yapılmaktadır. Sac fırında yaklaşık 600 derece ısıtılmaktadır. Bu doğrultuda simülasyon çalışmaları ısıtılmış saca göre yapılmıştır. Simülasyon sonucuna göre gerekli raporlamalar yapılarak parçanın uygunluğu teyit edilmiştir.

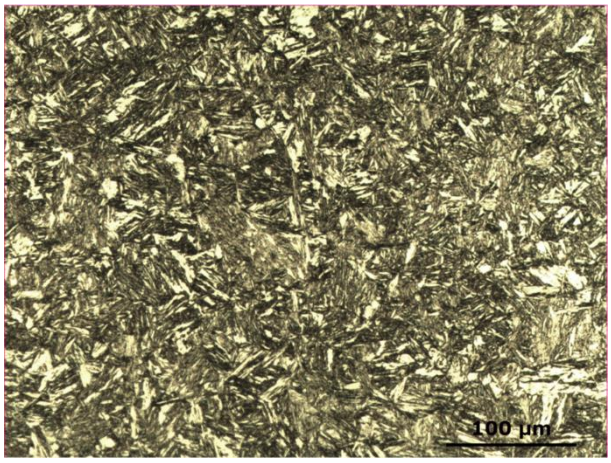
Kalıp tasarımı öncesinde uygun pres tipi ve kalıpta kullanılacak olan özel malzemelerin seçimi gerçekleştirilmiştir. Kalıp tasarımında sıcaklık ve soğumaya uygun çelik malzeme kullanılmıştır. Kalıp tasarımında ısıtılmış sacın soğutulması amacıyla kalıp üzerinde mevcut olan yapıları soğutmak amacıyla kalıpta su dolaşımı sağlanmalıdır. Bu doğrultuda soğutma sisteminin tasarımı da gerçekleştirilmiştir. Kalıp yapısı oluşturulurken tek proseste iki operasyon uygulanabilmesi için özel yapılar uygulanmıştır. Şekil 1'de sıcak şekillendirme kalıbı için üretilmiş örnek kalıp görseli bulunmaktadır.

Şekil 1. Sıcak şekillendirme kalıbı için üretilmiş kalıp görseli

Çalışma kapsamında sıcak şekillendirme kalıbı ile üretimi gerçekleştirilen parçaya çekme ve mikrosertlik testleri uygulanmıştır. Ek olarak parçanın mikroyapı analizi gerçekleştirilmiştir. Çekme test numuneleri ISO 6892-1 standardına göre hazırlanmıştır. Elde edilen numunelere mikrosertlik testi uygulanmıştır. Mikroyapı analizi için numune metalografik numune hazırlama proseslerine tabi tutulmuştur. Yüzeyin temizlenmesi amacıyla farklı grit kağıtlar kullanılarak zımparalama işlemi gerçekleştirilmiştir. Ardından elmas süspansiyon kullanılarak parlatma işlemi yapılmıştır. Mikroyapı görüntülerinin alınabilmesi amacıyla %3'lük nital dağlama ajanı ile dağlama işlemi gerçekleştirilmiştir. Ardından görüntü analiz programı kullanılarak farklı büyütmelerde mikroyapı görüntüleri alınmıştır. Elde edilen tüm veriler değerlendirilmiş ve bilimsel olarak yorumlanmıştır.

BULGULAR ve TARTIŞMA

Gerçekleştirilen çalışma sonucunda tasarımı yapılan sıcak şekillendirme kalıbı ile form verilmiş sac metal parçasına çekme, mikrosertlik testleri ve mikroyapı analizi gerçekleştirilmiştir. Yapılan test ve analizler sonucunda elde edilen sonuçlar bulgular ve tartışma kısmında incelenmektedir. Şekil 2'de form verilmiş parçanın mikroyapı görüntüsü verilmektedir.



Şekil 2. Çalışma kapsamında üretilen kalıp ile şekillendirilmiş sac metal parçasının mikroyapı görüntüsü

Çalışmada tasarlanan kalıp ile şekillendirilen Mangan-Bor çeliği üzerine incelemeler yapılmıştır. Sıcak şekillendirme işlemi için tipik olarak tercih edilen bu alaşımlar su verilmiş ve temperlenmiş çelikler olarak

bilinmektedir (Thyssenkrupp, 2022). Ferritik-perlitik bir yapı sergileyen alaşımlar süreç içerisinde tamamen martenzitik bir yapıya dönüşmektedir (Flachstahl, 2022; Thyssenkrupp, 2022). Şekil 2'de form verilmiş parçanın mikroyapı görüntüsü verilmektedir. Mikroyapı incelendiğinde literatürde bahsedildiği gibi martenzitik bir yapı görülmektedir. Bu yapı sayesinde yüksek mekanik özellikler sağlanabilmektedir. Çalışma kapsamında elde edilen mekanik sonuçlar incelendiğinde bu durumu doğrulayan yüksek mekanik özelliklerin sağlandığı görülmektedir.

Tablo 1. Sac Metal Parçanın Mekanik Test Sonuçları

Çekme Mukavemeti (MPa)	1412,52
Akma Mukavemeti (MPa)	1122,44
%Uzama	4,17
Mikrosertlik (HV)	465,20

Tasarımı gerçekleştirilmiş kalıp ile üretilen sac metal parçadan alınan numunelere mekanik testler uygulanmıştır. Elde edilen sonuçlar Tablo 1'de gösterilmektedir. Kullanılan malzemenin standarttaki mekanik özellikleri incelendiğinde sıcak şekillendirme öncesinde çekme mukavemeti değerinin 500-700 MPa arasında değiştiği görülmektedir. Akma mukavemeti değeri ise 300-550 MPa arasında değişim göstermektedir (Docol, 2022; Flachstahl, 2022). Literatürde yapılan çalışmalarda sıcak şekillendirme sonrasında mukavemet değerlerinin yükseldiği bildirilmektedir (Çavuşoğlu et al., 2020; GÜLER, 2013). Gerçekleştirilen çalışma sonucunda da literatür ile uyumlu bir şekilde yüksek değerlerde mukavemet değerleri elde edilmiştir. Güler (GÜLER, 2013) gerçekleştirdiği bir çalışmada Usibor 1500 çeliğinin sıcak şekillendirme işlemi sonrasında çekme dayanımının 1485 MPa olduğunu, sertlik değerinin 492 HV olduğunu bildirmiştir. Yapılan çalışma ile yakın değerler elde edilmiştir. Bu durum tasarımı gerçekleştirilen kalıp ile üretilen parçaların literatür ile uyumlu özellikler sergilediğini ortaya koymaktadır.

SONUÇ

Çalışma kapsamında sıcak şekillendirme kalıbının tasarımı gerçekleştirilmiş ve tasarlanan kalıp ile üretilen sac parçadan numuneler alınarak test ve analizler uygulanmıştır. Elde edilen sonuçlar incelendiğinde;

- Mikroyapı analizi sonucunda sıcak şekillendirme öncesi ferritik+perlitik bir yapıya sahip olan çeliğin sıcak şekillendirme sonrası martenzit bir yapı sergilediği ortaya koyulmuştur.

- Mekanik değerlere bakıldığında yüksek dayanımlar sergilediği gösterilmiştir. Yapılan araştırmalar sonucunda değerlerin literatür ile uyumlu olduğu görülmüştür.

- Tasarımı yapılan kalıbın kullanılması ile elde edilen sac metal özelliklerinin literatür ile uyumlu olması doğrultusunda tasarımın doğruluğu ortaya koyulmuştur.

- Sıcak şekillendirme kalıpları genellikle ithal edilmektedir. Çalışma sonucunda yerli olarak bu kalıbın üretilebileceği anlaşılmıştır.

Özet

Bu çalışmada K bant frekans modülasyonlu sürekli dalga (FMSD) radarı detaylı olarak analiz edilerek modellenmekte ve gerçeklenmektedir. RF ön uç benzetimleri için AWR Microwave Office programı Visual System Simulation (VSS) benzetim aracı kullanılmaktadır. Bu program ile faz kilitli döngü (ing. Phase Lock Loop), voltaj kontrollü osilatör (ing. Voltage Controlled Oscillator) blokları; güç yükseltici ve düşük gürültülü yükselteçi; alçak geçiren ve bant geçiren filtreleri; verici ve alıcı antenleri; iletim kanalı; mikser; temel bant filtre ve ayarlanabilir kazanç yükselteç; analog sayısal dönüştürücü (ing. ADC) ve hızlı Fourier dönüşüm (ing. FFT) modellenmektedir.

K bantta tasarlanan donanımda temel FMSD radar blokları; voltaj kontrollü osilatör içeren mikser entegresi baz alınarak, alçak geçiren ve bant geçiren filtreler, anten, güç bölücü, analog filtre ve yükselteçler tasarlanmaktadır.

C bantta faz kilitli döngü, düşük gürültülü yükselteç, mikser, güç bölücü, ayarlanabilir kazanç kontrollü yükselteç geliştirme kartları ve anten kullanılarak; alçak geçiren ve bant geçiren filtreler tasarlanarak FMSD radar sistemi oluşturulmaktadır. Kurulan sistem kullanılarak FMSD radarın tarama periyodu, faz gürültüsü, harmonik şiddeti, jammer, doppler etkisi parametrelerinin radar performansına etkileri incelenmektedir. FPGA ve ADC kullanılarak radar sinyal işleme algoritmasının geliştirilmesi için test verileri toplanmaktadır. Toplanan veriler MATLAB ortamında işlenerek mesafe ve hız hesaplamaları yapılmaktadır.

Radar sinyal işleme algoritması sınırlı vuru yanıtı (ing. FIR) bant geçiren filtre, pencereleme, FFT, sabit yanlış alarm oranı (ing. CFAR) detektörü, hareketli ortalama (ing. moving average) mesafe ve hız hesaplama algoritmalarını içermektedir.

Anahtar Kelimeler: FMSD radar, mesafe ölçümü, sistem benzetimi.

K Band Frequency Modulated Continuous Wave Radar Design and Implementation

Abstract

In this work, K band frequency modulated continuous wave (FMCW) radar is designed and implemented in detail. The Visual System Simulation tool of AWR Microwave Office program is used for RF front-end simulation. With use of this program, these blocks are modeled phase lock loop, voltage controlled oscillator, amplifier, low noise amplifier, low pass filter, band pass filter, transmitter antenna, receiver antenna, channel, mixer, baseband filter, variable gain amplifier, analog to digital converter, and fast fourier transform.

The hardware designed in K band contains basic FMCW radar blocks which are a mixer integrated circuit with voltage controlled oscillator, and designed units that are low pass filter, band pass filter, antenna, power divider, analog filter and amplifier.

The FMCW radar system built in C band contains phase lock loop, low noise amplifier, mixer, power divider, variable gain amplifier boards, antenna, low pass filter, and band pass filter. The parameters that are sweep period, phase noise, harmonic level, jammer, and doppler shift are analyzed with use of the system. Test data are gathered using FPGA, and ADC for developing radar signal processing algorithms. Range and velocity are calculated with processing the data at MATLAB.

Radar signal processing algorithms contain finite impulse response band pass filter, windowing, constant false alarm rate detector, moving average filter, range and velocity calculation algorithms.

Keywords: FMCW radar, range mesarument, system simulation.

GİRİŞ

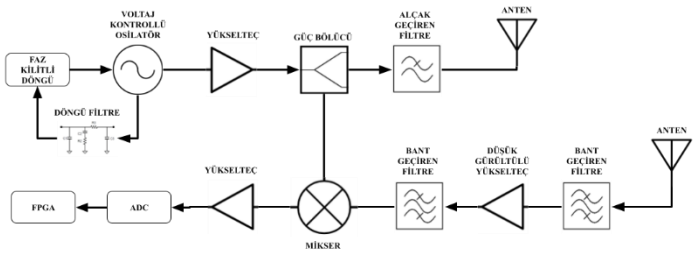
Radar, hedeflerin mesafeleri ve hızlarını radyo dalgaları kullanarak ölçen bir cihazdır. Elektromanyetik dalga kullandığı için sis, yağmur, kar gibi çeşitli hava şartlarında gece ve gündüz ölçüm yapabilmektedir. Temel çalışma yöntemi vericiden gönderilen sinyal boşlukta yayılarak hedeften yansır ve geri döner, alıcıya gelen sinyalden hedefin mesafesi ve hızı ölçülür (Skolnik, 1962).

Radar sistemleri son yılların popüler araştırma konusudur. İlk zamanlarında radar sistemleri büyük ve pahalı olmalarından dolayı sadece askeri uygulamalarda kullanılabilirdi. Ancak son yıllardaki entegre devre teknolojilerindeki gelişmeler sayesinde radar sistemleri, baskı devre kartı ve entegre devre seviyesinde uygulanabilmektedir. Voltaj kontrollü osilatör, faz kilitli döngü gibi temel bloklar ayrık devreler olarak kullanılmak yerine hepsi içinde radar alıcı-verici entegresi olarak kullanılabilmektedir. K bant ve W bant, Avrupa Telekomünikasyon Standartları Enstitüsü tarafından kullanıma açılması ile birlikte K ve W bantlara çıkan çalışma bantları sayesinde radar sistemleri daha küçük, hassas ve yüksek çözünürlükte olabilmektedir. Bu gelişmeler radar sistemlerinin ticari uygulamalardaki kullanımını arttırmaktadır. Başlıca otomotiv, endüstri ve tıp olmak üzere birçok alanda kullanılan radar sistemleri; kamera, lazer, kızılötesi gibi alternatif teknolojilere göre önemli avantajları vardır (Jankiraman, 2018).

Maliyet etkin ve yaygınca kullanılan frekans modülasyonlu sürekli dalga radarı entegreleri, uzman mühendisler tarafından donanımsal limitlerin ötesinde kullanılmak istenmektedir. Sayısal sinyal işleme bloğu veya mikrokontrolcü bloğunun paralel sinyal işleme yapamaması kaynaklı ölçümdeki gecikme, yetersiz tarama periyodu ve yetersiz FFT çözünürlüğü gibi donanımsal kısıtlamalardan dolayı mesafe ve hız ölçümlerinde belirsizlikler oluşmaktadır. Bu belirsizlikler hız arttıkça daha fazla olmaktadır. Bu çalışmada kötü hava şartlarında ve yüksek hızlarda düşük hata payı ile mesafe ölçümü yapabilmek için K bant donanım tasarımı ve FPGA'de uygulanabilir algoritma geliştirmesi yapılmaktadır. Çalışma, K bant donanım tasarımı ve gerçeklenmesi; algoritma geliştirmeleri için C bantta modüler radar sistemi tasarımı ve gerçeklenmesini içermektedir.

Sürekli dalga CW radar sadece hız ölçebilir. Mesafe ve hız ölçümü için genlik, frekans veya faz modülasyonları kullanılabilmektedir. Frekans modülasyonlu sürekli dalga radarında frekans modülasyonu üçgen, testere veya daha karmaşık şekilde yapılabilir.

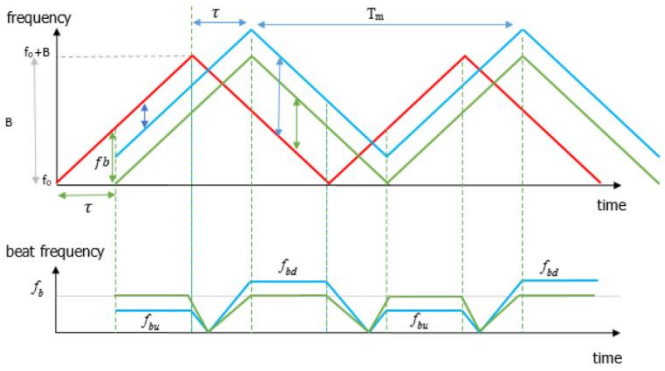
FMSD radar sistemi için gerekli temel bloklar Şekil 1'de belirtildiği gibi voltaj kontrollü osilatör, faz kilitli döngü, döngü filtre, mikser, yükselteç, güç bölücü, alçak geçiren filtre, bant geçiren filtre, düşük gürültülü yükselteç, analog yükselteç, ADC ve FPGA'dir.



Şekil 1. FMSD Radar Blok Şema Gösterimi

Şekil 1'deki diyagram verici sinyalini göndermek ve gelen sinyali almak için kullanılan iki anten içermektedir. Tek anten ve sirkülatör yerine bu yapı kullanılarak vericiden alıcıya olan sızıntı azalmaktadır, bu sayede daha yakın mesafeler ölçülebilmektedir.

FMSD radarı sürekli dalga radarı gibi sürekli yayın yapmaktadır ama frekans belirli bir bant genişliğinde lineer değişmektedir. Modülasyon testere, üçgen veya daha kompleks olabilmektedir. Bu modülasyon sayesinde aynı anda mesafe ve hız ölçümü yapılmaktadır. Şekil 2'de FMSD radarı üçgen modülasyonu görülmektedir.



Şekil 2. Üçgen Modülasyon

Modülasyonlu sinyal verici anteninden yayılırken, hedeften yansıyan gecikmeli sinyal alıcıda miksere gelir ve üretilen sinyal ile çarpılır. Bu gecikme Formül 1 ile hesaplanmaktadır.

$$\tau = \frac{2R}{c} \quad (1)$$

Burada R hedefin mesafesi, c ışık hızıdır.

Tarama periyodu ve bant genişliğine bağlı olarak mikser çıkışında temel bantta fb sinyali elde edilir (Formül 2).

$$\frac{f_b}{\tau} = \frac{B}{Tm/_2} \quad (2)$$

B bant genişliği, Tm tarama periyodudur.

Eğer radar ile hedef arasında hız farkı varsa doppler frekans kayması oluşur. Mikser çıkışında iki farklı frekansta sinyal oluşur. Bunlar fdu ve fbd olarak tanımlanırsa fb ve fd dopplerle ifadeleri Formül 3 ve 4'e göre hesaplanır.

$$f_{du} = f_b - f_d \quad (3)$$

$$f_{bd} = f_b + f_d \quad (4)$$

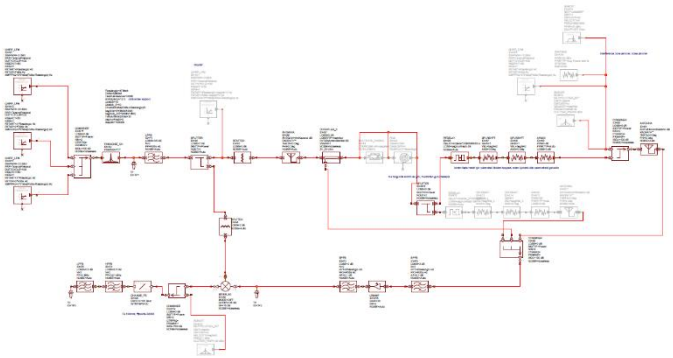
Bu iki frekans kullanılarak mesafe R ve bağıl hız V Formül 5 ve 6 ile hesaplanır (Dagdeviren, 2014).

$$R = \frac{c(f_{bu}+f_{bd})T_m}{8B} \quad (5)$$

$$V = \frac{c(f_{bd}-f_{bu})}{8f_c} \quad (6)$$

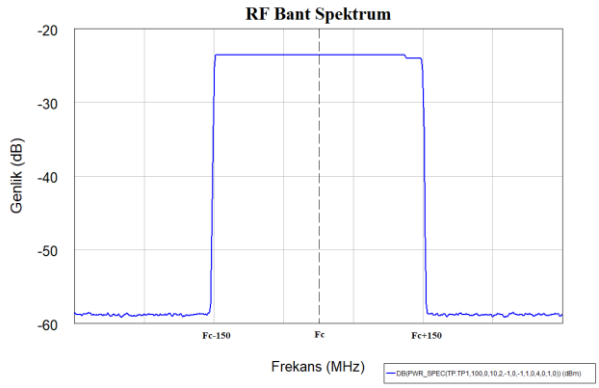
MATERYAL VE METOD

Kullanılacak temel bloklar belirlendikten sonra filtrelerin ve diğer blokların parametrelerinin belirlenmesi için AWR Microwave Office programının sistem simülasyonu aracı kullanılarak seçilen entegre parametreleri ile birlikte FMSD radar sistemi modellenmektedir (Şekil 3).



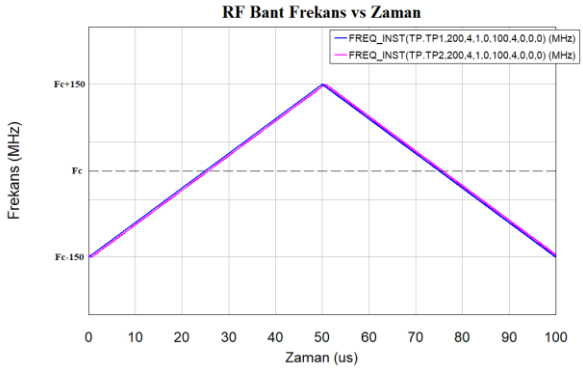
Şekil 3. Radar Sistemi Benzetim Modeli

Üretilen sinyalin spektrum grafiği verilen Şekil 4'de 300 MHz bant 100 us periyotta taranmaktadır.



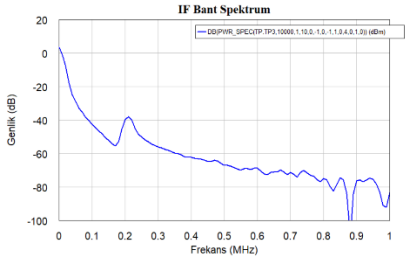
Şekil 4. RF Spektrum Benzetimi

Üretilen sinyal ile hedeften yansıyan sinyalin zaman vs frekans grafiği Şekil 5'de gösterilmektedir. İki sinyal arasında 5 metre uzaklıktaki hedef için 33,3 ns gecikme olmaktadır (Formül 1).



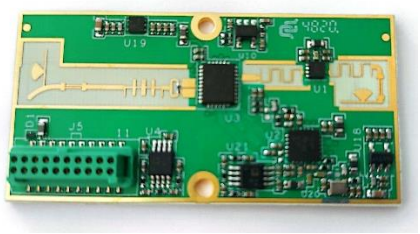
Şekil 5. Frekans-Zaman Grafiği

5 metredeki hedef için oluşturulan IF bant spektrum Şekil 6'da verilmektedir. DC'deki tepe alıcı verici antenleri arasındaki sızıntıdan oluşmaktadır, 0.2 MHz'deki tepe 5 metredeki hedef için oluşmaktadır.



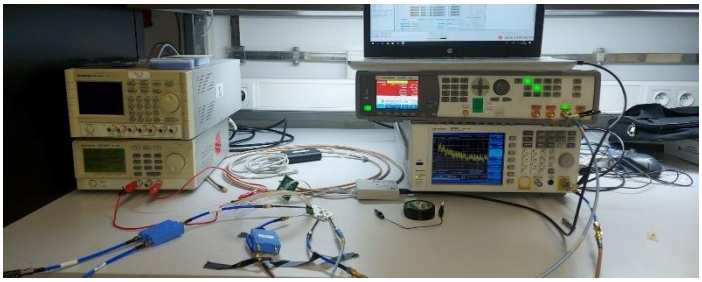
Şekil 6. IF Spektrum Benzetimi

FMSD radarı için gerekli bloklar tamamlandıktan sonra, güç devreleri tasarımları ve baskı devre tasarımları yapılarak K bant donanım üretilmektedir (Şekil 7).



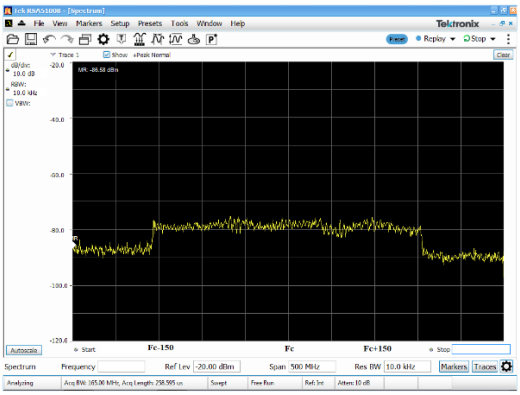
Şekil 7. K Bant Donanımı

Üretilen donanım laboratuvarda test edebilmek için problar kullanılarak Şekil 8'de verilen test düzeneği oluşturulmaktadır.

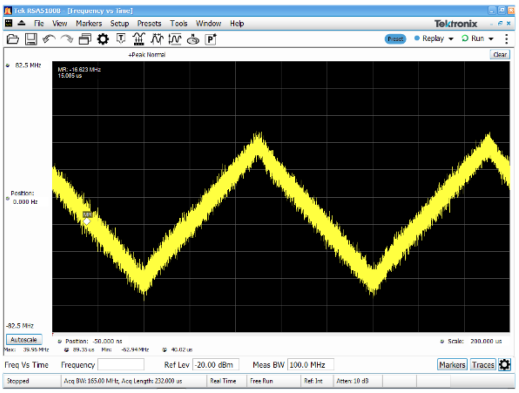


Şekil 8. K Bant Donanımı Test Düzeneği

K bant donanım ile 100 us tarama periyodunda 300 MHz bant genişliğinde yapılan frekans taramasına ait spektrum grafiği Şekil 9'da belirtilmekte ve benzetim sonucuna benzer performansta çalışmaktadır. Modülasyon lineerliğini incelemek için spektrum analizör cihazı ile cihaz bant genişliği limitlerinde 80 MHz tarama yapılarak frekans-zaman ölçümü üçgen modülasyon şeklinde yapılmaktadır (Şekil 10).

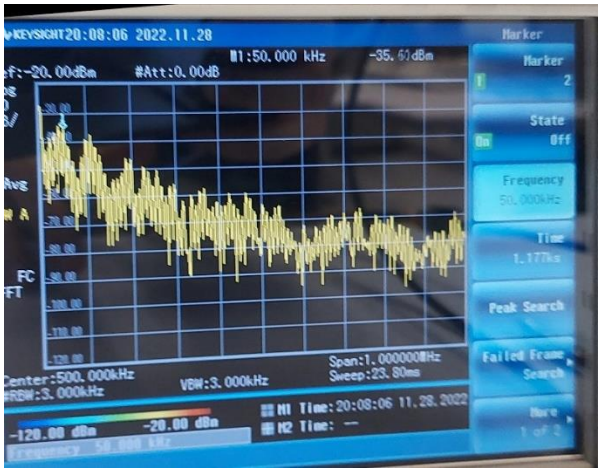


Şekil 9. K Bant Donanım RF Spektrum



Şekil 10. K Bant Donanım Frekans-Zaman Ölçümü

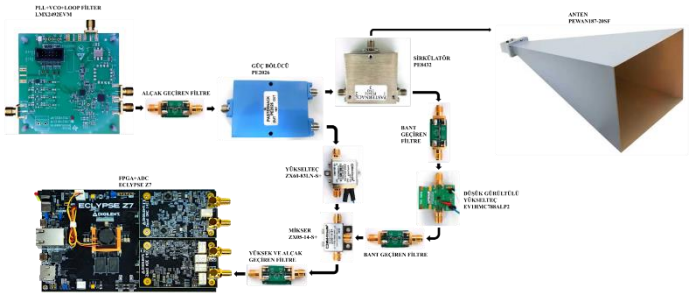
K bant donanımdaki bant geçiren filtrelerdeki üretimsel kayma ve anten kazancının düşük olmasından dolayı laboratuvar ortamında 1 m elektriksel uzunluktaki kablo ile IF sinyal ölçümü yapılmaktadır. Şekil 11'de verilen 50khz frekansında tepe ile yaklaşık 1 metre olarak ölçülmektedir.



Şekil 11. K Bant Donanım IF Spektrum

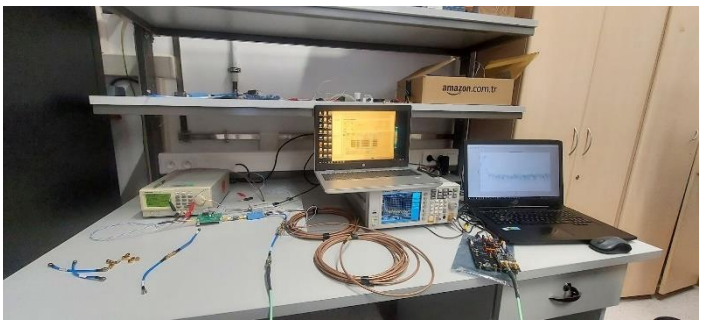
K bantta çeşitli testleri yapmaktaki zorluk ve maliyetlerden dolayı C bant FMSD radarı sistemi modüler bloklar ile kurulmaktadır. Bu sistem ile filtre, yükselteç, anten kazancı, modülasyon çeşitleri, bant genişliği, tarama periyodu dahil birçok parametre ile ilgili denemeler yapılarak sistem performansı geliştirilmektedir. Bu sistem ile laboratuvar ortamında doppler frekans kayması, jammer, interferans, yığın düzenekleri kurularak algoritma geliştirilmesi için test verileri toplanmaktadır.

C bant radar sistemi faz kilitli döngü, güç bölücü, yükselteç, sirkülatör, anten, mikser, düşük gürültülü yükselteç, ADC ve FPGA kartlarından oluşmaktadır (Şekil 12).



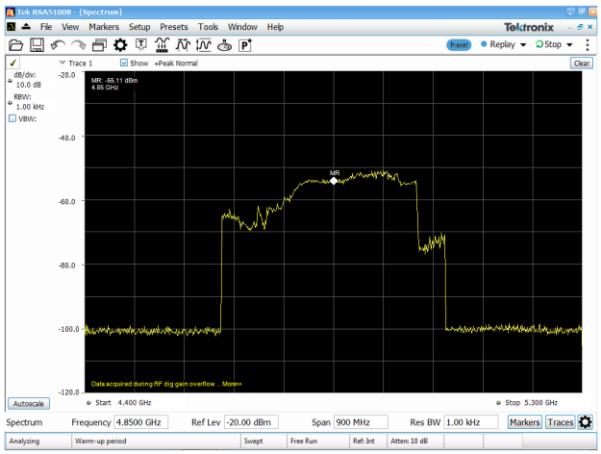
Şekil 12. C Bant Modüler Sistem Blok Şema

10 m elektriksel uzunlukta koaksiyel kablo ile kurulan test düzeneğine Şekil 13'de verilmektedir.



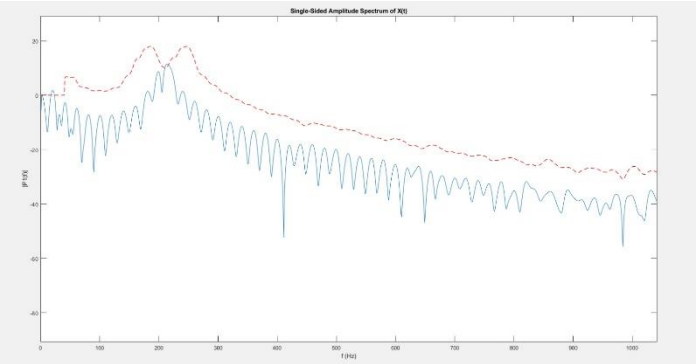
Şekil 13. C Bant Modüler Sistem Test Düzeneği

300 MHz bant genişliğinde 100us tarama periyotlu oluşturulan sinyalin spektrumu Şekil 14'de verilmektedir. PLL kartının faz gürültüsü, çıkıntı ve harmoniklerinden dolayı tarama çıkış gücü lineer değildir ve sistemdeki gürültü seviyesi -60 dBm seviyelerine kadar artmaktadır. Bu da maksimum ölçülebilir mesafeyi oldukça azaltmaktadır.



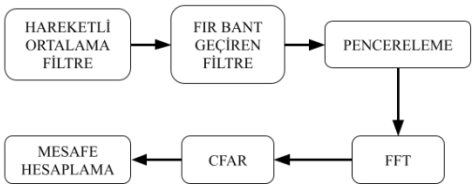
Şekil 14. C Bant Modüler Sistem RF Spektrum

10 metre elektriksel uzunluklu koaksiyel kablo ile (5 metre mesafedeki hedef için 5mx2) yapılan testin verileri FPGA ile toplanarak MATLAB'daki algoritmada yaklaşık 5 m mesafe doğru bir şekilde hesaplanmaktadır (Şekil 15).



Şekil 15. MATLAB Algoritma Çıktısı

ECLYPSE Z7 kartı ile örneklenen IF bant sinyal ethernet ile bilgisayara aktarılarak MATLAB'da algoritma ile mesafe ölçümü yapılmaktadır (Şekil 16). Hareketli ortalama filtre gürültü azaltmak için; FIR bant geçiren filtre yüksek frekanstaki sinyaller ve antenler arasındaki sızıntıları bastırmak için; pencereleme sinyali belirginleştirmek için; FFT sinyalin frekans yanıtı elde etmek için; CFAR ve mesafe hesaplama ile hedefin algılanması, mesafesini ve hızını hesaplamak için kullanılmaktadır.



Şekil 16. Algoritma Blok Şema

SONUÇ

Bütün bir FMSD radar sistemi sistem benzetimleri yapılıp, temel blokları tasarlanıp, ürettirilerek test edilmiştir. K bant sistem ile 5 metreye kadar C bant sistem ile 20 metreye kadar mesafe ölçümü 1 metre altı hata ile yapılmaktadır. K bant sistemin anten kazancı düşük olması ve filtrelerin üretimden dolayı kaydığı için maksimum mesafe azalmıştır. Sistemlerin faz gürültüsü ve çıkıntıların (ing. spur) yüksek olmasından dolayı sistem performansı düşmektedir.

Gelecek çalışmalarda K bant sistemin filtrelerinin iyileştirilebilir ve anten kazancının arttırılabilir. C bant sistemin çıkış gücü arttırılarak daha küçük hedefler ölçülebilir. Faz gürültüsü ve çıkıntıları azaltmak için döngü filtreler optimize edilebilir.

TEŞEKKÜR

Abstract

Electric vehicles (EV) are an important portion of many logistics fleets such as car rental services, small-size cargo services or even emergency vehicle fleets. However, we cannot say the full transition is made to EVs for all of these businesses. Hence many of the companies are still running with heterogenous fleet types. This study is proposing a decision support mechanism for dispatching the vehicles considering three separate objectives: cost, emission, and service quality. Cost is formulated based on fuel consumption while emission formulation contains expressions of approximate distance travelled and emission factors. The last objective is formulated considering factors that can affect delivery time. In addition traffic congestion information is also incorporated into each objective. The proposed model is generating a set of Pareto solutions instead of a single optimum due to the trade-off among the considered objectives. The novelty of the proposed work stems from the methodology that it uses to generate the solution set. That is, a parallel multi-objective optimization algorithm is being proposed to solve the mathematical model which guarantees Pareto optimality. The parallel nature of the method is reducing the time required for solving the mathematical model without depending on extra resources, i.e. by using the existing nodes of a single laptop the algorithm is parallelized. In other words, the methodology can be used in fast decision-making processes of transportation planning without sacrificing optimality in return for a shorter solution time. Besides, it considers various aspects without requiring bounds on them, unlike the epsilon constraint method.

Keywords: Dispacthing, multi-objective, optimization, parallelization, transportation

INTRODUCTION

After the wide settlement of mobile internet technology, online ride hailing services (e.g., Didi and Uber) become part of daily logistics and transport options. Moreover, electric vehicles (EVs) are gradually being promoted as an alternative to fuel vehicles due to the pushing facts about climate change and sustainability concerns. Ride-hailing service are no exception to this trend. However it is still hard to assume all fleets are unified in terms of the vehicle types. A high-quality order allocation approach is in great need to quickly process a series of customer request orders, so as to reduce total customer waiting time, transportation cost and emission levels. Lately Shi et al. (2022) used ant colony optimization for planning a full EV fleet considering their battery status and the charging station information. In addition to passenger logistics, the same problem is applicable to services where full truck load cargo services are offered with high capacity or mini van type of mid-size vehicles. Last but not least vehicle dispatching problem is relevant in emergency context as well. After a critical event is properly detected, emergency vehicles may be dispatched as quickly as possible to respond, potentially reducing the probability of deaths and injuries. Recently Rangel et al. (2022) provided a succinct summary on emergency management system (EMC) problem. The listed approaches are mostly from heuristics of types such as ant colony or genetic algorithms where optimal solution is not guaranteed. In their proposed approach vehicle dispatching is handled as a subtask which is supposed to be tackled with traffic light optimization. Inaddition Long et al. (2021) used tabu search to find a solution to vehicle dispatching problem where they focused on resilience and fairness of the system. Similarly Ashwin et al. (2022) proposed a solution where they handled vehicle dispatching together with routing problem.

In this work a multi objective decision making process is proposed for the generic form of vehicle dispatching problem. Since the proposed optimal multi objective optimization is suitable for decision making under time pressure, the approach is especially useful for fast decision making. The methodology

contains a liner integer mathematical model that contains three objectives representing total fuel consumption, travel time and CO2 emission. Therefore the approach allows for modelling heterogenous fleets which consists of vehicles of different fuel consumption and CO2 emission levels. The route generation is separated as a pre-processing step from the vehicle dispatching which allows to incorporate most recent traffic into the final decision.

MATERIALS AND METHODS

Proposed decision making structure consists of four main stages:

Step1 Input: Collecting the requests and current positions of the available vehicles. This is simply mapping coordinates of the sources and destinations.

Step2 Preparing the routes: Through a VBA code inputs can be donwloaded in a spreadsheet format from Yandex or Google map type of GPS services together with time of travel and total distance information for each route alternative. There can be more than one route from a vehicle to a new demand location. This dynamic feed from GPS services is the most neat way of incorporating traffic information to the decision making process. Depending on the traffic level the distance of the alternative routes will not be directly proportional to the travel time.

Step3 Running the MOBB algorithm: The algorithm is called ParMOdec. It proceeds by dividing the multi objective search space into regions where each search region is chosen purposefully based on derived mathematical properties. This division is utilized not only selecting the fruitful search areas but also determine the parallel branches and obtaining initial solutions that can be used for pruning the tree in the latter stages which helps reducing the search tree faster. More details about the derivations and steps of the algorithm can be found in (Turgut et al. 2017).

Step4 Evaluating the Pareto for final decision: As opposed to single objective, the output from a multi objective optimization is a set of solutions which are called Pareto (i.e. nondominated) as long as there is a clear trade-off among the objectives. This can be turned into an advantage by resorting efficient multi-objective algorithms for decision making in order to inject flexibility into the analytical decision-making process without sacrificing from quality of the solutions. Accordingly certain period of assessment will be required in order to choose the final solution to be applied.

Table 1: Properties of vehicles in the sample fleet

Type of vehicle	Ave. Engine Capacity(cm3)	Average CO2 Emission (g CO2/km) [1]	Fuel Consumption (liter/km)
E85	1693	135	0.07
Electric (EV)	-	0	0
LPG	1343	121	0.07
NG-biomethane (BIO)	1209	100	0.07
Hybrid-Gas	1786	46	0.03
Hybrid-Diesel	2678	49	0.03

[1] EEA Report 2017

As the demostration example a case with 9 locations are generated randomly which spreadth around a 300 by 300 km rectangular area. According to the problem structure 9 random coordinates are generated for the vehicles from the types represented in Table 1. All of these are mapped in Figure 1.

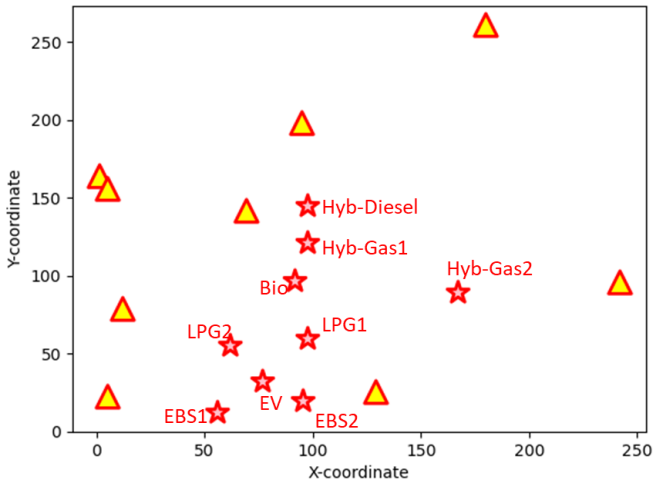

Figure 1: Initial layout of the instance (Triangles and stars represent the demand and the vehicle locations respectively.)

The problem under scope is formulated using the following sets and decision variables:

SETS:

R: possible routes

C: Set of customer orders, c, that need to be satisfied

V: Set of available vehicles v

v_r: Set of routes that use vehicle v, $r \in R$, $v \in V$

c_r: Routes that can serve customer demand c , $r \in R$, $c \in C$

DECISION VARIABLE:

x_r: Binary variable that denotes if route r is used or not, $r \in R$

The final mathematical model to be solved by the algorithm is as follows:

$$min \sum_{r \epsilon R} fuelconsumption_{v_r} * distance_r * x_r \quad (1)$$

$$min \sum_{r \epsilon R} traveltime_r * x_r \quad (2)$$

$$min \sum_{r \epsilon R} emmission_{v_r} * distance_r * x_r \quad (3)$$

$$s.t. \qquad \sum_{r \epsilon c_r} x_r \geq 1 \quad \forall c \in C \quad (4)$$

$$\sum_{r \epsilon v_r} x_r \leq 1 \quad \forall v \in V \quad (5)$$

In the above formulation Eqn. (4) ensures an assignment will be made to each request while Eqn.(5) guarantees that each vehicle will be dispatched to at most one destination. The three separate objective function expressions Eqn. (1)-(3) stand for total fuel consumption, travel (i.e. service) time and CO2 emissions respectively. The main decision variable x_r denotes which routes is selected as part of each solution.

After the mathematical model is formulated for the parameters of the instance problem it is solved using ParMoDec (Turgut et al. 2019) in a parallel mode.

RESULTS and DISCUSSION

Table 2: Objective values of each Pareto solution

Pareto Solution #	Total Fuel Consumption (lt)	Total Travel Time(hrs)	Total CO2 Emmission(kgs)
1	**33**	**17**	**53.9**
2	**35**	**17**	**58.2**
3	**33**	**16**	**54.0**

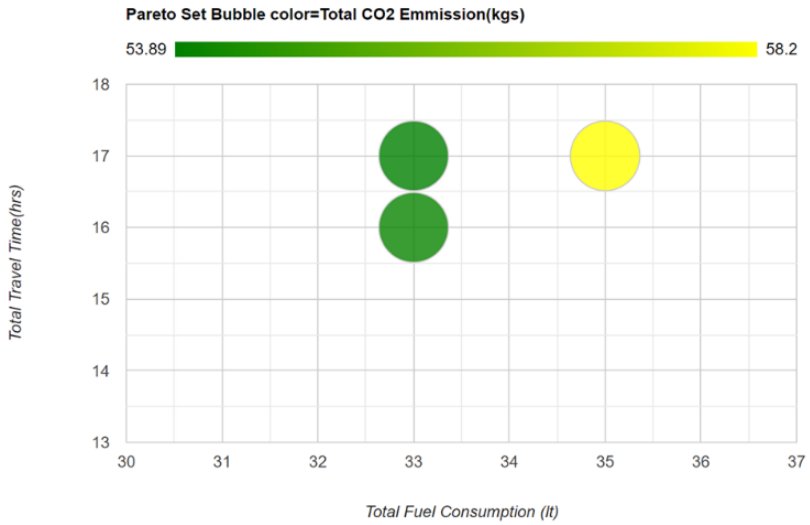

Figure 2: A possible visual representation of each Pareto solution to help the decision maker

Solutions are generated less than a second in a Intel(R) Core(TM) i7-4558U CPU @ 2.80GHz computer with 4 node parallelization. The methodology is valuable especially in time restricted decision making processes. However usage and contribution cannot be overlooked for solving strategic or tactical problems such as mid or long term allocation of vehicles. Capacity concern is not included for the focused type of problems. However the application area can be extended by adding a post processing step after obtaining the Pareto set during which the capacity violating solutions are eliminated.

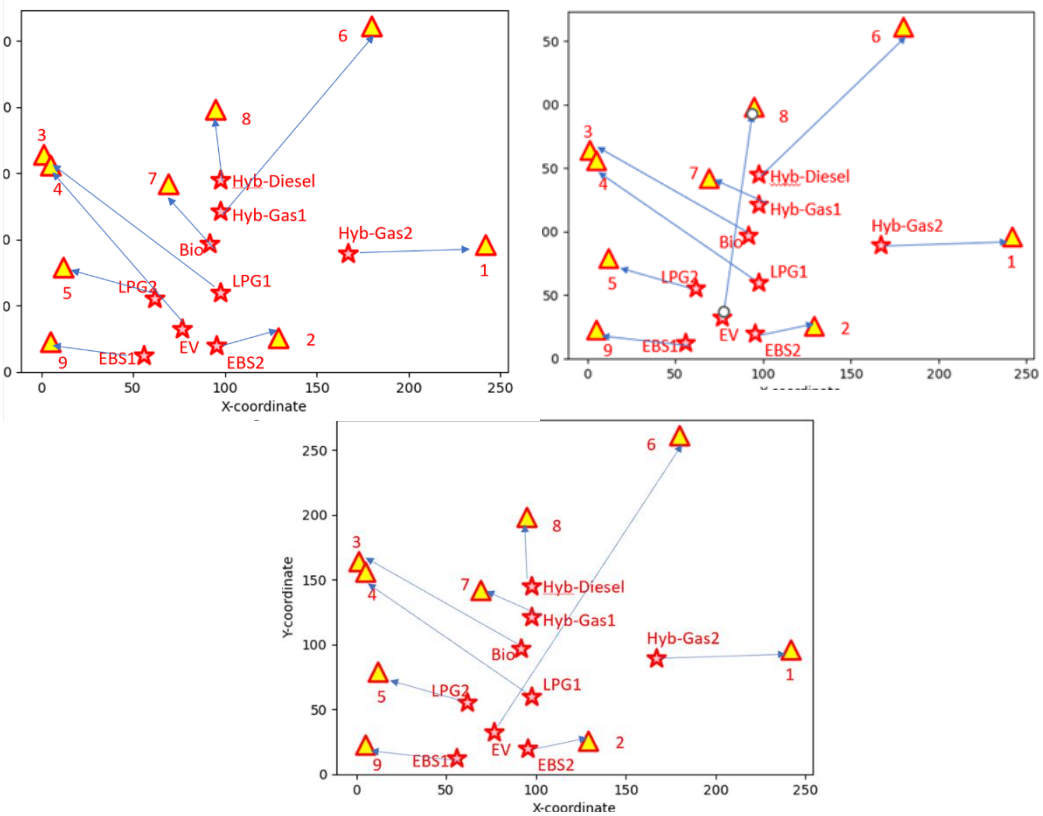

Figure 3: Details of each Pareto solution on the map

CONCLUSION

Alternative solutions provide great flexibility to decision maker in real life; especially if solutions have a guaranteed quality (i.e. optimality). The small instance used in this study showed that the proposed approach can be used for decision making of generic vehicle shipments which require new decision every 10-15 minutes after order information is updated. The richness of the approach stemming also from its ability to take into multiple criteria in natural conflict account. Dynamic routing decisions are generated best when they rely on live GPS information. Therefore possible extensions should be focusing more on versions where capacity concerns are included; and leaving route generation to GPS based procedures as a seperate stage.

As mentioned above the scope of the problem is open to contain solutions for various contexts. For instance in smart cities car sharing services will start allocating fleet at certain hubs by relying on mobility patterns of passengers (Xu 2021). This means the same MOBB algorithm can be used to generate Pareto set for alternative long term fleet allocation plans considering customer satisfaction, traffic congestion and cost type of aspects into account.

Proposed methodology can be used to attack nonlinear integer problems as well. Urban public transportation agencies sometimes have to operate mixing vehicles of different sizes on their routes, due to resource limitations or historical reasons. Services with different passenger-carrying capacities are provided to passengers during a mixed-fleet operation. A fundamental question arising here is how to optimally deploy a given fleet of different bus sizes to provide services that minimize passen- ger waiting time (Sadrani 2022).

Özet
Tekstil endüstrisi en çok su tüketen ve bundan dolayı fazla miktarda atıksu açığa çıkaran endüstrilerden biridir. Renkli, düşük BOD/COD oranına sahip ve dirençli organik kirleticiler içeren tektil atıksuları çevre ve insan sağlığı açısından tehlike oluşturmaktadır. Yüksek oksidasyon potansiyellerine sahip $SO_4^{\cdot-}$ ve $^{\cdot}OH$ gibi radikallerin oluşumuna dayalı İleri Oksidasyon Prosesleri (İOP), bu tür atıksuların arıtımında etkili ve çevreci bir alternatif olarak öne çıkmaktadır. Hetererojen İOP'lerinde yaygın olarak TiO_2 kullanılmaktadır. Bu çalışmada, nano boyutta borusal yapılı TiO_2 nanotüpler (TNT) kullanılmıştır. Hidrotermal yöntemle ile sentezlenen TNT'lerin Reactive Black 5 (RB5) boyarmaddesi kullanılarak hazırlanan benzetim boya banyosu atıksuyunun fotokatalitik gideriminde kullanılabilirliği incelenmiştir. Benzetim atıksuyun giderimine, TNT derişimi, UV lamba gücü, O_2 beslemesinin ve oksidant kullanımının etkileri araştırılmıştır. Sonuç olarak TNT derişimi ve lamba gücünün artışıyla giderim artmıştır. O_2 beslemesinin giderime önemli bir etkisinin olmadığı gözlenmiştir. H_2O_2 kullanımının etkisi reaksiyon ortamının pH'ına bağlı olarak değişmektedir.
Anahtar Kelimeler: TiO_2 nanotüpler, fotokatalitik oksidasyon, benzetim boya banyosu atıksuyu

Investigation of the Usability of TiO_2 Nanotubes in Photocatalytic Oxidation of Simulated Dye Bath Effluent.

Abstract
Since textile industry is one of the industries consuming a considerable amount of water, large amounts of wastewater is generated. Colored textile wastewater with low BOD/COD ratio and containing persistent organic pollutants constitute a major problem for the environment and human health. Advanced Oxidation Processes (AOP), based on the formation of radicals such as $SO4^{\cdot-}$ and $^{\cdot}OH$, which have high oxidation potentials, has emerged as an effective and environmentally friendly alternative in the treatment of such wastewaters. TiO_2 is the widely used in heterogeneous AOPs. In this study, nano-sized tubular TiO_2 nanotubes (TNT) were used. The usability of TNTs synthesized by hydrothermal method in the photocatalytic removal of simulated dye bath effluent wastewater prepared using Reactive Black 5 (RB5) was investigated. The effects of TNT concentration, UV lamp power, purging of O_2 and addition of oxidant on the removal of simulated wastewater were investigated. As a result, the removal of simulated wastewater increased with increase of TNT concentration and lamp power. It was observed that purging of O_2 did not have a significant effect on the removal. The effect of the use of H_2O_2 varied depending on the pH of the reaction medium.
Keywords: TiO_2 nanotubes, photocatalytic oxidation, simulated dye bath effluent

GİRİŞ

Hızlı nüfus artışı ile birlikte, endüstriyel, evsel ve tarımsal amaçlı su tüketimindeki artış, sınırlı olan kullanılabilir tatlı su kaynaklarını azaltmaktadır. Bunun yanı sıra tüketim sonrası açığa çıkan atıksular, çoğu zaman yeterince arıtılmadan alıcı sucul ortamlara verilmekte ve tekrar kullanılması mümkün olmamaktadır. Özellikle endüstriyel atıksular çok miktarda ve farklı türde dirençli organik bileşikler içermektedir. Dirençli organik bileşikler, günümüzde yaygın olarak kullanılan ve geleneksel arıtım yöntemleri adı verilen fiziksel, kimyasal ve biyolojik arıtım yöntemleri ile yeterince giderilememekte, hatta daha zararlı bileşiklere dönüşebilmektedir. Doğada biriken dirençli organik bileşikler ve bunların oluşturduğu ara ürünler zamanla canlı organizmalara geçmekte, besin zinciri yoluyla diğer canlılara ve insanlara kadar ulaşmaktadır.

Tekstil sanayi, yüksek hacimlerde su tüketen endüstriyel faaliyetlerden birisidir ve üretim süreçleri sonunda azo boyarmaddeler gibi dirençli organik bileşikler içeren, büyük miktarda renkli atıksu açığa çıkarmaktadır. Tekstil atıksuyunun yüksek COD ve düşük BOD içeriğine sahip olması biyolojik arıtım ile giderimi zorlaştırırken, suyun yoğun renk içeriği estetik sorunlara neden olmakta ve güneş ışığının suda yaşayan canlı organizmalara ulaşmasını engellemektedir. Bu durum bitkiler için yaşamsal öneme sahip fotosentetik aktiviteyi güçleştirmekte ve sudaki çözünmüş O_2 miktarını azaltarak diğer canlıların da zarar görmesine yol açmaktadır (Chandanshive ve ark., 2018). Bu açıdan tekstil atıksularının arıtılıp yeniden kullanılabilmesi büyük önem taşımaktadır.

Geleneksel arıtım yöntemlerinden biyolojik arıtım tekstil atıksularının arıtımı için uygun maliyetli bir yöntem olmasına karşın tekstil atıksuyunun içerdiği NaOH, NaCl, deterjan ve ağır metal iyonları gibi kimyasal türlerin mikroorganizmalara toksik etki göstermesi ve boyarmaddelerin biyobozunmaya dirençli olmaları bu yöntemin etkinliğini azaltmaktadır (Azanaw ve ark., 2022). En yaygın fiziksel arıtım yöntemlerinden membran filtrasyonu olumsuz kimyasal ortamlara dayanıklı ve etkin bir arıtım yöntemi olmasına karşın ilk yatırım maliyeti yüksektir ve tıkanma ile ilgili sorunlar ortaya çıkabilmektedir. Adsorpsiyon ise düşük maliyetli bir yöntem olmasına karşın geniş alanlar ve uzun temas süreleri gerektirir. Ayrıca işlemin etkinliği adsorbanın adsorpsiyon kapasitesi ile sınırlıdır. Bununla beraber her iki yöntemde de kirleticiler atıksudan başka bir faza taşınmış olur ve giderilmesi geren yeni bir kirlilik oluşur Kimyasal pıhtılaştırma ve topaklaştırma işlemi tekstil atıksuları için sıklıkla kullanılan düşük maliyetli bir ön arıtım işlemidir. Dispers ve sülfür boyamalar için başarılı sonuçlar veren bu yöntem reaktif, azo, asit ve bazik boyalar için yetersiz kalmaktadır. Son yıllarda daha etkin yeni polimerik topaklaştırıcılar geliştirilse de tıpkı fiziksel yöntemlerde olduğu gibi kirleticiler sadece atıksudan uzaklaştırılmakta tamamen ortadan kaldırılamamaktadır (Verma ve ark., 2012; Zhang ve ark. ,2021).

Geleneksel arıtım yöntemlerinin söz konusu sakıncalarının üstesinden gelmek için son yıllarda farklı yöntemler geliştirilmeye ve uygulanabilirlikleri incelenmeye başlanmıştır. İleri Oksidasyon Prosesleri (İOP) adı verilen bu yöntemlerin ana ilkesi $^{\cdot}OH$, $SO_4^{\cdot-}$ ve $O_2^{\cdot-}$ gibi seçicilikleri düşük, oksidasyon potansiyelleri yüksek güçlü oksidantlar oluşturmak ve bu oksidantlar ile organik kirleticileri parçalamaktır. Bu proselerin uygulanabilirlikleri çevre dostu olmalarına, maliyetlerine ve etkinliklerine bağlıdır. İOP'ler homojen ve heterojen İOP'ler olarak ikiye ayrılabilir. Homojen İOP'lerde; radikal oluşumu ve oksidasyon reaksiyonları tamemen sıvı fazda gerçekleşir. Hetrojen İOP'lerde ise yarı iletken katalizörler kullanılır (Zhang ve ark., 2021; Lama ve ark., 2022). Heterojen İOP'lerde en yaygın kullanılan fotokatalizör toksik olmaması, düşük maliyeti, fiziksel ve kimyasal olarak yüksek kararlılığı ve yüksek aktivitesinden ötürü TiO_2'dir. TiO_2 UV ışını ile uyarıldığında yüksek oksidasyon potansiyeline sahip $^{\cdot}OH$ radikalleri oluşmaktadır. Bu açıdan TiO_2'nin fotokatalitik etkinliği $^{\cdot}OH$ radikali üretimi ile artmaktadır. $^{\cdot}OH$ radikalinin artışı ise daha yüksek ışın absorpsiyon kapasitesi, daha fazla e^--h^+ çifti olşması, oluşan bu çiftlerin birleşme oranlarının düşük olmasına bağlıdır. Bu nedenle TiO_2'nin tanecik boyutu, yüzey alanı, kristal yapısı ve morfolojisinde yapılacak düzenlemeler ile fotokatalitik etkinlik arttırılabilmektedir. TiO_2'nin içi boş boru biçiminde yapısı olan TiO_2 nanotüpler (TNT) yığın haldeki TiO2'den daha geniş yüzey alanına sahiptir. Ayrıca TNT'lerin bir boyutlu borusal yapısı elektron taşınım hızını arttırır ve e^--h^+ birleşme oranını düşürür. TiO_2'nin kristal yapıları (anataz, rutil, brokit) amorf TiO_2'den daha yüksek fotokatalitik etkinliğe sahiptir. Bu yapılardan anatazın etkinlği ise diğerlerindan daha yüksektir (Alkanad ve ark., 2022).

TNT ilk olarak 1996 yılında Hoyer tarafından anodik alüminyum oksit kalıplar kullanılarak üretilmiştir. Hidrotermal yöntem ile TNT sentezi ise ilk olarak 2001 yılında Kasuga tarafından yapılmıştır. Bu yöntemlerden başka elektrokimyasal anodizasyon, elektroeğirme, mikrodalga, sonokimyasal, solvotermal yöntemlerle de TNT üretilebilmektedir. Bu yöntemlerden hidrotermal işlem diğerlerine göre daha kolay işlem basamaklarına sahiptir ve büyük miktarda üretim yapılmasına daha elverişlidir (Ou ve Lo, 2007).

Bu çalışmada hidrotermal yöntem ile üretilen TNT'ler RB5 boyarmaddesi kullanılarak hazırlanan benzetim boya banyousu atıksuyunun gideriminde kullanılmıştır.

MATERYAL VE METOD

Materyal

Deneysel çalışmalarda TiO_2 (Evonik), NaOH (Sigma-Aldrich), HCl (Merck, %37) ve H_2O_2 (Merck, %30) kullanılmıştır. Fotokatalitik oksidasyon deneylerinde kullanılan benzetim tekstil atıksuyu C. I. Reactive Black 5 (RB5, Dystar) boyarmaddesi kullanılarak hazırlanmıştır.

TiO_2 Nanotüplerin (TNT) Sentezi ve Karakterizasyonu

Bu çalışmada kullanılan TNT'ler 150 °C'de 24 saat süren hidrotermal işlem ile elde edilmiştir. Hidrotermal işlemin ve sentezlenen TNT'lerin karakterizasyonunun ayrıntıları önceki çalışmamızda verilmiştir (Karakurt ve Kartal, 2022).

Fotokatalitik Oksidasyon Deneyleri

Hidrotermal işlem ile elde edilen TNT'ler RB5 boyarmaddesi içeren benzetim boya banyosu atıksuyunun fotokatalitik oksidasyon ile gideriminin incelenmesinde kullanılmıştır. Benzetim boya banyosu atıksuyunun hazırlanmasında 20 g/L Na_2CO_3, 1.8 g/L NaOH ve 65 g/L NaCl kullanılmıştır. Hazırlanan boya banyosu atıksuyunun pH değeri 11.5 olarak ölçülmüştür. Fotokatalitik oksidasyon deneyleri kuvars camdan yapılmış ceketli bir fotoreaktörde gerçekleştirilmiştir. Işın kaynağı olarak 352 nm dalga boyunda ışın üreten UV-A lambalar (8 W, Topbulb) kullanılmıştır. Fotokatalitik oksidasyon süreci için gerekli O_2 gazı bir gaz dağıtıcı yardımıyla reaksiyon ortamına beslenmiştir.

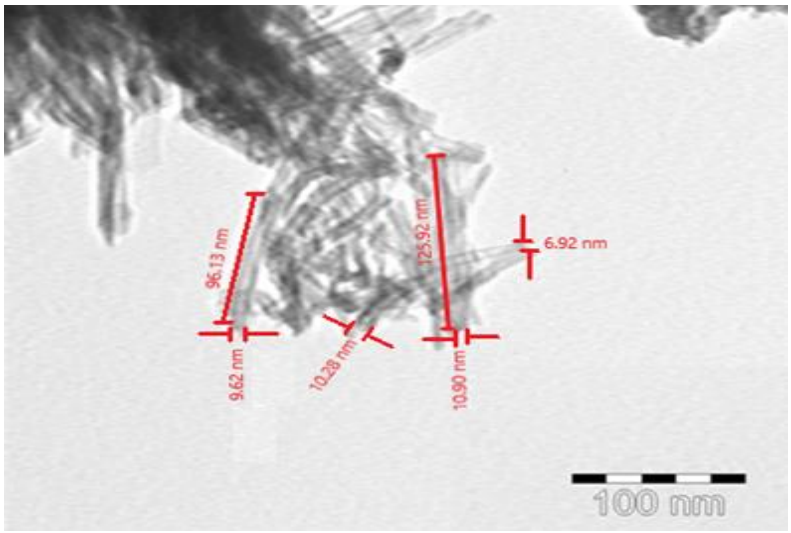
TNT'ler benzetim boya banyosu atıksuyuna eklenerek lambalar açılmadan 30 dakika boyunca karıştırılmıştır. Daha sonra lambalar açılarak fotokatalitik oksidasyon deneyleri başlatılmıştır. Belirli zaman aralıklarında reaksiyon ortamından alınan numunelerin absorbans değerleri benzetim boya banyosu atıksuyunun maksimum dalga boyunda UV-vis spektrofotometresi (Shimadzu UV 1800) ile ölçülerek % giderim Eşitlik (1)'e göre hesaplanmıştır.

$$\%\ \text{RB5 Benzetim Atıksuyu Giderimi} = \frac{A_O - A}{A_O} \times 100 \qquad (1)$$

Burada A_O ve A sırasıyla t=0 ve t=t anında RB5 atıksuyunun maksimum dalga boylarındaki absorbans değerleridir.

BULGULAR ve TARTIŞMA

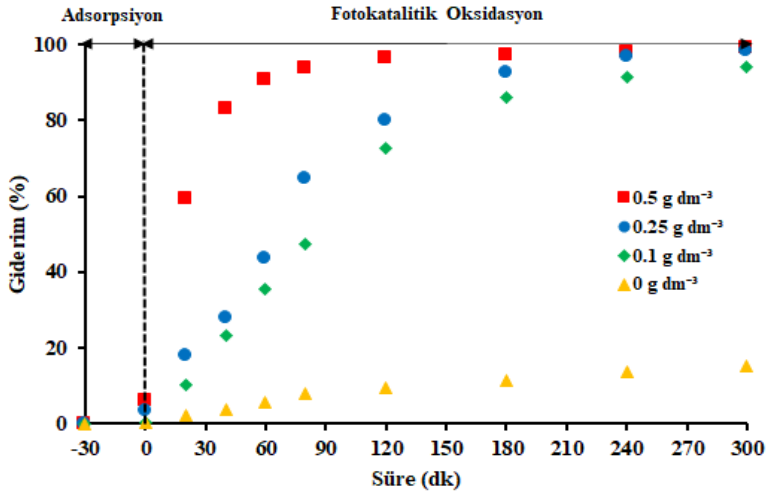
Hidrotermal yöntem ile sentezlenen TNT'lerin karakterizasyon bulguları önceki çalışmamızda verilmiştir. Şekil 1'de elde edilen TNT'lerin TEM görüntüsü görülmektedir. (Karakurt ve Kartal, 2022).



Şekil 1. Hidrotermal yöntem ile sentezlenen TNT'lerin TEM görüntüsü

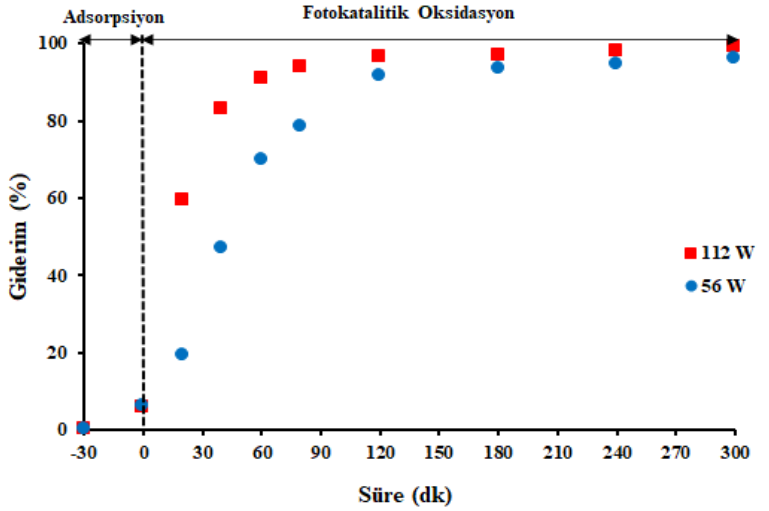
Kullanılan TNT miktarının RB5 benzetim boya banyosu atıksuyunun renk giderimine etkisinin belirlenmesi amacıyla atıksuyun kendi pH değerinde farklı miktarlarda TNT kullanılarak fotokatalitik oksidasyon deneyleri yapılmıştır. Şekil 2'den görüldüğü gibi, 0.1 g dm^{-3}, 0.25 g dm^{-3} ve 0.5 g dm^{-3} TNT derişimlerinde 300 dk sonunda sırasıyla % 94.2, % 98.3 ve % 99.1 giderim elde edilmiştir. Buna karşın TNT kullanılmadan yapılan deneysel çalışmada yalnızca % 15.3 giderim gözlenmiştir. TNT miktarının artışı ile UV-A ışınları ile uyarılan yüzey miktarı artmakta ve bunun sonucunda e^--h^+ çifti oluşturacak aktif merkez ve ·OH radikali miktarı da artmaktadır (Nickheslat ve ark., 2013). TNT kullanılmadan yapılan deney

sonucu görülen renk giderimi ise UV-A ışınlarının boya molekülünü doğrudan parçalaması ve atıksu içerisindeki Cl^- iyonlarının UV-A ışınları ile uyarılması sonucu reaktif radikaller oluşturması nedeniyle olduğu düşünülmektedir (Kusic ve ark., 2009; Navarro ve ark., 2018)



Şekil 2. TiO_2 nanotüp derişiminin benzetim boya banyosu atıksuyunun giderimine etkisi

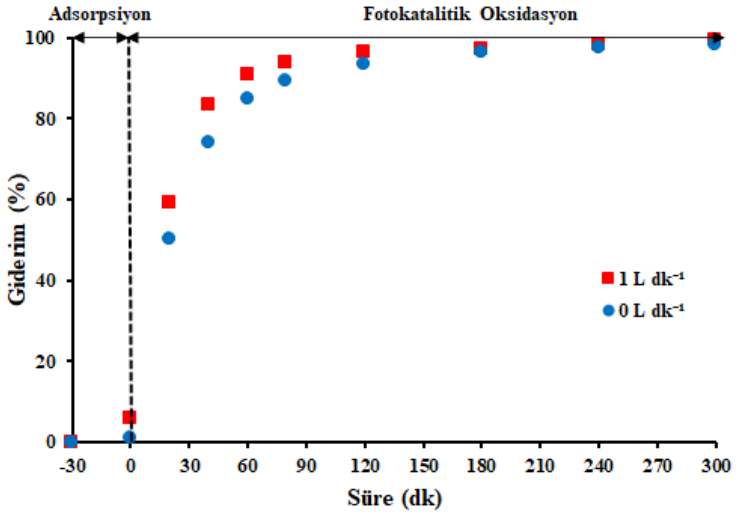
Benzetim boya banyosu atıksuyunun giderimine kullanılan ışın kaynağı şiddetinin etkisinin belirlenmesi için atıksuyun kendi pH değerinde, 0.5 g dm^{-3} TNT kullanılarak 14 adet UV-A lamba (112 W) ve 7 adet UV-A lamba (56 W) ile yapılan deneysel çalışmalar sonucunda Şekil 3'de görüldüğü gibi 20 dakika sonunda 112 W lamba gücü ile %59 giderime ulaşılırken 56 W ile olan giderim %19'da kalmıştır. 60. dakikada ise 112 W ve 56 W ile elde edilen giderim oranları sırasıyla % 91 ve % 71 olmuştur. 300 dakikalık deneysel çalışmaların sonucunda ise 112 W ile % 99 giderim elde edilirken 56 W ile % 96 giderim elde edilmiştir. Lamba sayısının artması sonucu artan ışın şiddeti ile birlikte oluşan ·OH radikali miktarı çoğalmakta ve bu durum fotokatalitik aktiviteyi arttırıcı etki yapmaktadır (Chiou ve ark., 2008). 112 W ve 56 W lamba gücü ile yapılan deneysel çalışmalardaki giderim hızları karşılaştırıldığında, 56 W'lık lamba gücünde yapılan deneysel çalışmanın ilk 20 dakikasındaki giderimin, 112 W'lık lamba gücü ile yapılan deneysel çalışmaya göre yavaş olmasının bu süreçte oluşan ·OH miktarının giderim için yeterli olmamasından kaynaklandığı düşünülmektedir. İlerleyen süre ile beraber giderim değerlerinin birbirine yaklaşması, zamanla atıksu içerisindeki boyarmadde içeriğinin azalmasıyla ·OH radikallerinin giderim için yeterli seviyeye ulaştığını göstermektedir.



Şekil 3. UV lamba gücünün benzetim boya banyosu atıksuyunun giderimine etkisi

O_2 beslemesinin boya banyosu atıksuyunun atıksuyunun fotokatalitik giderimine etkisinin belirlenmesi için yapılan deneysel çalışmalarda reaksiyon ortamına 1 L dk^{-1} debisinde O_2 beslenmesi sonucu elde edilen giderim ile O_2 beslemesi yapılmayan koşuldaki giderim miktarları karşılaştırılmıştır. Reaksiyon ortamına

beslenen O_2 TNT'lerin karışma hızını arttırmakta, boyarmaddelerin akışkan fazdan TNT yüzeyine olan difüzyonu da buna bağlı olarak artmaktadır. Atıksu içerisinde çözünmüş O_2'nin giderime bir diğer olumlu katkısı e^- tutucu olarak görev yapması ve e^--h^+ çiftlerinin yeniden birleşmesini engellemesidir. Ayrıca O_2 gazının e^- ile etkileşimi sonucu açığa çıkan $O_2^{\cdot-}$ (süperoksit) anyon radikali de organik bileşikleri parçalayabilen reaktif bir türdür (Kehoe ve ark., 2001;Tseng ve ark., 2012). Yapılan fotokatalitik oksidasyon deneylerinin ilk 20 dakikasında O_2 beslemesi yapılan koşulda %59 giderim görülürken, O_2 beslemesi yapılmayan koşulda ise %50'lik bir giderime ulaşılmıştır (Şekil 4). Zamanla her iki koşulda elde edilen giderim değerleri arasındaki fark azalmış 120. dakika sonunda O_2 beslemeli ve O_2 beslemesiz koşullardaki giderim değerleri sırasıyla %96 ve %93 olmuştur. O_2 beslemesinin olmadığı koşuldaki giderimin O_2 beslemesi olduğu koşula yaklaşması, O_2 beslemesinin olmadığı koşullarda havadaki O_2 nin zamanla suda çözünmesi ve atıksu içerisindeki boyarmadde derişiminin azalması ile çözünmüş O_2'nin boyarmadde giderimi için yeterli miktara ulaşması sonucu olduğu tahmin edilmektedir.



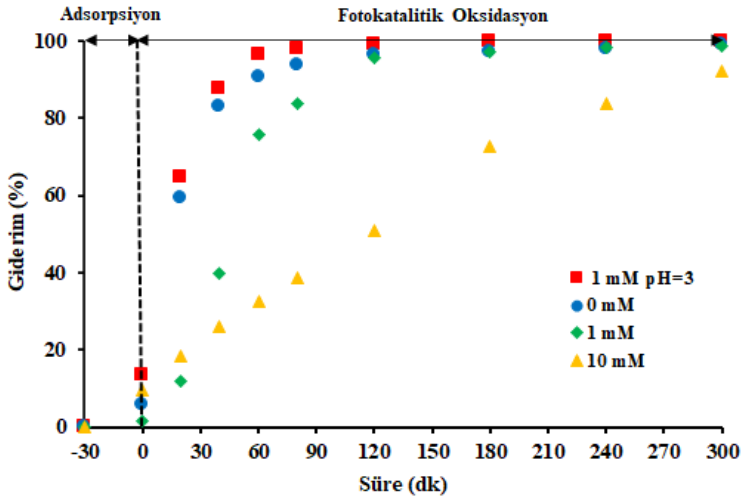
Şekil 4. O_2 gazı beslemesinin benzetim boya banyosu atıksuyu giderimine etkisi

UV-A/TNT sisteminde benzetim boya banyosu atıksuyu gideriminde H_2O_2 oksidantı kullanımına reaksiyon pH'sının etkisinin belirlenmesi amacı ile 0.5 g dm^{-3} TNT kullanılarak atıksuyun kendi pH değerinde 1 mM ve 10 mM H_2O_2 kullanılarak, pH 3 değerinde ise 1 mM H_2O_2 kullanılarak fotokatalitik oksidasyon çalışmaları yapılmıştır. Yapılan deneysel çalışmalar aynı koşullarda oksidant kullanılmayan deneysel çalışmanın sonucu ile karşılaştırılmıştır. Sonuçlar Şekil 5'de görülmektedir. Atıksuyun kendi pH değeri olan 11.5'da H_2O_2 kullanılmadan yapılan deneysel çalışmada 60. dakika %91 oranında giderim görülürken, 1 mM H_2O_2 kullanıldığında giderim %76'da, 10 mM kullanıldığında %33'de kalmıştır.1 mM H_2O_2 ile pH=3'de ise giderim oranı %96'ya çıkmıştır. 120 dakika sonrasında ise H_2O_2 kullanılmadan ve 1 mM H_2O_2 kullanılarak yapılan deneysel çalışmaların her ikisinde de %96 giderim elde edilirken 10 mM H_2O_2 kullanımı ile elde edilen giderim %51'de kalmıştır. Reaksiyon ortamının pH değerinin 3 olduğu koşulda 1 mM H_2O_2 ile %100 giderim elde edilmiştir. 300 dakika sonunda H_2O_2 olmaksızın yapılan deneysel çalışmada ve 1 mM H_2O_2 kullanılan deneysel çalışmada giderim oranları %99'a ulaşırken 10 mM kullanıldığında giderim %92 olmuştur. Benzetim boya banyosu atıksuyunun doğal pH değeri olan 11.5'de H_2O_2 bileşiği Eşitlik 2'ye göre bozunarak HO_2^- (hidroperoksit) anyonuna dönüşmektedir. Bu anyon da ortamda bulunan ·OH radikalleri ile etkileşerek $O_2^{\cdot-}$ anyon radikaline dönüşmektedir (Eşitlik 3). $O_2^{\cdot-}$ radikalinin oksidasyon potansiyelinin ·OH radikalinden düşük olması H_2O_2'nin giderimi azaltıcı etkisine yol açtığı düşünülmektedir. H_2O_2, pH 3 değerinde ise Eşitlik 4'deki gibi ·OH radikallerine dönüşür (Lee ve ark., 2022). TNT/UV-A etkileşimim sonucu oluşan radikallere H_2O_2' den gelen radikaller ·OH eklenince giderim artmıştır.

$$H_2O_2 \longrightarrow H^+ + HO_2^- \quad (2)$$

$$\cdot OH + HO_2^- \longrightarrow O_2^{\cdot-} + H_2O \quad (3)$$

$$H_2O_2 + h\nu \longrightarrow 2\,\cdot OH \quad (4)$$



Şekil 5. H_2O_2 eklenmesinin benzetim boya banyosu atıksuyu giderimine etkisi

SONUÇ

Hidrotermal yöntem ile sentezlenmiş TiO_2 nanotüplerin, Reactive Black 5 boyarmaddesi kullanılarak hazırlanmış benzetim boya banyosu atıksuyu giderimindeki fotokatalitik etkinliğinin belirlenmesi amacıyla yapılan bu çalışmada TiO_2 nanotüp derişimi artışı ile atıksu giderimi artmıştır. Kullanılan UV lamba gücünün artışı da giderimi hızlandıran bir etken olmuştur. Reaksiyon ortamına O_2 beslendiği koşullardaki giderim besleme yapılmayan koşullara göre daha hızlı olmuştur. H_2O_2 kullanımı pH=11.5 değerinde giderimi azaltıcı etkisi olurken pH=3 değerinde giderimi arttırmıştır.

TEŞEKKÜR

Bu çalışmaya 2014/08 nolu proje ile maddi destek sağlayan İnönü Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi'ne (İUBAP) teşekkür ederiz.

Abstract

Driving current of thermoelectric cooler(TEC) modules is one of the method to advance their cooling efficiency. Conventionally TEC modules driven with direct current(DC) or pulse width modulation(PWM) methods. However, some limitations of these methods exist in the application such as complex electronic circuits and distorting effect of high switching frequencies. A novel rectangular pulse current(RPC) driving method which is the constant duty cycle, was developed by optimising the input power due to low pulse frequency(≤1000Hz) of square wave to enhance the cooling efficiency and thermal stability of TEC module. An experimental set up including thermoelectric module, signal processing and temperature control parts was constructed and the system provides the same conditions for different driving methods. The measurement results show that the coefficient of performance of thermoelectric module with the RPC driving method was increased up to 19% as compared to DC driving method. The RPC driving method can be made a significant contribution to cooling challenges and technology in the field of semiconductor applications due to its particular properties.

Key words: thermoelectric cooler module, cooling performance, drive method, rectangular pulse, direct current

INTRODUCTION

In recent years, heat dissipation of electronic systems has grown rapidly with improving manufacturing technology. This growth has induced a serious electronic cooling problem. A conventional cooling system includes an evaporator, a compressor and a condenser and they are widely using for many purposes. However, energy costs and environmental regulations regarding the manufacture and release of chlorofluorocarbons (CFCs) are also increasing. These facts are encouraging manufacturers and their customers to seek alternative for conventional cooling technology [1].

Being no moving parts, environmentally friendly technology and requiring almost no maintenance, thermoelectric technology has become one of the most promising alternative methods to solve increasingly serious energy shortage and environmental pollution problems. Thermoelectric cooler (TEC) modules have been applied for electronic cooling in many industries such as medical instrument, aerospace, military, industrial products, offering the advantages of small size, quite operation, long lasting time, ease of use and reliability [2].

The coefficient of performance (COP) for the thermoelectric technology is the ratio of output and input energy, which depends on the current through the module and the temperature difference between two sides of the thermoelectric module. The COP of thermoelectric module is smaller than the COP of conventional cooling system has. Therefore much research has focused on the improvement of the COP of thermoelectric cooling systems by means of developing new materials for the TEC modules, optimization of module systems design, fabrication, improvement of the heat exchange efficiency and optimisation for geometrical dimensions of each pellet of TEC [1, 2, 3, 4, 5]. However, few studies have been carried out on the performance of cooling modules including the current driving method of them [2, 6].

This research concentrates on the current driving method of TEC module to improve its COP. One method of driving TEC modules is on-off control in which constant dc current is interrupted according to a set temperature [2]. The other driving method is based on pulse width modulation(PWM) to control the current passing through the module [6]. In this research, an optimised pulse frequency modulation(RPC) driving current is applied to the module to reduce the Joule heating and then to control the temperature of TEC module and improving the COP.

2. THEORY OF THERMOELECTRIC COOLING

A typical TEC module (Peltier module) consists of *p*- and *n*-type pellets connected electrically in series and thermally parallel sandwiched between two ceramics substrates. Whenever direct current passes through the circuit of thermoelectric heterogeneous conductors, it causes temperature differential between TEC module sides. As a result, one TEC face, which is called cold side, will be cooled while its opposite face, which is called hot side, is simultaneously heated. This phenomenon is known as the Peltier effect [8]. The refrigeration capability of a semiconductor material is dependent on combined effect of the material's Seebeck voltage, electrical resistivity, and thermal conductivity over the operational temperature range between cold and hot ends [2, 9]. It can be expressed as an endothermic quantity (Q_c) at the cold side and given by;

$$Q_c = \alpha I T_c - \frac{I^2 \rho l}{2A} - k\Delta T \quad (1)$$

where α, I and T_c, in the first term are the Seebeck coefficient [V/K], the direct current [A] passing through the module and the cold side temperature [K], ρ, *l* and A in the second term are the electrical resistivity [Ω m], length [m] and cross sectional area [m^2] of thermoelectric material, *k* and ΔT in the last term are the thermal conductance [W/K] and the temperature difference [K] between the hot and cold sides of thermoelectric couple, respectively.

The first term on the right hand side of Eq. (1) represents the Peltier effect, and is thought to generate heat flow proportional to the average current I. The second term represents the reduction in endothermic quantity due to the heat generation of the Peltier device itself, and corresponds to the half of the Joule heating of the Peltier device. The last term describes the reverse heat flow from the high temperature part due to the low temperature part.

The electrical energy consumption (Q_p) [W] of a couple is given by;

$$Q_P = \frac{I^2 \rho l}{A} + \alpha I \Delta T \quad (2)$$

The electric power consumption of a thermoelectric couple is used to generate the Joule heat and overcome the Seebeck effect, which generates power due to the temperature difference between two junctions of the couple. The COP of the thermoelectric couple for cooling is given by;

$$COP = \frac{Q_c}{Q_P} = \frac{\alpha I T_c - \frac{I^2 \rho l}{2A} - k\Delta T}{\frac{I^2 \rho l}{A} + \alpha I \Delta T} \quad (3)$$

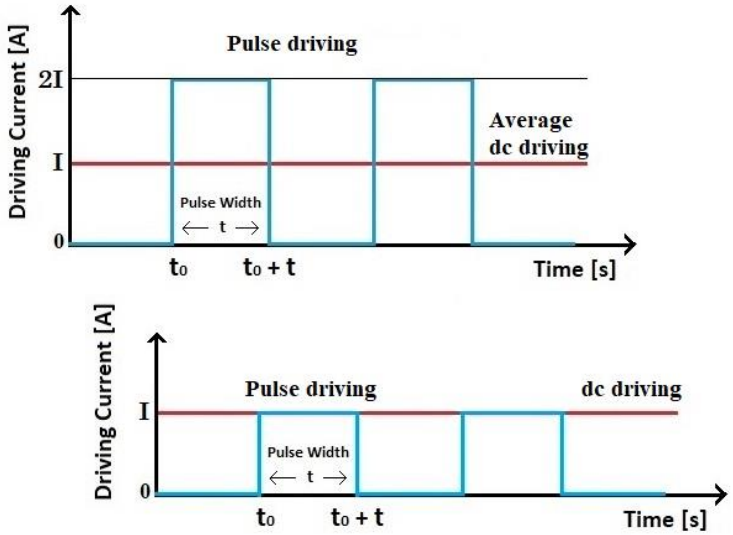
The COP of a thermoelectric material is a combined effect of the material Seebeck coefficient, electrical resistivity, geometrical dimensions of thermoelectric material and thermal conductivity over the operational temperature range between the cold and hot ends. The performance of thermoelectric material is called as a figure of merit (Z) and expresses;

$$ZT = \frac{\alpha^2 A}{k \rho l} T = \frac{\alpha^2}{kR} T \quad (4)$$

Each of the *n*- and *p*-type thermoelectric material properties varies as a function of temperature and therefore the figure of merit for each material is temperature dependent. Maximising the figure of merit is larger objective in the selection and optimising of thermoelectric materials and then it limits the temperature differential, whereas the geometrical dimensions for each *n*- and *p*-type of material defines the heat pumping capacity. The most widely used thermoelectric material for cooling in the temperature range of 0-200 ºC is the Bismuth-Telluride (Bi_2Te_3) due to its thermal properties at room temperature as compared to other thermoelectric materials [10].

3. DRIVING METHOD

Analysing the pulse current driving with constant amplitude the reduction in pulse current power (P_{pc}) can be understood in the endothermic quantity due to the heat generation of the Peltier device itself during the pulse driving. The duty cycle (one period) of the pulse driving is based on the driving current waveform of the Peltier device shown in Fig. 1. The reduction in the endothermic quantity can be explained in terms of average current applied to the Peltier device (I_{av}) as;



(a) (b)

Fig. 1. Driving current waveforms in different magnitudes, a) average and b) constant.

$$\frac{P_{pc}}{N} = \frac{\rho l}{2A} N \left(\frac{I_{av}}{N}\right)^2 = \frac{\rho l}{2A} \frac{I_{av}^2}{N} \quad (5)$$

where N is a real number between zero and one. Also, the reduction in the dc power (P_{dc}) of endothermic quantity, when applying the same average current I_{av} as dc to obtain the same Peltier effect, is expressed as;

$$\frac{P_{dc}}{N} == \frac{\rho l}{2A} \frac{I_{av}^2}{N} \quad (6)$$

The reduction in power using the PWM control is analysed in the endothermic quantity due to heat generation of the Peltier device itself during pulse driving with 50% duty cycle [2]. In addition, it is compared to the same average current as dc to obtain the same Peltier effect. In this case, when the average current is I, the peak of pulse drive must be 2I in the 50% duty cycle of PWM [Fig 2 (a)]. However, in this research, the average current and the peak of pulse drive are in the 50% duty cycle with the same magnitude and the performance of Peltier module driving with average dc is compared with pulse driving [Fig. 2 (b)]. Accordingly, it is clear that the reduction in driving power of endothermic quantity can be reduced N times regarding the driving direct current. The COP of the Peltier device can be expressed by;

$$COP = \frac{Q_c}{P_p} \quad (7)$$

where Q_c and P_p are the heat absorption and power consumption of the Peltier device respectively. The heat absorption can be calculated as;

$$Q_c = m\ C\ \Delta T \quad (8)$$

where m is the mass of heated side of the Peltier device [kg], C is the specific heat [J(kg K)] and ΔT is the temperature difference between hot and cold sides of Peltier device. The power consumption of the Peltier device can be calculated by input power as;

$$Q_p = IV \quad (9)$$

EXPERIMENTAL SET UP

The measurement system consists of 3 parts: driving of Peltier module, signal processing and temperature control. Fig. 2 shows a block diagram of the system. The Peltier module, type Z-MAX BV-2H, which has an aluminium layer on both sides is used. Thus, it is ease of fitting to the heat sink and minimises the heat loss. Table 1 shows the technical specifications of the Peltier module used. Peltier modules are very sensitive for the waveform of driving current and then their performance can be affected if the driving current has any harmonic or noise. Two batteries, which are 12 V 9 A in power, are used as a power supply. They are connected in series to increase the output voltage and can be provided a continuous noiseless power to be able to tolerate the power loss of Peltier module. A DC-DC converter, [Fig. 3] type DPS5015, is connected to the batteries in series to limit the driving current of the Peltier module with varied current values in the range of 0.5 to 5 A.

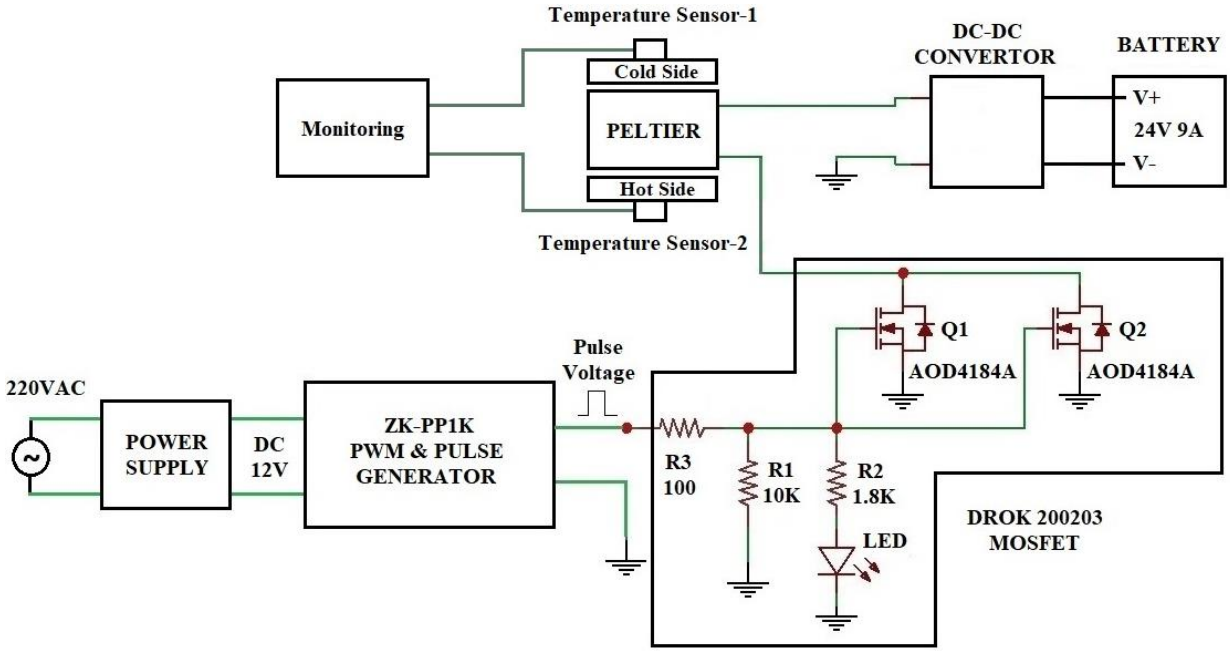


Fig. 2. Block diagram of measurement system.

Table 1. Technical specifications of the Peltier module used.

Dimensions	W70xD70xH27 (mm)
Cooling performance	57.8 W
Rated voltage	DC ±12 V
Rated current	6 A
Inner resistance	1.35 - 1.65 Ω

In signal processing part, a square wave generator type, ZK-PP1K produces a square signal 0 - 5 V, 30 mA, from 1 Hz to 150 kHz operating frequency. Its duty cycle can be arranged from 1% to 100%, but in this system, 50% duty cycle was chosen to drive the module at varied frequency. The output of square wave generator is connected to the MOSFET transistors, type DROK 200203. They can be operated from 5 - 36V up to 15A current and 20kHz frequency as an output. Since the tested Peltier module operates 12V, 6A power. The MOSFET transistors are increased the peak of square wave signal to this level of power.
In the temperature control part, the temperature on hot and cold sides of the Peltier device was measured by two digital thermometers, type LT172N. The initial temperature was recorded as a room temperature by means of a digital thermometer, just before the tests were begun to keep the thermal stability of hot and cold surfaces of the module. The LT172N digital thermometers have ±3% sensitivity in full scale due to

their temperature sensors used, which are the NTC thermistor, type GM-NTC-105C. The sensitivity of other measurement devices is less than ±0.001 in full scale. Therefore, the maximum overall measurement error of the system is found to be around ±3%. Fig. 3 and Fig. 4 show the general view of measurement system and Peltier device system respectively.

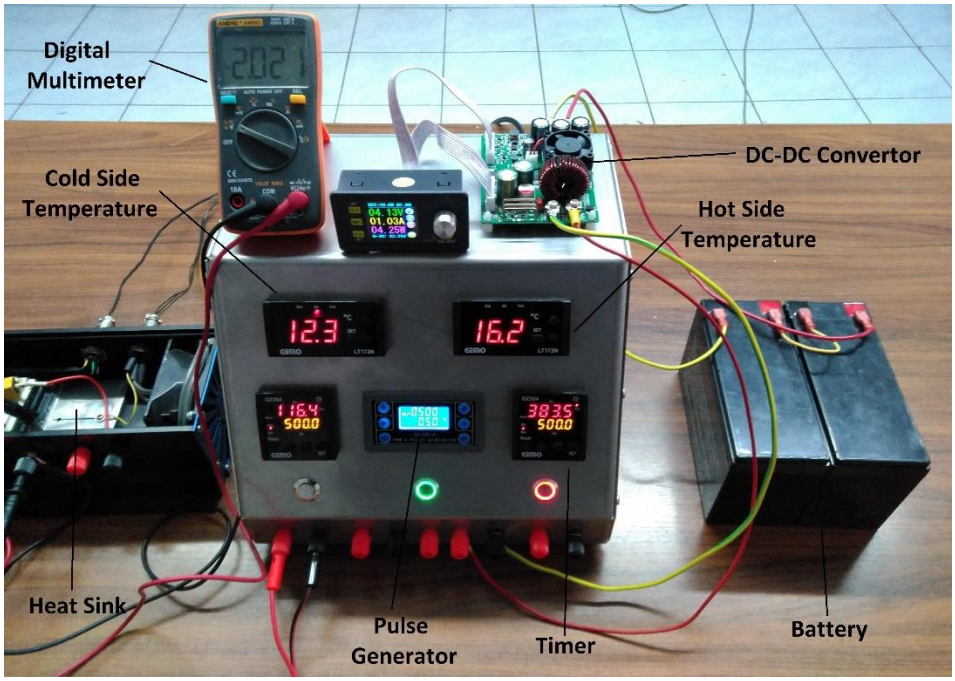

Fig. 3. View of measurement system.

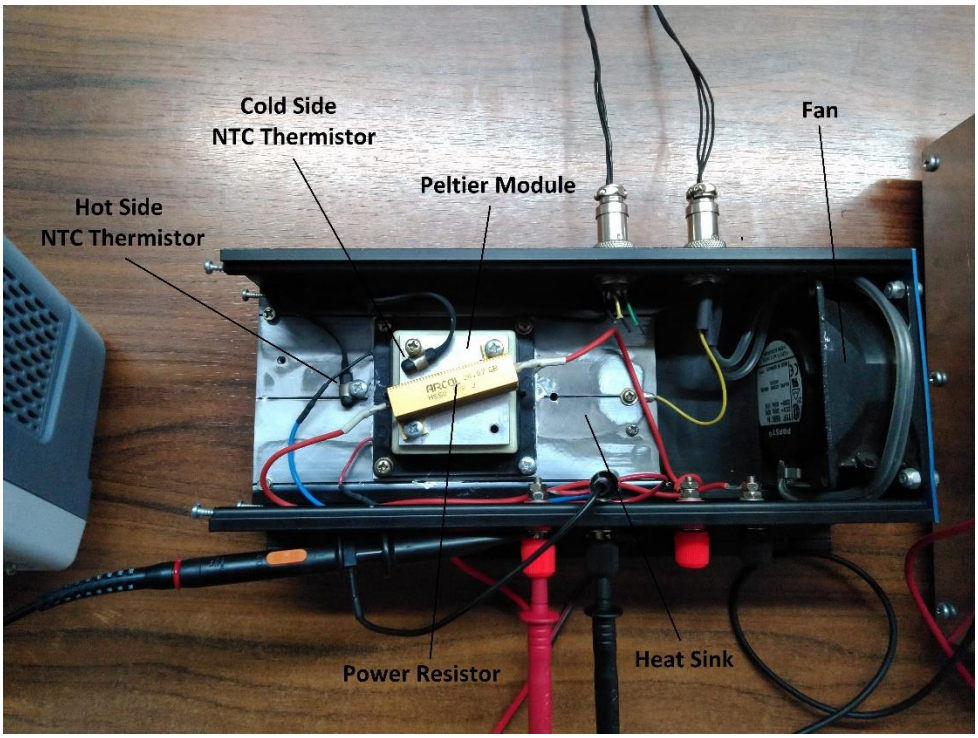

Fig. 4. Peltier device system.

RESULTS AND DISCUSSIONS

When the Peltier module is operated, it is heated up itself due to current passing through it and then its resistance changes. The voltage across the module varies with temperature, because, the current passing through the module keeps constant continuously. The voltage across the module was measured by a DC-DC convertor including LCD display and also it checked with oscilloscope, type UNI-T UTD2102CEX. Fig. 5 shows the variation of module resistance with the temperature difference between the cold and hot sides of the TEC module under constant 1 A dc current and in 500 seconds test time. The resistance of the

module slightly increases with the temperature difference up to about 1 °C, whereas it keeps almost constant at higher temperature difference values above 1 °C. The maximum change was about 0.59 ohm with the temperature difference 8.2°C. The aim of the research is to compare the performance of the module with applying DC current and square wave current. The dc current value was chosen from the peak value of the square waveform. Thus, the driving of the module was realised using the same system and conditions during the tests and both methods can be comparable in the same condition. The measurements were carried out using dc driving current values with 0.5, 1, 2, 3, 4 and 5 A and the obtained results were summarised in Table 2. The temperature difference (ΔT) increases with increasing dc current and voltage of the module, whereas the COP value decreases. The COP value was dramatically reduced after 1 A dc current.

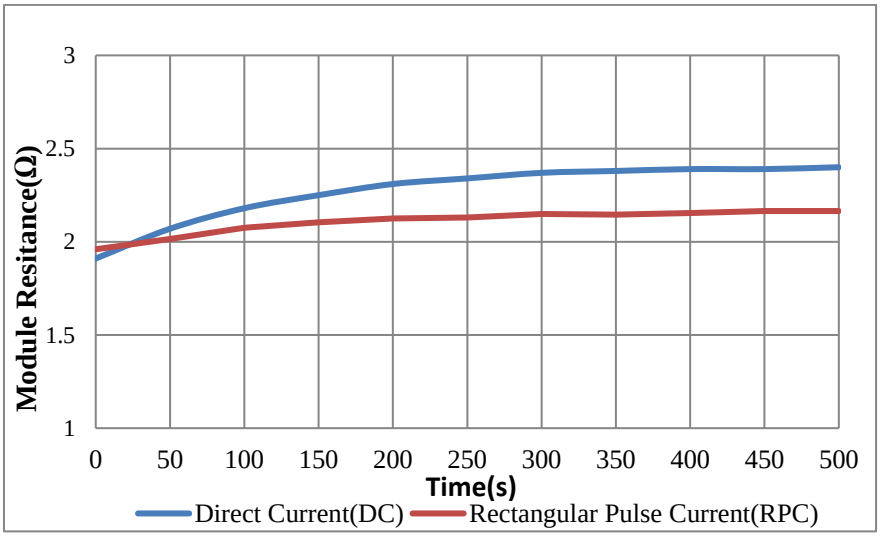

Fig. 5. Variation of module resistance with the temperature difference ΔT under constant 1 A dc current and in 500 seconds test time.

Table. 2. Measurement results at varied dc driving current values in 500 s test time.

Direct Current(DC)										
Current (A)	Cold Side Temperature (°C)	Hot Side Temperature (°C)	Ambient Temperature (°C)	ΔT (T_h-T_c) (°C)	ΔT (T_a-T_c) (°C)	$V_{(forward)}$ (V)	$V_{(average)}$ (V)	R(Ω)	COP	Test Time (s)
0.5	14.6	18.5	17.8	3.9	3.2	1.26	1.17	2.52	1.91	500
1.0	10.0	18.2	17.3	8.2	7.3	2.40	2.24	2.40	1.13	500
2.0	6.4	19.8	17.6	13.4	11.2	4.66	4.37	2.33	0.45	500
3.0	3.2	22.3	17.6	19.1	14.4	6.84	6.50	2.28	0.26	500
4.0	0.3	25.0	17.6	24.7	17.3	9.19	8.72	2.30	0.17	500
5.0	-0.9	27.9	17.6	28.8	18.5	11.50	10.95	2.30	0.12	500

The Peltier module was also derived by the square wave (50% duty cycle) with frequency values at 50, 100, 200, 300, 400, 500 and 1000 Hz. The operating frequency was determined by comparing the COP values among experimental data. Although they are very close to each other as shown in Table 3. The thermoelectric module has the best COP value at 500 Hz for the square wave driving current.
Electromagnetic interference is a critical issue during experiments due to the high frequency current pulses at Peltier modules. An appropriate shielding and smart control techniques are the tools for the employment of higher switching frequencies above 10 kHz [6]. Therefore, the electromagnetic interference issues, which emerged during experimental process, have raised considerable limitations on the PWM applicability. However, the electromagnetic interference can be ignored in the RPC applicability due to its low switching frequency. Moreover, the system does not require extra electronic circuit protection such as shielding, filtering, wire length and appropriate location of them.

When the COP value in the PWM driving method was compared with the COP value in the dc constant driving method has almost double shows that the RPC improves the cooling efficiency by reducing the input power due to the duty cycle in Peltier device.

The experimental data using the RPC method with 50% duty cycle during 500s test time were summarised in Table 4. It is clear that the COP was improved by the RPC driving method. Improvement of COP was maximum at 0.5A with 19%, whereas low than 1A RPC driving method more efficiency as compared to the dc driving current method. Fig. 6 shows variation of COP with dc and pulse driving method and improvement % between them. The COP values at low driving current were found to be higher than the COP values at high driving current due the input power and the Joule heating. Variation of COP with driving current is not linear; it seems an exponential change exists, since the thermoelectric semiconductors has non-liner property.

Table 4. . Measurement results at square wave driving current with 50% duty cycle in 500 s test time.

CONCLUSIONS

The present research highlights the improvement efficiency of TEC module using the RPC driving method. The RPC and DC driving methods can be applied to the module using the system at the same condition. Therefore the results easily are comparable to each other. Although, the COP was improved using the DC current and the PWM methods. There are some disadvantages for them such as reducing the lasting time and considerable limitations due to high switching frequencies. The RPC driving method was developed by optimising the input power due to duty cycle of square wave and increased the cooling efficiency up to 19% as compared to the DC current driving method. Moreover, the driving system does not require an extra electronic circuitry for the electromagnetic interference due to its operating frequency. One of the significant contribution to the module resistance is to keep almost constant at higher ΔT values above 1°C. High COP value obtained by the RPC method indicates that there can be made a significant contribution to the cooling challenges and cooling technology in the field of semiconductor applications and technology. The RPC driving method can be useful for cooling and temperature stability of electronic devices by means of Peltier module.

ACKNOWLEDGEMENT

This research is a part of the Physics Ph.D. thesis of Ilhan Kahraman. The authors would like to thank Gempa Electro Mechanic and Engineering Co. for financial support and Kahramansan Technology for financial and technical support of this research.

CONFLICT OF INTEREST

The authors declare that they have no conflict of interest.

Özet

Tekstil endüstrisinde boyama işleminde yaygın olarak kullanılan azo boyarmaddelerin dirençli ve biyolojik olarak zor parçalanabilen yapıda olması nedeniyle bu atıksuların arıtılmasında sülfat radikali oluşumuna dayalı ileri oksidasyon prosesleri gibi etkin arıtım yöntemlerinin uygulanması gerekmektedir. Peroksidisülfat UV, ısı ve geçiş metalleri ile aktive edildiğinde sülfat radikali oluşmaktadır. Bu çalışmada peroksidisülfat/ısı sisteminde Reactive Black 5 (RB5) boyarmaddesinin renk giderimine peroksidisülfat derişimi, aktivasyon sıcaklığı ve RB5 başlangıç derişimi gibi parametrelerin etkileri incelenmiştir. 55 °C aktivasyon sıcaklığında peroksidisülfat derişimi 1 mM'dan 3 mM'a yükseldiğinde renk giderimi %58'den %95'e artmıştır. Aktivasyon sıcaklığının artmasıyla renk giderimi önemli ölçüde artmış ve 40-55 °C sıcaklık aralığında RB5 boyarmaddesinin renk giderimi için aktivasyon enerjisi 190 kJ mol^{-1} olarak belirlenmiştir. Benzetim atıksuyu ile yapılan çalışmada 120 dakika sonunda %55 renk giderimi elde edilmiştir.

Anahtar Kelimeler: Reactive Black 5, peroksidisülfat, ısı aktivasyonu

Investigation of Removal of Reactive Black 5 Azo Dye in Peroxydisulfate/Heat System

Abstract

Since azo dyes used widely in dyeing process of textile industry are resistant and non-biodegradable, effective treatment methods such as advanced oxidation processes based on sulfate radical formation should be applied in the treatment of textile wastewaters. Sulfate radical is formed when peroxydisulfate is activated by UV, heat and transition metals. In this study, the effects of parameters such as peroxydisulfate concentration, activation temperature, and initial RB5 concentration on decolorization of Reactive Black 5(RB5) were investigated in peroxydisulfate/heat system. Decolorization increased from 58% to 95% when the peroxydisulfate concentration increased from 1 mM to 3 mM at an activation temperature of 55 °C. As activation temperature increased considerable increase in decolorization of RB5 was observed and the activation energy for decolorization of RB5 was determined as 190 kJ mol^{-1} in the temperature range of 40-55 °C. 55% decolorization was obtained after 120 minutes with simulated dye bath effluent.

Keywords: Reactive Black 5, peroxydisulfate, heat activation

GİRİŞ

Yapılarında azo grubu (-N=N-) içeren boyarmaddeler tekstil endüstrisinde pamuklu malzemeleri boyama işleminde yaygın olarak kullanılmaktadır. Bu boyarmaddeler dirençli ve biyolojik olarak giderilemeyen bileşiklerdir. Tekstil endüstrisinde fazla miktarda su tüketilmesinden ve kullanılan boyarmaddelerden dolayı çıkan atıksu fazla miktarda ve renkli olmaktadır. Ayrıca boyama işleminde azo boyarmaddelerin kullanımından dolayı BOD/COD oranı 0.4'den küçüktür. Bu oranın 0.4'den küçük olması bu atıksuların biyolojik olarak gideriminin zor olduğunu göstermektedir (Bilin´ska ve ark., 2016). Tekstil endüstrisi atıksularının arıtılmadan su ortamlarına verilmesinin çevreyi olumsuz yönde etkileyecek birçok etkileri olmaktadır. Örneğin renkli tekstil atıksuları su ortamlarına verildiğinde, güneş ışığı su ortamlarına geçememekte ve fotosentez oluşumu engellenmektedir (Hoang ve ark., 2022; Verma ve Dash, 2012). Bu nedenle özellikle biyolojik olarak giderilemeyen endüstriyel atıksuların arıtımına yönelik son yıllarda sülfat radikali ($SO_4^{\cdot-}$) oluşumuna dayalı ileri oksidasyon proseslerinin kullanımı araştırılmaya başlanmıştır (Giannakis ve ark., 2021; Hoang ve ark., 2022; Yang ve ark., 2019). Bu proseslerde sülfat radikali peroksidisülfat (PS, $S_2O_8^{2-}$) ve peroksimonosülfat (PMS, HSO_5^-) gibi oksidantların UV, ısı ya da geçiş

metalleri ile aktive edilmesiyle oluşmaktadır (Wang ve Wang, 2018). Peroksidisülfat 2.1 V oksidasyon potansiyeline sahip güçlü bir oksidant olmasına karşın oda sıcaklığında kirleticileri giderme hızı yavaş olduğundan aktivasyon işleminin uygulanması gerekmektedir (Ike ve ark., 2018). Uygulanan aktivasyon işlemiyle peroksidisülfatın yapısında bulunan peroksit bağı (-O-O-) kopmakta ve sülfat radikali oluşmaktadır. Peroksidisülfatın ısı aktivasyonu ile sülfat radikali oluşumu Eşitlik 1'de verilmiştir.

$$S_2O_8^{2-} + \text{ısı} \longrightarrow 2SO_4^{\cdot-} \quad (1)$$

Oluşan sülfat radikali yüksek oksidasyon potansiyeline sahip güçlü bir oksidant olup organik kirleticilerden elektron transfer ederek organik katyon radikali oluşturmaktadır. Elektron transferi mekanizması ile organik kirleticiler ya daha az toksik bileşiklere parçalamakta ya da mineralize olarak CO_2 ve H_2O'ya dönüşmektedir (Gao ve ark., 2012).

Bu çalışmada peroksidisülfat oksidantı ısı ile aktive edilerek Reactive Black 5 (RB5) azo boyarmaddesinin giderimi incelenmiştir.

MATERYAL VE METOD

Belirlenen derişimde hazırlanan RB5 boyarmadde (DyStar) çözeltisi kuvarz camdan yapılmış reaktöre boşaltılarak manyetik karıştırıcı (Isolab) ile karıştırılır ve reaksiyon ortamının sıcaklığı sirkülasyonlu su banyosu (Nüve) kullanılarak istenilen sıcaklığa getirilir. Çözeltinin pH'ı 0.1 M HCl (Merck, %37) çözeltisi ile 5'e ayarlandıktan sonra, $Na_2S_2O_8$ (Sigma –Aldrich) eklenerek deney başlatılır. Deney süresinde belirlenen sürelerde reaksiyon ortamından örnekler alınarak RB5 boyarmaddesinin 597 nm'de maksimum absorbans değeri UV-Vis Spektrofotometresi(UV-1800 Shimadzu) ile ölçülmüştür. Kalibrasyon grafiğinden yararlanılarak ölçülen absorbans değerlerine karşılık gelen derişim değerleri hesaplanmış ve 2 numaralı eşitlik kullanılarak % renk giderimi belirlenmiştir (Omaç F, 2021).

$$\%\ \text{Renk Giderimi} = \frac{C_0 - C}{C_0} \text{x} 100 \quad (2)$$

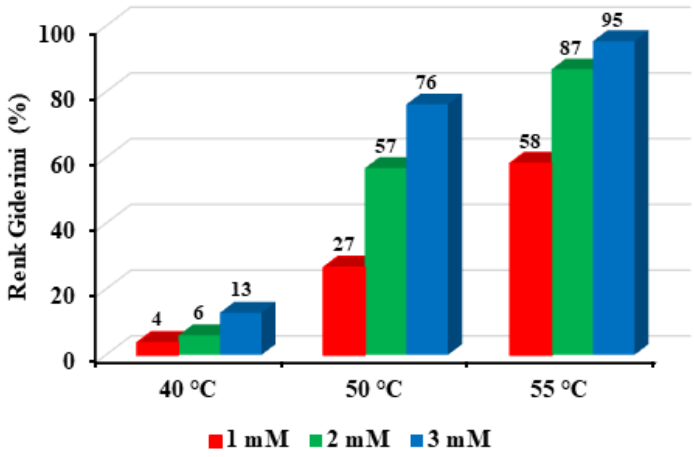
burada C_o and C sırasıyla t=0 ve t=t anındaki RB5 derişimidir.

Deneysel çalışmalarda kullanılan RB5 boyarmaddesi içeren benzetim atıksuyu 20 g/L Na_2CO_3, 1.8 g/L NaOH ve 65 g/L NaCl kullanılarak hazırlanmıştır.

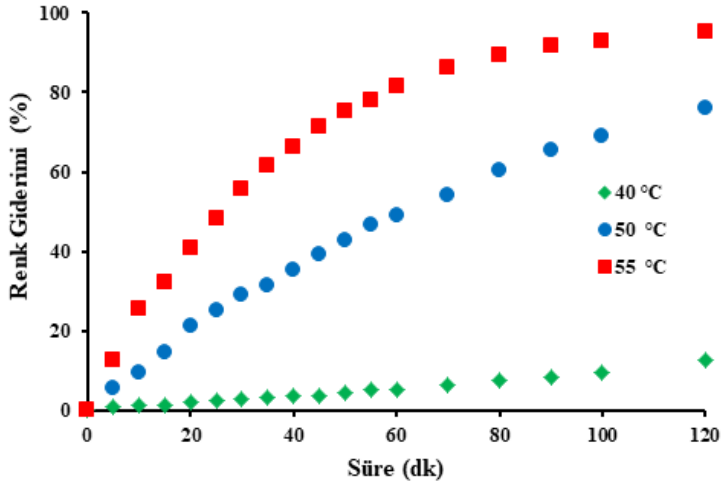
BULGULAR ve TARTIŞMA

Peroksidisülfat derişiminin RB5 boyarmaddesinin renk giderimine etkisini incelemek amacıyla farklı sıcaklıklarda 1-3 mM derişim aralığında deneysel çalışmalar yapılmış ve elde edilen sonuçlar Şekil 1'de verilmiştir. 40°C aktivasyon sıcaklığında peroksidisülfat derişiminin artması ile RB5 boyarmaddesinin renk gideriminde önemli bir artış gözlenmemiştir. Aktivasyon sıcaklığı 50°C olduğunda 1 mM, 2 mM ve 3 mM derişim değerleri için sırasıyla %27, %57 ve %76 giderim elde edilirken aktivasyon sıcaklığının 55°C'ye yükseltilmesiyle her üç derişim değeri için sırasıyla %58, %87 ve %95 giderim değeri elde edilmiştir. Peroksidisülfat miktarı artmasıyla daha fazla sülfat radikali oluştuğundan renk giderimi artmaktadır (Chekem ve ark., 2020). Bu sonuçlardan aktivasyon sıcaklığının da renk giderimi üzerinde önemli bir etkisi olduğu anlaşılmaktadır.

Aktivasyon sıcaklığının RB5 boyarmaddesinin renk giderimine etkisini incelemek amacıyla 3 mM peroksidisülfat derişiminde farklı aktivasyon sıcaklıklarında yapılan deneylerde elde edilen sonuçlar Şekil 2'de verilmiştir. 40, 50 ve 55 °C sıcaklık değerlerinde sırasıyla %13, %76 ve %95 renk giderimi elde edilmiştir. Aktivasyon sıcaklığının artması ile giderim önemli ölçüde artmaktadır. Sülfat radikalinin oluşması için peroksidisülfat oksidantının aktive edilip peroksit bağlarının enerji sağlanarak kopması gerekmektedir. Peroksidisulfat yapısındaki peroksit bağlarının bağlanma enerjisi 140 kJ/mol olup 50°C'den yüksek sıcaklıklarda sağlanan enerji ile bu bağlar kopmaktadır (Zhou ve ark., 2019). Aktivasyon sıcaklığın yükselmesi ile peroksidisülfatın bozunması artmakta ve bunun sonucunda daha fazla sülfat radikali oluşmaktadır (Luo ve ark., 2020; Xu ve ark., 2016).



Şekil 1. Peroksidisülfat miktarının farklı sıcaklıklarda RB5 boyarmaddesinin renk giderimine etkisi (pH=5, [RB5]=30 ppm)



Şekil 2. Aktivasyon sıcaklığının RB5 renk giderimine etkisi (pH=5, [PS]=3 mM, [RB5]=30 ppm)

RB5 boyarmaddesinin renk giderim hızı, yalancı birinci mertebe kinetik modele göre Eşitlik 3'de verildiği gibi yazılabilir (Ghauch ve ark.,2012; Sun ve ark.,2019).

$$r = -\frac{d[RB5]}{dt} = k_{gör}[\text{RB5}] \quad (3)$$

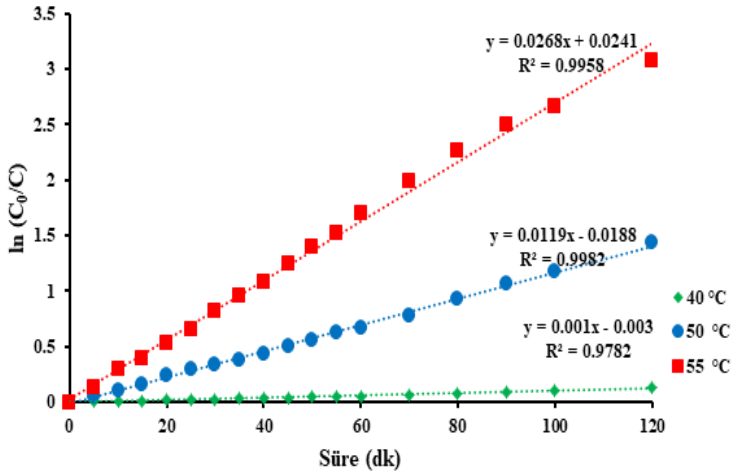
Burada,

r : Renk giderim hızı (mg dm^{-3} dk^{-1})
kgör : Görünür hız sabiti (dk^{-1})
[RB5] : RB5 derişimi (mg dm^{-3})
t : Süre (dk)

3 numaralı eşitliğin integrali alınarak 4 numaralı eşitlik elde edilir.

$$\ln\left(\frac{C_o}{C}\right) = k_{gör}t \quad (4)$$

Her bir aktivasyon sıcaklığı için ln (C_o/C) değerleri t'ye karşı çizildiğinde elde edilen doğrularım eğiminden $k_{gör}$ değerleri bulunur (Şekil 3). 40, 50 ve 55 °C sıcaklık değerleri için $k_{gör}$ değerleri sırasıyla 0.001 dk^{-1}, 0.0119 dk^{-1} ve 0.0268 dk^{-1} olarak belirlenmiştir.



Şekil 3. Farklı aktivasyon sıcaklık değerleri için çizilen ln$[RB5]_O$/[RB5] – t grafiği (pH=5, [PS]=3 mM, [RB5]=30 ppm)

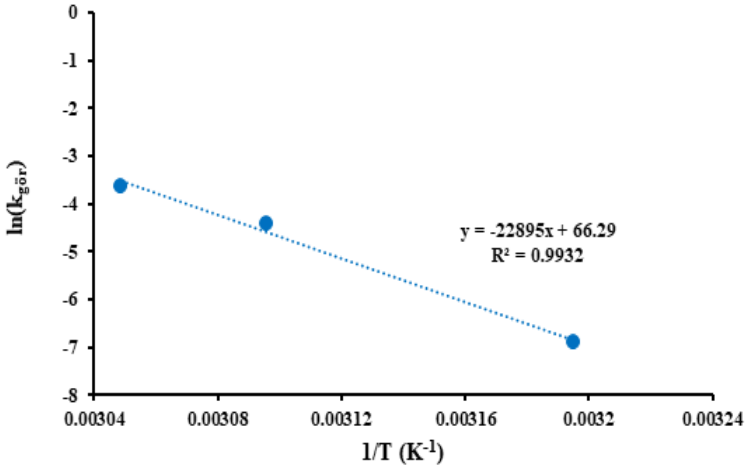
Belirlenen $k_{gör}$ değerleri kullanılarak bu değerlerin sıcaklığa bağlı olarak değişimini veren Arrhenius eşitliğinden (Eşitlik 5) aktivasyon enerjisi hesaplanır (Chekem ve ark., 2020). 1/T değerlerine karşı çizilen $lnk_{gör}$ grafiği doğrusal olup eğimi –Ea/R'ye eşittir (Şekil 4) ve bu eğim değerinden RB5 boyarmaddesinin renk giderimi için aktivasyon enerjisi 190 kJ mol^{-1} olarak hesaplanmıştır.

$$lnk_{gör} = lnA - \frac{E_a}{RT} \quad (5)$$

Burada,

A : Frekans faktörü
E_a : Aktivasyon enerjisi (J mol^{-1})
R : Gaz sabiti (8.314 J mol^{-1} K^{-1})
T : Mutlak sıcaklık (K)

Isı ile aktive edilmiş peroksidisülfat kullanılarak yapılan çalışmalarda belirlenen aktivasyon enerjisi değerleri Tablo 1'de verilmiştir.

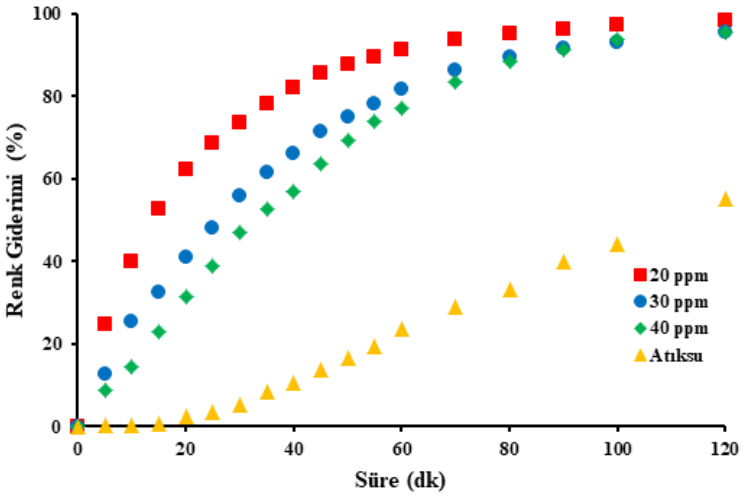


Şekil 4. RB5 boyarmaddesinin renk giderimi için 40-55 °C sıcaklık aralığında çizilen Arrhenius grafiği

Tablo 1. Peroksidisülfat/Isı sisteminde farklı bileşikler için belirlenen aktivasyon enerjisi değerleri

Bileşik	Sıcaklık aralığı (°C)	Aktivasyon enerjisi (kJ mol^{-1})	Kaynak
Ibuprofen	50-70	168	Ghauch ve ark., 2012
Bisfenol A	40-70	184	Olmez-Hanci ve ark., 2013
Atrazin	30-60	141	Ji ve ark., 2015
Reactive Black 5	40-70	141	Andrew ve ark., 2020
Reactive Black 5	40-55	190	Bu çalışma

RB5 boyarmadde başlangıç derişiminin renk giderimine etkisini incelemek amacıyla, 55°C aktivasyon sıcaklığında 20-40 ppm derişim aralığında RB5 boyarmadde çözeltisi kullanılarak deneysel çalışmalar yapılmış ve sonuçlar Şekil 5'de verilmiştir. Boyarmadde derişimi arttıkça çözeltideki peroksidisülfat/boya molekülü oranı azaldığından renk giderimi azalmaktadır (Kordkandi ve Forouzesh, 2014; Peng ve ark., 2021). Düşük boyarmadde derişimlerinde giderim hızı daha yüksek olmakla birlikte 120 dakika sonunda 20, 30 ve 40 ppm derişimleri için sırasıyla %98, %85 ve %96 giderim elde edilmiştir. Benzetim atıksuyu ile yapılan deneyde ise 120 dakika sonunda %55 renk giderimine ulaşılmıştır. Benzetim atıksuyu NaCI ve $NaCO_3$ gibi kimyasal maddeler içerdiğinden giderim düşük olmaktadır.



Şekil 2. RB5 renk giderimine boyarmadde başlangıç derişiminin etkisi
(pH=5, [PS]=3 mM, T= 55 °C)

SONUÇ

Bu çalışmada RB5 azo boyarmaddesinin peroksidisülfat/ısı sisteminde renk giderimi incelenmiştir. Peroksidisülfat derişimi ve aktivasyon sıcaklığı arttıkca RB5 boyarmaddesinin renk gideriminin arttığı gözlenmiştir. 40-55 °C sıcaklık aralığında renk giderimi için aktivasyon enerjisi 190 kJ mol^{-1} olarak hesaplanmıştır. Benzetim atıksuyu ile yapılan çalışmada 120 dakika sonunda %55 renk giderimi elde edilmiştir.

TEŞEKKÜR

Bu çalışma İnönü Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından FYL-2019-1600 nolu proje kapsamında desteklenmiştir.

Özet

Bu makalede, sıradan içten yanmalı bir motora sahip skuterin verimliliğini arttırmak için skutere entegre edilebilen bir hibrit güç grubu tasarımı yapılmıştır. Tasarlanan hibrit güç grubu ile aynı çıkış mili üzerinden iki farklı motorun da hareket verebilmesine olanak sağlanmıştır. Ayrıca bu tasarımda gerekli olan gücü sağlamak için 48V 800 Watt gücünde sabit mıknatıslı doğru akım elektrik motoruna (PMDC) ihtiyaç olduğu tespit edilmiştir. Elektrik motoru (EM) ile skuterin dahili içten yanmalı motorunun (İYM) tasarımında paralel hibrit sistemi kullanılmıştır. Bu sayede skuterin ana yapısında köklü bir değişiklik yapılmadan tasarım gerçekleştirilmiştir. Aynı zamanda İYM düşük tork devirlerinde kullanım dışı kalması ile birlikte yakıt ekonomisi ve CO_2 emisyonlarında önemli oranda iyileştirmeler sağlanmıştır.

Hybrid powertrain design for a scooter with an internal combustion engine

Abstract

In this article, a hybrid powertrain design has been made that can be integrated into the scooter which is designed to increase the efficiency of the scooter with an ordinary internal combustion engine. With the designed hybrid power group, it has been possible to move two different engines over the same output shaft. In addition, it has been determined that a 48V 800 Watt permanent magnet direct current electric motor (PMDC) is needed to provide the required power in this design. A parallel hybrid system was used in the design of the electric motor (EM) and the internal combustion engine (ICE) of the scooter. In this way, the design was carried out without making any radical changes in the main structure of the scooter. At the same time, significant improvements were achieved in fuel economy and CO_2 emissions, with the ICE being out of use at low torque speeds.

Keywords: Hybrid, electric, scooter, power, transmission, CO_2

GİRİŞ

İki tekerlekli taşıtlar, kullanım kolaylığı, sınırlı park alanı, kısa mesafe yolculukları ve uygun bakım maliyetleri nedeniyle özellikle nüfusu kalabalık merkezlerde kullanılmaktadır (Sheu & Hsu, 2006; TSENG, 2014). Bu özelliklerinden dolayı kargo taşıma şirketleri ve bireysel gıda ulaştırma şirketleri skuterleri yoğun bir şekilde kullanmaya başlamışlardır. Çevrimiçi hazır yemek dağıtım şirketlerinin sağladığı olanak kullanıcılara cazip gelmekte ve bu durum şirketleri her geçen gün daha fazla büyütmektedir. Gün geçtikçe daha fazla tüketici yemek hazırlamak için zaman ayırmak yerine çevrimiçi yemek satın almayı tercih etmektedir(Alvarez-Palau, 2021).

Dünya çapında çevrimiçi yemek dağıtım pazarının büyüklüğünün 2020'de 136.431 milyon ABD dolarına ulaşacağı tahmin ediliyor (statista, 2019). Birleşik Krallık yiyecek dağıtım pazarının 2019'da 850 milyon siparişten 8,4 milyar sterlinlik toplam satış elde ettiği ve bir önceki yıla göre %18'lik satış artışı sağladığı tahmin ediliyor (MCA, 2019). Teslimat hizmetleri, en düşük maliyetle hızlı bir teslimat yanıtı verebilmek

için gıda hazırlama noktasından teslimat noktasına kadar olan mesafenin yaklaşık 5 km den az olduğu kentsel alanlarda sunulmaktadır (Allen ve ark., 2021). Yemek teslim edilen mesafeler bisiklet, Skuter, motosiklet, araba gibi birçok seçenekle kat edilebilir. Çevrimiçi yemek ulaştırma şirketleri müşteriyi, teslimatı hızlı bir şekilde ulaştırarak memnun edebilmektedir (Mao 2019).

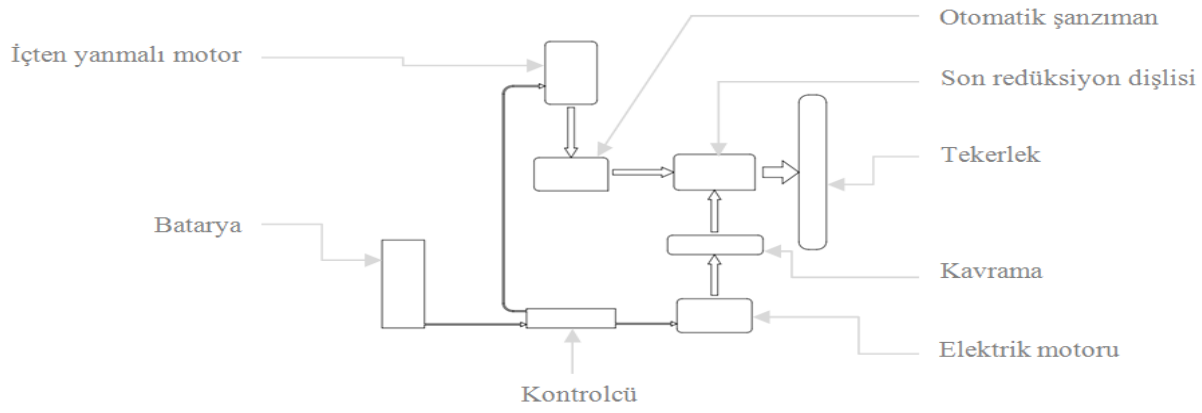
Çevrimiçi alışveriş ve özellikle süreli hazır yemek siparişlerinin artması siparişi tüketiciye ulaştırma seçeneklerinde değişikliklere neden olmaktadır. Özellikle yoğun nüfusun yaşadığı şehir merkezlerinde iki tekerlekli araçların, ulaşım zamanı, maliyet ve park edilebilme özelliklerinden dolayı tercih sebebi olmaları sayılarının hızla artmasına neden olmuştur. Bu özellikler, bireysel kullanıcıları dört tekerlekli taşıtlarla yapılacak ulaşım çözümünün mümkün olmadığında, toplu taşımaya yönelen kullanıcıları, tekrar tek başlarına bir İYM'li skuter ile trafiğe dahil olabilmesine sebep olmaktadır. Ancak küçük İYM'li skuterlerin emisyonları binek araçlardan daha fazladır (Krithika ve Subramani, 2020). İYM'li skuterların kullanımının artması CO_2 salınımını da aynı oranda arttırmaktadır. Ayrıca skuterler birçok şehir merkezinde baskın hava kirliliğinin kaynaklarından birisidir (Stephens, 2020). 2020'deki en büyük CO_2 emisyonu kaynağı insanları ve malları taşımak için benzin ve dizel gibi fosil yakıtların yakılmasıdır. ABD'deki toplam CO2 emisyonlarının yaklaşık %33'ü taşıt kaynaklıdır (epa.gov, 2020).

İYM'li skuterlerin neden olduğu bu sorunu çözmek için en iyi alternatif elektrikli skuterlar olabilir. Ancak bu skuterlerin kısa kullanım menzili, görev esnasında arada şarj edilecek bir yer bulunamaması, uzun şarj süresi ve ilk alım maliyetleri gibi olumsuzluklarından dolayı hala İYM'li skuterlar tercih edilmektedir. Elektrikli scooterlerın, benzinli skuterlerin yerini alamamasının nedenleri olarak bu dezavantajlar gösterilebilir (TSENG, 2014). Bu dezavantajları ortadan kaldırmak için hibrit tasarım en iyi alternatif olacaktır (Sheu & Hsu, 2006). Hibrit sistem ile hem daha iyi bir performans hem de çevreye salınan CO_2 miktarının azaltılabilmesi sağlanacaktır. Elektrik motorunun ve benzinli motorun bir arada senkronize olarak kullanılabildiği daha az CO_2 salınımı yapan ve iyileştirilmiş bir yakıt ekonomisine sahip olan aynı zamanda şarj problemlerini de minimize edebilen hibrit elektrikli araçlar günümüz ve yakın gelecek için en iyi çözüm olarak gözükmektedirler (Tong ve Jwo, 2007).

Bu makalede skuterin verimliliğinin arttırabilmesi ve mevcut olan güç grubuna EM dahil edilip tek bir yapı gibi çalışabilmesini sağlamak için gerekli hesaplamalar yapılmıştır. Tasarımda skuterin mevcut fabrika verileri analiz edilip, ilave donanımlar bu verilere eklendikten sonra gerekli yol yük kuvvetleri hesaplanmıştır. Tasarım bulunan kuvvetlere göre gerçekleştirilmiştir.

1. HİBRİT GÜÇ AKTARMA SİSTEMİ TASARIMI

Hibrit araçlar kullandıkları farklı iki motorun yerleştirilmesi ve birbirlerine veya çıkış miline bağlanmalarına göre seri hibrit, paralel hibrit veya seri-paralel hibrit olmak üzere çeşitli tiplere ayrılmışlardır. Bu tasarımda, skuterin mevcut güç grubunun yapısı bozulmadan ilave parçalar eklenerek paralel hibrit mimarisine benzer bir tasarım gerçekleştirilmek amaçlanmaktadır. Bu tercihin diğer bir sebebi ise maliyet açısından daha uygun olmasıdır. Tasarlanan Skuter paralel hibrit mimarisi Şekil 1'de, tasarımın yapılacağı skuterin özellkileri ise Tablo 1'de verilmiştir.



Şekil 1. Tasarlanan paralel hibrit elektrikli skuter güç grubunun şematik diyagram

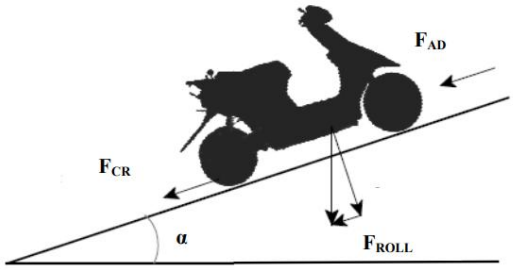
Tablo 1. Skuterin teknik özellikleri

Motor Tipi	Hava soğutmalı, 4 zamanlı
Motor Gücü	5,7 Kw (7,6 PS) / 7000 d/d
Motor Torku	8,4 Nm / 5750 d/d
Ağırlık	105 Kg
Yakıt Kapasitesi	6.5 lt
İlk Redüksiyon	V-Matic (2,52:1-0,82:1)
Son Redüksiyon	9,423
yük (maks)	176 Kg
Arka tekerlek çapı	400mm

Tasarlanan güç grubunda İYM ve mevcut güç grubu, sistemin temel yapısını oluşturmaktadır. Hibrit sistem için ayrıca bir elektrik motoru (EM), bir kavrama ve zincir-dişli mekanizması eklenmiştir. İYM Arka tekerleklere kauçuk V kayışı kullanan, sürekli değişken oranlı bir şanzıman (CVT) ile bağlanmıştır. CVT şanzımanda Tork-hız dönüşümü kademesiz olarak yapılabilmektedir. Sisteme bağlanan EM, zincir dişli mekanizması ile kavramaya bağlanmıştır. Kavrama ise hareketi son redüksiyon dişlisine ileterek, tekerleklere tahrik vermektedir. Böylece her iki motor da tekerleği tahrik edebilmektedir.

1.1 Taşıt Dinamik Kuvvetlerin Hesaplanması

Tasarlanacak güç grubunun dahil olacağı hibrit skuteri kabul edilen bazı değerleri karşılayacak şekilde hareket ettirmesi gerekmektedir. Skuterin sadece EM ile eğimsiz yolda 20 km/h hıza ulaşması istenmektedir. %10 meyil ile ise 10 km/h hızın altına düşmemelidir. Ayrıca 20 km/ h hıza meyilsiz yolda yaklaşık 20 saniyede ulaşabilmelidir. Rüzgar hızı sıfır kabul edilmiştir. $C_r = 0{,}0015$, $C_x = 0{,}65$, $A = 1{,}5m^2$, $K_m = 1{,}08$ alınmıştır. Şekil 2'de kuvvetlerin taşıta etki etme yerleri ve yönleri gösterilmektedir (Yap, 2005).



Şekil 2. kuvvetlerin taşıta etki etme yerleri ve yönleri

Gerekli olan kuvvetler aşağıdaki denklemlerden hesaplanabilir. Toplam çekme kuvveti (F_{TR})

$$F_{TR} = F_{ROOL} + F_{AD} + F_{CR} + F_a \quad (1)$$

Burada F_{ROOL}, aracın lastik ve yol arasındaki direnci aşması için gerekli olan lastik yuvarlanma direnç kuvveti eşitlik (2) ile gösterilmektedir. Hava sürtünmesinden kaynaklı aerodinamik direnç kuvveti eşitlik (3) ile gösterilmektedir. Yokuş direnç kuvveti eşitlik (4) ile gösterilmektedir. İvme direnç kuvveti eşitlik (5) ile gösterilmektedir(Çetinkaya, 2010; Yap, 2005).

$$Yuvarlanma\ Direnç\ Kuvveti = F_{ROOL} = m \cdot \varrho \cdot C_R \cdot Cos\alpha \quad (2)$$

$$Aerodinamik\ Direnç\ Kuvveti = F_{AD} = {}^{1}/_{2} \cdot \rho \cdot C_X \cdot A \cdot (v \pm v_o)^2 \quad (3)$$

$$Yokuş\ direnç\ kuvveti = F_{CR} = m \cdot \varrho \cdot Sin\alpha \quad (4)$$

$$İvme\ Direnç\ Kuvveti = F_a = K_m \cdot m \cdot a \quad (5)$$

Tablo 2'de skuterin sürücüsü ile beraber toplam kütlesi gösterilmektedir. Güç aktarma sistemi tasarımı için uygun güçte ve devirde bir EM belirlemek gerekmektedir. EM'in gücünün hesaplanabilmesi tablo 2'deki 235kg'lık kütle alınmıştır.

m	=	Kütle [kg],
ϱ	=	Yerçekimi ivmesi $[m/s^2]$,
C_R	=	Yuvarlanma direnç katsayısı [boyutsuz],
α	=	Taşıtın bulunduğu zeminin yatayla yaptığı açı [derece],
ρ	=	Havanın yoğunluğu $[kg/m^3]$,
C_X	=	Aerodinamik sürtünme katsayısı [boyutsuz],
A	=	Taşıtın ön alanı $[m^2]$,
v	=	Taşıt hızı $[m/s]$,
v_o	=	Rüzgar hızı $[m/s]$,
K_m	=	Tekerleklerin dönme eylemsizliğinden gelen katsayı [boyutsuz],
a	=	Taşıt ivmesi $[m\ /\ s^2]$

Tablo 2. skuterin sürücüsü ile beraber toplam kütlesi

S.No	Nesne	Kütle	Birim
1	Skuter	105	Kg
2	Sürücü	80	Kg
3	Koruyucu Ekipman	20	Kg
4	Batarya Kontrolcü ve Kablolama	20	Kg
5	Elektrik Motoru	7	Kg
6	İlave Güç Grubu Parçaları	3	Kg
	TOPLAM	235	Kg

Değerler eşitlikte yerlerine konularak skuterin istenen değerlerde hareket edebilmesi için gerekli olan minimum kuvvet hesaplanabilir. Bulunan sonuçlar toplam yol kuvvetini vermektedir. (F_{TR}) Eşitlikteki v_X, taşıt hızını belirtmektedir.

$$F_{TR} = F_{ROOL} + F_{AD} + F_{CR} + F_a \quad (6)$$

$$F_{TR} = 3{,}406N + 68N + 229{,}38N + 38{,}07N = 385N \quad (7)$$

$$P_{LOAD} = F_{TR} \cdot v_X \quad (8)$$

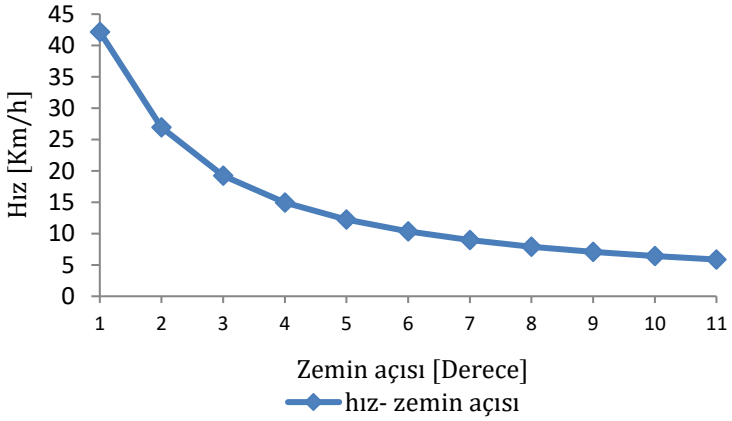
$$P_{LOAD} = 338\ N \cdot 20\ km/h \cdot (1000/3600) \quad (9)$$

$$P_{LOAD} = 1882\ Watt \quad (10)$$

Bulunan kuvvet değerinde düzeltme yapılması gerekmektedir. F_{TR} kuvveti skutera etkiyen bütün kuvvet çeşitlerinin maksimum değerleri alınarak hesaplanmıştır. Ayrıca maksimum hızında maksimum meyil çıkması gerekmemektedir. Sekil 3'te 750 Watt gücünde olan bir elektrik motorunun bağlı bulunduğu güç grubu ile skuteri ulaştırabileceği hız miktarı %10 meyile karşılık gelen yaklaşık 5 derecelik açıya gore gösterilmiştir. %10 meyil istenen değerdir. Skuteri, maksimum kuvvet ihtiyacının olacağı bu eğim bölgesinde yaklaşık olarak 11km/h hız ile yokuş çıkabilmektedir. Dolayısı ile daha düşük güçlü bir EM belirlenen değerlerde skuteri hareket ettirebilmektedir. Bu durum için verilecek taviz sadece yokuş çıkma kabiliyeti esnasında skuterin hızının biraz daha düşmesidir. Kullanılan tüm araçlarda böyle gerçekçi bir durumla az yada çok karşılaşmak mümkün olmaktadır. Böylece daha ekonomik bir EM kullanarak güç aktarma sisteminin yapısı kurulabilir. Daha optimum bir motor, kapasitesi daha düşük batarya kullanımına da izin vermektedir. 750 Watt gücündeki motorun skutere uygulayabileceği kuvvet eşitlik 11'de hesaplanmıştır.

$$F_{TR} = 750\,Watt/[20\,km/h\,\cdot(1000/3600)] = 135\,N \qquad (11)$$

Denklem 11'de bulunan değer ile skuter belirlenen koşullarda yakuş kuvvveti hariç diğer bütün kuvvetleri yenebilecek durumdadır. Yokuş kuvveti arttığında, EM'in ivme kuvvetini karşılama miktarı düşecektir. Bu durumda yokuş çıkarken skuterin ivmelenmesini azaltacaktır.



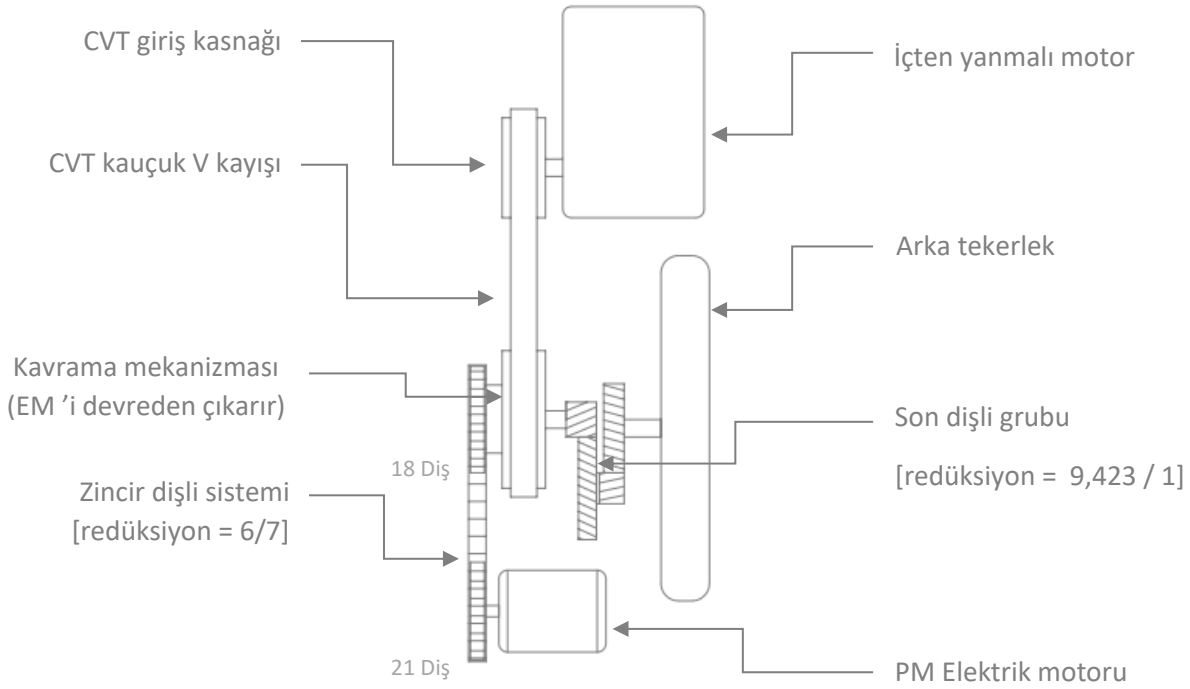
Sekil 3. Skuter hızının eğime gore değişimi "750 Watt gücündeki motor için"

1.2 Hibrit Güç Aktarma Sisteminin Tasarlanması

Yukarıda hesaplanan güç değeri için piyasada kolaylıkla bulunan 800 Watt gücündeki sabit mıknatıslı doğru akım (PMDC) elektrik motoru (EM) seçilmiştir. Bu motora uygun gerekli redüksyon oranları ve güç aktarma şeması şekil 5'te gösterilmiştir. Hesaplamalara göre %5-10 arasında daha güçlü bir motor kullanmak ileride yaşanabilecek olan güç düşümü durumlarını bertaraf edebilir. Şekil 6 'da hibrit güç aktarma sisteminde kullanılan PMDCEM görülmektedir.

Güç	:	800 W
Voltaj	:	48V
Nominal Hız	:	2750 d/dak

Şekil 4. Hibrit güç aktarma sisteminde kullanılan PMDC elektrik motor



Şekil 5. redüksyon oranları ve güç aktarma şeması

Kullanılan EM rotor mili devri maksimum 2750d/dak'ya kadar güç grubuna hareket verebilmektedir. Skuter istenen maksimum hızda hareketine devam ederken EM 2700 d/dak altında ve yakın bir devirde dönmelidir. Şekil 5'te gösterilen son dişli grubu redüksiyon oranı 9,423/1 'dir. EM hibrit güç aktarma grubuna son redüksiyondan önce dahil olmaktadır. Tekerlek çevresi, bir tekerlek turunda alınabilen mesafe, 20 km/h hız için arka tekerleğin yapaması gereken devir gibi yapılan ölçümler ve hesaplamalar sonunda dişli grubu son redüksiyon oranının değiştirlmesi gerekmektedir. EM skuterın kavrama mekanizmasına zincir dişli sistemi ile hareket vermektedir. Zincir dişli sisteminde yapılan redüksiyon düzeltilmesi sonucunda EM-Tekerlek arasındaki son redüksiyon oranı 8,077 olmaktadır. Eşitlikler aşağıda gösterilmiştir.

$$(9,423/1) \cdot (6/7) = 8,077 \tag{12}$$

$$Tekerlek\ çevresi = 2 \cdot \pi \cdot r = 1,25\ m \tag{13}$$

EM kullanımında, skuterin yapabileceği maksimum sürat olan 20 km/h değerine ulaşılabilmesi için skuter arka tekerleğinin dakikada dönmesi gereken devir sayısı aşağıdaki eşitlik yardımı ile bulunmaktadır.

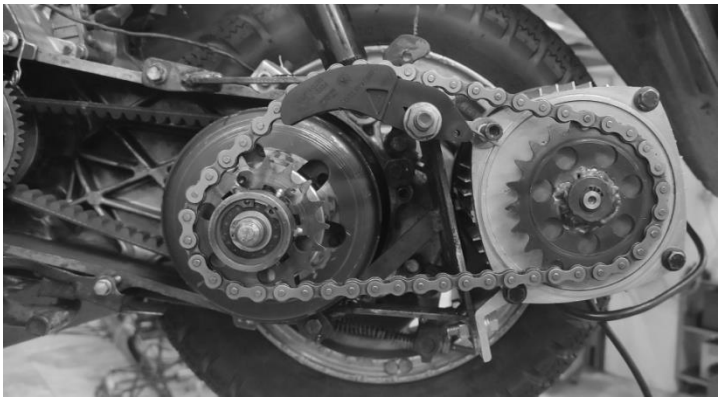
$$20\ km/h \cdot (1000/3600) = 333,3\ m/dak \tag{14}$$

$$333,3\ m/dak\ /\ 1,25m = 266,64\ \ d/dak \tag{15}$$

Eşitlik 13 'deki tekerlek devri için olması gereken EM devri ise aşağıdaki eşitlik yardımı ile bulunmaktadır.

$$266,64\ d/dak \cdot 8,077 = 2153,6\ d/dak \tag{16}$$

Eşitlik 16' da bulunan sonuç EM'in maksimum devrine yakın ve maksimum devrinden küçüktür. Bu durum EM yük altında iken devir sayısındaki azalmadan dolayı skuter hızının belirlenen değer altına düşmemesi için gereklidir. Hibrit güç aktarma sisteminin görünümü Şekil 6'da verilmiştir.



Şekil 6. Tasarlanan hibrit güç aktarma sistemi

SONUÇ

Bu makale içten yanmalı motora sahip bir Skuter için hibrit güç aktarma sistemi tasarımını gerçekleştirmiş ve çalışmanın sonunda bir prototip yapılmıştır. Hibrit güç aktarma sistemi, paralel hibrit mimarisine yakın, ancak özel detaylar dikkate alınarak dizayn edilmiştir. Tasarımda sistemin karşılaması istenen kuvvetlere göre bir EM belirlenerek, EM' in devir aralıklarının güç grubuna uyumu için yeni bir zincir dişli mekanizması kullanılmıştır. Skuter üzerine uygulanan hibrit güç aktarma sistemi sayesinde İYM düşük verimli olduğu bölgelerde çalıştırılmayacak, bu bölgelerde EM devreye girecektir. Yapılan hesaplamalar ile Skuter şehir içi trafiğinde mesafe olarak %25 oranında EM kullanabilmektedir. Bu oran her 100 km'lik yolun 25km'lik mesafesinde EM' in kullanabileceği anlamına gelmektedir.

ABD Çevre Koruma Ajansının (EPA) emisyon miktarı hesaplayıcısının sonuçlarına göre hibrit güç aktarma sistemine sahip olan skuterin salınım yaptığı CO_2 miktarı ile konvansiyonel skuterin salınım yaptığı CO_2 miktarları kıyaslanmıştır. Konvansiyonel skuter 100 km'de ortalama 2 lt yakıt yakmaktadır. Hibrit güç aktarma sistemi dahil edilen Skuter 100 km'lik mesafenin 25 km'sini EM ile katedebilmektedir. Bu durumda skuterin her 100 km'lik hareketinde İYM 25 km'lik mesafe boyunca çalışmamaktadır. Dolayısı ile her 100 km'de 2kg yakıt yerine 1,5 kg yakıt tüketilecektir. Bu durumda skuterin yakıt tüketimi %25 oranında azalmaktadır. Tüketilen 1,5 kg'lık yakıt sonucunda 3,45kg CO_2 salınımı yapılacaktır. Aradaki CO_2 farkı hibrit Skuter sayesinde çevreye bırakılmayacak, böylece daha sürdürülebilir bir ortam yaratılacaktır (epa.gov, 2022).

Bu çalışmanın devamında yapılan hesaplamaların testleri gerçekleştirilecektir. Belirlenen bir güzergahta konvansiyonel Skuter ile hibrit güç aktarma sistemine sahip skuterin aynı şartlar altında yakıt tüketim değerleri ölçülecek ve CO_2 miktarları hesaplanacaktır. Çevreye salınan CO_2 miktarı doğrulanacak, Kullanılan yakıt ile kıyaslanacaktır.

TEŞEKKÜR

Tubitak 2209-A "mikrohibrit motorsiklet güç sistemi projelendirmesi" projesi kapsamında beraber çalıştığımız Batuhan Yüksel KIZILTOPRAK ve Coşkun Anıl ZAMAN'a teşekkür ederiz.

Özet

İleri Oksidasyon Prosesleri (İOP) reaksiyon ortamında yüksek oksidasyon potansiyeline sahip serbest radikallerin oluşturulması temeline dayanır. Bu prosesler radikallere göre hidroksil radikali oluşumuna ve sülfat radikali oluşumuna dayalı ileri oksidasyon prosesleri olarak sınıflandırılmaktadır. Sülfat radikali oluşumu için peroksidisülfat ve peroksimonosülfat gibi oksidantların UV, ısı ve geçiş metalleri ile aktive edilmesi gerekir. Renkli ve çok miktarda atıksu çıkmasından dolayı tekstil endüstrisinin atıksularının arıtılmasında sülfat radikali oluşumuna dayalı İOP'lerinin kullanılması önem kazanmaktadır. Bu çalışmada peroksimonosülfat oksidantı UV ışını ile aktive edilerek Reactive Black 5 (RB5) boyarmaddesinin renk giderimi incelenmiştir. Sadece UV lamba ya da peroksimonosülfat oksidantı kullanıldığında önemli ölçüde renk giderimi elde edilmezken her ikisinin birlikte kullanılması durumunda 120 dakika sonunda %100 giderim elde edilmiştir. Peroksimonosülfat oksidantının aktive edilmesinde UV-C ışınının daha etkili olduğu gözlenmiştir. Peroksimonusülfat/UV sisteminde 10-30 ppm RB5 derişim değeri aralığında için 120 dakika sonunda %100 renk giderimi elde edilirken, 40 ppm değerinde %86 giderim elde edilmiştir. Peroksimonosülfat derişiminin artması ile renk gideriminin arttığı gözlenmiştir. Peroksimonosülfat/UV sisteminde etkin olan radikalin sülfat radikali olduğu belirlenmiştir.

Anahtar Kelimeler:, Peroksimonosülfat, UV aktivasyonu, Reactive Black 5

Investigation of Removal of Reactive Black 5 Azo Dye in Peroxymonosulfate/UV System

Abstract

Advanced Oxidation Processes (AOPs) are based on the formation of free radicals with high oxidation potential in the reaction medium. These processes are classified according to radicals as hydroxyl radical and sulfate radical based advanced oxidation processes. Oxidants such as peroxydisulfate and peroxymonosulfate must be activated by UV, heat and transition metals for the formation of sulfate radicals. The use of sulfate radical based AOPs have become important in the treatment of textile industry wastewater due to the production of colored and large amounts of wastewater. In this study, decolorization of Reactive Black 5 (RB5) was investigated by activating peroxymonosulfate oxidant with UV light. An appreciable removal was not obtained in the presence of UV-C light alone or peroxymonosulfate alone, while 100% removal was achieved after 120 minutes with use both of them together. It was observed that UV-C light was more effective in activating the peroxymonosulfate oxidant. 100% decolorization was achieved after 120 minutes in the RB5 initial concentration range of 10-30 ppm, while 86% decolorization was obtained at 40 ppm in peroxymonosulfate/UV system. As peroxymonosulfate concentration increased, an increase in decolorization was observed. Sulfate radical was determined as an active radical in peroxymonosulfate/UV system.

Keywords: Peroxymonosulfate, UV activation, Reactive Black 5

GİRİŞ

İleri Oksidasyon Prosesleri (İOP) reaksiyon ortamında yüksek oksidasyon potansiyeline sahip serbest radikallerin oluşturulması ile su, hava ya da toprakta bulunan organik kirleticilerin giderimini sağlayan bir arıtım yöntemidir (Deng ve Zhao, 2015; Oturan ve Aaron, 2014). İOP'de başlıca hidroksil (·OH) ve sülfat ($SO_4^{\cdot-}$) radikalleri oluşmaktadır. Hidroksil radikali oluşumuna dayalı İOP, suda bulunan kirleticilerin gideriminde yaygın olarak kullanılmakla beraber son yıllarda sülfat radikali oluşumuna dayalı proseslerin de atıksu arıtımında potansiyel uygulamaları araştırılmaktadır. Bu proseslerde sülfat radikali peroksit bağı içeren (-O-O-) peroksidisulfat (PDS, $S_2O_8^{2-}$) ve peroksimonosülfat (PMS, HSO_5^-) gibi oksidantların aktive

edilmesiyle oluşur (Giannakis ve ark., 2021). En yaygın uygulanan aktivasyon yöntemleri UV, ısı ve geçiş metalleri ile yapılan aktivasyondur. Peroksimonosülfat oksidantı asimetrik yapıda olup uygulanan aktivasyon ile sülfat ve hidroksil radikallerini oluşturmaktadır. Bu oksidantın UV aktivasyonu ile sülfat radikali oluşumu Eşitlik 1'de verilmiştir.

$$HSO_5^- + h\upsilon \longrightarrow SO_4^{\bullet -} + {}^{\bullet}OH \quad (1)$$

Oluşan sülfat radikali pH'a bağlı olarak değişen 2.5–3.1V arasında değişen oksidayon potansiyeli ile hidroksil radikali (1.8–2.7 V) kadar güçlü bir oksidanttır (Ghanbari ve Moradi, 2017). Her iki radikalin organik kirleticileri parçalama mekanizması farklı olup hidroksil radikali C=C bağlarına eklenerek ya da C-H bağından hidrojen ayrılması yoluyla, sülfat radikali ise genellikle organik kirleticilerden elektron uzaklaştırılması yoluyla kirleticileri parçalar (Tan ve ark., 2013). Sülfat radikalinin hidroksil radikaline göre birçok üstünlükleri vardır. Örneğin sülfat radikali organik bileşikleri parçalamada seçici olup yarılanma ömrü hidroksil radikaline göre daha uzundur. Ayrıca hidroksil radikalinin parçalayamadığı perflorokarboksilik asit gibi bileşikleri parçalayabilmektedir (Ji ve ark., 2016). Bu nedenle su kirliliğini önlemek açısından endüstriyel ve tarımsal faaliyetler sonucu suya karışan organik kirleticilerin gideriminde sülfat radikali oluşumuna dayalı İOP'nin kullanılması önem kazanmaktadır.

Boyama işleminde kullanılan boyarmaddelerden ve uygulanan işlemlerde fazla miktarda su tüketilmesinden dolayı tekstil endüstrisi renkli ve fazla miktarda atıksu ortaya çıkaran endüstrilerden biridir. Azo yapısındaki boyarmaddeler kullanıldığında bu atıksuların biyolojik olarak giderimi zor olmaktadır. Bu nedenle tekstil endüstrisi atıksularının arıtılmasında etkin bir arıtım yönteminin uygulanması gerekmektedir. Sülfat radikali oluşumuna dayalı İOP'leri ile özellikle suda bulunan biyolojik olarak giderilemeyen dirençli kirleticilerin uzaklaştırılmasına yönelik çalışmalar yapılmaktadır (Peternel ve ark., 2010; Shu ve ark., 2016; Yang ve ark., 2010). Bu çalışmada peroksimonosülfat/UV sisteminde Reactive Black 5 (RB5) azo boyarmaddesinin renk giderimi incelenmiştir. RB5 başlangıç derişimi ve peroksimonosülfat miktarı gibi parametrelerin renk giderimine etkileri araştırılmıştır.

MATERYAL VE METOD

Materyal

Deneysel çalışmalarda potasyum peroksimonosülfat ($KHSO_5.0.5KHSO_4.0.5K_2SO_4$, Sigma–Aldrich), HCI (Merck, %37), etil alkol (Isolab, %99.9), tersiyer bütil alkol (Merck) ve Reactive Black 5 (DyStar) azo boyarmaddesi kullanılmıştır.

Metod

Belirlenen derişimde hazırlanan 500 mL RB5 boyarmadde çözeltisi kuvars camdan yapılmış 0.7 dm^3 hacmindeki reaktöre boşaltılarak manyetik karıştırıcı (Isolab) ile karıştırılır. Boyarmadde çözeltisinin pH'ı 0.1 M HCl çözeltisi ile istenilen pH değerine ayarlandıktan sonra peroksimonosülfat oksidantı eklenir. 5 dakika karıştırıldıktan sonra lambalar açılarak deney başlatılır. Deneysel çalışmalarda 254 nm dalga boyunda 2 adet 8W UV-C lamba (Osram) ya da 8W 352 nm dalga boyunda UV-A lamba (Eiko) kullanılmıştır. Lambalar kuvars reaktörden 10 cm uzaklığa yerleştirilmiştir. Deneysel çalışmalar boyunca sıcaklık 25°C'de sabit tutulmuştur. Deney süresinde belirlenen sürelerde reaksiyon ortamından örnekler alınarak RB5 boyarmaddesinin 597 nm'de absorbans değerleri UV-Vis Spektrofotometresi (UV-1800 Shimadzu) ile ölçülmüştür. Ölçülen absorbans değerlerinden derişim değerleri hesaplanmış ve Eşitlik 2 kullanılarak % renk giderimi belirlenmiştir (Omaç F, 2021).

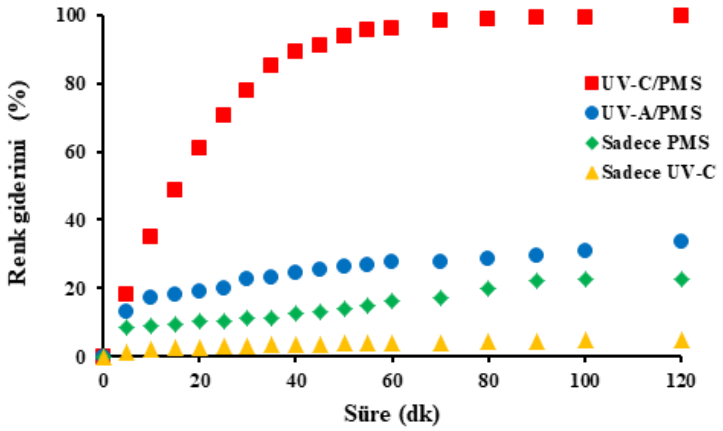
$$\%\ \text{Renk Giderimi} = \frac{C_0 - C}{C_0} \text{x}100 \quad (2)$$

burada C_o and C sırasıyla t=0 ve t=t anındaki RB5 derişimidir.

BULGULAR ve TARTIŞMA

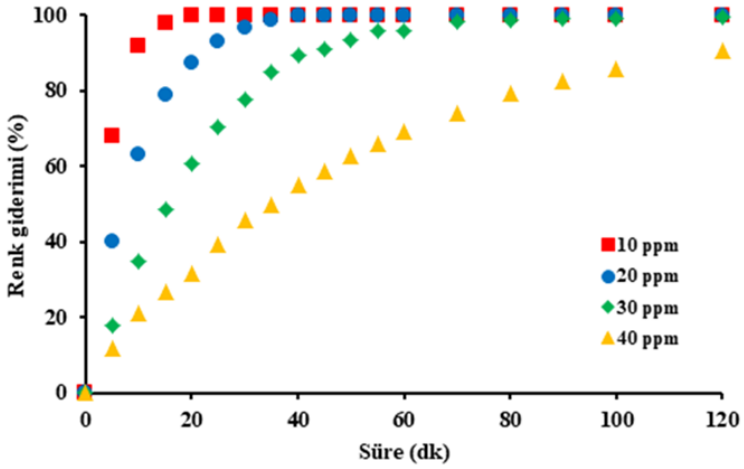
Deneysel çalışmalarda öncelikle farklı koşullarda kontrol deneyleri yapılmıştır. Şekil 1'den görüldüğü gibi, sadece UV lamba ya da peroksimonosülfat oksidantı kullanıldığında 120 dakika sonunda sırasıyla %5 ve %23 giderim elde edilirken peroksimonosülfat oksidantı 254 nm dalga boyuna sahip UV-C lamba ile

birlikte kullanıldığında giderim değeri aynı süre sonunda %100'e çıkmıştır. UV-C lamba yerine 352 nm dalga boyunda UV-A lamba kullanıldığın da ise 120 dakika sonunda %34 giderim elde edilmiştir. peroksimonosülfat oksidantının oksidasyon potansiyeli (1.8 V) sülfat radikaline göre daha düşük olup aktive edilmeden kullanıldığında kirleticileri giderme hızı yavaştır. Sadece UV lamba kullanıldığında fotoliz yoluyla giderim olmaktadır ve RB5 boyarmaddesinin fotoliz ile giderimi düşüktür. peroksimonosülfat oksidantı UV-C lamba ile aktive edildiğinde Eşitlik 1'e göre sülfat ve hidroksil radikallerini oluştuğundan renk gideriminde önemli ölçüde artış gözlenmiştir. UV-C lamba yerine UV-A lamba kullanıldığında daha düşük renk giderimi elde edilmiştir. RB5 boyarmaddesinin 254 ve 352 nm'de hesaplanan molar absorpsiyon katsayıları sırasıyla 12516 ve 5932.6 $M^{-1}cm^{-1}$'dir. Yüksek molar absorpsiyon katsayısı daha çok ışının RB5 tarafından absorplandığını gösterdiğinden UV-C lamba ile giderim daha fazla olmuştur.



Şekil 1. Farklı koşullarda yapılan kontrol deneyleri
(pH=3, [RB5]=30 ppm)

Peroksimonosülfat/UV sisteminde RB5 boyarmaddesinin renk giderimine RB5 başlangıç derişiminin etkisini araştırmak için pH=3'de 1 mM peroksimonosülfat oksidantı kullanılarak farklı RB5 derişimlerinde deneyler yapılmıştır. Şekil 2'den görüldüğü gibi, 30 dakika sonunda 10 ,20, 30 ve 40 ppm RB5 derişim değerlerinde %100, %97, %78 ve %46 renk giderimi elde edilirken, 120 dakika sonunda 20 ve 30 ppm değerleri için %100 ve 40 ppm değerinde ise %86 giderim gözlenmiştir. Sabit oksidant ve UV-C ışın şiddetinde boyarmadde derişiminin artması ile birim boyarmadde molekülü başına düşen sülfat radikali azalmaktadır. Bundan dolayı yüksek RB5 derişimlerinde, reaksiyon ortamında oluşan sülfat radikali yeterli olmamaktadır. Ayrıca yüksek derişimlerde oluşan ara ürün miktarı da fazla olmakta ve böylece ortamda bulunan sülfat radikallerini bu ürünler de tükettiğinden RB5 renk giderimi azalmaktadır (Kordkandi ve Forouzesh, 2014; Peng ve ark., 2021; Yang ve ark., 2019).



Şekil 2. RB5 boyarmaddesinin renk giderimine RB5 başlangıç derişiminin etkisi (pH=3, [PMS]=1 mM)

Peroksimonusülfat/UV sisteminde RB5 boyarmaddesinin renk giderimine PMS derişiminin etkisini belirlemek amacıyla 30 ppm derişiminde RB5 boyarmadde çözeltisi kullanılarak pH=3'de 0.25-2 mM derişimlerinde yapılan deneylerde elde edilen sonuçlar Şekil 3'de verilmiştir. 0.25 mM PMS kullanıldığında 120 dakika sonunda %87 renk giderimi gözlenmiştir. 0.5- 2 mM derişim aralığında ise tüm değerler için %100 giderim elde edilmiştir. PMS oksidantının derişiminin artmasıyla daha fazla sülfat radikali oluşacağından renk giderimi de artmaktadır (Dhaka ve ark., 2018, Luo ve ark., 2020).

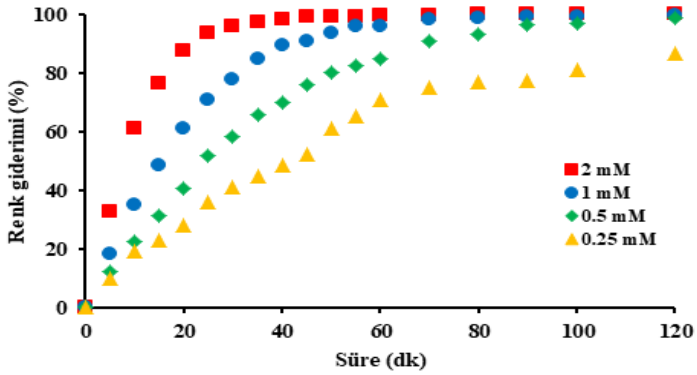
Peroksimonosülfat/UV sisteminde RB5 boyarmaddesinin renk gideriminde etkin olan radikali belirlemek için reaksiyon ortamına radikal tutucu alkoller eklenmiştir. Etil alkol (EtOH) gibi α- hidrojeni içeren alkol ortama eklendiğinde, etil alkolün sülfat ve hidroksil radikallleri ile olan reaksiyonlarına ait hız sabitleri yüksek olduğundan her iki radikal de etil alkol tarafından tutulmaktadır (Eşitlik 3 ve 4). Tersiyer bütil alkol (TBA) gibi α- hidrojeni içermeyen alkol ortama eklendiğinde ise bu alkol tarafından hidroksil radikali tutulmaktadır (Eşitlik 3-6) (Ji ve ark., 2015). Alkol:oksidant mol oranı 50:1 alınarak yapılan deneysel çalışmalarda ortama TBA ve EtOH eklendiğinde 120 dakika sonunda elde edilen renk giderimi değerleri sırasıyla % 61 ve %46'dır (Şekil 4). Alkol eklenmeden aynı koşulda yapılan deneysel çalışmada ise %100 renk giderimine ulaşılmıştır. Bu durum etkin olan radikalin sülfat radikali olduğunu göstermektedir.

$SO_4^{\bullet-}$ + EtOH ⟶ Ürünler k=1.6 - 7.7x10^7 M^{-1} s^{-1} (3)

$^{\bullet}OH$ + EtOH ⟶ Ürünler k=1.2 - 2.8x10^9 M^{-1} s^{-1} (4)

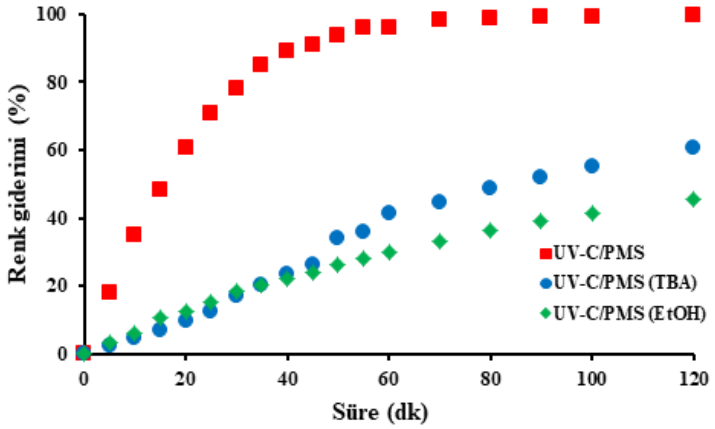
$SO_4^{\bullet-}$ + TBA ⟶ Ürünler k=4-9.1x10^5 M^{-1} s^{-1} (5)

$^{\bullet}OH$ + TBA ⟶ Ürünler k= 3.8-7.6x10^8 M^{-1} s^{-1} (6)



Şekil 3. RB5 boyarmaddesinin renk giderimine peroksimonosülfat derişiminin etkisi

(pH=3, [RB5]=30 ppm)



Şekil 4. RB5 boyarmaddesinin renk giderimine EtOH ve TBA eklenmesinin etkisi (pH=3, [RB5]=30 ppm, [PMS]=1 mM)

SONUÇ

Bu çalışmada RB5 azo boyarmaddesinin peroksimonosülfat/UV sisteminde renk giderimi incelenmiştir. Peroksimonosülfat oksidantının aktive edilmesinde UV-C ışınının daha etkili olduğu belirlenmiştir. RB5 boyarmaddesinin başlangıç derişimi arttıkça renk gideriminin azaldığı ve peroksimonosülfat derişiminin artmasıyla da arttığı gözlenmiştir. Peroksimonosülfat/UV sisteminde etkin olan radikalin sülfat radikali olduğu görülmüştür.

TEŞEKKÜR

Özet

Flavobacterium glaum bakterisinin yeniden sınıflandırılması sonucu ortaya çıkmış olan *Chryseobacterium* sp. turuncu-sarı renk pigmente sahip, psikrotolerant, gram negatif bir bakteri türüdür. Yapılan araştırmada Galindez adasından temin edilmiş olan Y11 kodlu kutup tatlı göl suyuna ait örnek kullanılarak yapılan bakteri izolasyonu sonucunda kanamisin içerikli besiyeri içerisinde tespit edilmiş, 16S rRNA analizine göre *Chryseobacterium* sp. ile %99.54 oranında benzerlik gösteren izolat elde edilmiştir. Bakteriye ait morfolojik ve fizyolojik karakterizasyon işlemleri sonucunda bakterinin 15-22ºC aralığında optimum üreme gösterdiği, IAA (Indol-3 acetic acid) üretimi 24.saat ölçümlerinde 4,33 µg olduğu tespit edilmiştir. Bakteriye ait gerçekleştirilen ağır metal inhibisyonu deneyleri sonucunda 50 mg/ml ve 100 mg/ml konsantrasyonlarında Pb'ye direnç gösterdiği tespit edilmiştir.

Anahtar kelimeler: Antarktika, mikroorganizma izolasyonu, psikrotolerant

Isolation and characterization of *Chryseobacterium* sp. EK1 from polar fresh lake water

Abstract

Chryseobacterium sp., which emerged as a result of reclassification of *Flavobacterium glaum*, is a psychrotolerant, gram-negative bacterium with orange-yellow pigment. In this study, an isolate with 99.54% similarity to *Chryseobacterium* sp. was obtained based on 16S rRNA analysis and which was isolated from the kanamycin-containing medium by using the sample of polar fresh lake water with the code Y11 obtained from Galindez island. As a result of the morphological and physiological characterization, the bacterium showed optimum growth in the range of 15-22ºC, and produced 4.33 µg IAA (Indol-3 acetic acid) at 24th hour of fermentation. Also, this strain showed resistance to Pb at concentrations of 50 mg/ml and 100 mg/ml.

Keywords: Antarctica, isolation of microorganism, psychrotolerant

GİRİŞ

Antarktika kıtası dünyanın en kuzey ucu olmakla birlikte, buzla kaplı ve dünyanın en soğuk noktasıdır. Bu kıtada yaşamın oldukça sınırlı olması ve verimsiz çevre şartları olması nedeniyle çalışmalar oldukça kısıtlıdır. Ancak, ekstrem çevre şartlarında yaşam sürdürebilen mikroorganizmalar mevcut olup bu tip mikroorganizmalar ekstremofil olarak isimlendirilmektedir. Antarktika kıtası da oldukça düşük sıcaklık değerleri ve değişken tuz konsantrasyonları ile mikroorganizma yaşantısı için ekstrem şartları sağlamaktadır.

Çalışmanın amacı, ekstrem koşullara sahip Antartika'daki Galindez adasından bakteri izolasyonu ve karakterizasyonudur.

MATERYAL VE METOD

Mikroorganizma izolasyonu

Y11 kodlu su örneği 30 µg/ ml konsantrasyonda kanamisin içeren NA (Nutrient Agar) besiyeri içerisine 100 µl olacak şekilde yayma ekim tekniği ile ekilmiştir. 7 gün süre ile 15 ºC'de inkübe edilmiştir.

Genomik DNA izolasyonu

Genomik DNA izolasyonu için Cutting, 1990'a ait metod kullanılmıştır. Bakteri 10 ml NB (Nutrient Broth) besiyeri içerine ekilmiş, 15 ºC'de 2 gün süre ile inkübe edilmiştir. Üreyen bakteri kültüründen 2 ml alınarak 6500 rpm'de 10 dk santrifüj edilmiştir. 2 ml sıvı kültüre ait pelet 567 µl TE tamponu içersinde çözülmüştür. Karışıma 30 µl Proteinaz K (20 mg/ml), 6 µl RNAz A (20 mg/ml), 24 µl lizozim (100 mg/ml), 30 µl %10'luk SDS eklenerek 37 ºC'de 1 saat inkübe edilmiştir. Ardından, karışım üzerine 5 M NaCl den 100 µl ve CTAB/NaCl'den 800 µl eklenerek 65 ºC'de 10 dk inkübe edilmiştir. Sonraki aşamada ise 1:1 oranında fenol:kloroform:izoamilalkol (25:24:1) eklenerek karışım 13 000 rpm'de 10 dk santrifüj edilmiştir. Süpernatant yeni tüpe alınarak üzerine 0.7x izopropanol eklenmiş, 13 000 rpm'de 5 dk santrifüj edilmiştir. Dibe çökmüş olan DNA üzerine 1 ml %70'lik etanol eklenerek 13 000 rpm'de 5 dk santrifüj edilmiştir. Etanol 37 ºC'de uçurulduktan sonra DNA 20 µl TE içerisinde çözülmüştür (Cutting, 1990).

16S rRNA bölgesinin PZR ile çoğaltılması

PZR reaksiyonunun gerçekleştirilmesinde, üniversal primerler olan BactF ve 1492R primerleri kullanılmıştır (Çizelge 1). PZR içerik ve koşulları Çizelge 2'de verilmektedir.

Çizelge 1. PZR reaksiyonu için kullanılan primer dizileri

Primer adı	5'→ 3' nükleotid dizisi	Tm (°C)	Amplikon Büyüklüğü (bç)	Özellik	Referans
BactF	AGAGTTTGATCATGGCTCAG	62	1465-1520	16S rRNA dizisi	Lane (1991)
1492R	GGTTACCTTGTTACGACTT	59			

Çizelge 2. Çalışmada kullanılan PZR içerik ve koşulları

PZR içeriği		**PZR Koşulları**	
İçerik	Miktar (µl)	Sıcaklık (ºC)	Süre
5X Q5 DNA polimeraz tamponu (1X)	4	98	30 sn
10 mM dNTP (200 µM)	0.4	98	10 sn
İleri Primer (10 µM)	1	Tm-5	30 sn
Geri Primer (10 µM)	1	72	1000 bç/ 15-30 sn
Kalıp DNA (100 ng/µl)	1	72	5 dk
Q5 DNA Polimeraz (0,02 U/µL)	0.2	+ 4	∞
Toplam Hacim	20		

PZR reaksiyonu sonrası ürünler 1 mg/ml etidyum bromür içeren % 0.8 konsantrasyonunda hazırlanmış agaroz jelde, 50 dk. 80 V akım ile yürütülmüştür. Elektroforez tamponu olarak 1X TAE (Tris-asetat-EDTA) kullanılmıştır. Elektroforez işleminin ardından jeldeki DNA bantları UV transilluminatörde incelenmiştir. Ardından, jelden kesilen bantlarda DNA ekstraksiyonu için NucleoSpin Gel and PCR Cleanup kiti

kullanılmıştır. Ekstrakte edilen DNA'ların konsantrasyonu NanoDrop® ND-2000 cihazında belirlenerek ilgili sekans firmalarına gönderilmiştir.

DNA dizileme ve filogenetik ağaç oluşturma

DNA dizileme BM Labosis (Ankara) firması tarafından gerçekleştirilmiştir. Sanger dizileme yöntemi kullanılarak AB3730xl cihazında kapiller ayırım ile yapılan dizileme sonucunda elde edilen nükleotit dizileri BLAST programı aracılığı ile veri tabanındaki dizilerle karşılaştırılmıştır. (https://blast.ncbi.nlm.nih.gov/Blast.cgi). BLAST programından çekilen nükleotid dizileri kullanılarak ClustalW (Thompson, Higgins, & Gibson, 1994) yardımıyla çoklu dizi hizalamaları gerçekleştirilmiştir. MEGAX yazılım paketinde bulunan (Kumar, Stecher, & Tamura, 2016) Neighbor Joining algoritması ve Kimura iki parametre testi kullanılarak filogenetik ağaç oluşturulmuştur. Dış grup olarak *Vibrio* chrolerae kullanılmıştır.

Indol-3-asetik asit (IAA) üretimi

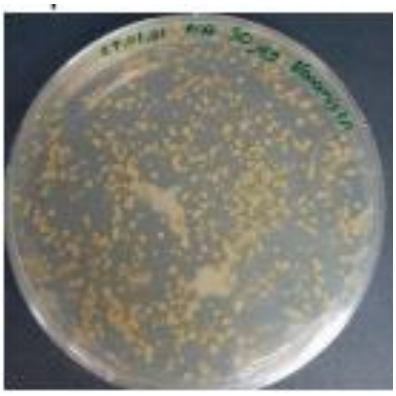
Indol-3-asetik asit (IAA) üretiminin belirlenebilmesi için (Fan vd., 2018) tarafından rapor edilen yöntem uygulanmıştır. Suşlar, Tripton-Maya Ekstraktı (TY) içeren sıvı besiyerinde karanlık ortamda, 15 °C ve 200 rpm'de 120 saat inkübe edilmiş ve 24 saat aralıklarla 2 ml kültür alınarak IAA üretimine ait ölçüm yapılmıştır. İnkübasyon sonrasında alınan 2 ml bakteri kültürleri 10 dk boyunca 13,000 x g'de santrifüj edilmiştir. Elde edilen süpernatantdan 1 ml alınıp üzerine 2 ml Salkowski ajanı (1 litre için: 4.5 g FeCl3 ve 10.8 M H2S04) eklenmiştir. Kuvvetli bir şekilde vorteks yapılan numuneler 30 dk oda sıcaklığında inkübe edilmiştir. Ölçümler 24 saat aralıklarla 5 gün boyunca tekrar edilmiştir. IAA standardı bilinen konsantrasyonlarından hazırlanan standart bir eğri ile karşılaştırılarak OD_{600} nm' de izolatın IAA üretim potansiyeli tespit edilmiştir.

Ağır metal direncinin belirlenmesi

50 mg/ml ve 100 mg/ml konsantrasyonlarda Pb içeren NA plakalarına McFarland değeri 0.5 olan kültürden çizgi ekim yapılarak 7 gün süre ile 15 ºC'de inkübe edilmiştir.

BULGULAR VE TARTIŞMA

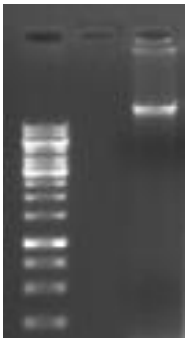
Y11 kodlu kutup tatlı gölsuyunun kanamisin içerikli NA petrisi içerisine ekilmesi sonucu turuncu pigmentli koloni oluşumu gözlemlenmiştir (Şekil 1).



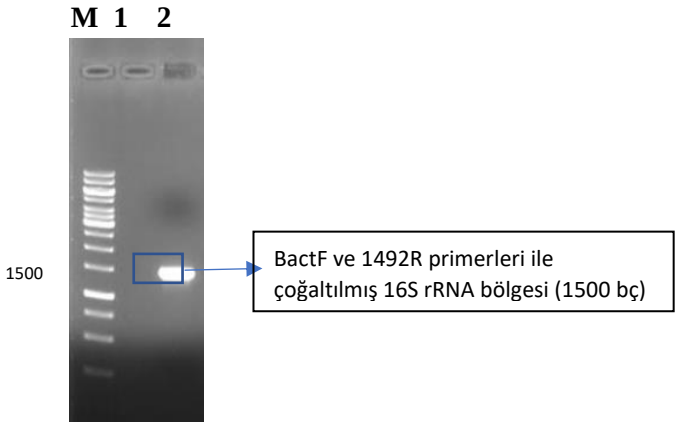
Şekil 1. Kanamisin içerikli besiyerinde Y11 kodlu su örneğinden elde edilen koloniler.

Oluşan kolonilerden biri seçilerek genomik DNA izolasyonu yapılmış (Şekil 2) ve 16S rRNA analizi için PZR gerçekleştirilmiştir (Şekil 3).

M 1



Şekil 2. M: Generuler 1 kb ladder, 1: Koloniden elde edilen ait genomik DNA.

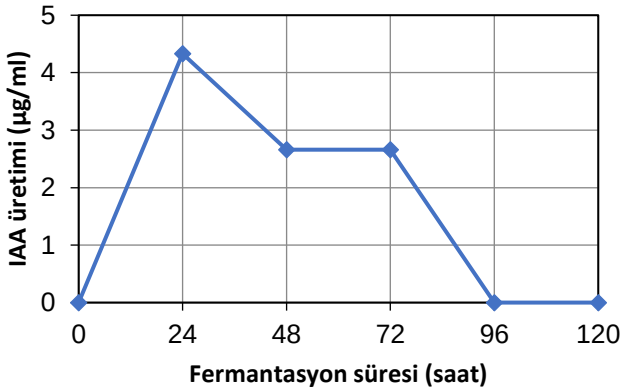


Şekil 3. M: Generuler 1 kb ladder. 1. Negatif kontrol reaksiyonu, 2: İzolata ait 16S rRNA amplikonu.

Filogenetik analizler sonucunda izolat *Chryseobacterium* sp. ile %99.54 oranında sekans benzerlik göstermiş ve *Chryseobacterium* sp. EK1 olarak adlandırılmıştır (Şekil 4).

Şekil 4. *Chryseobacterium* sp. EK1'e ait filogenetik ağaç.

Chryseobacterium sp. EK1 en iyi IAA üretimini fermantasyonun 24. saatinde sağlamış (Şekil 5) ve maksimum 100 mg/ml PB varlığına tolerans gösterebilmiştir (Şekil 6).



Şekil 5. *Chryseobacterium* sp. EK1'de IAA üretimi.

a) **b)**

Şekil 5. *Chryseobacterium sp.*EK1'in Pb'ye toleransı. a) 50 mg/ml Pb, b) 100 mg/ml Pb.

TEŞEKKÜR

2019 yılı 3. Kutup Bilimleri Seferi kapsamında örneklerin temini için sayın Prof. Dr. Ersan BAŞAR'a, Prof. Dr. Fatma TELLİ KARAKOÇ ve Dr. Öğr. Üyesi Yılmaz KAYA hocalarıma teşekkürlerimi sunarım. Çalışma OMÜ PYO tarafından PYO.ZRT.1904.22.004 proje kodu ile desteklenmiştir.

Özet

Metal işleme operasyonlarında metalin metale temasını önlemek amacıyla kullanılan yağlara, yağların film dayanımını artırmak ve metal yüzeyler arasındaki sürtünmeyi azaltmak amacıyla aşırı basınç (EP) ve aşınma önleme (AW) katkı maddeleri ilave edilmektedir. EP ve AW katkı maddeleri metal yüzeyler ile fiziksel absorpsiyon veya kimyasal reaksiyon yoluyla etkileşime girerek yağ film dayanımının artırılmasını sağlayan katkılardır. Metal işleme yağları formülasyonlarında yağın EP ve AW özelliklerinin iyileştirilmesi için yaygın olarak kullanılan en etkili katkı maddeleri klor, çinko, kükürt ve fosfor bileşikleridir. Bu bileşiklerden yüksek sıcaklıklara dayanıklı olmaları ve metal yüzeyler arasındaki sürtünmeyi en etkin şekilde azaltmaları sebebi ile en çok tercih edilenleri kükürtlü katkı maddeleridir. Kükürtlü katkı maddeleri metal yüzeylerde metal-sülfit tribofilm oluşturarak sürtünmeyi minimuma indirmekte ve yağların yük taşıma kapasitesini artırmaktadır. Kükürtlü EP ve AW katkı maddeleri arasında olefin, trigliserit, izobütilen, yağ asitleri (erusik, oleik) gibi yapılar ön plana çıkmaktadır. Bu çalışma kapsamında, kükürtlü olefin, kükürtlü trigliserit, kükürtlü ester katkı maddelerinin, Grup II baz yağ içerisindeki aşınma önleme ve aşırı basınç performansları karşılaştırılmıştır. Kullanılan kükürtlü katkı maddelerinin performans karşılaştırılması için Dört Bilye Test cihazı ile çalışılmıştır. Dört Bilye test cihazında aşınma önleme performansını belirlemek için ASTM D 4172 metodu ile çalışılırken, yük taşıma kapasitesini belirlemek için ASTM D 2783 metodu kullanılmıştır. Dört Bilye test cihazında aşınma testinden çıkan çelik bilyelerin yüzey morfolojisi 3D Mikroskop cihazında incelenmiş ve karşılaştırmaları yapılmıştır. Yapılan çalışmalar ve performans değerlendirmelerinin sonucunda, en yüksek aşınma önleme ve aşırı basınç performansının kükürtlü trigliserit içeren formülasyon ile elde edildiği, en düşük aşınma önleme ve aşırı basınç performansının ise kükürtlü olefin içeren formülasyon olduğu belirlenmiştir.

Anahtar Kelimeler: Kükürtlü Katkılar, Yağlayıcılar, Aşınma Önleme, Aşırı Basınç

Investigation of the performance effects of sulfurized EP and AW additives used in metalworking oils with a 4 ball tester

Abstract

Extreme pressure (EP) and anti-wear (AW) additives are added to the oils used in metalworking operations to prevent metal-to-metal contact, to increase the film strength of the oils and to reduce the friction between metal surfaces. EP and AW additives are additives that interact with metal surfaces through physical absorption or chemical reaction to increase oil film strength. Chlorine, zinc, sulfur and phosphorus compounds are the most effective additives commonly used in metalworking oils formulations to improve the EP and AW properties of the oil. Sulfur additives are the most preferred of these compounds because they are resistant to high temperatures and reduce the friction between metal surfaces in the most effective way. Sulfur additives form a metal-sulfide tribofilm on metal surfaces, minimizing friction and increasing the load carrying capacity of oils. Among the sulfurized EP and AW additives, structures such as olefin, triglyceride, isobutylene, fatty acids (erucic, oleic) come to the fore. In this study, the antiwear and extreme pressure performances of sulfurized olefin, sulfurized triglyceride, sulfurized ester additives in Group II base oil were compared. 4 Ball Tester was used to compare the performance of the sulfurized additives used. The ASTM D 4172 method was used to determine the anti-wear performance of the 4 Ball tester,

while the ASTM D 2783 method was used to determine the load carrying capacity. The surface morphology of the steel balls, which came out of the wear test in the 4 Ball Tester, was examined in the 3D Microscope device and comparisons were made. As a result of the studies and performance evaluations, it was determined that the highest anti-wear and extreme pressure performance was obtained with the formulation containing sulfurized triglyceride, while the lowest anti-wear and extreme pressure performance was the formulation containing sulfurized olefin.
Keywords: Sulfurized Additives, Lubricants, Anti Wear, Extreme Pressure

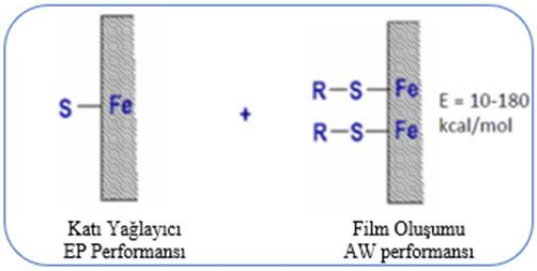
GİRİŞ

Metal işleme; taşlama, kesme, honlama, delme gibi operasyonlarda metalin şekillendirilmesi işlemidir. Bu operasyonlar esnasında, metallerin yüzeyleri arasında sürtünme ve aşınma meydana gelmekte, buna bağlı sıcaklık artışı ve ısı açığa çıkmaktadır. Metaller arasındaki sürtünmeyi ve dolayısı ile oluşacak ısıyı azaltmak için bu operasyonlarda metal işleme sıvıları (MWF) kullanılmaktadır. Metal işleme sıvıları; temel olarak pür ve su ile emülsiye edilebilir yağlar olmak üzere 2 ana grupta incelenmekte, her bir grup da kendi içerisinde operasyona, işlenen malzeme ve yağdan beklenen ihtiyaca göre farklı yapılarda formüle edilebilmektedir. Pür metal işleme yağları temel olarak mineral esaslı yağlayıcılar kullanılarak formüle edilen yağlardır. Fakat formülasyonda kullanılan mineral esaslı yağlar yük kapasitesini artırmak ve makinenin ömrünü uzatmak için tek başlarına yeterli performansı sağlayamazlar. Bu nedenle, metal işleme operasyonlarında kullanılan yağlara metal-metal temasını önlemek, metal yüzey ile etkileşim halindeki yağ filminin mukavemetini ve yük dayanımını artırmak için "aşırı basınç (EP) ve aşınma önleyici (AW)" katkı maddeleri ilave edilmektedir.

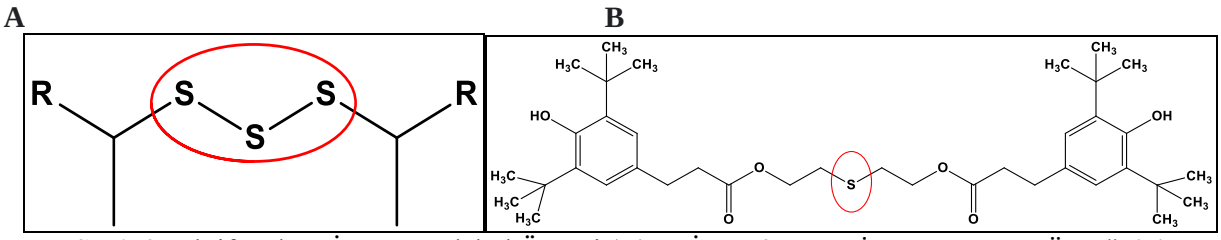
AW ve EP katkı maddeleri metal yüzeyi ile kimyasal reaksiyona girerek etki göstermektedirler. Metal-metal sürtünmesi sonucu ortaya çıkan ısı, katkı maddelerinin metal yüzeyi ile reaksiyon için gerekli aktivasyon sıcaklığına ulaştığında katkı molekülleri içindeki bağlar kırılarak reaksiyon ürünleri meydana gelmekte ve yüzeyde polimerik yapısal film oluşmaktadır. (Bastian, 1951, Gündoğdu, 2006). EP ve AW katkıları, yüzeyde oluşan kopma dayanımı büyük ve kayma gerilmeleri küçük olan bu film sayesinde sürtünmeyi azaltır, aşınmayı kontrol eder ve şiddetli yüzey bozulmalarını önlerler.

Metal işleme yağlarında EP ve AW katkı maddeleri olarak klor, çinko, kükürt ve fosfor bileşikleri kullanılmaktadır. Bu bileşikler arasında yüksek sıcaklıklara dayanıklı olmalarından ve aşırı basınç esnasında metal sülfit tribofilmler oluşturarak (Şekil 1.) metal yüzeyler arasındaki sürtünmeyi en etkili şekilde azaltmalarından dolayı kükürtlü katkı maddeleri tercih edilmektedir (Canter, 2014). Kükürtlü katkılar öncelikle metal yüzey üzerinde adsorbe edilen disülfitlerden, aşınma önleyici özellikleri bulunan organik monosülfitlere dönüşmektedir. Basınç ve sıcaklık etkisi ile de yapıda bulunan organik kükürtler parçalanarak inorganik sülfürler olarak reaksiyona girmekte ve bu sayede aşırı basınç özelliği göstermektedirler.

Kükürtlü katkı maddeleri aktif ve inaktif kükürt bileşikleri olarak ikiye ayrılır (Canter, 2007, Riga ve ark., 1993). Aktif kükürt bileşikleri metal yüzeylerde düşük sıcaklıklarda reaksiyona girerken, inaktif kükürt bileşikleri daha yüksek sıcaklıklarda reaksiyona girmektedir (Fitch, 2006). Ayrıca, aktif kükürt molekülleri, iki veya daha fazla kükürt atomundan oluşan zincirleri içermektedir (Şekil 2A) ve diğer kükürt molekülleri ile bağlandığında kolayca kırılabilen kimyasal bir zincir oluşturur. İnaktif kükürt molekülleri ise ikiden daha az kükürt atomu içermekte (Şekil 2B) ve kükürt atomları karbon ya da oksijene bağlandığında kırılması daha zor bir yapı oluşturmaktadırlar (Stubbs, 2022).



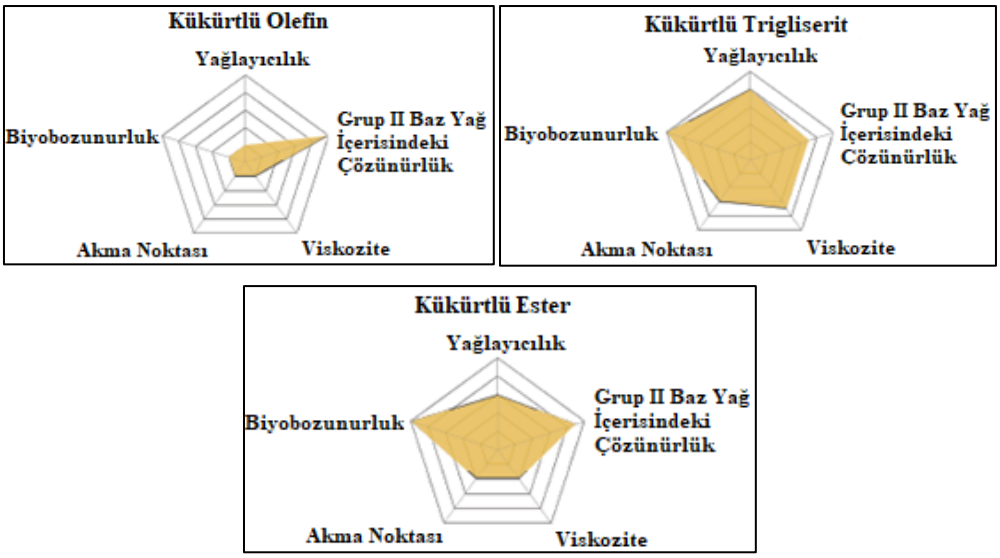
Şekil 1. Kükürtlü Katkı Maddelerinin Metallerle Olan Etkileşimleri



Şekil 2. Aktif Kükürt İçeren Molekül Örneği (A) ve İnaktif Kükürt İçeren Molekül Örneği (B)

Aktif kükürt bileşikleri sarı metalde korozyon ve lekelenme sorunlarına neden olur ve bakır, çinko ve diğer metalleri aşındırmaktadır. Bu sayede, kükürdün aktiflik özelliği Cu gibi sarı metal üzerinde oluşturduğu korozyon oranından belirlenebilmektedir. Kükürt iyonları çözelti içinde bakır iyonları ile birleşerek yağda Cu_2S (bakır sülfür), $CuSO_3$ (bakır sülfit) ve $CuSO_4$ (bakır sülfat) gibi bakır tuzları oluşturur. Bu metalik tuzlar, mineral yağda çözünmezler ve hemen çökmeye başlarlar. Bu nedenle, bakır-kükürt tuzları metaller üzerinde korozyona sebep olmaktadırlar (Sundin, 2018). Ayrıca aktif kükürt içeren katkı maddeleri, su ile kolayca hidrolize olur, bu da hem katkı maddesinin etkisini kaybetmesine hem de asidik ürünlerin oluşmasına neden olur. Bu asidik ürünler, bronz ve pirinç gibi yumuşak metaller içeren bileşenleri aşındırabilir (Atan, 2011). Bu sebeplerden dolayı kükürtlü katkı maddeleri yumuşak metallerde tercih edilmemektedir.

Kükürtlü katkı maddelerin seçiminde yağlayıcılık, çözünürlük, biyobozunurluk, viskozite gibi özellikler göz önünde bulundurularak kükürtlü olefin, kükürtlü trigliserit ve kükürtlü ester bileşikleri tercih edilmiştir. Şekil 3'te yer alan bilgilere göre kükürtlü trigliserit yapısı, en iyi yağlama özelliğine sahipken, kükürtlü olefin yapısının yağlayıcılık özelliği zayıftır. Öte yandan çözünürlükleri karşılaştırıldıklarında Grup II baz yağ içerisindeki en iyi çözünürlüğe sahip katkıların kükürtlü olefin ve kükürtlü ester yapıları olduğu görülmektedir (Lubes'N'Greases, 2022).



Şekil 3. Kullanılan Kükürtlü Katkıların Özelliklerinin Karşılaştırılması

Bu çalışmada 3 farklı aktif kükürtlü AW ve EP katkı maddesi ISO VG 22 Grup II Parafinik Baz Yağ içerisinde formüle edilerek hazırlanan yağlayıcıların 4 bilye test cihazı ile nihai ürün performansına etkileri incelenmiştir. Aşırı basınç performansını belirlemek için ASTM D 2783 metodu kullanılırken, aşınma önleme performansı için ASTM D 4172 metodu kullanılmıştır.

MATERYAL VE METOD

Günümüzde Grup II baz yağların yağlayıcı formülasyonlarında kullanımları Grup I yağlara göre daha yüksek oksidasyon stabilitesine sahip olduklarından giderek artmaktadır. Bu nedenlerden, çalışmada viskozitesi ISO VG 22 olan Grup II baz yağ kullanımı tercih edilmiştir. Grup II baz yağların genel teknik özellikleri Tablo 1'de gösterilmiştir.

Tablo 1. Grup II- Baz Yağın Teknik Özellikleri

Özellikler	ISO VG 22 Grup II Baz Yağ	Yöntem
Yoğunluk (g/ml, 15°C)	0,8435	ASTM D 1298
Kinematik viskozite (40°C, cSt)	21,133	ASTM D 445
Kinematik viskozite (100°C, cSt)	4,4229	ASTM D 445
Viskozite İndeksi	121	ASTM D 2270
Parlama Noktası (°C)	235	ASTM D 92

Dört Bilye Test Cihazı

Dört bilye test cihazı, yağlama sıvılarının yük dayanımı ve aşınma önleme özelliklerinin belirlenmesini sağlamak üzere kullanılan bir cihazdır. Formülasyonların kaynama yükü ve aşınma önleme performansının karşılaştırması bu cihaz ile gerçekleştirilmiştir. Bu testte, bileşik şekilde yerleştirilmiş 3 sabit bilyeye karşı yük altında dönen 1 adet bilye kullanılarak test gerçekleştirilir.

Bu çalışmada, ASTM D 2783 Yağlama Sıvılarının EP (Aşırı Yük Dayanımı) ve ASTM D 4172 Yağlama Sıvılarının Aşınma Önleme Özelliklerini Belirlemek için Standart Test metotlarından yararlanılmıştır.

Dört bilye test cihazında, ASTM D 2783 koşullarında yağlanmış bilyelerin birbirine kaynadığı en düşük yük değeri belirlenerek yağlayıcının hangi EP seviyesini aştığı tespit edilir. ASTM D 4172 standardı gereğince belirtilen test koşullarında ise yağlanmış bilyeler aşınma testine tabi tutularak bilyeler üzerindeki aşınmaları ölçülür. Tablo 3'te gösterilen test koşulları altında aşırı yük dayanımları, Tablo 4'te gösterilen test koşulları altında ise aşınma önleme özellikleri ölçülmüştür.

Tablo 3. ASTM D 2783 Parametreleri

Test Parametreleri	Test Koşulları
Hız	1760±40 rpm
Sıcaklık	18-35 °C
Max. Yük	800 kgf
Zaman	10 ± 0,2 sn

Şekil 5. 4 Bilye Test cihazı Şematik Diyagramı (Lin, 2012)

3D Mikroskop

3D mikroskop cihazı; metal parçaların mikron boyutlarında x, y, z koordinatlarında yüzey morfolojisini ölçmek ve yüzey alanı, hacim, genişlik ve derinliği belirleyebilmektedir. Bu cihaz sayesinde, klasik bir mikroskopla tespit edilemeyen performans farklılıklarını tespit etmek mümkün olmaktadır. 3D mikroskop cihazı ile 3 boyutlu renkli orijinal görüntü ile derinliklerin farklı renklerle gösterildiği iki tip görüntü almak mümkün olmaktadır.

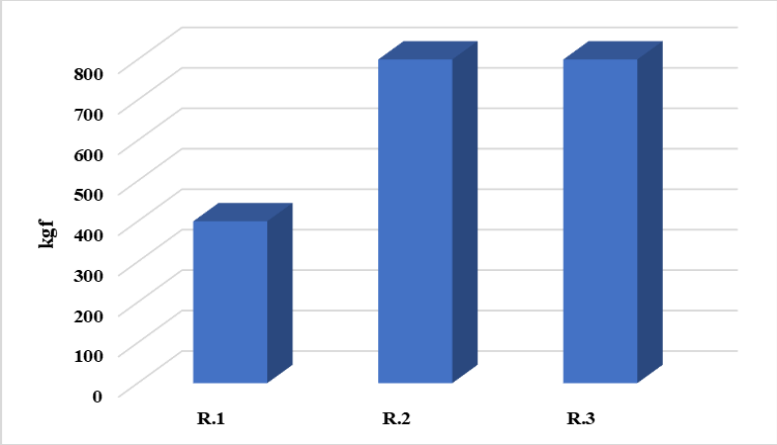
BULGULAR

Yük Dayanımı Testi (EP) (ASTM D 2783);

3 farklı EP ve AW özellik gösteren kükürtlü katkı maddeleri bulunan formülasyonların aşırı basınç özelliklerini karşılaştırmak üzere ASTM D 2783 metoduna göre analizleri gerçekleştirilmiştir. Kaynamanın olduğu ilk yük değeri belirlenerek Tablo 5'te verilmiştir. Elde edilen verilere göre, kükürtlü trigliserit içeren R.2 formülasyonunun 800 kgf değerini geçtiği ve en yüksek yük taşıma kapasitesine sahip olduğu belirlenmiştir. Kükürtlü ester içeren R.3 formülasyonu R.1 formülasyonuna göre daha yüksek yük taşıma kapasitesine, Kükürtlü olefin içeren R.1 formülasyonu ise 400 kg ile en düşük yük taşıma kapasitesinde olduğu tespit edilmiştir.

Tablo 5. 4 Bilye Yük Taşıma Kapasiteleri

Ürün	Yük Taşıma Kapasitesi (kgf)
Baz Yağ + (5%) Kükürtlü olefin (R.1)	400
Baz Yağ + (5%) Kükürtlü Trigliserit (R.2)	>800
Baz Yağ + (5%) Kükürtlü Ester (R.3)	800



Şekil 6. 4 Bilye Yük Taşıma Kapasitesi Grafik Diyagramı

Aşınma Önleme Testi (AW) (ASTM D 4172);

Aşınma önleme özelliklerini belirlemek için ASTM D 4172 metoduna göre analizleri gerçekleştirilmiştir. 60 dk boyunca sabit yük altında gerçekleşen testin yüzey aşınmaları incelenmiştir. Tablo 6'da belirtilen 2D mikroskop ile aşınma izi çapları xy koordinatlarında ve Tablo 7'de belirtilen 3D mikroskop ile aşınma izi çaplarının xyz koordinatlarında görüntüleri alınmıştır. Elde edilen verilere göre, kükürtlü trigliserit içeren R.2 formülasyonu 0,001 ile en düşük aşınma hacmine sahip olduğundan en yüksek aşınma önleme özelliği göstermiştir. Aşınma hacmi 0,003 olan kükürtlü ester içeren R.3 formülasyonu kükürtlü olefin içeren R.1 formülasyonuna göre daha iyi aşınma performansı göstermektedir. Kükürtlü olefin içeren R.1 formülasyonu ise 0,010 ile en yüksek aşınma hacmine sahip olmakta ve en düşük aşınma performansı göstermektedir.

SONUÇ

Bu çalışma kapsamında, metal işleme sıvılarında kullanımı mümkün olan 3 farklı kükürtlü AW ve EP özelliği gösteren katkı maddeleri kullanılarak Grup II baz yağ içerisindeki aşınma önleme ve aşırı basınç performansları karşılaştırılmıştır. Aşınma önleme ve aşırı basınç performanslarını belirlemek için Dört Bilye Test cihazı kullanılmıştır. Aşınma önlemede kullanılan çelik bilyelerin yüzey morfolojisi 3D mikroskop cihazı ile incelenmiştir. Sonuç olarak aşağıdaki bulgular elde edilmiştir

- 4 Bilye test cihazında en yüksek yük taşıma kapasitesine >800 kgf ile kükürtlü trigliserit içeren R.2 formülasyonu sahip olurken, en düşük yük taşıma kapasitesini kükürtlü olefin içeren R.1 formülasyonu göstermiştir.
- Aynı zamanda, 4 Bilye test cihazında en yüksek aşınma önleme performansını 0.001 mm^3 ile kükürtlü trigliserit içeren R.2 formülasyonu gösterirken, en düşük aşınma önleme performansını kükürtlü olefin içeren R.1 formülasyonu göstermektedir.

Yapılan bu çalışma sonucunda, kükürtlü katkıların aşınma önleme ve aşırı basınç performans özellikleri incelenmiş ve kesme, delme, çekme, frezeleme, derin çekme gibi metal işleme operasyonlarında kullanılan metal işleme sıvılarının formülasyon çalışmalarına katkı sağlanması amaçlanmıştır.

Abstract
Tie bars in composite plate shear walls – concrete filled (C-PSW/CF), are used to connect the wall side plates in the transverse direction, ensuring the distribution of internal forces between the concrete and the plates, thus ensuring composite behavior. In some cases, studs are used together with tie bars to help redistribute the internal forces within the wall members and increase composite behavior. In this study, different tie bar-stud configurations were numerically investigated for a wall to observe wall lateral response, tie bar and stud axial force demand. Five different tie bar-stud configurations were considered. Finite element (FE) models of each configuration were developed and analyzed under monotonic lateral displacement up to 4.1% wall drift. Wall pushover curves and axial force curves for selected tie bars and studs were obtained and compared for each tie bar-stud configuration. Compared to C-PSW/CF, where only tie bars were used as connector elements, tie bar axial force demands were reduced in walls with tie bar-stud configurations.
Keywords: Composite plates shear walls, concrete filled, tie bar, stud, finite element, axial force

INTRODUCTION

Experimental, analytical and numerical studies on CPSW/CF was conducted by many researchers for various aspect of wall behavior (Oduyemi and Wright 1989; Wright et al. 1991; Xie and Chapman 2006; Eom et al. 2009; Sohel et al. 2012; Ramesh 2013; Alzeni and Bruneau 2014; Polat and Bruneau 2017; Polat and Bruneau 2018; Varma et al. 2019; Polat et al. 2021; Polat 2022). In C-PSW/CF, different types of connectors are used to connect the wall plates to the infill concrete. Examples of connectors are tie bars, studs, beaten connectors, T-shape connectors, etc. (Polat 2020). According to the AISC Seismic Specifications (AISC 2016) composite action between the concrete and plates can be achieved using either tie bars or a combination of tie bars and studs. Only these two connectors are considered in this study. Tie bars and studs have different behavior characteristics in terms of force transfer between plate and concrete. Tie bars carry more axial force, while studs carry more shear force. Although both connectors transfer shear force, tie bars can carry axial force that can counter the transverse expansion of concrete, while studs carry relatively less axial force and more shear force as they are not continuous throughout the wall thickness. It should be noted that while only a single tie bar is used to interconnect the two plates in the transverse direction, the plates are fixed into the concrete with two studs: one stud for each plate. Because studs are not continuous between the plates, typically headed studs are commonly used (Zhang et al. 2014). In headed studs, the stud is anchored to the concrete and outward slippage of the stud is constrained in case of transverse dilation of the concrete resulting from wall deformation.
Besides achieving composite action between the wall parts, tie bars and studs help prevent steel plate local buckling before the plates yield in compression. The place local buckling is given by plate slenderness which is given by vertical connector spacing to plate thickness. The wall considered in this study is the same wall model used by Polat et al. (2021) and Polat (2022). That wall was adopted based on a reference wall that was tested experimentally by Alzeni and Bruneau (2017) and has only tie bars as connector elements. For that wall, plate local buckling was considered based on the plate slenderness given by vertical spacing of tie bars. In this study, the same wall model was considered with different tie bar-stud configurations without any modifications to wall geometry, plate slenderness and material properties.

Wall model and tie bar - stud configurations

Figure shows the wall in elevation and plan view. The distribution of tie bars along the wall height and width shown in **FigureHata! Başvuru kaynağı bulunamadı.**a and the typical layout of tie bars with the defined horizontal bar spacings on the cross section is shown in **Figure**b. The width, height and total

thickness of the wall are 1016mm, 3048mm and 219.2mm, respectively. The horizontal spacings of the tie bars are 203.2mm for the interior ties and 152.4mm for the exterior ties.

Two types of tie bar-stud configurations were considered in the study. Both configurations also had two sub-configurations in which stud length were differed. **Figure** shows these two configurations together with the reference wall for a partial height of the wall. For the reference wall, only tie bars were used and no studs. This model was denoted with Wall-T-St00. **Figure**b shows the first tie bar-stud configuration, where the studs positioned at the center of the diagonal spacings of the tie bars. This model was denoted with Wall-T-St11. In the third configuration shown in **Figure**c, the studs were located at the center of the vertical spacing of the tie bars. This model was denoted with Wall-T-St21. Note that in these configurations, stud length was equal to 50mm. For the sub-configurations, however; the stud spacings were adjusted to 25mm. The sub-configurations were denoted with Wall-T-St12 and Wall-T-St22 and they are similar to main configurations in stud layout as shown in **Figure**(a-b). **Figure** shows the six of the tie bars and studs (Tie_{11}, Tie_{12}, Tie_{21}, Tie_{22}, Tie_{31}, Tie_{32}; St_{11}, St_{12}, St_{21}, St_{22}, St_{31}, St_{32}) identified for the numerical investigation conducted in this study.

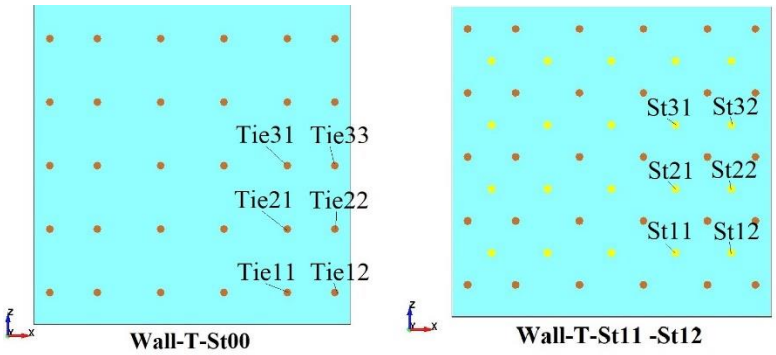

Figure 3. Identification of tie bars and studs under investigation

Numerical Modeling

Tie bar axial forces of C-PSW/CF vary depending on a few parameters, such as axial strain demand in the concrete where the bars are located, and plate local buckling in the region where the tie bars are located. These parameters were considered in the FE modeling with the appropriate definition of the wall geometry and material models. Definition of accurate wall geometry and material models are important in terms of representative simulation of the elastic and inelastic wall behavior such as global wall stiffness and strength; and the elastic and inelastic behavior of the wall parts in the local level such as plate local buckling and tie bar and studs force responses. The developed FE models could realistically simulate the steel plate local buckling, and the parameters that influence the tie bar axial force demand (such as the shear dilation of the concrete) could be accounted by the choice of proper concrete material model.

Figure shows the top views of developed FE models of the three types of tie bar-stud configuration of the walls (note that concrete infill is invisible in the Figure). A similar procedure as described by Polat and Bruneau (2017)Polat was followed in the development and analysis of FE models. The sandwiching plates of the wall were modeled using shell elements having a thickness of 7.94mm. The infill concrete of the wall was modeled using an eight-node solid element equal in length in each side that was equal to 25.4mm. The tie bars and studs were modeled using a two-node beam element with a length of 25.4mm. The infill concrete had a material property of fc=47.8 MPa (uniaxial compressive strength) and the steel plate had a material property of Fy=427MPa (yield strength), Es=205000 MPa (elastic modulus). Elastic material properties were used for the tie bars and studs.

Finite element Analysis Results

Wall Lateral Response

To investigate whether different tie bar-stud configurations have any effect on wall lateral responses, lateral responses of walls were obtained as base shear versus drift ratio (pushover curves). **Figure** shows the comparison of pushover curves of the walls with the five different tie bar-stud configurations. Wall-T-St00 (the wall model with only tie bars and without any studs) reached a peak strength of 905kN at about 1.4% drift. Following this drift, reductions of up to 9% were observed in strength up to 4% drift. The wall model Wall-T-St11 obtained a peak strength of 950kN at about 1.7% drift. On the other hand, the same wall but smaller studs' length, in other words the wall model of Wall-T-St12, obtained a peak strength of 940kN at about 1.6% drift. Following these peak strengths drift levels, the strengths of the walls slightly decreased to 890kN and 870kN, respectively for Wall-T-St11 and Wall-T-St12; corresponding to about 6-7% strength drop. The wall model Wall-T-St21 obtained a peak strength of 956kN at about 1.9% drift whereas Wall-T-St22 obtained a peak strength of 950kN at about 1.8% drift. Following these peak strengths drift levels, the strengths of the walls slightly decreased to 918kN and 900kN, respectively for Wall-T-St21 and Wall-T-St22; corresponding to about 4-5% strength drop. For all the walls, the reduction in strength was attributed to plate local buckling, which became significant in larger drift levels and more pronounced for the wall without any stud (i.e., for Wall-T-St00).

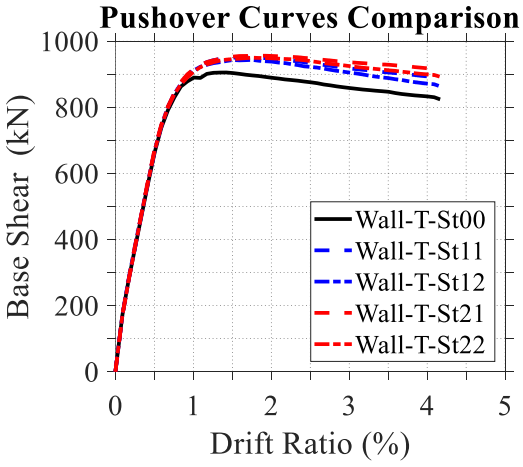

Figure 6. Comparison of pushover curves

Tie bars and Studs Axial Force Demands

Tie bars and studs axial force demands were obtained from the analyses of wall models under monotonic displacement up to 4.1% drift. Axial force demands of the tie bars and studs of the wall models for five different configurations are presented as a function of wall drifts from **Figure** to 10. Considering the forces of all the tie bars, Tie_{12} and Tie_{22} receive the largest force demands, while Tie_{11} and Tie_{31} receive the

smallest force demands. This is consistent with the fact that because Tie_{12} and Tie_{22} are outer ties and are closer to the wall edge than Tie_{11} and Tie_{31}, thereby the region of concrete they are in is subject to greater axial strain demands. Considering only the interior tie bars (i.e., Tie_{11}, Tie_{21} and Tie_{31}) Tie_{21} receives relatively larger axial force demand than Tie_{11} and Tie_{31}, and the force curve of Tie21 exhibits a steeper increase than the force curves of other ties; attributed to plate local buckling in this region. It should be noted that plate local buckling induces additional axial force demand on tie bars due to prying mechanism (Polat et al. 2020). Considering the axial force demands of the tie bars of the walls with stud (**Figure**-10), the axial force demands on tie bars were reduced as the studs were also loaded. In the Wall-T-St11 and -St12, $Stud_{12}$ and $Stud_{22}$ receive most of the axial force demands, while in the Wall-T-St21 and -St22 a relatively more equal force sharing is seen between the studs.

Table shows the maximum axial force demands of tie bars and studs at approximately 4.1% drift. In the Table, the axial force demands of the tie bars of the Wall-T-St00 are given as the reference axial force demands for the tie forces in the other walls. Total axial force demands of the tie bars and studs were also presented in the last column of the Table. The reduction in axial forces observed in the stud effect in the tie bars is presented for each wall based on the reference tie bars forces. The decrease in tie forces were slightly higher for walls with longer stud length. The influence of studs on tie bar force reduction is more significant for Tie_{31} for all configurations. For example, 50%, 45%, 65%, 53% decrease in the tie force were measured for Wall-T- St11, -St12, -St21, -St22, respectively.

RESULTS and DISCUSSION

Connectors in CPSW/CF have an important function in terms of developing and increasing the composite action between concrete and steel plate. A single type of connector or a combination of multiple connectors can be used for walls. While studs are generally used to take shear stresses within the wall parts, tie bars are used mainly to carry axial forces by counteracting concrete lateral expansion under wall deformation. In this study tie bars and studs were considered as the wall connectors. A planar CPSW/CF without boundary elements was used to investigate influence of studs on tie bar axial force demands. Five different tie bar-stud configurations were developed and analyzed. Numerical analyzes using a complex finite element program and explicit modeling of wall models show that studs play an important role in reducing the axial force demands on the tie bars.

CONCLUSION

The study has the following outcomes:

- The use of studs in addition to the tie bars slightly increases the lateral strength of the CPSW/CF,
- Regardless of the use of studs, the highest axial force demands on tie bars occur at ties placed close to the wall end,
- The use of studs with tie bars in the walls reduced the axial force demands on the tie bars,
- The reduction in tie bars force demands was greater in configurations with longer studs.
- The influence of studs on tie bar force reduction is more significant for Tie_{31} for all configurations,

The numerical study conducted in this paper showed the significance of studs in reducing the tie bars axial force demands for planar CPSW/CF. The study can further be extended to CPSW/CF with different cross-section geometries and different direction of wall bending.

Abstract
Alzheimer's disease (AD) is one of the main causes of death among elder people. Still, there is no treatment for this disease, but an early diagnosis can help in slowing down its progression effectively. Since the application of machine learning and especially deep learning in Alzheimer's diagnosis very impressive results have been achieved in the research domain but several challenges require more research until clinical application becomes feasible. Convolution neural networks (CNNs) proved to be the best deep learning model for computer vision applications. It achieved the highest accuracy for detecting AD from neuroimages. In this paper, we review different models based on CNNs implemented to model the 3D features of neuroimages, different transfer learning, data augmentation, and recent architectures designed to overcome the overfitting problem which is a common problem for AD diagnosis using deep learning due to the small size of neuroimaging datasets. In addition, we report the used neuroimaging modalities and the most used platforms from which researchers always retrieve their datasets for AD-related research.
Keywords: convolutional neural networks, transfer learning, Alzheimer's, neuroimaging

INTRODUCTION

Alzheimer's disease is the sixth cause of death among older people in the United States (*Alzheimer's Association. 2017 Alzheimer's Disease Facts and Figures. Special Report*, n.d.). It is expected that the over 60 population is becoming 2 billion by 2050 which will be 21% of the world's population which was 8% in 1950 (*R. Haux, Health Information Systems–Past, Present*, n.d.). This reveals a massive increase in the number of people being affected by Alzheimer's disease estimated to be 100 million by 2050 (Janghel and Rathore, 2021). Alzheimer's disease (AD) is the most common type of dementia, it is a neurodegenerative disease that occurs as a result of changes in amyloid and tau proteins levels; causing a disability of communication between neurons and cell death in different brain regions. Hence, it results in the loss of cognitive abilities accompanying Alzheimer's disease. Till now there is no treatment for this disease, but an early prediction of conversion to AD helps slow down the progression of dementia more effectively.

It has been revealed by research that changes in the brain begin 20 years before AD symptoms appear (*Alzheimer's Association. 2017 Alzheimer's Disease Facts and Figures. Special Report*, n.d.). Diagnosis of Alzheimer's disease in its early stages is more challenging than in later ones, therefore it is of bigger importance and more helpful for patients to predict the progression of a patient from mild cognitive impairment (MCI) toward AD than distinguishing AD from normal control (NC). MCI is the cognitive decline stage before AD, this stage is categorized into stable MCI (sMCI) and progressive MCI (pMCI). Not all MCI patients develop AD. sMCIs are patients who did not develop AD in the follow-up period, while pMCIs are patients who developed AD. The development always occurs in a time range of 6 to 36 months. Distinguishing between sMCI and pMCI is very challenging due to the high similarities between brain changes in both cases.

The advancement of different neuroimaging technologies such as functional magnetic resonance imaging including structural MRI (sMRI) and functional MRI (fMRI), and positron emission tomography (PET), revolutionized brain disease diagnosis. Neuroimaging methods are less invasive, of lower risk, and cost-effective providing better interpretation, understanding, and evaluation of the very complex brain's structure and activity. The need for utilizing machine learning in medical diagnosis arose from the fact that radiologists exhibit an error percentage that may be fatal for some diseases.

Through the last 2 decades, machine learning has been widely investigated in the literature for the diagnosis of AD based on neuroimaging data. Several conventional machine learning methods like decision trees, random forest, and SVM lead to promising results. But these conventional methods encounter 2 major problems, first, the pre-processing stage is time-consuming and complicated, and feature extraction is done in a hand-crafted manner by a radiologist. A machine learning model is composed of three building blocks: feature extraction, feature dimension reduction, and the classification process. Thanks to deep learning, the three processes can be automatically combined in a single pipeline. Training the deep learning model for classification while extracting features leads to significantly better classification accuracies (Ebrahimighahnavieh et al., 2020) as features are extracted depending on the classification result through the training process. Also, deep neural networks are capable of learning hidden information and disease-related patterns within the image.

Hence, deep learning, especially convolutional neural networks (CNNs) that emulate the way the visual brain cortex works is dominating medical image analysis. CNNs have proved to achieve a better performance in Alzheimer's disease diagnosis and all image analysis areas compared to other machine learning methods (Ebrahimighahnavieh et al., 2020; Fathi et al., 2022; Sethi et al., 2022). In the beginning, 2D-CNN was widely applied to neuroimaging by researchers, but a massive loss of information is encountered due to the 3D nature of neuroimages (Ebrahimighahnavieh et al., 2020). Thus, 3D CNN which was developed originally for video scene analysis is now utilized for AD diagnosis to capture the spatial relationships across the three planes of a neuroimaging volume. However, 3D CNNs result in a massively bigger number of parameters while the number of images in medical datasets is small raising the problems of overfitting and computational complexity. For this purpose, we are conducting this study to review different methods that were introduced for modeling the features of 3D neuroimages for AD diagnosis and overview several approaches to solving the overfitting problem.

REVIEW PROTOCOL

In this section, the review protocol including research questions, search strategy, inclusion, and exclusion criteria, are presented. We aimed through this paper to explore the state-of-the-art methods introduced to perform AD diagnosis and identify the future trends and research gaps in the area of applying CNNs to AD diagnosis.

Research Questions

Through this study we tried adequately to answer the following research questions:
RQ1: What are the different approaches used to model 3D information in neuroimaging data for AD classification using CNNs?
RQ2: What are transfer learning models, data augmentation, and recent CNN models used to overcome overfitting?
RQ3: What are the different datasets and neuroimaging modalities used by researchers in this area?

Search Strategy

The studies included in this review were acquired by conquering 4 databases on August 6, 2022, limiting our search to the years 2020, 2021, and 2022. Web of Science, Scopus, IEEE, and PubMed are the databases through which we searched for the title, abstract, and keywords, and refined the search to journal papers using the following query: ("deep learning" OR "Deep Learning") AND ("Alzheimer's" OR "Alzheimer").

Inclusion/ Exclusion Criteria

For applying the inclusion/exclusion criteria, we first screened the title and abstract of each paper, if a final decision could not be made, full-text was assessed to make a final decision. The studies investigated in this review were included based on the following criteria:

1- Only journal papers which are written in English were included and reviews, surveys, collections, and comparison studies were not included.
2- Studies not using CNNs and at least one neuroimaging modality like MRI, fMRI, or PET were not included.
3- Studies not applying transfer learning or data augmentation or a recent architecture to overcome overfitting were not included.
4- Studies not modeling features across the third dimension were not included.

5- Studies introducing image generation, segmentation, or other image processing methods without using them in AD diagnosis or prognosis prediction, as well as those predicting MMSE score or MCI to AD conversion time without performing AD classification, were not included.
6- Studies differentiating Alzheimer's disease from other neurodegenerative diseases without including AD classification from NC or MCI, and studies just classifying NC from MCI without including pMCI vs sMCI classification were not included.

After searching the databases we retrieved 1506 articles, after removing duplicates 709 papers were screened according to the inclusion/exclusion criteria, we ended up with 55 papers for this review.

RESULTS and DISCUSSION

Different CNN-Based Models

Several variations of conventional 3D-CNNs were utilized with 3 convolutional blocks (F. Gao et al., 2020a), 4 blocks (Jo et al., 2020a), 5 blocks (Tufail, Anwar, et al., 2022a), 6 blocks (Feng et al., 2022a; Tufail, Ullah, et al., 2022), and 7 blocks (Bron et al., 2021), each block having 2 convolutional layers of the same kernel's size along all the blocks in the network. In these studies, a fully connected layer is used in (Feng et al., 2022a; F. Gao et al., 2020b; Jo et al., 2020b) and 3 fully connected layers in (Tufail, Anwar, et al., 2022b; Tufail, Ullah, et al., 2022). Also, (Dyrba et al., 2021) used 3 consecutive convolution blocks each having five 3D convolution layers of the same size and 3 fully connected layers. (Lian, Liu, Wang, et al., 2022) implemented 11 convolution layers; 8 layers of size 3x3x3 and 3 layers of size 2x2x2 placed after layers 2,5, and 8 respectively to downsample feature maps and increase receptive field.

Several well-known CNN architectures proved to be efficient with computer vision applications such as AlexNet (Krizhevsky et al., n.d.), ResNet (Abrol et al., 2020a), LeNet-5 (LeCun et al., 1998), Inception (Szegedy, Ioffe, et al., n.d.), VGG (Simonyan and Zisserman, 2014), and GoogleNet (Szegedy, Liu, et al., n.d.). ResNet is the most used among the studies by those (Ebrahimi et al., 2021; Y. Li et al., 2021; Abrol et al., 2020; Chen and Xia, 2021; Ren et al., 2022; Y. Li et al., 2022b). (Y. Li et al., 2022a) compared their introduced 3D-ResNet-50 with its variants ResNet-10, ResNet-34, and ResNet-101 to outperform them. In the same context, (Bae et al., 2021) reduced the complexity of ResNet-50 by proposing a ResNet-29 (contains 29 layers instead of 50). (Guan et al., 2022) used residual blocks (blocks of which ResNet is a constituent) with a large convolutional kernel size of 4x4x4 to increase the receptive field followed by a 1x1x1 convolution. As for other architectures, (Folego et al., 2020) extended LeNet-5 (that is used also by (Ebrahimi et al., 2021)), VGG, ResNet, and GoogleNet to 3D convolution. (Pena et al., 2022) used a 3D-CNN with residual blocks introduced originally by (Bi et al., 2020) and extended the Inception model to 3D convolution with different 3 convolution layers of different sizes to capture features at different scales. And fused the output features of both networks in a fully connected layer. (J. Li et al., 2022) combined a 3D U-Net (Fan et al., 2021) with self-supervised contrastive learning (T. Chen et al., 2020), updating the weights based on the supervised loss of U-Net and the contrastive loss. Both (Ocasio and Duong, 2021) and (Q. Li and Yang, 2021) implemented their 3D-ResNet and 3D-VGG and compared them.
Different from ResNet architecture, DenseNet (G. Huang et al., 2017) that was used by (X. Gao et al., 2022a; Y. Li et al., 2022b) does propagate feature maps along the network concatenating feature maps of all previous dense blocks (blocks of which DenseNet is a constituent) as an input to each block, instead of summing the features maps output of each block and its previous one. Hence, it better alleviates the vanishing gradient which is the main purpose behind implementing ResNet. (M. Liu et al., 2020) applied 3D-DenseNet to hippocampus volume only, to decrease the network's complexity outperforming a 3D U-Net in a comparison. Another study (Poloni and Ferrari, 2022) extended an EfficientNet (Tan and Le, 2019) to 3D, training two identical networks on right and left hippocampus respectively, and combining their generated features. Each of three identical 3D-CNNs captured the features of both left and right hippocampus, and the asymmetry differences between them respectively proposed by (A. Li et al., n.d.). A 2D-CNN was then cascaded on the 3 networks modeling the co-relation between them for the classification decision. PointNet++ (Qi et al., 2017), SpiralNet++ (Gong et al., 2019), and 3D ResNet-34 were used by (Sarasua et al., 2022) with point clouds, meshes, and volumetric representations of the hippocampus respectively. (Yiğit et al., 2022) applied a majority voting on a conventional 3D-CNN and 2D VGG-16. (Y. Chen and Xia, 2021) trained several 3D-CNNs, each on a different ROI using a weighted ensemble to make the classification result more influenced by the most informative ROIs. (Goenka and Tiwari, 2022) examined patch-based, voxel-based, and merging certain 2D slices as a 3D volume selected from the

original 3D image with a 3D-CNN. To overcome the complexity due to the big number of parameters in 3D-CNN several approaches were introduced in the literature. For example,(Liang et al., 2021) used temporal pooling developed for video frames to fuse the extracted feature maps from 2D slices of a 3D MRI by 2D-CNN into a single 2D feature map as an approach, while applying temporal pooling to the 2D slices compressing them in a single 2D image before being fed to 2D-CNN as another approach. For the same purpose, (Y. Li et al., 2022b) used a 2D-CNN to extract features from 2D slices of sagittal, coronal, and axial views, modeling inter-view features by an LSTM. Similarly, (Ebrahimi et al., 2021) used three 2D-CNNs in a majority vote for each of the sagittal, coronal, and axial views with an LSTM after each 2D-CNN to model the intra-view features. They compared this model with a majority vote of three 3D-CNNs. An ensemble via sum rule of pre-trained AlexNet, GoogleNet, ResNet50, ResNet101, and Inception-v3 as 2D-CNN architectures was applied by (Nanni et al., 2020). Their input was different combinations of 3 slices across the sagittal, coronal, and axial projections as an RGB image to model the three-dimensional features. Regarding attention mechanisms that direct the network to focus on the most informative features, (Folego et al., 2020; Guan et al., 2022; Lian, Liu, Wang, et al., 2022) used attention blocks within their network. (Lian, Liu, Pan, et al., 2022) used an attention map generated by a 3D-CNN to direct two classification 3D-CNNs modeling global and local features respectively. (Pei et al., 2022) used in addition to an attention block a global context block to capture long-distance features dependency. Some studies combined more than imaging modality, (He et al., 2021a) cascaded a 2D-CNN on three 3D-CNNs for combining MRI, fMRI, and PET modalities. (Y. Pan et al., 2021) used two 3D-CNN streams for MRIs and PETs fusing their extracted features. An advanced approach was introduced by (Gao et al., 2022b) combining the output features of each 2 dense blocks corresponding to each other in both networks through a pathwise convolutional block that provides a feature map as an input to the next dense block in both networks. PCA (Chan et al., 2014) which is an unsupervised method was used with convolutional filters as a feature extractor from Spatio-temporal representations of fMRI by (Y. Wang et al., 2021a; Jia and Lao, 2022a) respectively, where fMRI features were fused with sMRI features generated from a 3D CNN. A 3D-convolutional auto-encoder encoded the features of consecutive MRI sessions in a latent space vector that is input to multi perceptron layer for classification (Ouyang et al., 2022a). They aimed here to benefit from the decoder's loss for better feature extraction. Graph-CNN (Bruna et al., 2013) was applied by (S. G. Huang et al. 2021a; S. G. Huang et al., 2021b; Qiu et al., 2022) to a triangulated mesh representation of the cortical surface. Finally, 3D-convolutional layers were used in constructing generators and discriminators of GANs (Goodfellow et al., 2014) used for generating missing images (X. Gao et al., 2022b; Y. Pan et al., 2021; Y. Pan et al., 2020), and enhancing images quality (Zhou et al., 2021a) to improve their models' classification performance. While (Yu et al., 2022) benefitted from GANs' unsupervised learning capability with partially labeled datasets.

Transfer Learning Approaches

There are different approaches to transfer learning have been used in the literature:

1)Pre-trained: In this approach, the source and target datasets are unrelated to one another. (Y. Li et al., 2021; Nanni et al., 2020; Liang et al., 2021; Helaly et al., 2022) used some well-known architectures in the literature that are pre-trained on generic datasets such as ImageNet like AlexNet, GoogleNet, Inception-v3, VGG, and ResNet. (Ocasio and Duong, 2021a) extended the pre-trained 2D versions of LeNet-5 and ResNet to 3D, benefitting from the pre-trained weights on huge 2D image datasets by duplicating 2D filters along the third dimension.

2)Domain adaption: In this approach, the source and target datasets are related to each other. (Folego et al., 2020; S. G. Huang et al., 2021a) pre-trained the model on a dataset (e.g., ADNI) and fine-tuned it on another (e.g., OASIS). Studies (Pena et al., 2022; Irie et al., 2020; Yiğit et al., 2022; Guan et al., 2022; S. G. Huang et al., 2021a) pre-trained the model on AD vs NC and fine-tuned on sMCI vs pMCI. (Kwak, Niethammer, et al., 2022) applied zero-shot learning in which the pre-trained model is tested on the target dataset without fine-tuning. Similarly, (X. Pan et al., 2021a; Ouyang et al., 2022; Abrol et al., 2020) mixed AD, NC, sMCI, and pMCI for pre-training and tested the model on sMCI vs pMCI classification. (Ocasio and Duong, 2021b) compared zero-shot learning and fine-tuning. An unsupervised module DsAN (Zhu et al., 2021) that performs domain specific feautres adaption instead of general adaption was concatenated by (Ren et al., 2022) with the classifier. Weights of a pre-trained in a previous medical diagnosis study were used as initial weights in the proposed model (Q. Li and Yang, 2021). Exploiting the correlation between brain age and MCI-to-AD, (F. Gao et al., 2020a) transferred the knowledge by keeping the classifying layer of a pre-trained network instance on age prediction, where the age prediction result is used to correct the result of

another pre-trained network instance that is fine-tuned for MCI-to-AD conversion problem. Unsupervised contrastive learning in (Y. Li et al., 2022a) was used to increase the correlation between a generic medical images dataset as a source dataset and the sMCI vs pMCI as the target one. Federated learning (Xu et al., 2021) was applied by (Y. L. Huang et al., 2021) where multiple instances of the model are trained across different datasets, sharing their weights, and averaging them to achieve global weights of a model, outperforming traditional domain adoption in a comparison.

3) One-shot learning: In this method, a subset of a dataset is used to pre-train the model then it is fine-tuned with the whole dataset as done by (Jin et al., 2022).

4)Knowledge Distillation: In this approach, a re-trained larger (teacher) model transfers its knowledge to a smaller untrained (student) model that tries to produce the same output as the teacher one as done by (Guan et al., 2021; Y. Li et al., 2022b).

Data Augmentation Techniques

1)Traditional augmentation: Traditional position augmentation techniques; scaling, flipping, cropping, rotation, translation, and zoom-in/out were applied by (Jin et al., 2022; Lian, Liu, Wang, et al., 2022; Y. Li et al., 2021; M. Liu et al., 2020; Ocasio and Duong, 2021a; A. Li et al., n.d.; Helaly et al., 2022; Sethi et al., 2021; Jo et al., 2020a; Tufail, Anwar, et al., 2022a; Kwak, Stanford, et al., 2022; Pei et al., 2022; Goenka and Tiwari, 2022; Sarasua et al., 2022; Dyrba et al., 2021; Lian, Liu, Pan, et al., 2022). Moreover, a comparison between random width and height shift, random zoomed in/out, and random weak Gaussian blurring were done by (Tufail, Ullah, et al., 2022). (J. Li et al., 2022) used gamma transformation, adding noise, histogram equalization, sharpening, and smoothing as color augmentation in addition to some position augmentation.

2)Synthesizing: GANs were used by (X. Gao et al., 2022b; Y. Pan et al., 2020, 2022) to generate missing PET images for a neuroimaging multi-modality approach based on the correlation between MRIs and PETs of subjects having images in both modalities. The generated images in GAN by the generator make the discriminator a better classifier for an unsupervised purpose (Yu et al., 2022). Authors (S. G. Huang et al., 2021b) generated new triangular meshed surfaces, not synthesizing the neuroimages themselves.

3)Others: (Qiu et al., 2022) estimated any missing subject at a time point in an MRI session's time series. (Feng et al., 2022b) augmented their data by including scans acquired from the same patient across multiple visits. Randomly sampling patches over the whole volume (Zhou et al., 2021b), trained the model with a higher variance of brain locations. A mix-up augmentation (H. Zhang et al., 2017), was used by (Guan et al., 2022; Ren et al., 2022; Bron et al., 2021) in which augmentation was done by linearly combining two randomly selected images of the same class to avoid degrading the spatial normalization. Each of several adjacency matrices representing the similarity of clinical variables between subjects and a sequence of 3D MRI feature maps is fed by (Vivar et al., 2021) into separate Graph-CNN + autoregressive LSTM networks to reconstruct the input data compensating for any missing data.

Recent Architectures as Overfitting Solution

Depth separable convolution (SIfre and Mallat, 2014) is an approach that decomposes a 3D convolution process to 1×1×n and n×n ×1, reducing the number of parameters. Separable convolution was utilized by (X. Pan et al., 2021b), where three 3D-CNNs (hence, a big number of parameters to be reduced) based on 3D-separable convolution were applied to sagittal, coronal, and axial 3D images combining their features. MobileNet (Howard et al., 2017) and ShuffleNet (X. Zhang et al., 2017) that are based on separable convolution were used by (He et al., 2021b) and (Y. Wang et al., 2021a) respectively. PCA used by (Bi et al., 2020) is an unsupervised method that applies convolution was used as a solution for the non-enough labeled images. Finally, (Irie et al., 2020) implemented a 3D ladder convolutional network consisting of 3 parts. An encoder produces an output (the MRI features), and a decoder reconstructs the MRI based on the encoded features. Then subtracting the constructed image from the real one to remove common features resulting in a parameter number decrease.

Neuroimaging Techniques & Datasets

Neuroimaging techniques are the most used biomarkers with machine learning applications for AD diagnosis. sMRI, PET, and fMRI were the imaging techniques used. Structural Magnetic resonance imaging

(sMRI) known mostly as MRI is a medical imaging technique that uses a magnetic field and computer-generated radio waves to create images of organs and tissues in your body. Functional magnetic resonance imaging or functional MRI (fMRI) measures brain activity by detecting changes associated with blood flow. Positron emission tomography (PET) is a functional imaging technique that uses radioactive substances to visualize changes in metabolic processes, and in other physiological activities like blood flow and regional chemical composition. sMRI dominated the studies, followed by PET and then fMRI as shown in figure 1.

The datasets used in the studies we have in this review were retrieved from different databases. There are several useful and common databases that researchers depend on in the literature. ADNI, AIBL, and OASIS are the most used platforms in the literature as shown in figure 2.

CONCLUSION

In conclusion, we conducted this review to investigate the state-of-art methods introduced in the literature for using convolutional neural networks in Alzheimer's diagnosis. We focused on three points, first, due to the 3D nature of neuroimages we investigated the different approaches used to model the three-dimensional features. Using 3D convolution is the most basic approach used but it has a drawback of a very big number of parameters. Therefore, some studies used multiple 2D-CNNs across sagittal, coronal, and axial slices and then used RNNs to model the inter-slices features. Second, we investigated the status of the proposed solutions for the overfitting problem which is a common challenge in medical diagnosis due to the small size of datasets and the big number of parameters in 3D models. We focus in this study on transfer learning, data augmentation, and recent architectures designed for the overfitting problem. Transfer learning is applied using pre-trained, domain adoption, zero-shot learning, and knowledge distillation. The findings reveal that domain adoption and knowledge distillation seem to gain the biggest attention in the literature in the coming years. As for domain adoption, it transfers weights from Alzheimer's or medical-related datasets which leads to learning more related features variation. While knowledge distillation transfers the knowledge of a bigger model to a smaller one (of a lower number of parameters) decreasing overfitting. Regarding data augmentation GANs are considered state-of-the-art for generating missing images which is always a drawback in medical diagnosis. Also, traditional augmentation methods were used as well. The third point we explored was the most used datasets and imaging modalities in this domain finding that it is very rare to find a study that did not use ADNI or sMRI.

The proposed methods in the literature have shown very promising results, but still, several research gaps need more future investigation:

- **sMCI vs pMCI Task:** This task is a very challenging one and always shows lower accuracy results than AD vs NC. This is due to the very high similarities between MCI subjects. Domain adoption transfer learning provided an improvement in this task's accuracy. However, still more work is needed to reach satisfactory results, especially using data augmentation and domain adoption transfer learning to capture more discriminative features from other similar subjects like AD (always more similar to pMCI) and NC (always more similar to NC).
- **Multi-imaging Modalities:** A few studies combined several imaging modalities like MRI and PET showing better accuracy than a single modality. This is due to the complementary information different modalities provide. Combining multi-modalities should be taken into consideration in future studies for boosting classification accuracy.

- **fMRI:** Alzheimer-related changes in brain activity captured by fMRI happen earlier than structural ones. Only a little number of studies performed diagnoses based on fMRI. fMRI is different from other modalities that it is of a 4D nature as it captures functional changes in a brain's volume across time (the 4th dimension). Therefore, it is challenging to model both spatial and temporal features.
- **Over Fitting:** Although several transfer learning and augmentation results decrease the CNNs' overfitting significantly, more improvement can be reached by applying recent architectures that have been proposed especially for overcoming small-size datasets problems. For example, HRNet (J. Wang et al., 2021), CapsNet (Mukhometzianov and Carrillo, n.d.), and ConvNeXt (Z. Liu et al., 2022) are highly recommended to be studied in future work.

Özet

Çalışma kapsamında Malathion insektisitinin model atıksudan Fenton yöntemi ile giderilebilirliği araştırılmıştır. Fenton prosesine etki eden Fe^{+2} ve H_2O_2 derişiminin suda bulunan Malathion pestisitinin yarattığı toplam organik karbon (TOK) giderim verimine olan etkisi incelenmiştir. Fe^{+2} ve H_2O_2 derişiminin istatistiksel optimizasyonunda çift yönlü ANOVA testi kullanılmıştır. Malathion insektisitinin yarattığı TOK kirliliği 10 mg/l Fe^{+2} ve 1000 mg/l H_2O_2 ile %75,25 oranında, 0,0054 $dk.^{-1}$ hızıyla birinci derece reaksiyon kinetiğine uygun olarak giderilmiştir. Bu optimum koşullarda gerçekleştirilen sitotoksisite değerlendirmesi sonucunda TOK giderimine paralel olarak Malathion insektisitinin suda neden olduğu toksisite çok toksik (LD_{50}=%13±1) seviyeden az toksik (LD_{50}=%70±2) seviyeye düşmüştür. Çalışma sonucunda pestisit kirliliğinin yarattığı organik yük ve toksisitenin Fenton prosesi ile etkin bir şekilde giderilebildiği görülmüştür.

Anahtar Kelimeler: Malathion, pestisit, insektisit, Fenton, TOK, toksisite, ANOVA.

Abstract

Within the scope of the study, the removal of Malathion insecticide from model wastewater by Fenton method was investigated. The effect of Fe^{2+} and H_2O_2 concentrations affecting the Fenton process on the total organic carbon (TOC) removal efficiency of Malathion pesticide in water was investigated. Two-way ANOVA test was used for statistical optimization of Fe^{2+} and H_2O_2 concentrations. TOC pollution created by malathion insecticide was removed with 10 mg/l Fe^{2+} and 1000 mg/l H_2O_2 by 75.25%, at a rate of 0.0054 min^{-1}, in accordance with first-order reaction kinetics. As a result of the cytotoxicity assessment performed under these optimum conditions, the toxicity of Malathion insecticide in water decreased from very toxic (LD_{50}=13±1%) to less toxic (LD_{50}=70±2%) in parallel with TOC removal. As a result of the study, it has been observed that the organic load and toxicity caused by pesticide pollution can be effectively removed by the Fenton process.

GİRİŞ

Organik fosforlu insektisitler, organik klorlu pestisitlerin yasaklanmasından sonra kullanılan pestisitlerin önemli bir kısmını oluşturmaktadır (Chawla ve ark, 2018). Organofosforlu pestisit kullanımı dünya tüketiminin yaklaşık %40'ını ve ABD tüketiminin %70'ini oluşturmaktadır (Zhang ve Pagilla, 2010). Pestisitlerin yoğun ve bilinçsiz kullanımı sonucu pestisitler yüzey akışı veya topraktan süzülerek su kaynaklarına ulaşmaktadır. Topraktan sızıntı yoluyla kontamine olan yeraltı sularının arıtımı ekonomik ve çevresel açıdan ciddi bir problem oluşturmaktadır. Bu nedenle yeraltı sularının korunması ve sürdürülebilirliğinin sağlanması oldukça önemlidir (Geed ve ark., 2022; Sankar ve Sivasubramanian, 2021; Liu ve ark., 2022).

Organofosforlu pestisitler biyolojik olarak kolayca parçalanamaz ve toksik etkileri nedeniyle sucul yaşamın zarar görmesine neden olmaktadır. Malathion insektisiti kanserojen, teratojenik ve endokrin bozucu etkiler göstermektedir (Badr,2020; Kralj ve ark., 2007; Yang ve ark., 2020). Çevreye ve canlılara olan etkileri sebebiyle pestisitlerle kontamine olmuş suların arıtımı zorunlu hale gelmektedir.

Fenton asidik şartlarda ferro demir (Fe^{+2}) ile hidrojen peroksidin (H_2O_2) reaksiyonu ile hidroksil ($^{\bullet}OH$) radikali üretimine dayanan toksik organik kirleticiler içeren atıksuların arıtımında kullanılan, basit ve etkili giderim sağlayan bir yöntemdir (Vasseghian ve ark., 2020). Malathion insektisitinin sucul ekosistemlerde

yarattığı organik yük ve toksisitenin Fenton prosesi gibi bir ileri arıtım yöntemiyle giderilmesi klasik arıtım yöntemlerine kıyasla umut vaat edici bir alternatiftir.

Bu çalışma kapsamında Malathion insektisitinin model atıksudan Fenton yöntemi ile giderilebilirliği araştırılmıştır. Fenton prosesine etki eden Fe^{+2} ve H_2O_2 derişiminin suda bulunan Malathion pestisitinin yarattığı TOK giderim verimine olan etkisi incelenmiştir. Fe^{+2} ve H_2O_2 derişiminin istatistiksel optimizasyonunda çift yönlü ANOVA testi kullanılmıştır. Malathion insektisitinin toksisitesinin belirlenmesi amacıyla sitotoksisite çalışmaları yapılmıştır.

MATERYAL VE METOT

Çalışma kapsamında Malathion insektisitinin model atıksudan Fenton yöntemi ile giderilebilirliği araştırılmıştır. Fenton prosesine etki eden demir ve hidrojen peroksit derişiminin Malathion giderim verimine etkisi incelenmiştir. Fenton çalışmaları 50 mg/l Malathion derişiminde, 250 ml numune hacminde, 125 rpm karıştırma hızında kesikli reaktörde gerçekleştirilmiştir. Fenton çalışmalarında model atıksuyun pH'ı 0,1 M H_2SO_4 çözeltisi kullanılarak pH 4'e ayarlanmıştır. Model atıksu pH'ının asidik koşullara ayarlanmasından sonra, Fe^{+2} ve H_2O_2 dozlaması yapılmıştır. Fenton çalışmaları 60 dakika boyunca devam ettirilmiştir. Çalışma başlangıcında ve çalışmalar süresince belirli zaman aralıklarında sistemden numuneler alınmıştır. Bu numunelerde pestisit kirliliğinin yarattığı organik yükün belirlenmesi amacıyla TOK analizi gerçekleştirilmiştir. Malathion insektisitine ait özellikler Tablo 1'de verilmiştir. Fenton prosesi TOK sonuçlarına göre optimize edilmiştir.

Tablo 1. Malathion insektisitine ait özellikler

Kimyasal yapı	Formül	$C_{10}H_{19}O_6PS_2$
Molekül ağırlığı	330,36 g/mol
CAS No	121-75-5

% TOK gideriminin hesaplanması için Eşitlik 1'de verilen bağıntı kullanılmıştır. Burada;

$$\text{TOK giderimi } (\%) = \frac{(TOK_0 - TOK_t)}{TOK_0} \times 100 \quad (1)$$

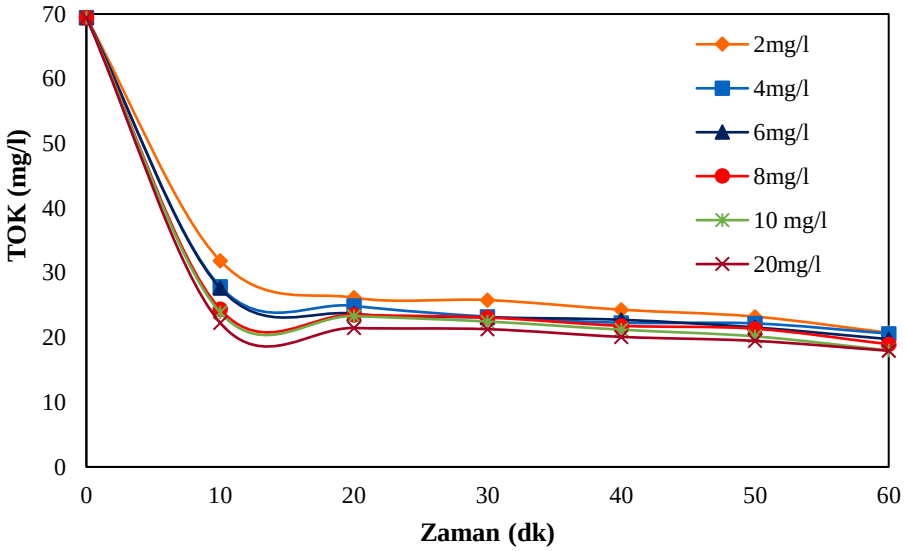
TOK_0: Model atıksuyun başlangıç TOK derişimi (mg/l),
TOK_t: t anındaki TOK derişimi (mg/l).

Malathion insektisitinin toksisitesinin belirlenmesi amacıyla Microtox Model 500 (Azur Environmental) analizörü ile sitotoksisite çalışmaları yapılmıştır. Microtox- sitotoksisite testi biyolüminesans olan *Vibrio fischeri* bakterisinin farklı derişimlerdeki test numunelerine maruziyeti sonucunda LD_{50} değerinin belirlenmesine dayanmaktadır. *V. fischeri* bakterisi test prosedürüne göre hazırlanan bir seri dilüsyona sahip test numunesinde 15 °C sıcaklıkta 5 ve 15 dakika inkübe edilmiştir. İnkübasyon sonunda başlangıç anına göre *V. fischeri* bakterisinin 5 ve 15 dakika maruziyet sonucundaki ışıma değerleri kaydedilmiştir. Test, numunenin bakteri süspansiyonuna doğrudan maruz bırakılmasının ardından *V. fischeri'* nin biyolüminesansının azalmasına dayanmaktadır.

BULGULAR ve TARTIŞMA

Çalışmalarda Fenton prosesine etki eden demir derişiminin (2, 4, 6, 8, 10 ve 20 mg/l Fe^{+2}) ve hidrojen peroksit derişiminin (250, 500, 1000, 1500, 2000 ve 2500 mg/l H_2O_2) Malathion giderim verimine etkisi incelenmiştir.

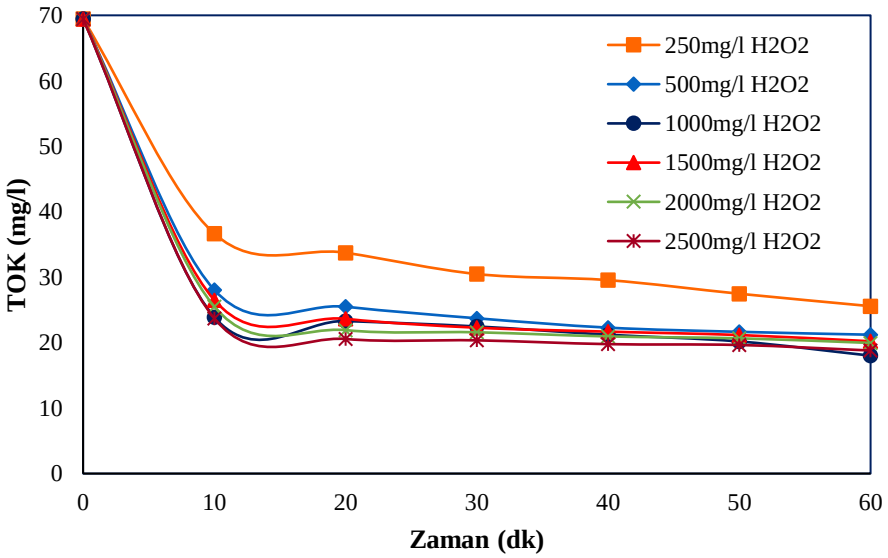
Fenton çalışmalarında Fe^{+2} derişiminin sistem verimine etkisi 2, 4, 6, 8, 10 ve 20 mg/l Fe^{+2} ilavesi ile incelenmiştir. Fe^{+2} derişiminin sistem verimine etkisinin incelenmesine ait giderim grafiği Şekil 1'de verilmiştir.



Şekil 1. Fe^{+2} derişiminin TOK üzerindeki etkisi

2, 4, 6, 8, 10 ve 20 mg/l Fe^{+2} ilavesi ile gerçekleştirilen çalışmalarda zamana bağlı % TOK giderimi sırasıyla %69,10, %71,45, %72,70, %73,86, %75,25 ve %75,34 olarak bulunmuştur.

H_2O_2 derişiminin sistem verimine etkisi 250, 500, 1000, 1500, 2000 ve 2500 mg/l H_2O_2 ilavesi ile incelenmiştir. H_2O_2 derişiminin sistem verimine etkisinin incelenmesine ait giderim grafiği Şekil 2'de verilmiştir.



Şekil 2. H_2O_2 derişiminin TOK üzerindeki etkisi

250, 500, 1000, 1500, 2000 ve 2500 mg/l H_2O_2 ilavesi ile gerçekleştirilen çalışmalarda zamana bağlı % TOK giderimi sırasıyla %64,19, %70,57, %75,25, %72,03, %72,41 ve %74,09 olarak bulunmuştur.

Deneysel verilerin istatiksel yorumlanmasında çift yönlü ANOVA testi kullanılmıştır. Ölçüm güvenilirliğini göstermek için her bir Fenton çalışması için çift yönlü ANOVA testinden elde edilen p değeri verilmiştir. Fe^{+2} derişiminin TOK giderim verimi üzerindeki etkisinin istatistiksel değerlendirmesine ve reaksiyon kinetiğine ait veriler Tablo 2 'de verilmiştir.

P değeri iki yönlü ANOVA testi kullanılarak grup içinde ve gruplar arası olarak her iki parametre için hesaplanmıştır. Bu p değerleri 0,01'den küçük olduğu için, her üç paralel deney koşulunun TOK ölçüm değerleri arasında anlamlı bir farkın olmadığı görülmüştür.
Malathion insektisiti ile gerçekleştirilen Fenton çalışmalarında TOK giderimi üzerinden belirlenen optimum koşullarda arıtım öncesi ve arıtım sonrası alınan örneklerde *V. fischeri* bakterisi üzerindeki toksik etkileri LD_{50} derişimleri belirlenerek incelenmiştir. Tablo 3'te görüldüğü üzere giriş suyu çok toksik iken arıtımla birlikte toksisite az toksik olarak bulunmuştur.

Tablo 3. Malathion insektisitinin toksisite sonuçları

Numune Adı	Sonuçlar		
Pozitif kontrol (LD_{50}, %v/v)	97±2 (t=5 dk)	98±2 (t=15 dk)	Toksik değil
Negatif kontrol (LD_{50}, %v/v)	25±1 (t=5 dk)	23±1 (t=15 dk)	Çok toksik
Giriş atıksuyu (LD_{50}, %v/v)	10±1 (t=5 dk)	13±1 (t=15 dk)	Çok toksik
Arıtım sonrası (LD_{50}, %v/v)	68±2 (t=5 dk)	70±2 (t=15 dk)	Az toksik

SONUÇ

Bu çalışmada Malathion insektisitinin yarattığı organik yük ve toksisitenin Fenton yöntemi ile giderilebilirliği araştırılmıştır. Elde edilen sonuçlar aşağıda özetlenmiştir.

- Fe^{+2} ve H_2O_2 derişiminin istatistiksel optimizasyonunda çift yönlü ANOVA testi kullanılmıştır.
- Malathion insektisitinin yarattığı TOK kirliliği 10 mg/l Fe^{+2} ve 1000 mg/l H_2O_2 ile %75,25 oranında, 0,0054 dk^{-1} hızıyla birinci derece reaksiyon kinetiğine uygun olarak giderilmiştir.
- Bu optimum koşullarda gerçekleştirilen sitotoksisite değerlendirmesi sonucunda TOK giderimine paralel olarak Malathion insektisitinin suda neden olduğu toksisite çok toksik (LD_{50}=%13±1) seviyeden az toksik (LD_{50}=%70±2) seviyeye düşmüştür.
- Çalışma sonucunda pestisit kirliliğinin yarattığı organik yük ve toksisitenin Fenton prosesi ile etkin bir şekilde giderilebildiği görülmüştür.

Özet
Sonlu elemanlar modellerinde, gerilme-deformasyon hesaplamaları için üç boyutlu analiz programları kullanılıyor olsada iki boyutlu analiz programlarıda güncel olarak yaygın bir şekilde kullanılmaktadır. Tünel açma süreci doğal olarak 3 boyutlu bir işlemdir. Bu durumu 2 boyutlu analizlerde uygun bir şekilde uygulayabilmek amacıyla analiz edilen kesitte tünel kazısı yaklaştığında oluşan gevşeme ve deplasmanları modellemek için tünel kazı bölgesindeki malzemenin rijitliğinin azaltılması yoluna gidilmiştir. Gevşetmenin ne ölçüde yapılacağının belirlenmesi amacı ile 2 farklı yöntem kullanılmış olup bulunan değerler karşılaştırılmıştır. Birinci yöntemde, farklı elastisite modülleri kullanılarak gerçekleştirilen analiz aşamalarında elde edilen tünel deplasmanları kullanılarak, elastisite modülü - deplasman eğrileri oluşturulmuştur. Elde edilen bu eğrilerin şekli ve eğiminin değiştiği noktalar dikkate alınarak, analizlerde gevşetme için kullanılacak elastisite modülü değerleri belirlenmiş ve grafikler üzerinde gösterilmiştir. İkinci yöntemde, Vlachopoulos ve Diederich, kazı kesitinin tünel yüzüne olan mesafesinin (X) tünel yarıçapına (R_t) oranı ile Tünel kazı çeperinin etrafında oluşacak plastik kaya zonu yarıçapının (R_p) tünel yarıçapına (R_t) oranının bilinmesi durumunda, destekleme sisteminin uygulanması gereken toplam tünel taç deformasyonu değerleri önermişlerdir. Elde edilen bu deformasyon miktarına göre gevşetme için kullanılacak olan elastisite modulü değeri belirlenmiştir.
Anahtar Kelimeler: Tünel, Sonlu elemanlar metodu, Elastisite modulü

Comparison of the results of different relaxation analysis methods applied in energy and diversion tunnels

Abstract
Although three-dimensional analysis programs are used for stress-strain calculations in finite element models, two-dimensional analysis programs are currently widely used. Tunneling is a 3D process. In order to apply this situation in 2D analysis, the stiffness of the material in the tunnel excavation area is reduced to model the relaxation and displacements that occur when the tunnel excavation is started. Two different methods were used to determine the relaxation rate. In the first method, elasticity modulus - displacement curves were created by using the tunnel displacements obtained in the analysis stages using different elasticity modules. Considering the points where the slope of these curves changed, the elasticity modulus values to be used for relaxation in the analyzes were determined. In the second method, Vlachopoulos and Diederich proposed the deformation value that the support system should be applied if the ratio of the distance of the excavation section to the tunnel face (X) to the tunnel radius (Rt) and the radius of the plastic rock zone to be formed around the excavation (Rp) to the tunnel radius (Rt) are known. The modulus of elasticity to be used for relaxation was determined according to the amount of deformation obtained.
Keywords: Tunnel, Finete element method, Elasticity modulus.

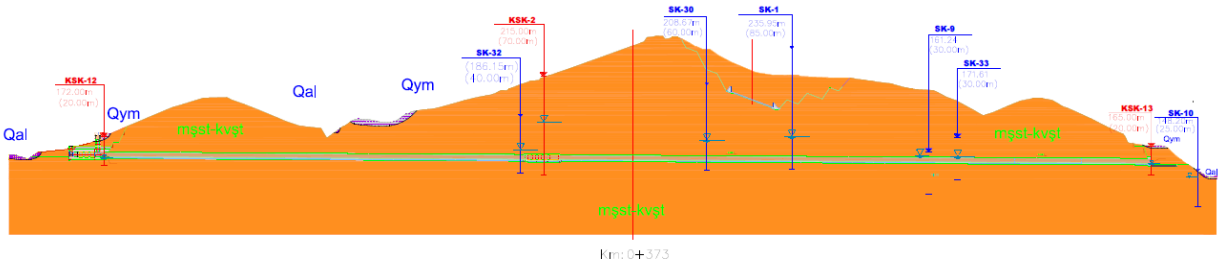
GİRİŞ

Tüneller, yeryüzünden farklı amaçlarla yer altında hedeflenen lokasyonlara ulaşabilmek için kazılarla oluşturulan yeraltı açıklıklarıdır (Yılmaz,I. 2007). Tünel tasarımında deneyimlenen zorluklar göz önüne alındığında belirsizliklerin irdelenmesi geoteknik mühendisliğinin en önemli konularından biridir. Çünkü zemin yapısı çelik ve beton gibi öngörülebilir ve yapısal özellikleri tahmin edilebilir malzemelerden oluşmadığı için yapılan analizlerin sonuçlarını büyük oranda etkilemektedir (Tekin,E. 2012).

Tünel imalatları, yapılan kazılar nedeniyle doğal olarak bir 3 boyutlu işlemdir. Ancak günümüzde her ne kadar analizlerin gerçekleştirilebilmesinde 3 boyutlu sonlu elemanlar yöntemini kullanan programlar olsa da 2 boyutlu sonlu elemanlar yöntemini kullanan programlarda sıkça kullanılmaktadır. Bu nedenle tünel imalatları sırasında gerçekleştirilen 3 boyutlu kazı işlemlerinin 2 boyutlu analizlere uygun bir şekilde tatbik edilmesi gerekmektedir. Bunun için kazı yapılacak bölgede bir rahatlama (gevşetme) uygulaması yapılır. Rahatlama faktörü (R_f) kazı aşamalarındaki deformasyonlara karşılık bir yükleme oluşturulmasıdır. Böylece yapılan iki boyutlu analizlerde üçüncü boyuttaki etkiler göz önüne alınmış olur. Deneyimlenen zorluklar çerçevesinde karmaşık problemlerin çözümünde sonlu elemanlar yöntemi, güncel durumda geoteknik problemlerin çözümünde en sık kullanılan sayısal modelleme yöntemlerinden biridir. Sonlu elemanlar yönteminin temelinde, yeraltı yapısı gibi karmaşık bir problemin, kabul edilebilir yaklaşımlarla basite indirgenerek sayısal bir çözüm aranması yatmaktadır (Arıkan, M. A. S., 1991). Çözümün gerçekleştirilebilmesi için modelin belli sayıda sonlu elemanlara ayrılarak modellenmesi gerekmektedir. Derivasyon tünelinin gevşetme analizlerinin gerçekleştirilmesinde Phase2 bilgisayar programı kullanılmıştır. Phase2 yazılımı, düzlemsel deformasyon (plane strain) ve eksenel simetrik (axisymmetric) yaklaşımları ile 2 boyuta indirgenmiş çözümlemeler yapabilen bir sonlu elemanlar programıdır. Bu çalışma kapsamında bir vaka analizi özelinde derivasyon tüneli profili üzerinde belirlenmiş bir adet kesite ait farklı metotlar ile gevşetme analizleri gerçekleştirilmiştir. Farklı metotlara ait analiz sonuçları karşılaştırılmış ve bu çalışma kapsamında sunulmuştur. Derivasyon tüneline ait plan görüntüsü en kesit görüntüsü Şekil 1.'de sunulmuştur.

Şekil 1. Derivasyon tüneli plan görüntüsü ve tipik tünel en kesiti

Derivasyon tüneli, güzergâhı boyunca farklı kaya koşulları ve örtü yüksekliklerine sahiptir. Gevşetme analizleri seçilen Km: 0+373 kesiti baraj mansap kısmında yer almakta ve yaklaşık 84.00m örtü yüksekliğine sahiptir.



Şekil 2. Derivasyon tüneli jeolojik profili

MATERYAL VE METOD

Derivasyon tünelinin tamamı Paleozoyik yaşlı Bayındır Formasyonuna ait mikaşistler içerisinde açılacaktır. Açılan sondaj kuyularına göre derivasyon tüneli güzergâhındaki mikaşistler genellikle az-orta (W2-W3), yer yer tamamen ayrışmış (W-5), orta-iyi yer yer az dayanımlı, kırıklı – çok çatlaklı, yer yer parçalanmış ve yapraklanmalıdır. Derivasyon tüneli yakınlarında açılan sondaj kuyuları Tablo 1. de gösterilmiştir.

Tablo 1. Derivasyon tüneli yakınında açılan sondaj kuyuları

SK No	Tünel KM	Tünel Güzergâhına Uzaklığı	Kuyu Derinliği (m)	Tünel Kazısı (m)

SK-1	0+410	49 m kuzeybatı	85	77 – 81 m arası
SK-9	0+585	90 m kuzeybatı	30	4 – 8 m arası

Tünel açılması sırasında karşılaşılacak problemlerin en aza indirgenmesi tünel güzergâhının jeolojik özelliklerinin tünel açılmadan belirlenmesi ile mümkündür. Tabakaların yatay, düşey ve eğimli olması durumunda, tünellerde değişik gerilmelerin ve bu gerilmelere bağlı olarak değişik olayların meydana gelmesi beklenir. Tabakalarla birlikte çatlak konumları ve ara uzaklığı tünellerde meydana gelen olaylarda önemli rol oynamaktadır. Jeolojik değerlendirmeler sonucunda kaya kütle sınıflaması RMR ve Q sınıflaması yapılmıştır. Yapılan hesaplamalar, sınıflamalar ve bu sınıflamalar sonucunda Roclab bilgisayar programından elde edilen girdi parametreleri Tablo 2.'de özetlenmiştir.

GEVŞETME ANALİZLERİ

Gevşetme analizleri çerçevesinde 2 farklı yöntem kullanılmış olup bu yöntemlere ait analiz ve hesaplama sonuçları aşağıda sunulmuştur.

I. Yöntem - Convergence Confinement Methodu:

Tünel içerisinde hiçbir destek sistemi olmadan deformasyon sınırlama (convergence confinement) tekniği ile kazı esnasında çekirdek yumuşaması kademeli olarak modellenerek her aşamada oluşan deformasyon hesaplanmıştır. Bu yöntem ile tünel kazısının zaman içerisindeki ilerleyişinin, tünel çeperlerinde oluşturacağı zamana bağlı deformasyonlar simule edilebilmektedir. Analiz sonuçları, deformasyon sınırları kullanılarak ilk destekleme sisteminin yapılacağı aşamayı belirlemek ve nihai tünel deformasyonunun oluşacağı aşamayı hesaplamak için kullanılmıştır.

II. Yöntem - Vlachopoulos ve Diederich Yöntemi:

Vlachopoulos ve Diederich (2009), kazı kesitinin tünel yüzüne olan mesafesinin (X) tünel yarıçapına (R_t) oranı ile Tünel kazı çeperinin etrafında oluşacak plastik kaya zonu yarıçapının (R_p) tünel yarıçapına (R_t) oranının bilinmesi durumunda, destekleme sisteminin uygulanması gereken toplam tünel taç deformasyonu

değerleri önermişlerdir. Elde edilen bu deformasyon miktarına göre gevşetme için kullanılacak olan elastisite modulü belirlenmiştir. Gerilme boşalma tekniği kullanılırken, ilk destekleme sisteminin kazı aynasından 2.00 m geride yapılmaya başlanacağı kabul edilmiştir. Bu yönteme göre tünel kaplamasının yapıldığı aşamadaki deformasyon ve gerekli elastisite modülü değeri aşağıda sunulmuştur.

BULGULAR ve TARTIŞMA

Gevşetme aşamasına ait elastisite modülünün belirlenmesi için gerçekleştirilen 2 farklı analiz metodundan ilk yöntem olan convergence confinement tekniğinde gevşetme aşamasına ait elastisite modulü oluşturulan elastisite modulü–deplasman eğrisinin eğiminin değiştiği nokta dikkate alınarak, 6. aşamada ana kaya elastisite modulünün %50'si olarak 1250.00 mPa olarak bulunmuştur. İkinci yöntemde Vlachopoulos ve Diederich tarafından önerilen gerilme boşaltma tekniği kullanılarak ise gevşeme anındaki elastisite modülü değeri 1100.00 mPa olarak bulunmuştur.

SONUÇ

3 boyutlu kazı işlemlerinin 2 boyutlu analizlere uygun bir şekilde gerçekleştirilebilmesi için kazısı yapılacak bölgenin rijitliğinin azaltılması gerekmektedir. Bu kapsamda convergence confinement tekniği ile çekirdek bölgesinde kademeli olarak elastisite modulü değerleri azaltılmış ve nihai tünel deformasyonunun oluşacağı aşama belirlenmiştir. Gerilme boşaltma tekniğinde ise Vlachopoulos ve Diederich (2009), tarafından önerilen eğri kullanılarak gevşetme için kullanılacak olan elastisite modülü belirlenmiştir. Yapılan analiz ve hesaplamalar neticesinde kazı bölgesine ait gevşeme anındaki elastisite modülleri sırasıyla 1250.00 mPa ve 1100.00 mPa olarak bulunmuştur. Bu durumda elde edilen elastisite modülleri arasındaki fark %12 olarak hesaplanmıştır. Her iki yönteme ait yapılan hesaplamalar neticesinde elde edilen elastisite modüllerinin birbirine yakın çıktığı belirlenmiştir.

TEŞEKKÜR

Abstract
The thermal design of the operation conditions of a circulating fluidized bed steam boiler with biomass fuel (wood chips produced from forest wastes) and computational fluid dynamics numerical solution by MFiX-PIC have been made. In the study, the hydrodynamic structure of a steam boiler is located in the Marmara Region/Turkey was investigated. For the numerical model boundary conditions of the steam boiler in which the circulation is provided by u-beam separators, the pseudo-combustion model has been created. For the pseudo-combustion model, the flue gas composition at a temperature of 850°C was calculated analytically and the model was defined as the gas density. Solutions to existing or potential problems were sought by examining the gas and solid phase. It has been observed that the horizontal positioning of the secondary and tertiary air nozzles negatively affecting the boiler pipes and the upward velocities. Numerical solutions have been made with the placement of the secondary and tertiary air nozzles at an angle of -20° (vertical). It has been observed that the angular change of nozzle placement causes a very low change in the amount of solids under the secondary air zone (-3.77%), while it causes an increase of 202.69% in the amount of solids in the upper secondary air zone.

INTRODUCTION

The use of fossil fuels for energy production disrupts the atmosphere balance and increases greenhouse gas emissions due to the release of carbon accumulated for many years into the atmosphere in a short time. However, biomass resources do not disturb the carbon balance in the atmosphere since the time between the generation and consumption of the resource is not too long. Especially during the growth of plant biomass, plants produce O_2 by photosynthesis and neutralize the CO_2 released by combustion in the life cycle (Srirangan, Akawi, Moo-Young, & Chou, 2012). Since biomass is the easiest renewable energy source to replace fossil fuels, efforts to transform existing fossil fuel systems are increasing (Schipfer & Kranzl, 2019).

Biomass combustion research has improved significantly in recent years. Although the experiments were seen as the primary method of operation at first, it was soon realized that the experiments were economically costly, time-consuming, and technically difficult, and the results were specific to the experimental facility. Unfortunately, the results obtained on the lab-scale had difficulty reflecting real facilities on a much larger scale.

Although the designs made with the thermodynamic equilibrium approach give analytical results regarding the working conditions of fluidized bed boilers, it is not sufficient to observe the problems and working conditions that may occur in any part of the boiler more comprehensively. Topal designed an RDF fuelled fluidized bed boiler with a thermal equilibrium approach and presented it with approximate cost calculations (Topal, 2018). With the development of the multi-phase computational fluid dynamics method, there have been great developments in lab-scale studies and industrial-scale studies. Gu et al. have studied scale-up characteristics of oxy-fuel combustion (from 0.1 MW_{th} to 330MW_e) using MP-PIC method with Barracuda VR software (Gu, Liu, Zhong, & Yu, 2020).

The two-fluid model (TFM) approach, in which solid and gas phases are considered as a continuous flow, forms the basis of multi-phase CFD studies. Considering that several studies have been done in the investigation of fluidized bed hydrodynamics and chemical reactions, the extensive knowledge is high and the calculation costs are lower, it has been seen that two-fluid model studies are still carried out today.

Coarse-grain DEM (Stroh vd., 2019) and Particle-in-Cell (PIC) (Clarke & Musser, 2020) methods are the most used methods among the methods developed and used in the literature to alleviate the high cost of the DEM methods.

The whole system can be investigated using CFD. In addition, it allows the investigation of certain parts of the system. Nakhaei et al. reviewed modelling of gas-solid cyclone separators (Nakhaei vd., 2020). There are several loop-seal CFD modelling studies. Also, there are several loop-seal CFD modelling studies in the literature with TFM, DEM, or PIC methods (Bandara vd., 2020; Basu & Butler, 2009; Peng vd., 2015; Zhao, Zhang, Liu, & Du, 2015). Nikolopoulos et al. compared TFM and coarse grain DEM in the case of a 1 MW_{th} fluidized bed simulation. They presented difference and common points of these methods. Also, they gave information about PIC method too (Nikolopoulos vd., 2017).

MATERIALS AND METHODS

The Eulerian-Lagrangian method particle-in-cell (PIC) in the Multiphase Flow with Interphase eXchanges (MFiX) 22.1 was used to study flow and particle behaviour in the fluidized bed.

While solid phases are modelled in the PIC method, particles with the same physical properties are transformed into statistically acceptable parcels with the approach that they will exhibit the same behaviour. In this method, particles that have different diameters with the same density should be defined as separate phases. For this reason, the determination of a single solid phase with a mean diameter approach for particle diameter distribution has been widely used in literature. In this study, several different diameters were selected to approximate the particle diameter distribution to reality. Figure 1 shows this statistical approach visually. (Clarke & Musser, 2020).

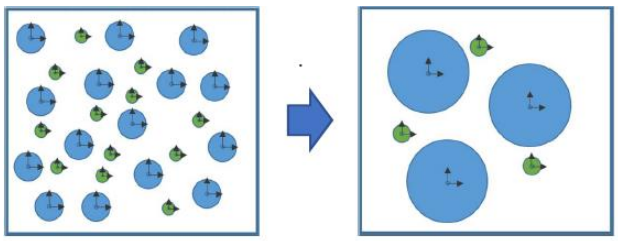

Figure 1 Visual concept of particle consolidation to computational parcels by type. (a) A single cell populated with particles. (b) The same single cell after a statistical weight has been applied to each particle type (Clarke & Musser, 2020)

The Navier-Stokes equations were slightly modified due to the presence of the solid phase. Gas volume fraction is defined as ε_f in the computational cell. Governing equations which continuity equations and momentum equations solved with MFiX-PIC are given below(ALTINSOY, KEÇECİ, & TOPAL, 2021; Clarke & Musser, 2020; Hartge, Ratschow, Wischnewski, & Werther, 2009; Vaidheeswaran, Gel, Clarke, & Rogers, 2021):

$$\frac{\partial}{\partial t}(\varepsilon_f \rho_f) + \nabla.(\varepsilon_f \rho_f \bar{u}_f) = 0 \tag{1}$$

$$\frac{\partial}{\partial t}(\varepsilon_f \rho_f \bar{u}_f) + \nabla \cdot (\varepsilon_f \rho_f \bar{u}_f \bar{u}_f) = -\varepsilon_f \nabla p + \nabla.\bar{\bar{\tau}}_f + \varepsilon_f \rho_f \bar{g} - \sum_{p=1}^{n_T} W_p \frac{V_p}{V_c} \beta_p (\vec{U}_f(\vec{x}_p) - \vec{U}_p) \tag{2}$$

Where W_p is the statistical weight, V_c and V_p are the volumes of fluid cell and particle, respectively. β_p is the drag force coefficient, $(\vec{U}_f(\vec{x}_p)$ is the gas velocity at parcel location, $\vec{U}_f$ and $\vec{U}_p$ is the parcel velocity. $\bar{\bar{\tau}}_f$ is the gas phase stress tensor:

$$\bar{\bar{\tau}}_f = 2\mu_f \bar{\bar{S}}_f, \quad \bar{\bar{S}}_f = \frac{1}{2}\left[\nabla \bar{u}_f + (\nabla \bar{u}_f)^T\right] - \frac{1}{3} \cdot \nabla \bar{u}_f \bar{\bar{I}} \tag{3}$$

In the PIC method, the particle collisions are not resolved directly, and the contact force is expressed as the gradient of the solids stress tensor (Clarke & Musser, 2020) as given by:

$$F_{contact} = \frac{\nabla \bar{\bar{\tau}}_s}{\varepsilon_s \rho_p} \tag{4}$$

Parcel motion equations:

$$\frac{d\vec{x}_p}{dt} = \vec{U}_p \tag{5}$$

$$\frac{d\vec{U}_p}{dt} = -\frac{\nabla p}{\rho_s} - \frac{\nabla p_s}{\varepsilon_s \rho_s} + \vec{g} + \frac{\beta_p}{\rho_s}(\vec{U}_f(\vec{x}_p) - \vec{U}_p) \tag{6}$$

Where p_s is the particle pressure:

$$p_s = \frac{P_s^* \varepsilon_s^\alpha}{\varepsilon_{s,\max} - \varepsilon_s} \tag{7}$$

where P_s^* ,α are PIC parameters, $\varepsilon_{s,\max}$ is the solid volume fraction at close pack.

The position and velocity of the parcels of solid particles is resolved by Newton's second law of motion. The interaction force in the momentum equations for gas-solid momentum transfer, I_{sg}:

$$I_{sg} = \beta_p(\overline{U_s} - \overline{U_f}) \tag{8}$$

Gidaspow Blend (Wen-Yu/Ergun) Drag Model

$$\beta = \begin{cases} \frac{3}{4} C_D \frac{\varepsilon_s \varepsilon_f \rho_f \left|\vec{u}_f - \vec{u}_s\right|}{d_p} \varepsilon_f^{-2,65} & \varepsilon_f \geq 0,8 \\ \frac{150\varepsilon_s(1-\varepsilon_f)\mu_f}{\varepsilon_f d_p^2} + \frac{1,75\rho_f \varepsilon_s \left|\vec{u}_f - \vec{u}_s\right|}{d_p} & \varepsilon_f \leq 0,8 \end{cases}$$

$$C_D = \begin{cases} \frac{24}{\mathrm{Re}(1+0,15\,\mathrm{Re}^{0,687})} & \mathrm{Re} < 1000 \\ 0,44 & \mathrm{Re} \geq 1000 \end{cases} \tag{9}$$

$$\mathrm{Re} = \frac{\varepsilon_f \rho_f \left|\vec{u}_f - \vec{u}_s\right| d_p}{\mu_f}$$

Thermal Design and Model

In the study, the hydrodynamic structure of a steam boiler that produces 50 t/h steam at 62 bar pressure, 450°C, and is located in the Marmara Region/Turkey was designed and investigated. For the numerical model boundary conditions of the steam boiler in which the circulation is provided by u-beam separators, the pseudo-combustion model has been created which is proposed by Adamczyk et al. [1]. For the pseudo-combustion model, the flue gas composition at a temperature of 850°C was calculated analytically and the model was defined as the gas temperature. The method used for the analytical calculation (Basu, Kefa, & Jestin, 2000) is the same as in Topal's (Topal, 2018) study. Calculated flue gas composition is given in Table 1.

Table 1 Analytical Results of Flue Gas Compositions

Parameter	**Value**
O_{2min}	0.8197701 Nm^3/kg-F
Excess air constant	1.4
V_{CO2}	0.7927701 Nm^3/kg-F
V_{SO2}	0
V_{NF}	0.0052 Nm^3/kg-F
V_{NA}	3.083897043 Nm^3/kg-F
V_{H2O} (Stoichiometric)	0.760207277 Nm^3/kg-F
Total flow rate of flue gas (V_{G0})	18.84726776 Nm^3/s
Total flow rate of flue gas at 850 (°C) (V_G)	77.53 m^3/s

The dimensions of the fluidized bed, whose geometry is given in the Figure 2, on the horizontal axis are 3836 mm x 2486 mm in the lower region while it was expanded to 3836 mm x 3746mm in the upper region.

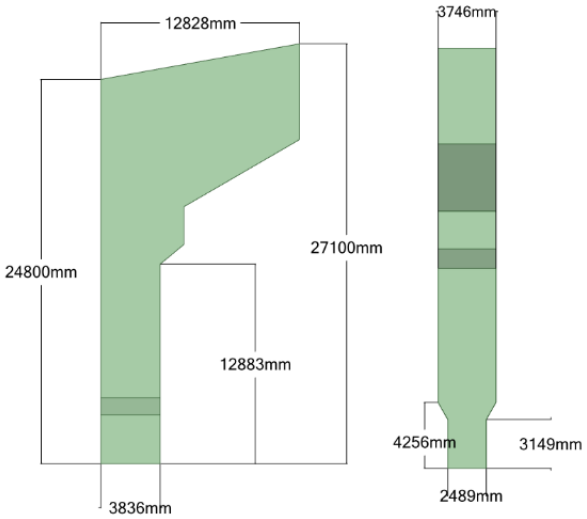

Figure 2 Geometry of the CFB Boiler

In the design, there is a wall (3,746 m. x 4,645 m.) separating the main bed area from heat transfer surfaces such as the superheater and economizer and providing circulation. In addition, 4 rows of u-beams were placed to prevent the solid particles moving in the horizontal direction from completely separating from the boiler. For secondary air supply, nozzles are placed on each surface at a distance of 0.5 m from the corners, 0.25 m from each other at 3 different heights (4.03 m., 5.33 m., 6.63 m.) as given in Figure 3.

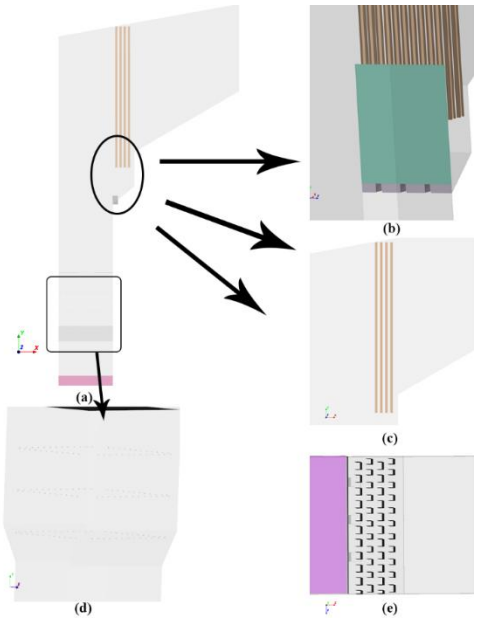

Figure 3 Illustration of the inner surface and point source regions for boundary conditions (a) fluidized bed overview (b) inner wall providing circulation (c) u-beams (d) secondary air nozzles (e) u-beam placement

For PIC simulation, five different grid number and five different statistical weight has been chosen and simulated. As a result of the validation study, 804540 grids and 25000 statistical weight were selected considering the cost and accuracy. PIC parameters and whole numerical modelling values are given in Table 2.

Table 2 Initial, boundary conditions and PIC parameters for CFD solution

Parameter	**Value**	**Parameter**	**Value**
Gas-solid drag model	Gidaspow blend (Wen-Yu/Ergun)	**Boundary Conditions**	
Grid number	804540	**Primary air boundary condition**

Solid fraction in bed	0,55	Nozzle angles	Horizontally: 20° angle for both Vertically: 0° for condition 1, -20° for condition 2

RESULTS and DISCUSSION

In this section, the effect of secondary air angles is investigated by comparing two different design results. In the current design, which is also used while validating the numerical model, it is observed that the average velocities on the boiler walls are high. The time-averaged contours of the gas velocities on the boiler walls are given in Figure 4(a). High gas velocities also caused the particles to hit the walls at high speed, caused damage to the pipes (water walls) and the surrounding insulation material. Figure 4(b) shows the time-averaged gas velocity contours in the wall regions as a result of the design improvement suggestion. Contrary to Figure 4(a), where the nozzles are placed horizontally (-20°), it is seen in Figure 4(b) that the velocities in the wall region approach 0 m/s. The high velocities seen in the wall region in the bed expansion region are due to the placement of the secondary air supply nozzles.

When the time steps are examined, it is seen that the velocities are high in the middle regions as expected in the fluidized beds, but the velocities are constantly high in the wall regions from the secondary air supply points. It has been observed that the particles move close to the walls over the dense region. In addition, it was observed that the horizontal velocities of the particles almost adjacent to the wall were zero or close to zero, while the particles tended to approach the walls.

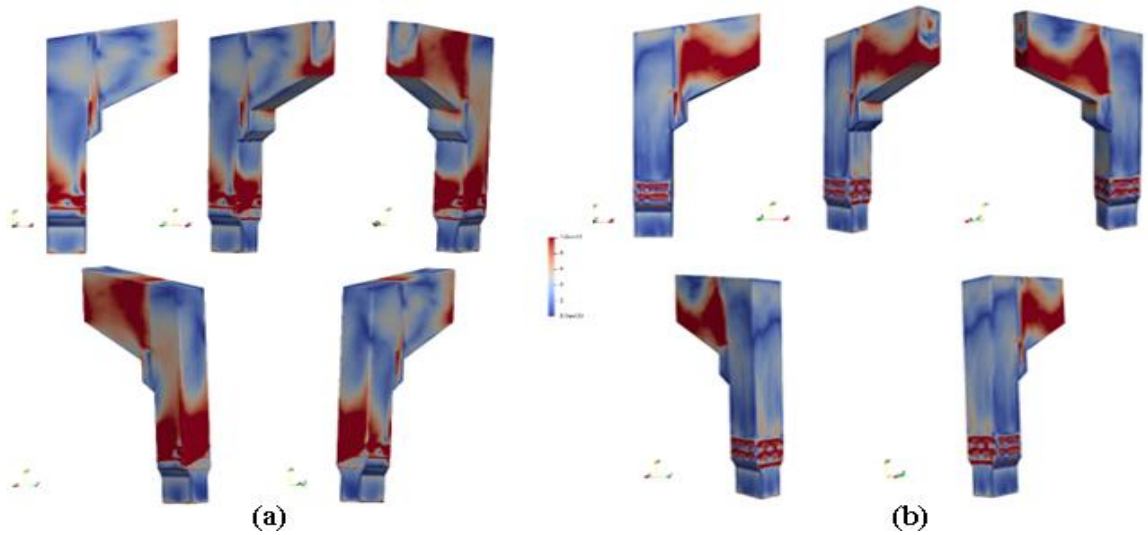

Figure 4 The time-averaged gas velocity values in the CFB boiler walls (a) existing design (b) design improvement (-20°) (Ug = 0 – 10+ m/s from blue to red)

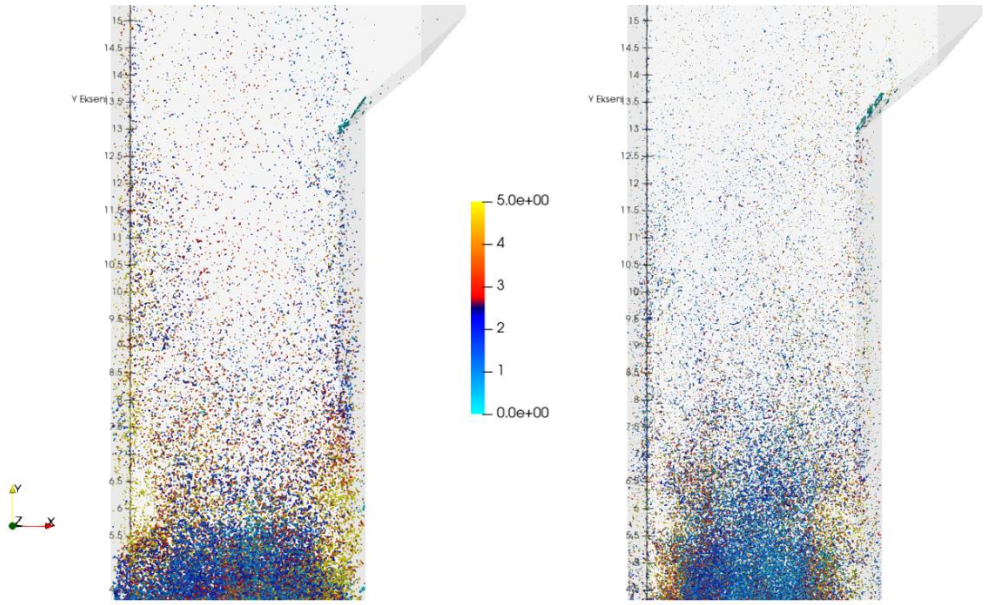
In addition, it was observed that sufficient particles could not reach the return zone and the circulation could not be provided at a sufficient level. It is estimated that the reason for this is that the horizontal angled placement of the secondary air nozzles causes a decrease in their vertical velocity due to the particles losing their energy as a result of their interaction with the wall and each other.

The variation of the average particle mass for three different surfaces is given in Table 3. While calculating the mass amounts, the average value was taken into account by taking the particle mass at each time step from the determined surfaces. Since the height of H = 3 m is within the heights at which the bed remains constant after the primary air is supplied, no change in the amount of particles was observed in either case. However, when the H = 8 m and the return zone solids were examined, 202.69% and 247.017% increases were observed, respectively. These increased amounts show that the particles are transported to the top of the bed and the circulation is improved without the design change greatly changing the bed structure.

Table 3 Comparative average particle masses on three different surfaces for existing design and design improvement

	H = 3 m.	**H = 8 m.**	**Return Zone**
Existing design	176.1556 kg	1.95975 kg	0.02967 kg
Design improvement (-20°)	169.51519 kg	5.93203 kg	0.10296 kg
Variation	**-3.77%**	**+202.69%**	**+247.017%**



(a) **(b)**

Figure 5 Instantaneous distributions and velocity profiles of particles in the range H = 4.5 m - H = 15 m (t = 25 s) (a) existing design (b) design improvement

Figure 5 shows the results of two different numerical solutions for the current situation and design improvement. During operation, the fluidized bed rises to a range of 4 m. - 4.5 m, and at higher altitudes, splashes of particles are observed. In order to clearly observe the particle circulation, the range of 4.5 m – 15 m was investigated. In the current situation (Figure 5(a)), the high velocity of the particles close to the walls poses a problem as mentioned before. It is observed in Figure 5(b) that the particles are collected in the centre of the bed with the design change.

CONCLUSION

Experimental investigation of large-scale fluidized bed steam boilers is very difficult due to their operating conditions. For this reason, it is important to model existing systems. The high volatile carbon content of biomass increases the importance of secondary and tertiary air design. The present study offers a proposal for solving the problems thought to be caused by the secondary air supply. Turning the horizontal flow inlet down by -20° solved the horizontal velocity problems and increased the solids circulation. The MFiX-PIC model was suitable for studying large-scale fluidized bed hydrodynamics.
It is suggested that a parametric study can be done with different nozzle angles to expand the study.

Abstract

Oil plants have a very important place in animal and human nutrition in terms of protein, carbohydrates, minerals and fat content. Vegetable oils are one of the main nutrients in the nutrition ring that people should take in order to lead a healthier life. In addition, the need for vegetable oils, which is the core material of biodiesel, which is evaluated especially in the energy sector, is increasing its importance day by day. In this case, it is inevitable to increase the production of oil crops in all sustainable agricultural lands. Throughout the world, oil crops are cultivated in two ways as annual and perennial. Oil crops grown for one year; soybean, rapeseed, sunflower, sesame, safflower, peanut, flax and camelina, perennial plants such as olive, coconut, jojoba, cocoa, palm and avocado. Safflower is an oilseed plant grown in winter and summer, belonging to the genus Carthamus of the Asteraceae (Compositeae) family, which shows foreign pollination and is grown for one year. It contains 20-50% oil in the seeds of the safflower plant and the fact that it is approximately 90% (oleic and linoleic) in terms of total unsaturated fatty acids is proof of how important the quality of edible oil. Transposable elements (TEs) are the most abundant group of genomic elements in plants that can be found in genic or intergenic regions of their host genomes. Approximately 50–90% of plant genomes are composed of transposons. The genome movements created by transposons are called transpositions. In general, transposons are divided into two groups, retrotransposons and DNA transposons, according to their transposition mechanism in the genome. In this work, a subset of EBR treated TE families in safflower leaf tissue was defined, based on genome-wide transposon homology and annotation. Our results indicated that, the read numbers for TE subfamilies yielded different distributions between DNA and RNA transposons. Several crop species have been improved utilizing molecular markers in various crop breeding programs. However, for safflower, its genetics and genomics were less studied, which can explain the lack of reliable marker systems for use in the process of developing superior safflower cultivars. This study was conducted to evaluate the genetic diversity and population structure of safflower accessions using transposons as a start for further scientific investigations and practical breeding use cases.

Keywords: *Carthamus tinctorius*, transposon, brassinosteroid, EBR, in silico

INTRODUCTION

Safflower (*Carthamus tinctorius* L.) is an important oilseed crop belongs to family Asteraceae. It is widely cultivated in semi-arid regions for its oil, foliage and flower. The safflower oil is rich in polyunsaturated fatty acids; it is edible and also medicinally valued (Dajue and Mundel, 1996). Carthamin, an orange-red dye, extracted from the petals of safflower used as a coloring agent in food and textile industry. The seeds of the safflower plant contain 20-50% oil and the fact that they are approximately 90% (oleic and linoleic) in terms of total unsaturated fatty acids proves how important the quality of edible oil is (Öztürk et al., 2008). In addition, since safflower oil has antioxidant properties and contains high tocopherol-containing vitamin E, it is likely to be included in the diets of cardiovascular patients. The fact that it is very effective in the amount of cholesterol is an indication that this plant is very valuable. After extracting the oil from the safflower seed, the remaining pulp takes its place in animal nutrition (Uğur, 2010). For this reason, it is very important in the raw material source of the vegetable oil and compound feed sector. It can also be used in animal nutrition, grazing, silage and hay making, feed industry, pulp making (it has an important place

in animal husbandry with its high protein rate of 25%), beekeeping and biodiesel production (İlkdoğan, 2012).

Transposons or transposable elements (TEs), are sequences of DNA that have the ability to be relocated within the genome. TEs, also known as transposons, are mobile genetic elements that enlarge prokaryotic and eukaryotic genomes (Wicker et al., 2007). McClintock (1950) initially cited the TEs as ‘‘controlling elements’’ because of their capability in effecting expression of nearby genes. Allelic variation for insertions of the transposable elements associated with stress-responsive expression can contribute to variation in the regulation of nearby genes. So novel insertions of transposable elements provide a potential mechanism for genes to obtain cis-regulatory impacts that could contribute to heritable variation for stress response. To cope with these stresses, they have evolved different defence systems during evolution. One of the adaptation for plants is genome expansion. Plants have larger genomes than other living organisms. Among plant species the size of the genome can vary about 2000-fold (Bennett et al., 2011). Also polyploidy may result genome expansion within plant species. These bursts can occur via environmental changes or stresses. This is explained by the burst of transposable elements (TEs) in their genome (Tenaillon et al., 2010; Casacuberta et al., 2013). Previously TEs have described as ‘’junk’’ or ‘’parasite’’ DNA sequences. However, now they approved as a source of genetic diversity and evolution. TEs can be defined as repetitive DNA sequences that can be transposed in host genomes with active or inactive sequences (Ramakrishnan et al., 2022). Till now with the advances in molecular biology and bioinformatic tools they have identified in many organisms. TEs are mobile genetic elements comprising large portions and a wide variety of eukaryotic genomes (Lisch, 2013). TEs are accountable for significant genomic variation in plants, whether within or between species (Catlin and Josephs, 2022).

TEs can change their localization via transposition in the genome and can be classified into two main classes according to their transposition mechanisms and evolutionary origins (Feschotte et al., 2002). One of it is Class I transposons (RNA transposons) are also called retrotransposons. They use mRNA as mediators and move via “copy-and-paste” mechanism. Firstly, RNA intermediate is transcribed from a genomic copy, then RNA intermediate reverse-transcribed into cDNA catalyzed by TE-encoded reverse transcriptase (RT). The copy inserted anywhere in the genome. This mechanism results in the formation of multiple copies in the genome. Class II (DNA transposons) use cut and paste replicative processes for their transposition. In this mechanism the copy is cut from its location and inserted into another region in the genome. Furthermore, TEs are classified according to their structural domains. Hence, beside two major classes there are nine orders and 29 super families based on their transposition mechanism and structure. (Kumar and Bennetzen, 1999; Wicker et al., 2007). Class I TEs are divided into five main orders: long terminal repeat/endogenous retrovirus elements (LTR retrotransposons), long interspersed nuclear elements (LINEs), short interspersed nuclear elements (SINEs), Penelope-like elements (PLEs) and Dictyostelium repetitive sequence elements (DIRS-like elements). LTR transposons are more abundant in plants than animals (Neumann et al., 2003). Different LTR retrotransposon families can be found predominantly in various plant species (SanMiguel et al., 1998). Class II TEs are classified as DDE, Crypton, Helitron, and Maverick/Polinton elements.

Brassinosteroids (BRs) can be synthesized in almost all parts of the plant. BRs are found in very low concentrations in various plant parts (such as pollen, seeds, leaves, stems, roots and flowers) (Rao et al., 2002). It is known that BRs are effective in plant growth and development and many other physiological events such as seed germination, rhizogenesis, flowering, maturation, cell expansion and elongation (Symons et al., 2006). During the studies carried out to determine the roles of BRs on physiological events in plants, it has been determined that an important function of these compounds is to correct or prevent the problems caused by various biotic and abiotic stress factors (Krishna, 2003). 2,4-Epibrassinolide (EBR) plays prominent roles in various physiological processes, including growth, differentiation and photosynthesis (Kim et al. 2012). As a potent plant growth regulator, EBR is used to increase the growth and yield of important agricultural crops (Khripach et al. 2000). It can also enhance plant tolerance to a variety of abiotic and biotic stresses (Xia et al. 2009; Sharma et al. 2013; Xi et al. 2013). For example, EBR application ameliorates the stress-induced inhibition of photosynthesis in tomatoes and cucumbers (Ogweno et al. 2008; Yu et al. 2004).

In this present study, we investigated a subset of EBR treated TE families in safflower was defined, based on genome-wide transposon homology and annotation. Based on our data TE genes play an important role in the regulation of safflower plant mechanisms.

MATERIALS AND METHODS

RNA-Seq data use in study

The Illumina RNA-HiSeq reads sequences were obtained from NCBI Short Read Archive. The untreated-control (C) and EBR treatment reads sequences were retrieved from NCBI Short Read Achieve (SRA) database (https://www.ncbi.nlm.nih.gov/sra) under accession number SRX8174604 and SRX8174605, respectively (Prasad et al., 2022). The sequenced read length for forward and reverse sequences of paired-end data is 100 bp in length. All readings were obtained in raw sequence data as ".sra" format and converted to "fastq" format for Illimuna by the NCBI (National Center for Biotechnology Information) SRA Toolkit. Lowquality reads and those containing adapter were removed from raw data using in-house Perl scripts. All subsequent analyses were performed on high-quality clean data. Transcriptome assembly for cleaned data was performed in Trinity with default parameters (Grabherr et al., 2011). For sequence mapping, all clean reads were aligned to the reference database using the SOAPaligner/SOAP2 v2.20 program (Xie et al., 2014). To identify the TEs responsive to drought stress, we used Basic Local Alignment Search Tool (BlastN 2.13.0) to search against all sequences of transposons in Repbase database (version 20160829) by using 1e-10 E-value as a cutoff point. Repbase is known as a worldwide reference standard for annotating the existence of repetitive DNA in genomic data.

RESULTS and DISCUSSION

Transposable elements are a major component of many eukaryotic genomes, and constitute the majority of plant nuclear DNA. Previous studies in several plant species have suggested that at least some families of transposable elements may become transcriptionally activated following environmental stress (Makarevitch et al., 2015). In this present study in silico identification of TEs were performed in transcriptome libraries of control and EBR-treated safflower plants. Read numbers of TEs in control and EBR-treated libraries were 11.723 and 11.776, respectively (Figure 1).

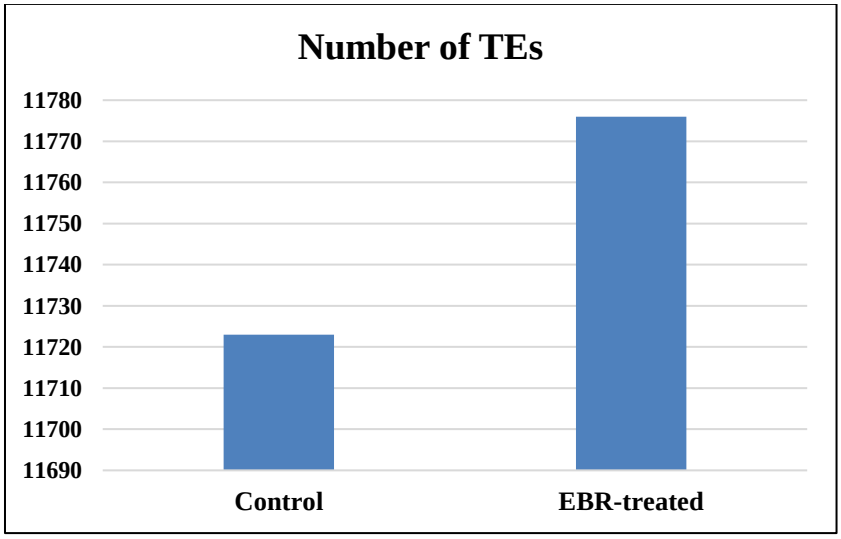

Figure 1. The numbers of transposons obtained from RNA-seq libraries of control and EBR-treated samples

When read numbers of TEs were taken into account it can be said that TEs expressed higher in EBR-treated samples than control samples. The read numbers for TE subfamilies yielded different distributions between DNA (Class II) and RNA (Class I) transposons. In both groups, the number of RNA (Class I); LINE/L1, LTR/Gypsy, LTR Copia, SINE; transposons is higher than that of DNA (Class II); DNA/CMC-EnSpm, DNA/hAT, DNA/MuDR, DNA/PIF-Harbinger transposons (Figure 2,3).

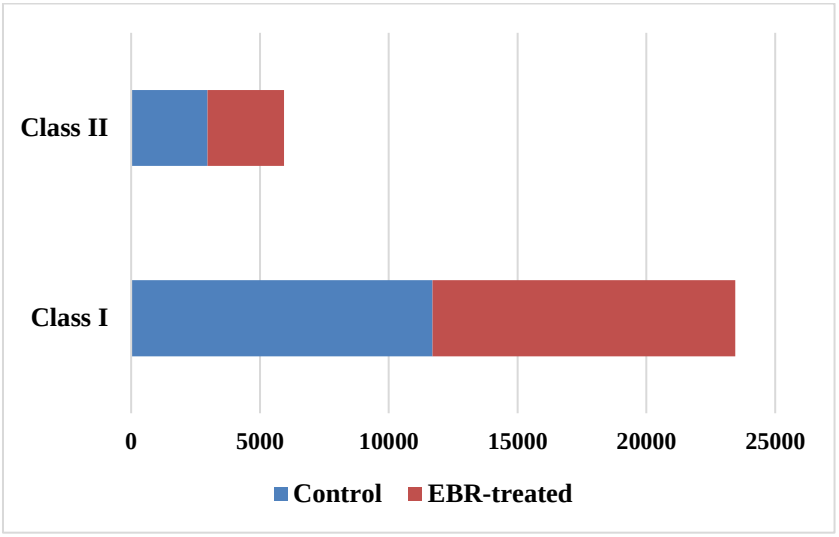

Figure 2. The read numbers for TE subfamilies different distributions between DNA (Class II) and RNA (Class I) transposons

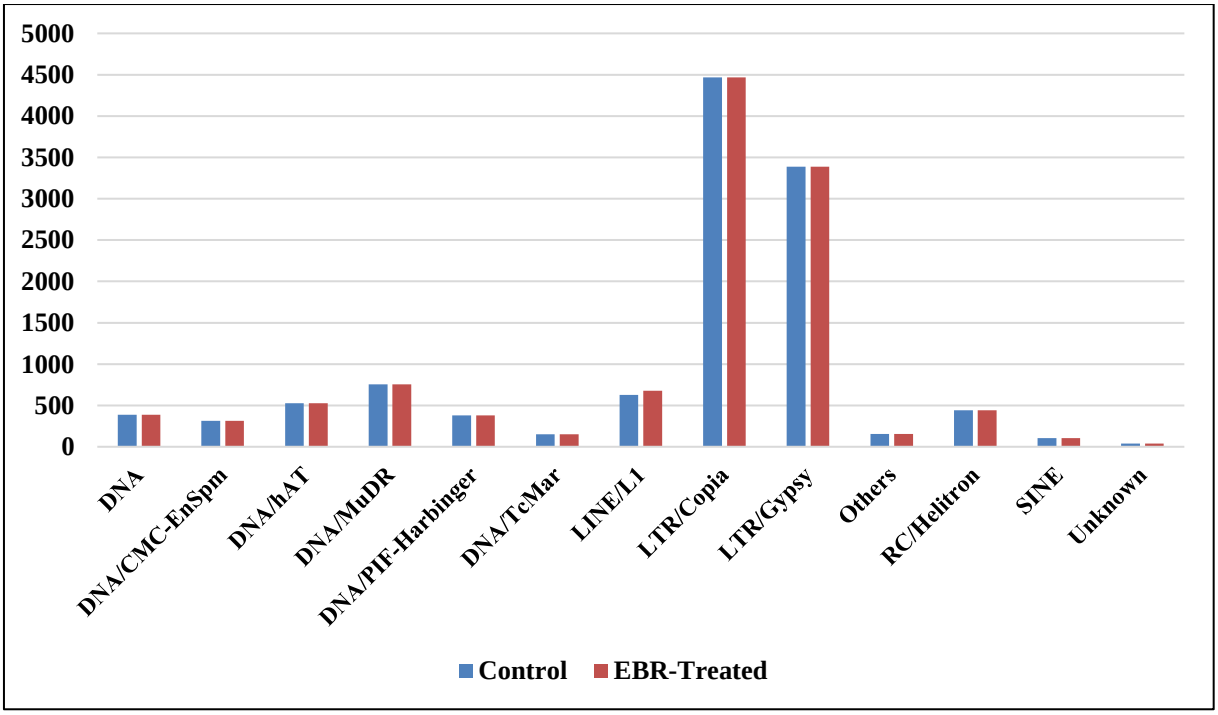

Figure 3. The numbers of DNA and RNA transposons obtained from RNA-seq libraries of Control and EBR-treated samples

A slight reduction was observed in the read numbers of RNA TEs such as Gypsy, Copia and LTR, TEs after EBR treatments, comparing to control. Interestingly, EnSpm, hAT and Harbinger showed incremental ratios after EBR treatment revealed a declined pattern in addition (Figure 3). Also retrotransposon LTR/Copia, LTR/Gypsy and LINE families showed significant transcription activity in EBR-treated libraries. Mariner families showed no significant transcription activity while SINE and MuDR families showed lower transcriptionally activity under EBR-treated conditions. These results supported that genome and transcriptome orientation by transposon activity might have a role in adaptation and regulation of stress response (Negi et al., 2016). Besides, regulation of epigenetic mechanisms has an impact on transcriptional activity of TEs in the water deficit (Makarevitch et al., 2015). Although DNA transposon's transcription

activity is controlled strongly, several retrotransposons become transcriptionally active under some stresses like drought stress, wounding or other abiotic stresses (Grandbastien, 1997; Takeda et al., 1998; Capy et al., 2000). But in this current study, it was observed that RNA transposons more active than DNA transposons. In addition retrotransposon classes such as Copia and Gypsy might play an active role in safflower since plenty of transcript encoding them was identified in the libraries.

CONCLUSION

In this present study, TE families was profiled to understand the molecular mechanisms occurred during the EBR-treated and control samples. As a result of that study it was observed that water deficit affected the transcriptional activity of several transposons. The analysis of TEs will provide useful information about mobility genetic elements roles in potato under the drought stress. This study is also valuable for the further researches of TE-mediated gene mutation and contributes to elucidating the roles of TEs in plant genome evolution. Identification of TEs which are taking part in stress can offer useful information for functional genomics and designing novel breeding strategies in developing stress tolerant plants.

Abstract

Living organisms produce a wide variety of secondary metabolites for adaptation to the environment or to protect themselves from enemies. Since these metabolites have to function in a suitable tissue at the right time or may be toxic to the living thing, their biosynthesis and transport must be regulated. ABC transporters are one of the largest protein families found in all living organisms. ATP-binding cassette (ABC) proteins are the transporter proteins that enable compound exchange across many different biological membranes using the energy released from ATP hydrolysis. Opium poppy (*Papaver somniferum* L.) is one of the most medically important plant because of producing benzylisoquinoline alkaloids (BIAs) such as morphine, codeine and noscapine. In opium poppy, BIA biosynthesis occurs in stem tissue and accumulates in capsule. These processes comprise three phloem cell types and involves in the translocation of key pathway intermediates between sieve elements and laticifers. In this study *in silico* transcriptome-wide tissue specific gene expression analysis of ABC transporter genes was performed in two different opium poppy Munich and HN1 cultivars that produce morphine and noscapine as major alkaloid, respectively. 11 differentially expressed ABC transporter family members were detected in Munich cultivar while 21 members were found in HN1. The fold changes of the genes ranged from -8 to 6 between capsule and stem tissues in Munich cultivar and -10 to 7 in HN1 cultivar. Five transcripts were shared between Munich and HN1 cultivars. Results showed that especially ABCG subfamily transcripts differentially expressed between tissues. Besides different major alkaloid producing cultivars displayed different expression patterns. This suggests that different alkaloids can be transported with different ABC transporter proteins in opium poppy.

Keywords: ABC proteins, gene expression, opium poppy, transcriptome

INTRODUCTION

Secondary metabolites have various functions in plants, such as the development process, adaptation to the environment or defence. As they can function in the produced part, they can also function away from the place where they are produced. For this reason, their transportation or accumulation in the relevant place requires important transport systems. (Larsen et al., 2017). Various studies have proposed different transport mechanisms for the secondary metabolites, like simple diffusion, transporter-mediated membrane transport and vesicle-mediated transport. Different carrier protein groups also take place for these mechanisms. There are 4 carrier protein families that have been identified for the transport of secondary metabolites so far. The classification of these transporters is nitrate-peptide transporter (NRT), purine permease (PUP), multidrug and toxic compound extrusion (MATE) and ATP-binding cassette (ABC) transporter families (Nour-Eldin et al., 2013; Takanashi et al., 2014; Jelesko, 2012; Yazaki et al., 2009).

ABC transporters are one of the largest families of proteins found in a wide variety of organisms, both in prokaryotes and eukaryotes (Henikoff et al., 1997). Many years ago, it was thought that eukaryotic ABC transporters are involved in the extrusion of compounds from the cytosol, as they are involved in cellular detoxification. Now it is known that ABC transporters are present in most cell membranes, plastidal, peroxisomal and mitochondrial membranes (Kretzschmar et al., 2011). ABC transporters are the importers and exporters which use energy obtained from ATP hydrolysis. Most ABC proteins involves transmembrane domain which catalyses the ATP hydrolysis and nucleotide binding domain that facilitates

the translocation of the substrates (Locher, 2009). According to the sub-domains, plant ABC proteins are classified into 8 subfamilies (ABCA-ABCG and ABCI; ABCH is absent in plants) (Sharom et al., 2011).

In plants alkaloids can be transported inter-organ, intercellular, and intra-cellular. (Shitan and Yazaki 2007). Biosynthesis of alkaloids may occur in different cell types within an organ, and transporter proteins transport pathway intermediates between the cells or tissues. Beaudoin and Facchini (2014) thought that thebaine, which is an intermediate of morphine. In opium poppy, is transport from sieve elements to laticifers before the synthesis of morphine.

Opium poppy (*Papaver somniferum L.*) is an annual plant with 2n=22 chromosomes and traditionally grown in Turkey (TMO, 2017). It is an important plant for its benzylisoquinoline alkaloids (BIA). It synthesizes more than 100 alkaloids. Morphine, noscapine, berberine, sanguinarine and papaverine are the most known members. BIA biosynthesis is a very complex pathway since the variety of the alkaloids (Singh et al., 2019). The BIA biosynthesized in the stem and transported to the different tissues such as capsule and root. For example, whereas morphine and noscapine accumulated in capsule, berberine and sanguinarine accumulated in roots (Yazıcı, 2017).

However, unlike primary metabolites, there is insufficient data on the transport mechanisms of these metabolites. In this study, we performed the gene expression analysis of ABC transporter families in two cultivars producing different major alkaloids Munich (morphine) and HN1 (noscapine).

MATERIALS AND METHODS

Data Collection

Publicly available transcriptomic datasets were downloaded from NCBI Short Read Achieve (SRA) database (https://www.ncbi.nlm.nih.gov/sra) under bioproject number PRJEB8056 (Munich) and PRJNA435962 (HN1).The analysis were conducted using the RNA-seq libraries ERX651056 (capsule) and ERX651082 (stem) for Munich cultivar and SRX3742160 (capsule) and SRX3742161 (stem) for HN1 cultivar.

Data Mining

First all the reads were converted to “fastq” format using SRA Toolkit. The adaptor sequences and uncertain nucleotides were discarded. Low quality nucleotides filtered by CASAVA software (version 1.8.2, Illumina, Hayward, CA). With the remaining sequences the transcriptome libraries assembled using Cufflinks software version v2.2.1 (Trapnell et al., 2010). After assembly the libraries mapped to P. somniferum genome using HISAT2 v2.0.5 with default parameters (Kim et al., 2015). ANNOVAR was used to annotate the transcripts.

Identification of Differentially Expressed Genes (DEG)

We performed differential expression analysis (DEA) with obtained data between the capsule and stem samples of each cultivar, induvially using Cuffdiff. The transcripts with an adjusted p-value ≤ 0.05 and log2 fold change (log_2FC) ≥ 2 were identified as upregulated and $log_2FC \leq 2$ were selected as downregulated transcripts.

RESULTS and DISCUSSION

DEA was conducted to evaluate the expression patterns between the transcriptome libraries of each cultivars' database. The library of each cultivar was analysed within itself, between capsule and stem tissues.

1. Transcripts detected in Munich cultivar

In total there were 11 transcripts found to be differentially expressed. The results showed 6 downregulated and 5 upregulated genes were detected in Munich cultivar. While the most down-regulated transcript was *XM_026530396.1* (*ABC transporter A family member 2-like isoform X2*), the most up-regulated transcript was *TCONS_00097823* (*ABC transporter F family member 3*). The expression level was ranged from -8 to +6 (Table 1). The annotation of the transcripts revealed that 5 of the transcripts (46%) were belong to the ABCG subfamily. The others were 1 ABCA, 1 ABCB, 2 ABCCs, 1 ABCF and 1 ABCI.

2. Transcripts detected in HN1 cultivar

In HN1 cultivar we found 21 differentially expressed transcripts. Among these transcripts 11 transcripts showed down-regulation and 10 transcripts showed up-regulation. The results showed that *XM_026521232.1* (*ABC transporter B family member 4-like*) was significantly down-regulated when we compare capsule vs stem hence we can say that this transcript expressed highly in stem than capsule. On the other hand, TCONS_00096438 (*ABC transporter G family member 32-like*) was found to be highly expressed in capsule than stem. The expression level was ranged from -10 to +7. Putatively encoding ABC transporters, including 3 ABCAs, 5 ABCBs, 2 ABCCs and 11 ABCGs were identified (Table 2).

Between Munich and HN1 cultivars 5 transcripts (*LOC113279866*, *LOC113281610*, *LOC113303660*, *LOC113350452* and *LOC113362827*) were found to be common. The expression patterns of these transcripts showed significant differences except for *LOC113350452* (Figure 1). The transcript showing the most change was determined as *LOC113362827*. The subfamilies of the ABC transporters were ABCG (3), ABCA (1) and ABCB (1). *LOC113362827* gene encodes the transcript corresponding to ABCB subfamily.

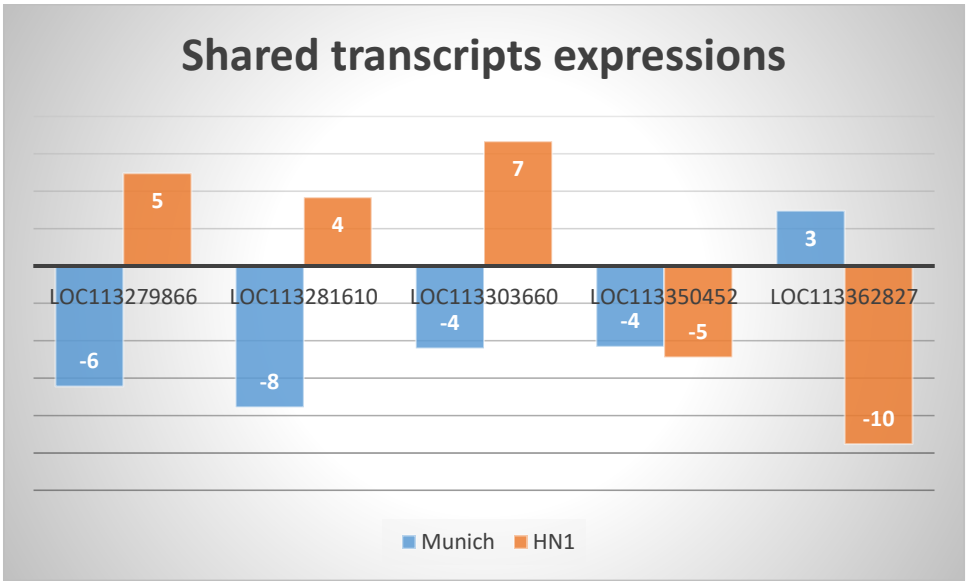

Figure 1. Expression profiles of shared genes

Cellular and molecular and studies have shown that the metabolites or the enzymes associated with the same alkaloid biosynthesis pathway do not need to be co-localized at the tissue, cellular, and subcellular level (Shitan and Yazaki, 2007). In this study, different major alkaloid producing cultivars have also unique transcripts that differentially expressed.

Most likely, the metabolites may be transported to the tissue where the enzyme is located to convert the intermediate product. In *Catharanthus roseus*, CrTPT2 which is a plasma-membrane localized ABCG transporter found to be transport the catharanthine to the leaf surface from where it synthesized. But its silencing experiments changed the accumulation of different alkaloids (De Luca et al., 2014). So it can be thought that some transporters are specific to an alkaloid.

From this point of view, while the genes *LOC113279866*, *LOC113281610*, *LOC113303660*, *LOC113350452* and *LOC113362827* working in oppositely in Munich and HN1 cultivar, *LOC113362827* works in parallel. The unique transcripts detected for Munich and HN1 cultivars are suggested to have a role in morphine and noscapine transport.

CONCLUSION

Here we performed the differentially gene expression analysis of ABC transporter genes which are involved in morphine and/or noscapine transport in a tissue specific manner. When we compared the capsule and stem, we found different expression patterns in both Munich and HN1 cultivars. In addition, it was determined that different transport proteins were involved in Munich and HN1 cultures. There are a large number of various secondary metabolite carrier proteins in plants, but studies on their identification and determination of their functions are quite incomplete. The understanding of secondary metabolite transporters in plants will certainly be a step forward to meet the demand for bioactive compounds used in medicines derived from plants. Therefore, the regulation of gene expressions by functional genomics seems to be a viable option for obtaining more products at less cost.

Özet

İskelet kas atrofisi, uzun süreli hareketsizlik, yetersiz beslenme, sarkopeni, kronik kalp yetmezliği ve özellikle tip-1 diyabetle birlikte gözlenen kas kütlesinde ve kasılma gücünde azalma olarak ifade edilir. Bu çalışmada diyabetik sıçanların yavaş kasılan iskelet kaslarında meydana gelen atrofide, pulslu manyetik alan (PMA) ve pterostilben (PTS, trans-3,5-dimethoxy-4-hydroxystilbene) uygulamalarının etkileri çeşitli yönlerden değerlendirildi.

Gruplar, kontrol (K, n=10), diyabet (DM, n=10), diyabet+pterostilben (DM+PTS, n=10), diyabet+pulslu manyetik alan (DM+PMA, n=10), diyabet+pulslu manyetik alan+pterostilben (DM+PMA+PTS, n=10) olarak oluşturuldu. Sıçanlar her gün 2 saat boyunca 10 Hz frekansında 1.5 mT şiddetinde PMA'ya maruz bırakıldı. Pterostilben antioksidanı günlük 30 mg/kg dozda uygulandı. 5 haftalık deney sürecinde haftada bir kez sıçanların kan glukoz seviyeleri ve ağırlıkları ölçüldü. Deney sonunda, dissekte edilen soleus kas preparatlarından biyomekanik kayıtlamalar alınarak kasılma kuvveti yanıtları değerlendirildi. İskelet kaslarında atrofi ve hipertrofi mekanizmalarının düzenlenmesinde ve protein sentez ve yıkımında önemli role sahip olan p-AKT, mTOR, FOXO3a ve insülin konsantrasyon miktarları ELISA yöntemiyle tayin edildi. Atrofinin şiddetine bağlı olarak değişkenlik gösteren toplam protein miktarı Bradford yöntemi kullanılarak tayin edildi. Miyofibriler proteinlerin degradasyonunda etkin olduğu düşünülen Trim63, FBXO32 ve FOXO3a gen ekspresyon analizleri gerçek zamanlı PCR ile yapıldı. Antioksidan ve pulslu manyetik alan tedavisinin birçok hastalık modelinde tedavi amaçlı kullanıldığı bilinmektedir, fakat bu çalışmada ilk kez diyabetik iskelet kas atrofisi üzerine etkileri ayrıntılı moleküler ve biyomekanik incelemelerle ela alındı. Elde edilen bulgular, diyabetle birlikte bozulan protein sentez yolaklarının antioksidan ve PMA uygulamalarıyla iyileştiğini ve atrofinin şiddetinde azalma sağladığını gösterdi PMA+PTS uygulamasının diğer gruplardan daha çok iyileştirici etki gösterdiği belirlendi.

Anahtar Kelimeler: Tip 1 diyabet, iskelet kas atrofisi, pterostilben, pulslu manyetik alan

Effects of non-invasive pulsed magnetic field and pterostilbene application on protein synthesis pathways in diabetic skeletal muscle atrophy

Abstract

Skeletal muscle atrophy is defined as a decrease in muscle mass and contractile strength observed in prolonged immobility, malnutrition, sarcopenia, chronic heart failure, and especially type 1 diabetes. In this study, the effects of pulsed magnetic field (PMF) and pterostilbene (PTS, trans-3,5-dimethoxy-4-hydroxystilbene) on atrophy of slow-twitch skeletal muscle of diabetic rats were investigated from different aspects.

The groups consisted of control (C, n=10), diabetes (DM, n=10), diabetes+pterostilbene (DM +PTS, n=10), diabetes+pulsed magnetic field (DM +PMF, n=10), diabetes+pulsed magnetic field+pterostilbene (DM +PMF+ PTS, n=10). Rats were exposed to 1.5 mT PMF at a frequency of 10 Hz for 2 hours daily. The antioxidant pterostilbene was administered at a daily dose of 30 mg/kg. During the 5-week experimental period, blood glucose levels and weight of the rats were measured once a week. At the end of the experiment,

biomechanical recordings were carried out from dissected soleus muscle preparations, and the responses to contractile force were evaluated. The levels of p-AKT, mTOR, FOXO3a, and insulin, which play important roles in regulating atrophy and hypertrophy mechanisms and protein synthesis and degradation in skeletal muscle, were determined by ELISA method. Total protein levels, which vary according to the severity of atrophy, were determined by the Bradford method. Analysis of gene expression of TRIM63, FBXO32, and FOXO3a, which are thought to be active in the degradation of myofibrillar proteins, was performed by real-time PCR. It is well known that antioxidant and pulsed magnetic field therapy have been used for therapeutic purposes in many disease models, but this study was the first to investigate their effects on diabetic skeletal muscle atrophy with detailed molecular and biomechanical studies. The results showed that the protein synthesis pathways impaired by diabetes were improved and the severity of atrophy was reduced by the application of antioxidants and PMF. The application of PMA+PTS showed a stronger curative effect than that of the other groups.

Keywords: Type 1 diabetes, skeletal muscle atrophy, pterostilbene, pulsed magnetic field

GİRİŞ

İskelet kası atrofisi ve hipertrofisi, çok sayıda molekülün birbiri ile etkileşim içerisinde olduğu çeşitli sinyal yolaklarının oldukça karmaşık bir iş birliği ile gerçekleşmektedir. İskelet kası protein sentezinde (anabolik) yer alan iki temel sinyal yolağından birisi, pozitif rol oynayan IGF1-PI3K-Akt/PKB-mTOR yolağı, diğeri ise negatif düzenleyici rol oynayan myostatin–Smad2/3 yolağıdır. Protein yıkımında (katabolik) etkin olan bir diğer yolak ise TNF-alfa ve NF-kappa B yolağıdır. Anabolik ve katabolik yolaklarda protein sentez ve yıkımını özel çevirim içi sinyal yolları ile etkileyen kilit proteinlerin varlığı uzun zamandır bilinmektedir (Rom ve Reznick, 2016). Bu sebeple birçok çalışmada iyileştirici etkilerinin olduğu düşünülen pulslu manyetik alan (PMA) ve antioksidan (pterostilben) uygulamalarının, metabolik yolaklar üzerindeki hedef protein, gen ekspresyonları ve iskelet kası kasılma kuvvetleri üzerine etkilerini incelemeyi amaçladık.

E3 Ubikitin-Proteozom (E3 Ub-P) yolağı üzerinden aktivasyon gösteren Trim 63 ve FBXO32 genlerinin protein yıkımına neden olduğu birçok çalışmada gösterilmiştir (Fanzani, Conraads, Penna, ve Martinet, 2012). Protein degradasyonuna katılan FBXO32 yukarı regülasyonunun katabolik durumlarda Ubikitin-Proteozom (Ub-P) sistemine bağlı kas proteolizinde kritik bir rol üstelendiği ifade edilmiştir (Bodine ve Baehr, 2014). Bazı çalışmalarda, PI3K aktivasyonunun baskılanmasıyla FBXO32 gen ekspresyonunun arttığı gösterilse de, düzenleyici mekanizması tam olarak bilinmemektedir (Lee ve ark., 2004). Bu çalışmada, Ub-P sisteminde ‘atrogen’ olarak ifade edilen TRIM63ve FBXO32 gen ekspresyonları gerçek zamanlı PCR ile kontrol edildi ve uygulanan yöntemlere bağlı olarak ortaya çıkan değişimler istatistiksel yöntemlerle analiz edildi. Atrofi süresince, FOXO’ların AKT tarafından inhibisyonu yetersiz olursa, aktif FOXO’lar çekirdek içerisine nüfuz ederek TRIM63 ve FBXO32 genlerini etkilemektedir (McKinnell ve Rudnicki, 2004; Zhang ve ark., 2014). Özellikle FBXO32, FOXO3a tarafından aktif hale getirildiğinden [7, 8] çalışmamızda FOXO3a protein derişim tayini ve gen ekspresyon analizleri yapıldı ve FBXO32 gen ekspresyonu ile aralarındaki ilişki değerlendirildi. Fosforile AKT (p-AKT)’nin aktivasyonu ile mTOR aktive ve fosforile olmaktadır (Zanou ve Gailly, 2013); mTOR protein sentezini, p70S6K ve 4E-BP1 üzerinden sağladığından, iskelet kas atrofisinde kilit rollerden olan mTOR protein tayini de bu çalışmada gerçekleştirildi. Daha önceki deneysel diyabetik çalışmamızda, STZ indüklenmiş sıçanların gastroknemius iskelet kaslarının sarkomerik yapılarında bozunmalar ortaya çıktığını ve kasılma yanıtlarında azalma olduğunu gözlemledik (Tastekin ve ark., 2018). Benzer şekilde diğer çalışmalarda da iskelet kası atrofisi ile birlikte kasılma parametrelerinin bozulduğu ve daha erken dönemlerde yorgunluğun görüldüğü yönünde bulgular mevcuttur (Chiu ve ark., 2016; Pelit, Emre, Dagli, ve Tuli, 2013). Deney sonunda, in-vitro olarak biyomekanik kayıtlamalar alındı ve yavaş kasılan iskelet kaslarına ait kasılma parametreleri değerlendirildi.

Çalışmanın hipotezi; son zamanlarda güçlü bir antioksidan olarak ortaya çıkan ve birçok hastalığın araştırılmasında olumlu etkileri gösterilen pterostilben uygulamasının tip 1 diyabetle birlikte bozulan iskelet kası metabolik yolak proteinlerini düzenlemesi yönündeydi. Ayrıca non-invazif PMA uygulamasının kanal kinetiklerini regüle ederek antioksidan etkinliğini artıracağı ve diyabetik atrofide meydana gelen hasarlanmaları iyileştireceği beklendi. Bu çalışmadan elde edilen bulgular doğrultusunda diyabetik atrofi konusunda literatüre kapsamlı bir bakış açısı kazandırmak ve olası mekanizmaların birbirleriyle bağlantılarının ayrıntılı bir şekilde incelenmesi amaçlandı.

MATERYAL VE METOD

Deney hayvanları

Bu çalışmada, ağırlıkları 350-400 g arasında değişen Wistar Albino türü 50 adet erkek sıçan kullanıldı. Hayvanlar Çukurova Üniversitesi Tıp Fakültesi Deneysel Tıp Araştırma ve Uygulama Merkezinden (ÇÜTF DETAUM) temin edildi. Hayvanlar tip 2 kafeslerde (363 cm^3) ve her kafeste en fazla 5 hayvan olacak şekilde barındırıldı. Ad-libitum beslenme olarak standart pellet sıçan yemleri ve çeşme suyu kullanıldı. Hayvanların muhafaza edildiği ortam; 12 saat aydınlık-12 saat karanlık, 22-27 ºC sabit sıcaklık ve % 40-60 nem oranına sahip olacak şekilde ayarlandı. Aspiratör yardımıyla ortamda temiz hava değişimi sürekli kontrol edildi.

Deneysel Diyabet Oluşturma

Hayvanlar bulundukları ortama alışmaları için bir hafta müdahale edilmeden beklendi. Daha sonra streptozotosin (STZ, Sigma Chemicals, St. Louis, MO, USA) indüklenmesi için, kan glukoz seviyeleri ve ağırlıkları not edildi. Hayvanların ağırlıklarına göre 0.1 M soğuk sitrat tamponu (pH=4.6) içerisinde 45 mg/kg/ml STZ homojen çözdürülerek hazırlandı. Sıçanlar anestezi vaporizatörü ile % 60 O_2 ve % 3-4 sevofluran (Abbott, USA) karışımı altında uyutuldu ve kuyruk veninden intra venöz (i.v) olarak hazırlanan STZ'ler uygulandı. STZ yapıldıktan 48-72 saat sonra sıçanların kuyruk venlerinden, glikometre (Accu-Chek Performa Nano, Roche Diagnostics, Mannheim, Germany) yardımıyla kan glukoz seviyeleri ölçüldü. Kan glukoz seviyeleri ≥16.7mMol/l olan sıçanlar diyabetik olarak kabul edildi.

Pulslu Manyetik Alan Uygulaması

Pulslu manyetik alan, 2r=60 cm çapında, r=30 cm aralığa sahip iki Helmholtz bobini arasında oluşturuldu. Programlanabilir bir sinyal üretecine (ILFA Elektronik, Adana, Türkiye) bağlandığında, bu bobinler üzerinden istenilen frekans ve şiddette manyetik alan çıkışı sağlanabilmektedir. Manyetik alanın pik değeri Hall etkili bir prob yardımıyla manyetik alan ölçmeye yarayan Gausmetre (F.W. Bell Model 6010, Sypris Company, Orlando, FL) ile yapıldı. Zamanla değişen manyetik alanın, 0.5 ms'lik bir yükselme süresi ve 9.5 ms'lik bir düşme süresi ile yarı-üçgen bir dalga formunda olduğu gözlendi. Bobinler arasındaki maksimum indüklenen elektrik alan Faraday yasası kullanılarak hesaplandı. Devredeki akım (I = 5,2 A), güç amplifikatörü ve bobinin çıkışı arasına seri olarak bağlanan bir direnç (0,1 Ω) ile osiloskop üzerinden gözlendi (Şekil 1).

Şekil 1. Helmholtz bobinleri arasında ölçülen manyetik alanın şekli (sol) ve manyetik alan ölçüm sisteminin genel görünümü (sağ).

Biyomekanik Kayıtlamalar

Kaslar optimum gerginlikte olacak şekilde organ banyosuna yerleştirildi, yaklaşık 30 dakikalık termoregülasyon ve dengelenme süresinden sonra, tek sarsı izometrik kasılma değerleri 0.5 ms (15-20 V) süreli 1 Hz kare pulslarla kaydedildi. Kaslar tekrar kastırılmadan önce 30 dakika dinlenim durumunda kalmalarına izin verildi ve ardından 0.5 ms süreli 100 Hz (15-20 V) frekanslı kare puls uyaranlarla tetanik kasılma yanıtları kaydedildi. Kas uyarılarına karşı elde edilen kuvvet değerlerini kaydetmek için kuvvet çevirici transdüser (FDT 10-A 500 g, Commat, Ankara, Türkiye) kullanıldı. Kas izometrik kasılma kuvveti (Pt, g-kuvvet), kasılma süresi (CT, ms), gevşeme süresi (RT, ms) ve tetanik kasılma kuvveti (Po, g-kuvvet) gibi kasılma parametreleri kaydedildi.

ELISA ve Bradford Protein Tayini

Sıçanların sağ arka bacaklarından alınan soleus kasları 100-150 mg'lık parçalara ayrıldı, PBS solüsyonu ile temizlendikten sonra eppendorf tüplerinde -80°C'de saklandı. Deney günü, dokular -80°C'den çıkarıldı ve ardından seramik havan ve tokmak yardımıyla hızla toz haline getirildi. Önceden hazırlanan tampon homojenizasyon çözeltisi: 50mM Tris-HCl, pH=7.6, 150mM NaCl, %1 NP -40, %1 sodyum deoksikolat, %0 içeren RIPA tamponu. 1 SDS (Boster Bio, ABD) (w:v, 1:10); fenilmetansülfonil florür (%99, Acros Organics, Belçika) (v:v, 1:100); 1 mM sodyum ortovanadat (%99, Acros Organics, Belçika) (v:v, 1:100); ve 1X proteaz inhibitör kokteyli (Abbkine, ABD) (v:v, 1:100), dokular üzerine eklendi ve steril cam çubuklarla iyice öğütülerek homojenatlar elde edildi. Homojenatlar daha sonra steril eppendorf tüplerine aktarıldı ve 10 dakika boyunca yaklaşık 10.000 rpm'de santrifüj edildi. Santrifüjün ardından toplanan süpernatantlar yeni steril tüplere aktarıldı. pAkt, mTOR, FoxO3a ve insülin miktarlarını ölçmek için Bioassay Technology Laboratory (Birmingham, UK) hazır kit ürünleri kullanıldı. Protein konsantrasyonları üretici firmanın talimatlarına göre bir mikroplaka okuyucuda (Multiskan Go, MA, ABD) kaydedildi. Kantitatif numune miktarları, sandviç ELISA protokolü kullanılarak 450 nm'de elde edilen absorbans verilerinden hesaplandı. Toplam protein tayini Bradford çözeltisi (Serva, 5X) ve sığır serum albümini (BSA, pH 7.0, liyofilik, Serva) kullanılarak ölçüldü. Bradford çözeltisinin 5X konsantrasyonu distile su ile 2:7.5 oranında seyreltildi. Kalibrasyon eğrisini oluşturmak için BSA referans çözeltisi distile su ile seyreltilerek standart çözeltiler hazırlandı. Protein tayini için belirlenecek örneklerden 50 µl örnek kuyucuklarına eklendi, daha sonra tüm kuyucuklara 200 µl Bradford çözeltisi eklendi ve oda sıcaklığında 5 dakika inkübe edildi. Absorbans değerleri 595 nm dalga boyunda okundu.

RNA izolasyonu ve gerçek zamanlı PCR (RT-PCR)

Taze PBS ile saflaştırılan soleus kasları 60 mg'lık eşit parçalara bölünerek steril tüplere yerleştirildi. Ardından 10 kat hacimde (600 µl) RNA geciktirici solüsyonu (Biological Industries, İsrail) eklendi ve tüpler deney gününe kadar -20 °C'de saklandı. RNA izolasyonu için Zymo Research Direct-zol™ RNA Miniprep Plus kiti kullanıldı. İskelet kası dokuları, üreticinin talimatlarına göre kitle birlikte sağlanan TRIZOL reaktifi kullanılarak homojenize edildi; kas dokuları nükleaz içermeyen bir tüpe yerleştirildi ve 800 µl TRIZOL reaktifi eklendi. Örneklerdeki RNA'nın saflığını ve miktarını belirlemek için bir µDrop plaka (Thermo Scientific) kullanıldı. RNA konsantrasyonu ~400-600 µg/ml ve RNA saflık oranı (A260/A280) ~1.7 olarak hesaplandı. Daha sonra toplam 20 µl cDNA, üreticinin protokolüne göre yüksek kapasiteli ters transkripsiyon cDNA kiti (abm Good, Richmond, BC, Kanada) kullanılarak 2 µg RNA örneklerinden sentezlendi. FBXO32, TRIM63 ve FoxO3a gen amplifikasyonu için kullanılan primer çiftleri (Metabion, Almanya) Tablo 1'de listelendi. Verileri normalize etmek için GAPDH (gliseraldehit-3-fosfat dehidrogenaz) kullanıldı. RT-PCR deneyleri Promega GoTaq® qPCR Master Mix Kit (Promega Corporation, Madison, WI) kullanılarak gerçekleştirildi. Reaksiyon bileşenleri; 1 µl şablon cDNA (1:4), 2 µl ileri ve geri primerler (her biri 10 µM), 10 µl qPCR ana karışımı (1X), 0,2 µl karboksi-X-rhodamin (CXR) referans boyası ve 4,8 µl RNaz içermeyen su ile toplam 20 µl hacimde hazırlandı. Reaksiyon Applied Biosystems® 7500 (Applied Biosystems, Singapur) cihazına belirtilen termal döngü koşulları ayarlanarak gerçekleştirildi: 95 °C'de 1 döngü başlangıç 3 dk denatürasyon, 95 °C'de 40 döngü denatürasyon 15 sn, ve 60 °C'de 1 dk tavlama+uzatma. Döngü eşikleri (C_t) her örnek için otomatik eşik analizi ile belirlendi. Örnekler 3 tekrarlı olarak çalıştırıldı ve gen ekspresyon seviyelerini belirlemek için $\Delta\Delta C_t$ yöntemi kullanıldı.

Tablo 1. RT-PCR analizlerinde kullanılan primer dizileri

Primer		Dizilim (5′-3′)
FBXO32	Forward (F)	CCATCAGGAGAAGTGGATCTATGTT
	Reverse (R)	GCTTCCCCCAAAGTGCAGTA
TRIM63	F	GCTGCCAATCCCTACTGGAC

	R	AGTCACTGGGGAACTTGTCG
GAPDH	F	TGCACCACCAACTGCTTA
	R	GGATGCAGGGATGATGTTC

İstatiksel Analiz

Deney gruplarından elde edilen veriler ortalama±standart hata olarak ifade edildi. Normal dağılım testi, Kolmogorov-Simirnov ile yapıldı. Veriler çok yönlü varyans analiz testi (Multivariate Analysis) kullanılarak karşılaştırıldı. İstatistiksel olarak anlamlı farklılık $p<0,05$ değerinde kabul edildi. Analizler IBM SPSS Statistics 20 programında yapıldı. Grafikler Graphpad Prism 8.30 programı ile oluşturuldu.

BULGULAR

Vücut ve Kas Ağırlık Değişimleri

5 haftalık deney süresi boyunca haftada bir kez gruplardaki sıçanların ağırlıkları tartıldı ve ortalama ağırlık ± standart hata (SH) olarak ifade edildi (Tablo 2).

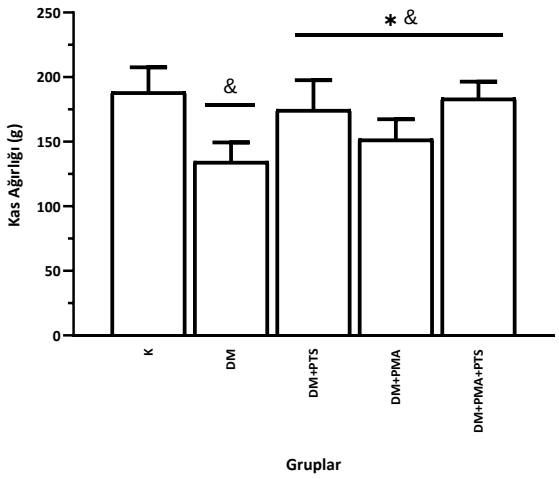
Tablo 2. Deney gruplarındaki hayvanların ortalama ağırlık değişimleri

Deney Grupları (n=10)	Ortalama Ağırlık Değişimleri (g)						
	Haftalar						
	0	1	2	3	4	5	Ortalama±SH
K	400±3,7	395±3,9	403±4,8	410±3,8	415±4,4	422±4,0	408±4,1
DM*	395±9,2	372±9,1	350±10,2	335±9,2	318±9,8	290±9,4	343±9,5
DM+PTS#	390±3,6	372±3,8	370±4,7	375±3,7	383±4,3	394±3,9	381±4,1
DM+PMA#	392±6,2	364±6,6	352±5,7	355±5,5	360±5,8	372±5,9	366±5,9
DM+PMA+PTS#	385±7,8	375±6,8	378±6,9	392±6,7	405±7,0	421±7,4	393±7,2

* K grubundan anlamlı olarak farklıdır ($p<0,05$), # DM grubundan anlamlı olarak farklıdır ($p<0,05$).

5 haftalık deney sonunda, diyabetik sıçanların final vücut ağırlıkları kontrol grubuna göre yaklaşık % 30 azaldı. Pterostilben ve PMA uygulamalarının, DM grubuna kıyasla anlamlı olarak farklılık gösterdiği belirlendi ($p<0,05$).

Deney sonunda sıçanlardan dissekte edilen nemli soleus kas ağırlıkları hassas terazi ile ölçüldü ve istatistiksel olarak gruplar karşılaştırıldı.

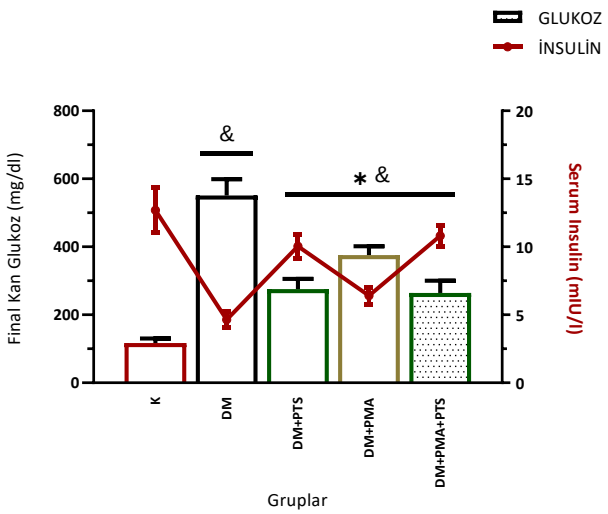


Şekil 2. Deney sonunda soleus kaslarına ait nemli ağırlık değişimleri. Sonuçlar, Ortalama ± Standart Hata olarak verildi. & K grubundan anlamlı olarak farklıdır ($p<0,001$), * DM grubundan anlamlı olarak farklıdır ($p<0,001$).

Soleus kaslarında; DM grubuna göre kas ağırlığında en fazla artış DM+PMA+PTS (% 10,23) grubunda, en az artış DM+PTS (% 3,41) ve DM+PMA (% 3,39) gruplarında gözlendi.

Kan Glukoz ve Serum İnsülin Değerleri

Sıçanların periyodik olarak her hafta sonu kan glukoz seviyeleri glukometre yardımıyla ölçüldü.

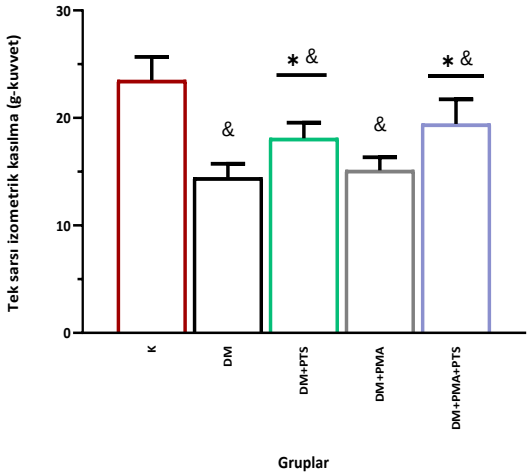


Şekil 3. Deney sonunda gruplara ait ortalama kan glukoz ve serum insülin seviyeleri. Sonuçlar, Ortalama ± Standart Hata olarak verildi. $^{\&}$ K grubundan anlamlı olarak farklıdır ($p<0,05$), * DM grubundan anlamlı olarak farklıdır ($p<0,05$).

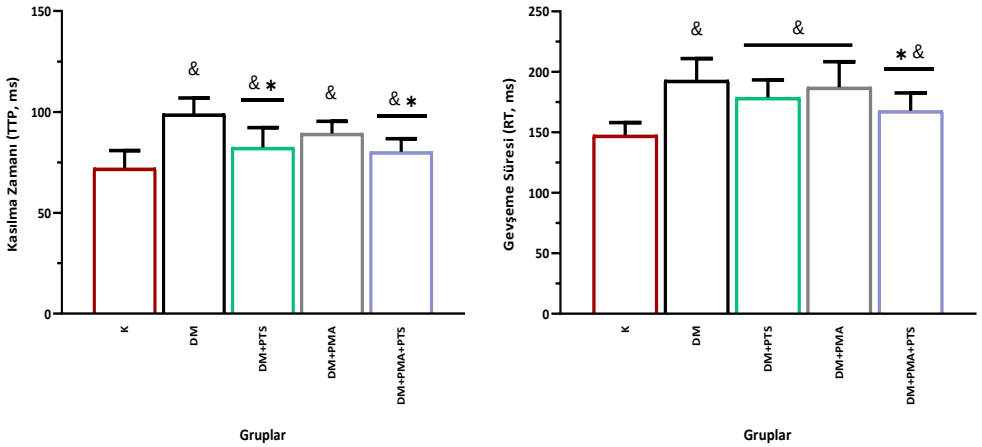
Elde edilen bulgulara göre STZ indüklenmesiyle birlikte DM grubu kan glukoz seviyesi K grubuna göre % 347,32'lik bir artış gösterdi. Diğer grupların DM grubuna göre kan glukoz seviyelerindeki azalma oranı; DM+PTS (% 34,60) > DM+PMA+PTS (% 31,10) > DM+PMA (% 14,63) olarak bulundu. Deney sonunda sıçanların kanlarından analiz edilen serum insülin seviyeleri incelendiğinde, DM grubundaki sıçanların serum insülin değerlerinin K grubuna göre % 57,08 oranında azaldığı görüldü. DM grubuna göre diğer grupların azalan insülin seviyeleri; DM+PMA+PTS (% 135,11) > DM+PTS (% 91,49) > DM+PMA (% 46,81) olarak bulundu.

İzometrik Tek Sarsı Kasılma Kuvvetleri ve Kasılma Parametreleri

Sıçanların soleus kasları çıkarıldıktan sonra organ banyosu içerisinde tek sarsı kasılma yanıtları ve kasılma parametreleri kaydedildi.



Şekil 4. Soleus kaslarındaki tek sarsı (P_t) kasılma kuvvetlerinin gruplara göre değişimi. Sonuçlar, Ortalama ± Standart Hata olarak verildi. & K grubundan anlamlı olarak farklıdır ($p<0,05$), * DM grubundan anlamlı olarak farklıdır ($p<0,05$).

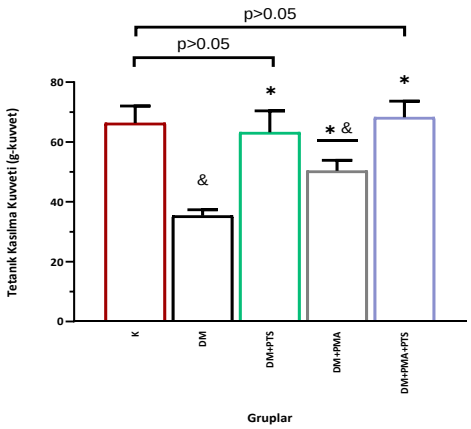


Şekil 5. Soleus kaslarına ait kasılma ve gevşeme sürelerindeki değişimler. TTP, kasılmanın tepe noktasına kadar geçen süreyi; RT, kasılmanın tepe noktasından bitimine kadar geçen süreyi göstermektedir. Sonuçlar, Ortalama ± Standart Hata olarak verildi. & K grubundan anlamlı olarak farklıdır ($p<0,05$), * DM grubundan anlamlı olarak farklıdır ($p<0,05$).

Kontrol grubuna göre diyabetik sıçanların soleus kaslarında kasılma sürelerinin %26,19 oranında uzadığı görüldü. Diyabetle birlikte uzayan kasılma süresi yanıtlarının uygulanan yöntemlerle DM grubuna göre; DM+PMA+PTS (% 7,86) > DM+PTS (% 6,50) > DM+PMA (% 5,24) olarak azaldığı bulundu. Kontrol grubuna göre diyabetik sıçanların soleus kaslarından kayıtlanan gevşeme sürelerinin yaklaşık % 26,90 oranında uzadığı görüldü. Diyabetle birlikte uzayan gevşeme süresi yanıtlarının DM grubuna göre: DM+PMA+PTS (% 13,22) > DM+PTS (% 8,45) > DM+PMA (% 1,89) olarak azaldığı bulundu.

Tetanik Kasılma Kuvvetleri

Tek sarsı kasıma kuvvetleri kayıtlandıktan sonra, 100 Hz frekans, 0.5 ms süre ile 15-20 V uyaranla maksimum kasılma yanıtları (P_0) kaydedildi.

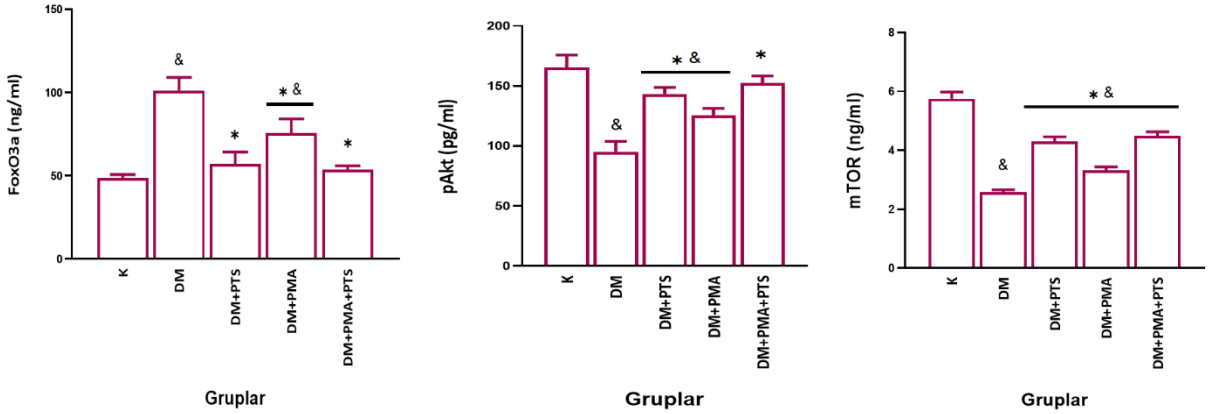


Şekil 6. Soleus kaslarındaki tetanik kasılma (P_0) kuvvetlerinin gruplara göre değişimi. Sonuçlar, Ortalama ± Standart Hata olarak verildi. & K grubundan anlamlı olarak farklıdır ($p<0,05$), * DM grubundan anlamlı olarak farklıdır ($p<0,05$).

Kontrol grubuna göre DM grubundaki sıçanların soleus kaslarında tetanik kasılma kuvvetlerinin % 38,43 oranında azaldığı gözlendi. Pterostilben ve PMA uygulamalarının DM grubuna göre tetanik kasılma kuvvetlerini: DM+PMA+PTS (% 80,83) > DM+PTS (% 74,35) > DM+PMA (% 48,19) olarak artırdığı bulundu.

ELİZA Protein Derişimleri

K grubuna göre DM grubundaki sıçanların FOXO3a protein derişimlerinin % 62,50 oranında arttığı bulundu. Pterostilben ve PMA uygulamalarına bağlı olarak DM grubuna göre soleus kaslarında en fazla FOXO3a derişim azalmasının DM+PMA+PTS grubunda olduğu görüldü.

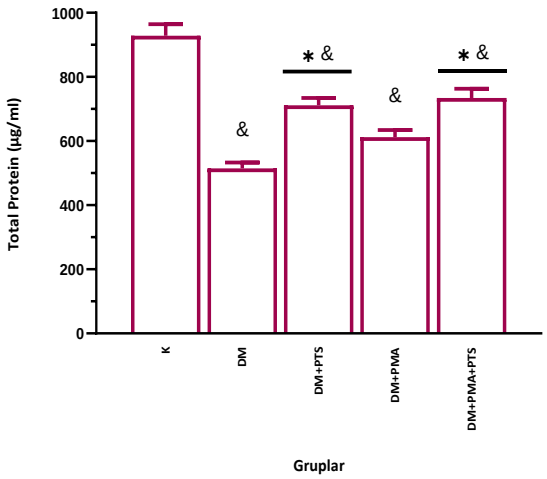


Şekil 7. Soleus kaslarındaki FOXO3a, p-AKT ve mTOR protein derişimleri. Sonuçlar, Ortalama ± Standart Hata olarak verildi. & K grubundan anlamlı olarak farklıdır ($p<0,05$), * DM grubundan anlamlı olarak farklıdır ($p<0,05$).

K grubuna göre DM grubundaki sıçanların p-AKT protein derişimlerinin % 37,22 oranında azaldığı bulundu. Pterostilben ve PMA uygulamalarına bağlı olarak DM grubuna göre soleus kaslarında en fazla p-AKT derişiminin % 18,52 artışla DM+PMA+PTS grubunda olduğu görüldü. K grubuna göre DM grubundaki sıçanların mTOR protein derişimlerinin % 57,86 oranında azaldığı bulundu. Pterostilben ve PMA uygulamalarına bağlı olarak DM grubuna göre soleus kaslarında en fazla mTOR derişiminin % 57,54 artışla DM+PMA+PTS grubunda olduğu görüldü.

Bradford Toplam Protein Derişimleri

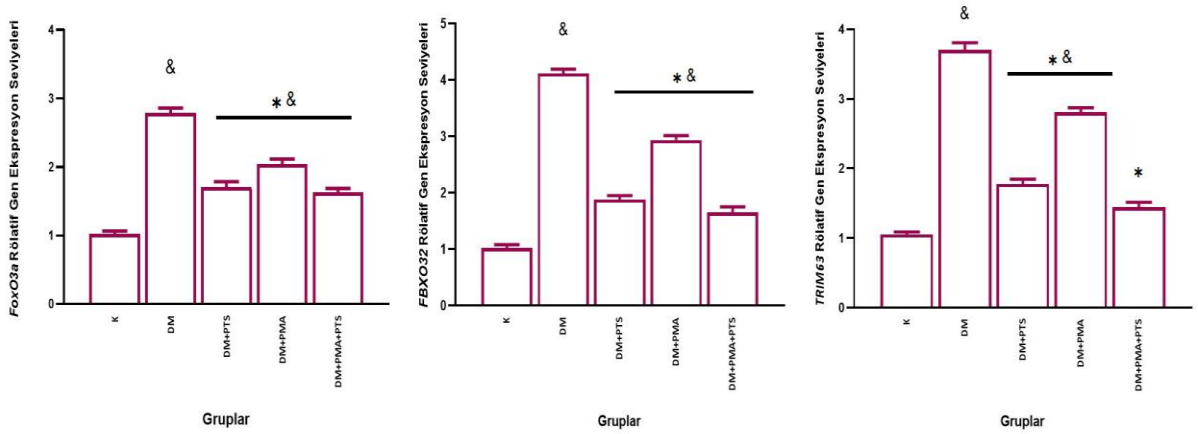
Toplam protein miktarının K grubuna göre DM grubunda % 50,67 oranında azaldığı bulundu. STZ indüklenmesiyle birlikte azalan toplam protein derişiminin DM grubuna göre PMA+PTS uygulamasıyla % 42,49 oranında arttığı görüldü.



Şekil 8. Soleus kaslarındaki toplam protein derişimleri. Sonuçlar, Ortalama ± Standart Hata olarak verildi. & K grubundan anlamlı olarak farklıdır ($p<0,05$), * DM grubundan anlamlı olarak farklıdır ($p<0,05$).

Real Time qPCR Gen Ekspresyon Değerleri

FOXO3a, FBXO32 ve Trim 63 gen ekspresyonları incelendi.



Şekil 9. Soleus kaslarında FoxO3a, FBXO32 ve TRIM63 gen ekspresyon katlı değişim değerleri. Sonuçlar, Ortalama ± Standart Hata olarak verildi. & K grubundan anlamlı olarak farklıdır ($p<0,05$), * DM grubundan anlamlı olarak farklıdır ($p<0,05$).

K grubuna göre DM grubundaki sıçanların FOXO3a gen ekspresyon miktarlarının % 189,11 oranında arttığı bulundu. Pterostilben ve PMA uygulamalarında, DM grubuna göre soleus kaslarında en fazla FOXO3a gen ekspresyon azalmasının % 49.60 ile DM+PMA+PTS grubunda olduğu görüldü K grubuna göre DM grubundaki sıçanların FBXO32 gen ekspresyon miktarlarının % 270,98 oranında arttığı bulundu. Pterostilben ve PMA uygulamalarıyla, DM grubuna göre soleus kaslarında en fazla FBXO32 gen ekspresyon azalmasının % 60,73 ile DM+PMA+PTS grubunda olduğu görüldü. K grubuna göre DM grubundaki sıçanların TRIM63 gen ekspresyon miktarlarının % 276,85 oranında arttığı bulundu. Pterostilben ve PMA uygulamalarıyla, DM grubuna göre soleus kaslarında en fazla TRIM63 gen ekspresyon azalmasının %165,40 ile DM+PMA+PTS grubunda olduğu görüldü.

TARTIŞMA

Tip-1 DM ile birlikte kas büyümesi ve gelişmesi önemli ölçüde bozulmaktadır. Bu durum, azalan kas kütlesi ve kas boyutu, metabolik kontrol yetersizliği ve glikolitik bir fenotipe geçiş ile sonuçlanmaktadır (Andersen, Gadeberg, Brock, ve Jakobsen, 1997; Andersen, Gjerstad, ve Jakobsen, 2004; Fritzsche ve ark., 2008). Kas yapısı ve metabolizmasındaki bu değişiklikler genellikle kas fonksiyonlarındaki azalmalarla ilgilidir (Almeida, Riddell, ve Cafarelli, 2008; Gordon ve ark., 2010; Huttunen ve ark., 1984; Poortmans, Saerens, Edelman, Vertongen, ve Dorchy, 1986). Büyüme ve yapısal fonksiyona ek olarak, kas rejenerasyonu çalışmalarında

belirtildiği gibi, atrofik hasarlanmalar ve tamir mekanizması Tip-1 DM'den olumsuz olarak etkilenmektedir (Gulati ve Swamy, 1991; Krause ve ark., 2013; Krause, Riddell, ve Hawke, 2011). STZ indüklenen Tip-1 DM'li wistar albino erkek sıçanlar (350-400g) üzerinde yapılan bu çalışmada, soleus iskelet kaslarında meydana gelen atrofik mekanizma ve metabolik aktiviteler incelendi. Elde ettiğimiz bulgulara göre, DM grubundaki sıçanların vücut ağırlıklarının K grubuna göre % 30,41 oranında azaldığı görüldü. PMA+PTS uygulamasının DM'ye göre % 48 vücut ağırlık kaybını önlediği tespit edildi. Bulduğumuz sonuçlar, Manickam ve arkadaşlarının (Manickam, Ramanathan, Jahromi, Chansouria, ve Ray, 1997) STZ ile indüklenmiş sıçanlarda, pterostilben uygulamasının (oral) vücut ağırlık kaybını % 20 önlendiği yönündeki bulgular ile uyumludur. Çalışmamızda ağırlık kaybının daha belirgin önlenmesi, antioksidanların i.p. olarak uygulanmasına bağlanmaktadır.

Enjekte edilebilir insülin kullanımının maliyet ve uygulama zorlukları yanında, Tip-1 DM'li bireylerin yoğun insülin kullanım programlarına katılmaları insüline karşı direnç geliştirebilmektedir (Schechter ve Reutrakul, 2015). Çalışmamızda, DM grubunda artan kan glikoz ve azalan insülin seviyelerinin PTS ve PMA+PTS uygulamalarıyla anlamlı olarak iyileşme gösterdiği bulundu. İnsülin seviyelerindeki iyileşmenin kan glikoz seviyelerindeki iyileşmeden daha etkin görünmesi, GLUT-4 aktivasyonu ve pankreatik beta hücre yenilenmesiyle ilişkilendirilmektedir. Bu yorum daha önce pterostilbenin beta hücre granüllenmesine katkıda bulunduğunu gösteren çalışma ile de desteklenmektedir (Tamaddonfard ve ark., 2013). Elde ettiğimiz biyomekanik kayıtlamalarda, STZ indüklenmesiyle soleus kaslarında % 34,31 oranında tek sarsı kuvvet kaybı olduğu gözlendi. Diyabetik koşullarda kasılma ve gevşeme mekanizması göz önüne alındığında, yavaş kasılan kaslarda, kasılma proteinleri ve Ca^{+2}'nin troponin C'ye bağlanma ilgisinin azalması ile ilişkilendirilebilir (Barclay ve Weber, 2004). Tetanik kasılma yanıtlarına baktığımızda, DM grubuna göre antioksidan ve PMA uygulamalarının anlamlı düzeyde kuvvet artışı sağladığı görüldü. Sonuçlar daha önce Fraysse ve arkadaşlarının soleus ve ekstensor digitorum longus kaslarında Ca^{+2} homeostazisine bağlı olarak gerçekleştirdikleri kuvvet yanıtlarıyla ve Moran ve arkadaşlarının yaşa bağlı olarak yaptıkları araştırmalarla tutarlıdır (Moran, Warren, ve Lowe, 2005).

Tıbbi uygulamalarda kullanılan nutrasötiklerin metabolizma üzerinde çok az yan etkisinin olduğu veya hiç olmadığı düşünülmektedir ve diyabet dâhil birçok patolojik durumda güvenilir kullanımları nedeniyle son yıllarda büyük ilgi görmektedir (Bacha, Nasir, Iqbal, ve Anjum, 2017). Pterostilben'in nörolojik, kardiyovasküler, metabolik ve hematolojik hastalıklar dâhil olmak üzere çok çeşitli insan hastalıklarında koruyucu ve terapötik özelliklere sahip olduğu ön görülmektedir (Dvorakova ve Landa, 2017). Pterostilben için, 80 sağlıklı gönüllüde 6-8 hafta boyunca yürütülen bir klinik çalışmada (randomize, çift kör ve plasebo kontrollü), pterostilbenin genellikle 250 mg/gün'e kadar olan dozlarda tüketim için güvenli olduğu bildirilmiştir (Riche ve ark., 2013). Pulslu manyetik alan, vücutta nöronları depolarize, repolarize ve hiperpolarize edebilen küçük elektrik akımlarını güvenli bir şekilde indüklediğinden, bu enerjinin canlılar üzerinde yönlendirilmesinin potansiyel olarak nöronal aktiviteyi ve ilgili vasküler yanıtları modüle edebileceği hipotezi öne sürülmüştür (Kavak ve ark., 2009). Yapılan bir çalışmada, 6 hafta boyunca 30 dk./gün, 15 Hz (1.46 mT) uygulanan PMA uygulamasının, STZ indüklenmiş sıçanların vücut ağırlıklarını, kas kuvvetini, kas kütlesini ve insülin seviyelerini artırdığı, diyabetik sıçanların kan glikoz seviyelerinde ise azalma sağladığı ifade edilmiştir (Yang ve ark., 2018).

DM grubunda azalan mTOR seviyesinin PMA+PTS uygulamasıyla anlamlı düzeyde iyileştirildiği görüldü. DM grubuna göre, PMA uygulaması tek başına en az etkiyi bu protein üzerinde göstermiştir. FOXO3a gen ekspresyon analizlerine baktığımızda; DM grubunda artan FOXO transkripsiyon faktörlerinin, diyabetik soleus kaslarında kontrol grubuna göre daha fazla olduğu görüldü. FBXO32 ve TRIM63 gen ekspresyon analizleri incelendiğinde, pterostilben antioksidanının PMA ile birlikte uygulanmasının daha etkili olduğu görüldü. Bu sonuçlar daha önce Wang ve arkadaşlarının (Wang ve ark., 2018) yaptıkları çalışmalarla uyum göstermektedir. Metti ve arkadaşları da polifenol pterostilben uygulamasının otofaji indüklenmiş iskelet kas miyopatisinde iyileştirici etkileri olduğunu ifade etmiştir (Metti ve ark., 2020).

SONUÇ

Sonuç olarak elde edilen bulgulara göre, pterostilben uygulamasının atrofik sinyal yolaklarını düzenlemede etkili olduğu görüldü. PMA uygulamasının PTS ile kullanımında iyileşmeyi artırıcı yönde etkisinin daha fazla olduğu görüldü. Bu sonuçların diyabetik iskelet kas atrofisi konusunda yapılan farmakolojik araştırmalara, nutrasötik ilaç çalışmalarına ve tıpta alternatif tedavi yöntemlerinin geliştirilmesine katkı sağlayacağına

inanıyoruz. Böylelikle, hastalığın tedavisinde ortaya çıkan ekonomik yükün hafifletilebileceği ve bu yöntemlerin uygulanabilir kolaylığından dolayı da hasta yaşam kalitesi ve bakım yükünün iyileştirilebileceği ön görülmektedir. Daha sonraki çalışmalarda, elektrofizyolojik olarak kanal kinetiklerinin kayıtlanması, elektron mikroskobik ve immünohistokimyasal görüntülemelerin yapılmasıyla anabolik ve katabolik yolakların ayrıntılı incelenmesi planlanmaktadır.

TEŞEKKÜR

Bu çalışma, Çukurova Üniversitesi Bilimsel Araştırma Projesi (BAP) Birimi tarafından TSA-2021-13978 nolu proje ile desteklenmiştir. BAP Birimi'ne bu çalışmayı desteklediklerı için teşekkür ederiz.

Özet
Ultrasonik test (UT), tahribatsız muayenede (NDT) en yaygın olarak uygulanan kusur tespit yöntemlerinden biridir. Ultrasonik test temel olarak; yüksek nüfuz gücü, iyi hassasiyeti, boyut ve şekilleri tahmin etme yeteneği, hızlı algılama sonuçları ve operatörler için tehlikeli olmaması nedeniyle gerçekleştirilmiştir. Ultrasonik faz dizilerin geliştirilmesi ve uygulanması, yirmi birinci yüzyılın başında tamamlandı. Huygens-Fresnel prensibi ve Helmholtz ses basıncı entegrasyon teoremi ultrasonik faz dizi testinin öncü fikirleridir. Tahribatsız değerlendirme (NDE) uygulamaları için ultrasonik dizilerin kullanımı son yıllarda hızla büyümüştür. Diziler, hassasiyet ve denetim performansı açısından tek elemanlı dönüştürücülere göre önemli avantajlara sahiptir. Faz dizi ultrasonik test, kusurları görüntüleme ve boyutlandırma için hızlı bir yöntem olarak kullanılır. Ultrasonik faz dizi yöntemi, piezoelektrik elemanın ultrasonik sinyaller aldığı elektronik işlemeyi ifade eder. Ultrasonik görünümler, ultrasonik yol ve tarama parametreleri arasındaki farklı düzlem görünümleriyle elde edilen görüntülerdir. Temel ultrasonik görünümler, a-tarama, b-tarama, c-tarama vb. gibi birden çok görünüme sahiptir. Bu çalışmada, faz dizi ultrasonik yöntemin tarihçesi ve gelişimi incelenmiştir. Yöntem hakkında detaylı teknik bilgi verilmiştir. Yöntemin artıları ve eksileri ele alınmıştır. Bu yöntem kullanılarak havacılıkta kusur tespiti uygulaması gelecekteki çalışmalarda yapılacak ve değerlendirilecektir.
Anahtar Kelimeler: Faz Dizi Ultrasonik Test, Havacılık, Tahribatsız Muayene.

Theoretical Investigation of Phased Array Ultrasonic Technique Used in Aviation

Abstract
Ultrasonic testing (UT) is one of the most commonly applied flaw detection methods in non-destructive testing (NDT). Ultrasonic testing is mainly carried out due to its high penetrating power, good sensitivity, ability to predict sizes and shapes, fast detection results and no danger to operators. The using of ultrasonic arrays for non-destructive evaluation (NDE) applications has grown rapidly in recent years. Huygens-Fresnel principle and the Helmholtz sound pressure integration theorem are the leading ideas of ultrasonic phased array testing. The development and implementation of ultrasonic phased arrays was completed at the beginning of the twenty-first century. Arrays have significant advantages over single-element transducers in terms of precision and control performance. Phased array ultrasonic testing is used as a rapid method for imaging and sizing flaws. Ultrasonic phased array method refers to the electronic processing in which the piezoelectric element receives ultrasonic signals. Ultrasonic views are images obtained with different plane views between ultrasonic path and scanning parameters. The basic ultrasonic views have multiple views such as a-scan, b-scan, c-scan etc. In this study, the history and development of phased array ultrasonic method were investigated. Detailed technical information about the method is given. The pros and cons of the method are discussed. Using this method, the application of flaw detection in aviation will be made and evaluated in future studies.
Keywords: Phased Array Ultrasonic Testing, Aviation, Non-Destructive Testing.

1.Giriş

Ultrasonik test (UT), tahribatsız muayenede (NDT) en yaygın olarak uygulanan kusur tespit yöntemlerinden biridir (Gao ve ark., 2020). Ultrasonik test, malzeme karakterizasyonu ve kusur muayenesi için en önemli

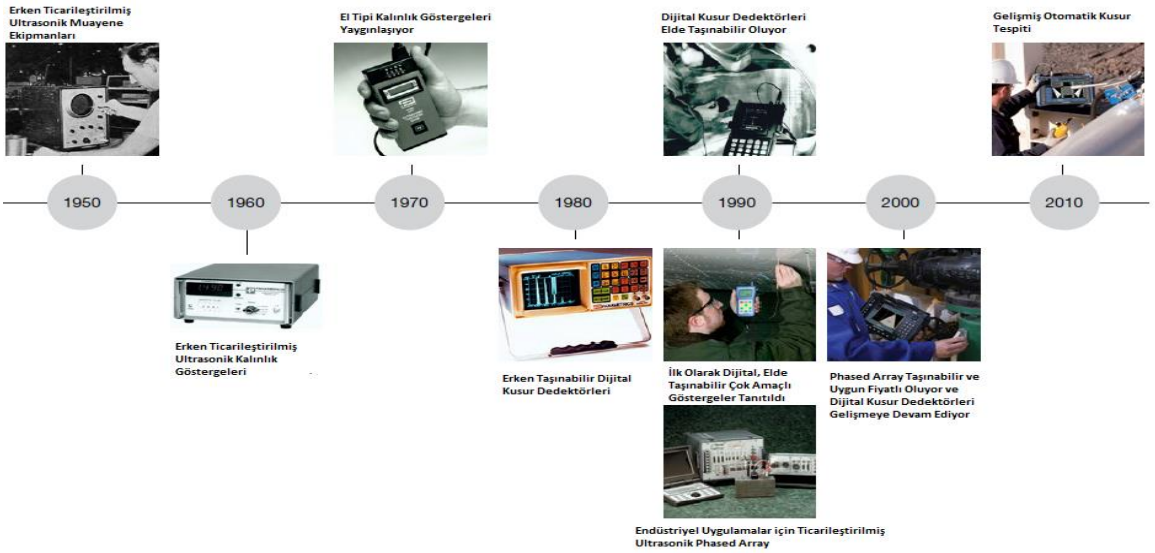
tahribatsız muayene tekniklerindendir (Pei ve ark., 2020). Ultrasonik test temel olarak; yüksek nüfuz gücü, iyi hassasiyeti, boyut ve şekilleri tahmin etme yeteneği, hızlı algılama sonuçları ve operatörler için tehlikeli olmaması nedeniyle gerçekleştirilmiştir (Kim ve ark., 2020). Ultrasonik dalgalar malzemeler arasında çok verimli bir şekilde yayılabileceğinden ve insanlara zararlı olmadığından, yapılardaki iç kusurları ölçmek için yaygın olarak uygulanır (Pei ve ark., 2020). Lazer ultrason, geniş bir frekans bandında temassız ve yüksek duyarlı olma avantajlarından dolayı ultrasonik test alanında önemli bir bileşen haline gelmiştir (Gao ve ark., 2020).

Katunin ve ark. uçak yapılarında kusur tanımlaması üzerinde çalışmış ve hem termografinin hem de ultrasoniğin, tesir edilen darbe hasarının tespiti ve yerini belirlemede büyük etkinlik gösterdiği ve termografinin daha hızlı olmasına rağmen ultrasonik tekniğin daha ayrıntılı kusur değerlendirmesi ve daha fazla sayıda delaminasyon sağladığı sonucuna varmıştır (Caminero ve ark., 2019).

Huygens-Fresnel prensibi ve Helmholtz ses basıncı entegrasyon teoremi ultrasonik faz dizi testinin öncü fikirleridir. Faz dizi dönüştürücüye gelince, birkaç bağımsız dizi elemanı belirli bir sıraya göre bir dizi oluşturur. Her dizi elemanı bağımsız verici ve alıcı devrelere sahiptir ve her dizi elemanının iletim gecikme süresi kontrol edilerek ses ışınlarının sapması ve odaklanması gerçekleştirilebilir. Faz dizi sisteminin özü, iletim ve alımı içeren faz düzenlemesinde yatmaktadır (Gangfeng ve ark., 2018).

Bağımsız bir teknoloji olarak ultrasonik faz dizilerin geliştirilmesi ve uygulanması, yirmi birinci yüzyılın başında tamamlandı. Faz dizi ultrasonik teknoloji, 1980'lerin başında tıp alanından sanayi sektörüne geçti. 1980'lerin ortalarında, karmaşık şekilli faz dizili problar üretmek için piezokompozit malzemeler geliştirildi ve kullanıma sunuldu. 1990'ların başında, faz dizi teknolojisi, ultrasonik el kitaplarında ve mühendisler için eğitim kılavuzlarında yeni bir NDE (tahribatsız değerlendirme) yöntemi olarak dahil edildi. 1985'ten 1992'ye kadar olan uygulamaların çoğu, nükleer basınçlı kaplar (nozullar), büyük dövme milleri ve düşük basınçlı türbin bileşenleri ile ilgiliydi. Piezokompozit teknolojisi; mikro işleme, mikro elektronik ve bilgi işlem gücündeki (prob tasarımı ve ışın-bileşen etkileşimi için simülasyon paketleri dahil) yeni gelişmeler, 1990'ların sonunda faz dizi teknolojisinin devrim niteliğindeki gelişimine katkıda bulundu. Bilgisayar yetenekleri arttıkça fonksiyonel yazılımlar da geliştirildi.

Tahribatsız değerlendirme (NDE) uygulamaları için ultrasonik dizilerin kullanımı son yıllarda hızla büyümüştür. Diziler, hassasiyet ve denetim performansı açısından tek elemanlı dönüştürücülere göre önemli avantajlara sahiptir. Dizi teknolojisinin benimsenmesi; elektrik üretimi, havacılık, petrol, benzin ve otomotiv dahil olmak üzere çok çeşitli endüstriyel sektörlerde olmuştur (Humeida ve ark., 2014). Faz dizi ultrasonik test (PAUT); tıp, nükleer güç ve malzeme değerlendirme dahil olmak üzere çeşitli tahribatsız uygulamalar için kullanılmıştır. Bu tekniğe yönelmedeki sebeplerden biri; ultrasonik ışının, ultrasonik probları yeniden yapılandırmaya gerek kalmadan yönlendirilebilmesi ve odaklanabilmesidir (Kim ve ark., 2020). Bu tekniğin teknolojik gelişimi Şekil 1.1'de verilmiştir(Introduction to Phased Array Ultrasonic Technology Applications,2010).



Şekil 1.1. Ultrasonik ve faz dizi muayene cihazlarının yıllara göre gelişimi

Faz dizi ultrasonik test, kusurları görüntüleme ve boyutlandırma için hızlı bir yöntem olarak kullanılır (Satyanarayan ve ark., 2007). Ultrasonik faz dizi yöntemi, piezoelektrik elemanın ultrasonik sinyaller aldığı elektronik işlemeyi ifade eder. Bir PAUT probu, her biri elektronik işleme yoluyla ultrasonik sinyalleri kabul edebilen çok sayıda küçük elemandan oluşur. Böylece PAUT, malzemenin iç görüntüsünü gerçek zamanlı olarak elde edebilir. PAUT'un avantajlarından biri, dizin ekseni boyunca tarama yapmadan kusurların görüntülerini elde etme yeteneğidir (Jung ve ark., 2018).

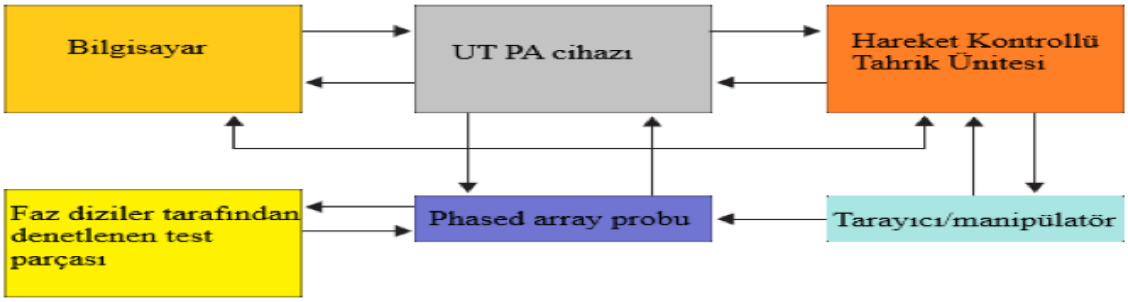
Faz dizinin umut verici yönü, geliş açısı ve odak mesafesi gibi parametrelerin elektronik olarak kontrol edildiği ultrasonik ışını üretme yeteneğidir. Diğer önemli yönler, açısal ışın tarama görüntülerini kullanarak ışın yönlendirmesini görselleştirme yeteneğidir ve ışın, bir test yapısının herhangi bir noktasına odaklanabilir. Faz dizi tekniği, geleneksel ultrasonik NDT yöntemlerine kıyasla yüksek çözünürlükle birlikte deneysel verilerin yüksek üretkenliğini ve güvenilirliğini sağlar. Faz dizi ultrasonik aletler, iç yapıyı kontrol etmek için yüksek frekanslı ses dalgaları kullanır. Ultrasonik faz dizi tekniği elektronik ışın şekillendirme ve yönlendirmeye izin verdiği için, tek bir prob düzeneğinden çok sayıda farklı ultrasonik ışın profili oluşturmak mümkündür ve bu ışın yönlendirmesi, elektronik taramalar oluşturmak için dinamik olarak programlanabilir. Ultrasonik faz dizi tekniği, bir incelemede kullanılacak dönüştürücü sayısının azaltılması, eğrilik ve karmaşık geometrik varyasyonlara sahip alanları kontrol etme yeteneği ve kusur konumunun ölçümünde daha iyi hassasiyet gibi geleneksel dönüştürücüye kıyasla bazı avantajlar sunar. Çok elemanlı sinyal odaklama nedeniyle faz dizi ultrasonik test, ultrasonik sinyallerin zayıflaması ve çözünürlüğünün daha iyi özelliklerini gösterir (Caminero ve ark., 2019). Ultrasonik faz dizi tekniği, kompakt dönüştürücünün özelliklerine ve dizi elemanlarının düzgün zaman gecikmeli sinyalleri nedeniyle yüksek denetim hassasiyetine sahiptir. Bu nedenle, türbin rotorları, köşe şekilli bileşenler ve nükleer santral bileşenleri dahil olmak üzere karmaşık yapıların denetimi için diğer tahribatsız muayene yöntemlerine göre bazı avantajlara sahiptir (Li ve ark., 2019).

2. Faz Dizi Ultrasonik Kontrol Yöntemi

Hava araçlarının birincil yük taşıyan yapılarında karbon fiber takviyeli plastik (CFRP) tabakanın uygulanması, yüksek mukavemet-ağırlık oranları nedeniyle sürekli artmaktadır. Bu nedenle, dahili kusurların tespit edilmesini ve ölçülmesini sağlayan etkili bir tahribatsız muayene tekniği, güvenlik açısından kritik yapıların güvenliğini ve güvenilirliğini sağlamak için çok önemlidir ve çok talep edilmektedir. Faz dizi ultrason; delaminasyon, fiber dalgalılığı, gözeneklilik vb. gibi CFRP yapılarının dahili kusurlarını belirlemek ve değerlendirmek için iyi kurulmuş bir tekniktir. Ultrasonik faz dizi tekniği tekniklerinin uygulanması, her bir dizi elemanı çifti ile görüntü noktası arasındaki ultrasonik ışın yolunun doğru bir şekilde belirlenmesini gerektirir. Bununla birlikte, dalga yayılım davranışı kavisli şekil, elastik anizotropi ve çok katmanlı mikro yapılar nedeniyle karmaşık olduğundan, spar, stringer ve rib gibi CFRP yapılarının köşe kısımları için çok zordur (Cao ve ark., 2021).

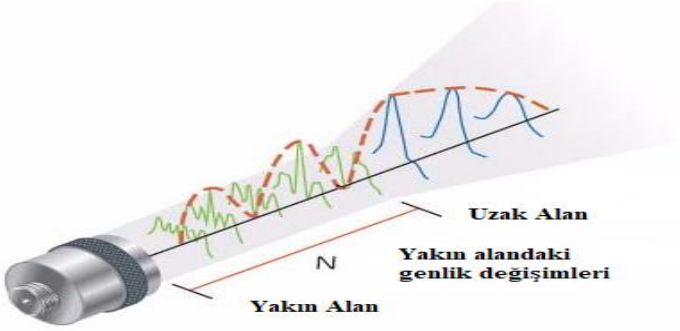
2.1 Ultrasonik Faz Dizi Sistemi

Geleneksel ultrasonik dönüştürücüler yüksek frekanslı ses dalgaları üreten ve alan tek bir aktif elemandan ya da biri iletmek ve diğeri almak için olmak üzere iki eşleştirilmiş elemandan oluşur. Faz dizi probları ayrı olarak darbelenebilen 16 ila 256 küçük elemana sahip bir dönüştürücü düzeneğinden oluşur. Bunlar bir şerit (doğrusal dizi), 2D matris, bir halka (halka dizisi), dairesel bir matris (dairesel dizi) veya daha karmaşık bir şekilde düzenlenebilir. Geleneksel dönüştürücülerde olduğu gibi, faz dizili problar; doğrudan temaslı kullanım için, bir takoz ile bir açı demeti tertibatının parçası olarak veya bir su yolu üzerinden ses kuplajıyla daldırma kullanımı için tasarlanabilir. Dönüştürücü frekansları en yaygın olarak 2 MHz ila 10 MHz aralığındadır. Çok elemanlı probu çalıştırabilen, geri dönen ekoları alıp sayısallaştırabilen ve bu eko bilgisini çeşitli standart formatlarda çizebilen karmaşık bir bilgisayar tabanlı alet içeren faz dizi sistemi Şekil 2.1'de verilmiştir(Advances in Phased Array Ultrasonic Technology Applications,2007).



Şekil 2.1. Faz dizi sisteminin temel bileşenleri ve aralarındaki bağlantı

Faz dizi ultrasonik teknolojinin ana özelliği, çok elemanlı bir probdaki ayrı elemanların bilgisayar kontrollü uyarılmasıdır (genlik ve gecikme). Piezokompozit elemanların uyarılması, yazılım aracılığıyla açı, odak mesafesi ve odak noktası boyutu gibi tanımlanmış parametrelere sahip ışınlar üretebilir. Bir dönüştürücünün ses alanı, yakın alan ve uzak alan olmak üzere iki bölgeye ayrılır. Yakın alan, ses basıncının bir dizi maksimum ve minimumdan geçtiği dönüştürücüye yakın bölgedir ve yüzeyden N mesafesinde son eksende maksimumda biter. Yakın alan mesafesi N, dönüştürücünün doğal odağını temsil eder. Yukarıda bahsedilen dönüştürücünün ses alanı Şekil 2.2'de verilmiştir(Phased Array Testing: Basic Theory for Industrial Applications,2010).



Şekil 2.2. Bir dönüştürücünün ses alanı

Uzak alan, N'nin ötesinde, ışın çapı genişledikçe ve enerjisi dağıldıkça ses basıncının kademeli olarak sıfıra düştüğü bölgedir. Yakın alan mesafesi, dönüştürücünün frekansının ve eleman boyutunun ve test ortamındaki ses hızının bir fonksiyonudur ve faz dizi testinde yaygın olarak bulunan kare veya dikdörtgen elemanlar için aşağıdaki gibi hesaplanabilir:

$$N = \frac{kL^2 f}{4c} \quad \text{veya} \quad N = \frac{kL^2}{4\lambda} \tag{1}$$

Burada;
N = yakın alan uzunluğu
k = en boy oranı sabiti
L = eleman veya açıklık uzunluğu
f = frekans
c = test malzemesindeki ses hızı
λ = dalga boyu = $\frac{c}{f}$
Dairesel elemanlarda k kullanılmaz ve uzunluk terimi yerine elemanın (D) çapı kullanılır:

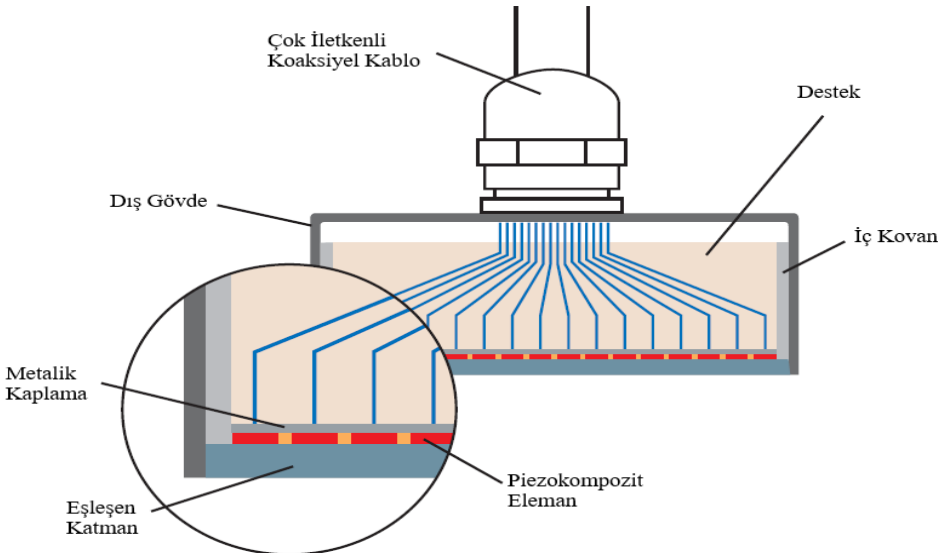
$$N = \frac{D^2 f}{4c} \text{ veya } N = \frac{D^2}{4\lambda} \tag{2}$$

2.2. Faz Dizi Prob Özellikleri

Dizi, büyük miktarlardaki bir nesnenin organize bir düzenlemesidir. NDT için bir ultrasonik dizinin en basit biçimi, denetim kapsamını ve/veya belirli bir denetimin hızını artıracak şekilde düzenlenmiş birkaç tek elemanlı dönüştürücü dizisi olacaktır.

Faz dizi probları birkaç bölüme ayrılmış bir piezoelektrik elemandır. Endüstriyel NDT uygulamaları için modern faz dizi probları, tipik olarak, bir polimer matrisine gömülü çok sayıda küçük, ince piezoelektrik

seramik çubuklardan oluşan piezokompozit malzemeler etrafında inşa edilir. Üretilmeleri daha zor olabilse de kompozit problar tipik olarak benzer tasarıma sahip piezoseramik problara göre 10 dB ila 30 dB hassasiyet avantajı sunar. Şekil 2.3'de bir faz dizi probunun kesiti verilmiştir(Phased Array Testing: Basic Theory for Industrial Applications,2010).



Şekil 2.3. Faz dizi probu kesiti

2.3. Faz Dizi Takozları

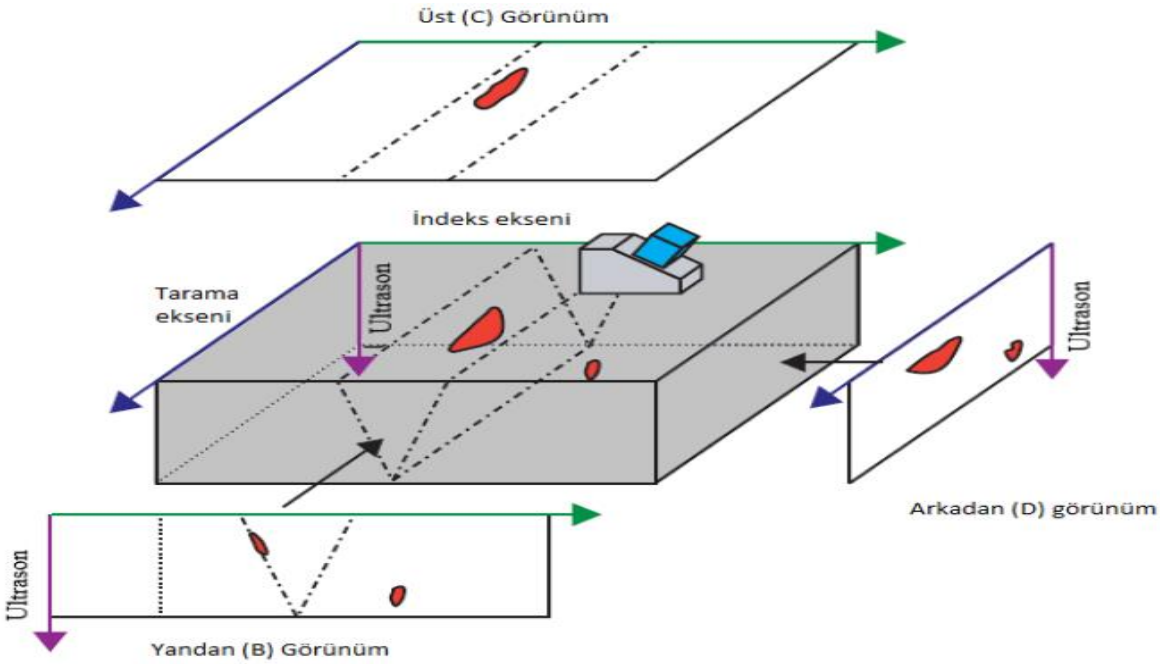
Faz dizi prob tertibatları genellikle bir plastik takoz içerir. Takozlar, düz ışınlı doğrusal taramalar dahil olmak üzere hem enine dalga hem de boyuna dalga uygulamalarında kullanılır. Bu takozlar, temel olarak faz dizi sistemlerinde geleneksel tek elemanlı kusur tespiti ile aynı işlevi yerine getirir, probdan gelen ses enerjisinin test parçasına bağlanmasını sağlayacak şekilde Snell yasasına göre istenen açıda dönüştürür ve/veya kırar. Faz dizi sistemleri, tek bir takozdan birden çok açıda ışınlar oluşturmak için ışın yönlendirmesini kullanırken, bu kırılma etkisi de ışın oluşturma sürecinin bir parçasıdır. Enine dalga takozları, geleneksel dönüştürücülerle kullanılanlara çok benzer ve geleneksel takozlar gibi birçok boyut ve biçimde gelirler. Bazıları tarama uygulamaları için bağlayıcı besleme delikleri içerir. Bazı tipik faz dizi prob takozları Şekil 2.4'de görülmektedir(Phased Array Testing: Basic Theory for Industrial Applications,2010).

Şekil 2.4. Faz dizi prob takozları

Sıfır dereceli takozlar, ses enerjisini birleştirmek ve düz doğrusal taramalarda ve düşük açılı boyuna dalga açılı taramalarda prob yüzünü çizilmelere veya aşınmaya karşı korumak için kullanılan düz plastik bloklardır.

2.4. Ultrasonik Görünümler (Taramalar)

Ultrasonik görünümler, ultrasonik yol ve tarama parametreleri arasındaki farklı düzlem görünümleriyle elde edilen görüntülerdir. Bu görüntüler Şekil 2.5'de gösterilmiştir (Introduction to Phased Array Ultrasonic Technology Applications:,2007).



Şekil 2.5. Ultrasonik görünümler (B-taraması, C-taraması ve D-taraması**)**

2.4.1 A-Tarama

Bir A-taraması, alınan ultrasonik darbe genliğinin uçuş süresine (ultrasonik yol) veya bir dalga biçimine karşı bir görünümüdür. Bir A-taraması, bir RF (radyo frekansı) veya iki kutuplu doğrultulmuş sinyal olarak görüntülenebilir.

2.4.2 B-Tarama

B-tarama, kaydedilen ultrason verilerinin 2 boyutlu bir görünümüdür. Genellikle yatay eksen tarama konumudur ve dikey eksen ultrason (U_{ses}) yolu veya zamanıdır. Eksenler, gerekli ekrana bağlı olarak tersine çevrilebilir. Görüntülenen verilerin konumu, alım anındaki kodlayıcı konumlarıyla ilgilidir. Esasen, bir B-tarama, bir dizi yığılmış A-taraması veya dalga biçimidir. Her A-taraması, bir kodlayıcı/zaman tabanlı örnekleme konumu ile temsil edilir. A-taraması, genlik renk kodludur. Yığılmış A-taramaları veya bir B-taraması, mekanik veya elektronik ışın hareketi ekseninde etkili bir şekilde eko-dinamik kılıftır. Bu nedenle, bu ekran kusur görüntüsünü uzatır ve ışın yayılması ve diğer faktörler nedeniyle kusur boyutunu bozar. Bunu anlamak ve telafi etmek için imleç boyutlandırma konusunda biraz deneyim gereklidir. Ultrasonik yol; kırılma açısı ve gecikme için düzeltilirse, B-taraması, yatay eksende tarama uzunluğu ve dikey eksende derinlik ile incelenen parçanın hacim düzeltmeli yan görünümünü temsil edecektir.

2.4.3 C-Tarama

C-taraması, test numunesinin üstten veya plan görünümü olarak görüntülenen ultrasonik verilerin 2 boyutlu görünümüdür. Eksenlerden biri tarama eksenidir; diğeri indeks eksenidir. Geleneksel ultrasonik sistemlerde her iki eksen de mekaniktir; lineer faz dizilerde bir eksen mekanik, diğeri elektroniktir. Görüntülenen verilerin konumu, veri alımı sırasında kodlayıcı konumlarıyla ilgilidir.

2.4.4 D-Tarama

D-taraması, verilerin iki boyutlu grafik sunumudur. B-taramasına benzer, ancak görünüm B-taramasının dik açısındadır. B-taraması yandan bir görünüm ise, D-taraması arkadan bir görünümdür. Hem D taramaları hem de B taramaları, yalnızca önceden tanımlanmış bir derinlikteki verileri gösterecek şekilde geçirilir. Eksenlerden biri indeks ekseni olarak tanımlanır; diğeri ultrasonik yoldur (U_{ses}). B-taraması tarama eksenini zamana karşı gösterirken, D-taraması indeks eksenini zamana karşı gösterir.

2.4.5 S-Tarama

Bir S-taraması (sektörel veya azimut taraması), gecikme ve kırılma açısı için düzeltilmiş belirli bir kanaldan tüm A-taramalarının 2 boyutlu bir görünümünü temsil eder. Tipik bir S-taraması, aynı odak mesafesini ve öğeleri kullanarak bir dizi açıyı tarar. Yatay eksen, düzeltilmiş bir görüntü için çıkış noktasından öngörülen mesafeye (test parçası genişliği) karşılık gelir ve dikey eksen derinliğe karşılık gelir.

S-taramaları, faz dizilere özgüdür ve boyuna dalga veya enine dalga; temas, daldırma veya bir takoza monte edilmiş olabilir. S-taramaları da düzeltilmemiş veya düzeltilmiş olarak görüntülenebilir; düzeltilmiş S taramaları gerçek reflektör konumlarını gösterir ve görselleştirme ve görüntü karşılaştırmaları için kullanışlıdır.

2.5 Faz Dizi Teknolojisinin Sınırlamaları ve Geliştirilmesi

Faz dizi ultrasonik teknolojisi bu bölümde bahsedilen sayısız avantajın yanı sıra, Tablo 2.1. de listelenen ve teknolojinin büyük ölçekli uygulamasını sınırlayabilecek belirli konulara sahiptir.

Tablo 2.1. Faz dizi ultrasonik teknolojisinin sınırlamaları

Sorunlar	Detaylar
Ekipman çok pahalı	Donanım, geleneksel UT'den 10 ila 20 kat daha pahalıdır. Pahalı yedek parçalar Çok fazla maliyetli yazılım yükseltmesi
Problar çok pahalı ve teslimatı uzundur	Özelliklerden ödün vererek simülasyon gerektirir Geleneksel problardan 12 ila 20 kat daha pahalı fiyat
Gelişmiş ultrasonik bilgiye sahip çok yetenekli operatörler gerektirir	Bilgisayar, mekanik, ultrasonik ve çizim becerilerine sahip multidisipliner bir teknik İnsan gücü, büyük ölçekli denetimler için büyük bir sorun Faz dizideki temel eğitim eksik.
Kalibrasyon zaman alıcı ve çok karmaşıktır	Prob ve sistem için birden fazla kalibrasyon gereklidir; işlevselliğin periyodik kontrolü rutin olmalı, ancak çok zaman alıyor.
Veri analizi ve çizimi zaman alıcıdır	Kusur verilerinin fazlalığı, yorumlamayı ve analizi zaman alıcı hale getirir. Çoklu A-taramaları nedeniyle çok sayıda sinyal, analiz ve düzenleme gerektirebilir. Zamana dayalı edinimde veri çizimi zaman alıcıdır.
Yöntem standartlaştırılmamış	Bu teknolojinin karmaşıklığı nedeniyle, faz dizi tekniklerinin mevcut standartlara entegre edilmesi zordur. Standartlar mevcut değildir. Prosedürler çok spesifik.

3.SONUÇ

Faz dizi tekniği, geleneksel ultrasonik NDT yöntemlerine kıyasla yüksek çözünürlükle birlikte deneysel verilerin yüksek üretkenliğini ve güvenilirliğini sağlar. Ultrasonik faz dizi tekniği bir incelemede kullanılacak dönüştürücü sayısının azaltılması, eğrilik ve karmaşık geometrik varyasyonlara sahip alanları kontrol etme yeteneği ve kusur konumunun ölçümünde daha iyi hassasiyet gibi geleneksel dönüştürücüye kıyasla bazı avantajlar sunar. Karmaşık yapıların denetimi için diğer tahribatsız muayene yöntemlerine göre bazı avantajlara sahiptir. Pahalı yedek parçalar, maliyetli yazılım yükseltmesi, ekipman pahalılığı ultrasonik faz dizi tekniğinin geleneksel ultrasonik teknikten 10 ila 20 kat daha pahalı olmasına sebep olur. Faz dizi probları pahalıdır ve teslimat süresi uzundur. İleri seviye ultrasonik bilgiye sahip çok yönlü operatörler gerektirir. Kalibrasyon zaman alıcı ve çok karmaşıktır. Kusur verilerinin fazlalığı, yorumlamayı ve analizi zaman alıcı hale getirir.

Özet
Sulama amacıyla yer altı su kaynakları, özellikle Konya bölgesinde büyük oranlarda tarımda kullanılıyor olmasına rağmen, bu kaynaklar Dünya su kaynakları potansiyelinin sadece % 0.75'lik bir kısmını oluşturmaktadır. Yer altı su seviyelerinin, bilinçsiz su kullanımı ve yağışların azalması gibi sebeplerden dolayı giderek düşmesi ise, birçok problemi beraberinde getirmektedir. Tarımsal sulama, yer altı su seviyelerinin azalması konusunda önemli bir faktör olduğu için, bu çalışmada Konya ilinin tarımsal açıdan önemli ilçelerinden biri olan Karapınar ilçesindeki yer altı su seviyesinin, bitki su ihtiyacıyla olan ilişkisi değerlendirilmiştir. İlçeyi temsil etmesi açısından Akören ve Akçayazı Mahallerinde bulunan DSİ yer altı su seviyesi gözlem kuyularının 2016-2019 yılları arasındaki değerleri baz alınmıştır. Bu süreçte Akören ve Akçayazı kuyularındaki seviye düşüşü, sırasıyla 7 m ve 10 m olmuştur. Toplam bitki su ihtiyacını (m^3) hesaplayabilmek amacıyla, bitki ekiliş alanları (ha) ve bitki su tüketim değerlerinden (mm) yararlanılmıştır. Su seviyelerindeki azalma ve bitki su ihtiyacı değerlerindeki artışın yıllara göre yüzdesel olarak ifade edilmesi ve değerlerin birbiriyle karşılaştırılması sonucu, bitki su ihtiyacında yaşanan artışın, yer altı su seviyesini olumsuz etkilediği görülmüştür. 2016 yılına kıyasla 2019 yılında, Akören ve Akçayazı yer altı suyu seviyelerinde sırasıyla % 13.21 ve % 9.58'lik azalmalar söz konusu iken, toplam bitki su ihtiyacında % 11.92'lik bir artış söz konusu olmuştur. Dolayısıyla, sulama konusunda üretimin aksamayacağı ve mevcut su kaynaklarının muhafaza edileceği yöntem ve düzenlemeler getirilmelidir.
Anahtar Kelimeler: Bitki su ihtiyacı, Yer altı suyu, Karapınar ilçesi, Sulama.

Effects of crop water requirement on ground water level change: The sample of Konya-Karapınar

Abstract
Although groundwater resources for irrigation are used in agriculture to a large extent, especially in the Konya region, these resources constitute only 0.75% of the world's water resources potential. The gradual decrease of underground water levels due to reasons such as unconscious use of water and decrease in precipitation brings along many problems. Since agricultural irrigation is an important factor in the reduction of groundwater levels, in this study, the relationship between groundwater level and crop water requirement in Karapınar district, which is one of the agriculturally important districts of Konya province, was evaluated. In order to represent the district, the values of the DSI underground water level observation wells in Akören and Akçayazı Districts between 2016-2019 are taken as a basis. During this period, the level drops in Akören and Akçayazı wells were 7 m and 10 m, respectively. In order to calculate the total plant water requirement (m^3), planting areas (ha) and plant water consumption values (mm) were used. As a result of expressing the decrease in water levels and the increase in the plant water requirement values as percentages over the years and comparing the values with each other, it has been observed that the increase in the plant water requirement affects the groundwater level negatively. From 2016 to 2019, while the groundwater levels of Akören and Akçayazı decreased by 13.21% and 9.58%, respectively, there was an increase of 11.92% in the total plant water requirement. Therefore, methods and regulations should be introduced in irrigation, where production will not be interrupted and existing water resources will be preserved.
Keywords: Crop water requirement, Groundwater, Karapınar District, Irrigation.

GİRİŞ

Bitki su ihtiyacının bir kısmı ya da tamamının yağışlarla karşılanamadığı bölgelerde, sulama yapılması gerekmektedir. Mevcut suyun tarım arazilerine ulaştırılması amacıyla inşa edilen yapı ve sistemler sayesinde, tarımsal sulama faaliyetleri gerçekleştirilebilmektedir. Bu kaynaklardan yerüstü suları ile birlikte, yer altı suları da tarımsal sulamada önemli bir paya sahiptir.

Dünya'daki toplam su hacminin %2.5'lük (35 milyon km^3) kısmını oluşturan tatlı su kaynaklarının, % 30.1'ini de (10.5 milyon km^3) yer altı suları oluşturmaktadır (Anonim, 2022a). Bu bilgi ışığında yer altı sularının oldukça düşük bir orana (% 0.75) sahip olduğunu söylenebilir. Yer altı suları, yağışların toprak alt katmanlarına sızdığı ve buradaki partiküllerin boşluklarında tutunarak depolandığı noktada oluşmaktadır. Aküferlerde toplanan yer altı suları, kapillarite ile kendiliğinden ya da sondaj kuyularının açılması sonucu yer yüzeyine ulaşabilmektedir. Suyun bu kuyular vasıtasıyla bitkilere verilebilmesi için bir enerji kaynağına da ihtiyaç duyulmaktadır. Yer altı su seviyesinin giderek düşmesi ise, hem gereken enerjinin artmasına, hem de su kaynaklarının azalmasına sebep olmaktadır.

Konya Kapalı Havzası, Türkiye kullanılabilir yer altı su potansiyelinin yaklaşık % 17'sine tekabül eden, toplam 2.435 milyar m^3 yer altı su kaynağına sahip iken, yüzey suları 1.93 milyar m^3'lük kısmı oluşturmaktadır (WWF, 2014). Havzanın büyük bir yer altı suyu potansiyeline sahip olması sonucu, yer altı su kuyularından sulama suyu temini önemli bir paya sahiptir. Bunun yanında havzada ruhsatsız kuyuların varlığının fazla olması, su tüketiminin yüksek ve kontrolsüz olmasına sebep olmaktadır.

Küresel ısınma sebebiyle meydana gelen daha fazla buharlaşma, kuraklık ve düzensiz yağış gibi faktörler su kaynaklarının olumsuz etkilenmesine sebep olmaktadır (Karaman ve Gökalp, 2010). Bununla birlikte, Konya bölgesindeki tarım arazilerinde bitki su tüketimi yüksek ürünlerin geçmiş yıllara nazaran daha fazla ekiliyor olması, toplam su kullanımını artırmaktadır. Yararlı yağışların azalmasına karşın, su tüketiminin fazla olması durumu da yer altı su varlığını olumsuz anlamda etkilemektedir.

Yer altı su seviyelerinin azalması sonucu, suyun bitki kök bölgesine ulaştırılabilmesi için gereken enerji miktarı artmakta, bu da üreticilere ekonomik anlamda daha fazla masraf getirmekle birlikte, kullanılan enerji kaynağına bağlı olarak daha yüksek oranda sera gazı emisyonunun açığa çıkmasına sebep olmaktadır. Bazı bölgelerde de obruk gibi insan hayatı için tehlikeli sonuçlar doğurabilecek doğal oluşumlar meydana gelebilmektedir.

Obruklar, yer altı suyunun karbondioksit ile tepkimeye girmesi sonucu ortaya çıkan karbonik asitin, suda eriyebilen kayaçları çözerek yer altında boşluk ve mağara sistemlerini oluşturması ve mağara tavanında yer alan materyallerin zayıf dayanımlı olmalarından dolayı, mağara tavanındaki yapının çökmesi ile meydana gelmektedir (Orhan ve ark., 2020). Konya-Karapınar ilçesinde sayısı son zamanlarda daha da artan obrukların, yer altı su seviyesinin düşmesiyle ilişkisi olduğu bilinen bir gerçektir.

Yer altı su seviyesinin azalmasında ihtiyaçtan fazla kullanılan tarımsal amaçlı suyun büyük bir etkisi bulunmakla birlikte, bu çalışmada Karapınar ilçesine ait iki adet yer altı su seviyesi gözlem kuyusunun 2016-2019 yılları arasındaki değişimine bağlı olarak, yetiştirilen ürünlerin su tüketimine ilişkin sonuçları değerlendirilmiştir.

MATERYAL VE METOD

Önemli bir tarım potansiyeline sahip olmasına rağmen, düşen toplam yıllık yağışın düşük olduğu bir bölge olan Konya ili Karapınar ilçesi, 2747 km^2 yüzölçümü ve 1026 m deniz seviyesinden yüksekliğe sahiptir. İlçe, Türkiye'nin en az yağış alan yerlerinden biri olup, yıllık toplam 279,5 mm yağışa sahiptir. Bununla birlikte, güneyinde ülkenin en fazla rüzgar erozyonuna maruz kalan sahası da bulunmaktadır (Anonim, 2022b).

Karapınar'da en fazla yağış sırasıyla ilkbahar, kış, sonbahar ve yaz aylarında düşmektedir. En fazla yağış Nisan ve Mayıs aylarında düşmekle birlikte, en az yağışın görüldüğü ay da Ağustos'tur. Yaz mevsiminde düşen yağış, yıllık toplam yağışın sadece % 9'unu oluşturduğu için, ilçede tarımsal sulama zorunlu hale gelmiştir (Yılmaz, 2010).

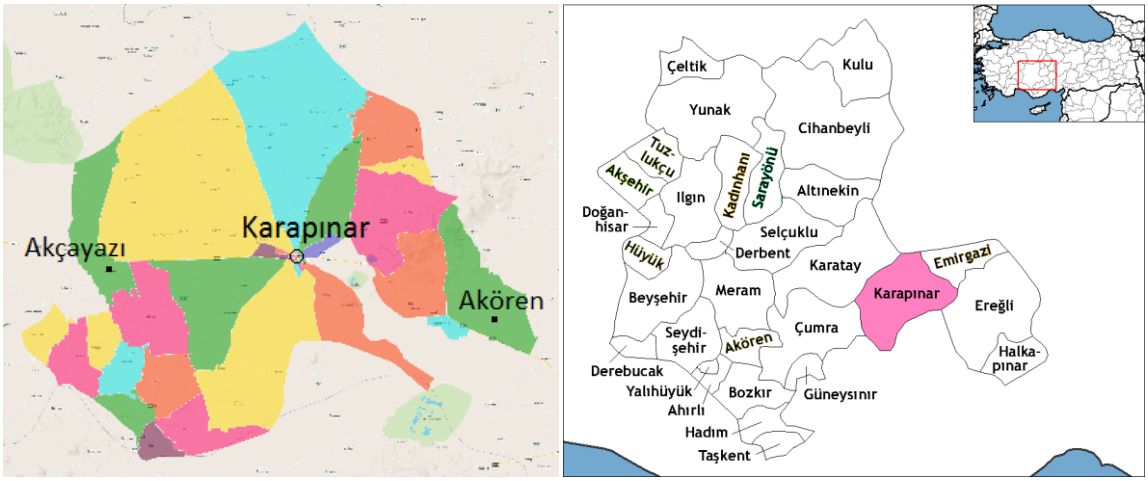
Karapınar ilçesi toplam 135.751,4 ha'lık bir tarım alanına sahip olup, bu değer ilçe yüzölçümünün yaklaşık yarısını oluşturmaktadır. Bu alan içerisinde tarla bitkileri 123.564,6 ha, meyve, içecek ve baharat bitkileri 532,1 ha ve sebzeler 1.654,7 ha'lık bir alanda yetiştirilmektedir. 10.000 ha'lık kısım ise nadasa bırakılmaktadır. İlçede üretim miktarı en yüksek olan başlıca bitkiler; şeker pancarı, mısır, yonca, buğday, patates ve arpadır. Ekim alanlarına baktığımızda, buğday, mısır, arpa, şeker pancarı ve yonca başta gelen bitkilerdir (TÜİK, 2021). Tablo 1'de ilçede en çok üretimi yapılan bitkilere ait bilgiler verilmektedir.

Tablo 1. Karapınar ilçesinde başlıca üretimi yapılan bitkiler ve ekim alanları (TÜİK, 2021)

	Bitki	Üretim Miktarı (ton)	Ekim Alanı (ha)
1	Şeker Pancarı	997.453	16.578,7
2	Mısır	581.595	28.700
3	Yonca	565.600	10.100
4	Buğday	180.236	40.500,2
5	Patates	68.440	1.550
6	Arpa	43.450	16.931,2
7	Domates	42.000	560
8	Ayçiçeği	38.700	9.200
9	Havuç	37.500	750
10	Fiğ	12.460	3.115

Karapınar, tarımsal üretim açısından Konya'nın önde gelen ilçelerindendir. Şeker pancarı ve yonca üretiminde Konya ilçeleri arasında ilk sırada, buğday, mısır, patates ve domates üretiminde ise ikinci sırada yer almaktadır. Ayrıca, Türkiye'de en çok şeker pancarının üretildiği ilçe konumundadır. Görüldüğü üzere, Karapınar ilçesi ülkenin tarımsal üretimine önemli ölçüde katkı sağlamaktadır.

Karapınar sınırları içerisinde yer alan Akören ve Akçayazı Mahalleri'nde bulunan ve DSİ tarafından ölçümleri yapılan iki adet yer altı su seviyesi ölçüm kuyusunun 2016-2019 yılları arasındaki değerleri baz alınarak, çalışma gerçekleştirilmiştir. Akören ve Akçayazı Mahalleleri, 2019 yılı verilerine göre sırasıyla 564 ve 694 nüfusa sahip olup, Karapınar ilçe merkezine sırasıyla 29 km ve 26 km uzaklıkta bulunmaktadırlar (Anonim, 2022c). İlçeyi temsil etmesi açısından bu iki bölge seçilmiştir (Şekil 1).

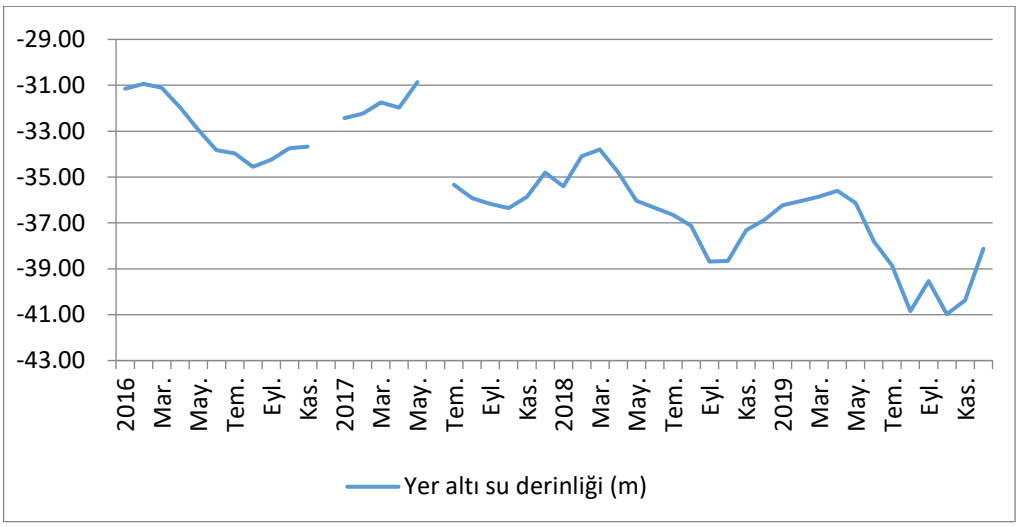


Şekil 1. Akören ve Akçayazı Mahallelerinin Karapınar ilçesindeki konumu (Anonim, 2018).

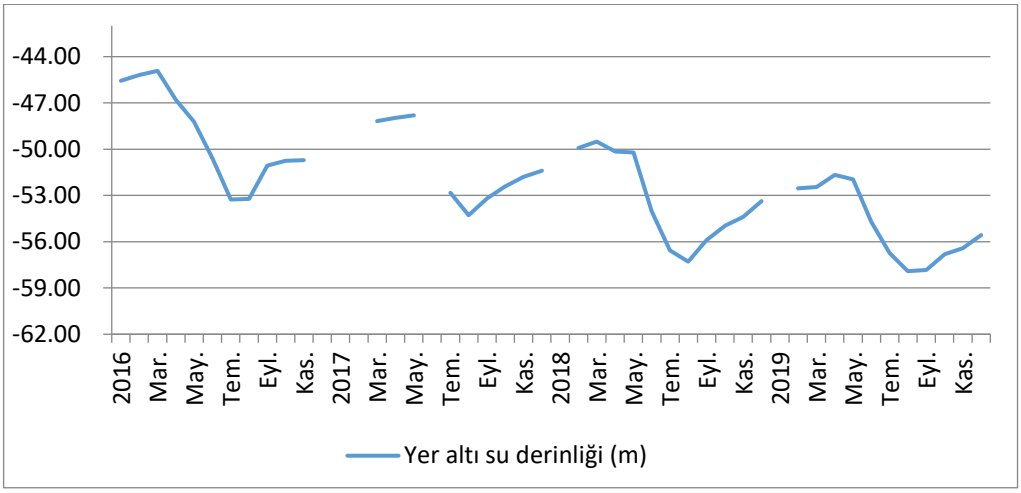
Gözlem kuyularının 2016 Ocak ayı ve 2019 Aralık ayı arasındaki yer altı su seviyesi değerleri Devlet Su İşleri IV. Bölge Müdürlüğü'nden temin edilmiştir. Çalışmada, su seviye değişimleri ile bölgede yetiştirilen bitkilerin toplam su ihtiyaçları arasındaki ilişkinin değerlendirilmesi amaçlanmıştır. Bitki ekiliş alanları (ha) ve bitki su tüketim değerleri (mm) çarpılarak, toplam bitki su ihtiyacı (m^3) bulunmuştur. Yer altı su seviyesinin düşmesi sonucu meydana gelebilecek problemlerle birlikte çözüm yolları ortaya konulmuştur.

BULGULAR ve TARTIŞMA

Karapınar ilçesi Akören ve Akçayazı Mahallelerindeki yer altı su seviyesi ölçüm kuyularına ilişkin grafikler, Şekil 2 ve Şekil 3'te verilmektedir. Grafikler incelendiğinde, Karapınar ilçesine yıllık toplam yağışın % 91'inin ilkbahar, sonbahar ve kış mevsimlerinde düşmesi nedeniyle, yer altı su seviyelerinin yaz mevsiminden sonraki aylarda artmaya başladığı görülmektedir. En fazla yağış, Nisan ve Mayıs aylarında düşse de, bu aylardan itibaren başlayan sulama faaliyetleri neticesinde, su seviyesi çoğunlukla Mart ayından sonra düşmeye başlamış ve Ağustos ayında yılın en düşük seviyesine ulaşmıştır.



Şekil 2. Akören Mahallesi yer altı suyu seviye değişimi (2016-2019) (DSİ, 2020)



Şekil 3. Akçayazı Mahallesi yer altı suyu seviye değişimi (2016-2019) (DSİ, 2020)

Gözlem kuyularındaki toplam değişimle birlikte, yılın ilk ve son aylarındaki seviye değerleri baz alınarak oluşturulan yıllık değişim değerleri Tablo 2'de verilmiştir. 2016-2019 yılları arasındaki toplam değişime baktığımızda, yer altı su seviyesi Akören gözlem kuyusunda yaklaşık 7 m, Akçayazı gözlem kuyusunda ise 10 m düşmüş durumdadır. Yer altından tarımsal ya da diğer amaçlarla (içme kullanma, endüstriyel vb.) çekilen su miktarının yağışlarla karşılanamıyor olması, su seviyelerinin giderek düşmesine sebep olmaktadır.

Yıllık değişimler incelendiğinde, her iki kuyu için de en yüksek seviye değişiminin 2016 yılında yaşandığı, son yıllarda ise seviye değişim oranlarının giderek azaldığı görülmektedir. Bunun sebebi, yer altı su seviyesinin giderek çekilmesi sonucu, suyun yeryüzüne ulaşması için daha fazla enerji gerekmesi ve sulama faaliyetinin 2016 yılına oranla aynı verim ile yapılamıyor olmasından kaynaklanmaktadır.

Tablo 2. 2016-2019 yılları arasında gözlem kuyularındaki yer altı su seviyesi değişimi (DSİ, 2020)

Yıllar	Akören				Akçayazı			
	İlk aydaki su seviyesi (m)	Son aydaki su seviyesi (m)	Yıllık değişim		İlk aydaki su seviyesi (m)	Son aydaki su seviyesi (m)	Yıllık değişim	
			m	%			m	%
2016	-31.15 (Ocak)	-33.68 (Kasım)	-2.53	8.12	-45.57 (Ocak)	-50.71 (Kasım)	-5.14	11.3
2017	-32.43 (Ocak)	-34.81 (Aralık)	-2.38	7.33	-48.18 (Mart)	-51.39 (Aralık)	-3.21	6.66
2018	-35.41 (Ocak)	-36.87 (Aralık)	-1.46	4.12	-49.92 (Şubat)	-53.37 (Aralık)	-3.45	6.91
2019	-36.23 (Ocak)	-38.13 (Aralık)	-1.9	5.24	-52.54 (Şubat)	-55.57 (Aralık)	-3.03	5.45
-6.98 m (% 22.40) (2016 Ocak-2019 Aralık Toplam Değişim)					**-10.00 m (% 21.94) (2016 Ocak-2019 Aralık Toplam Değişim)**			

Karapınar ilçesinde yetiştirilen başlıca ürünlerin 2016-2019 yılları arasındaki ekilen alan büyüklükleri (ha) Tablo 3'te verilmiştir. Yıllık bitki su tüketimi yüksek olan şeker pancarı, mısır ve ayçiçeği gibi bitkilerin ekim alanlarının artması buna karşın buğday ve arpa gibi hububat bitkilerinin ekim alanlarının azalması, sulamada ihtiyaç duyulan toplam sulama suyu miktarını artırmaktadır. Bununla ilgili olarak, Tablo 4'te bitkilerin yıllık toplam su tüketim miktarları (mm) verilmiştir. Yıllık bitki su tüketimi ve ekilen alan değerleri vasıtasıyla hesaplanan toplam bitki su ihtiyaçları (m^3) Tablo 5'te verilmiştir.

Araştırmanın yapıldığı bitkilerin toplam bitki su ihtiyaçları 2016 yılında 602.018.754,3 m^3 iken, 2019 yılında yaklaşık %12 artarak 673.835.668,2 m^3 olmuştur. Özellikle 2019 yılındaki su ihtiyacı miktarında bir önceki yılın değerine oranla büyük bir artış yaşanmıştır. Yer altı su seviye değişimleri ve toplam bitki su ihtiyacı arasındaki ilişkiyi gösteren grafik, Şekil 4'te verilmektedir. Grafikte, Akören ve Akçayazı kuyularındaki seviye düşüşleri ve toplam bitki su ihtiyacının ilk yıla göre (2016) artış oranları yüzdesel olarak ifade edilmektedir. Şekil 4 incelendiğinde, 2016-2019 yılları arasında yeraltı su seviyeleri ile bitki su tüketimleri arasında zıt yönde bir paralellik olduğu söylenebilir.

Tablo 3. Karapınar ilçesinde yetiştirilen başlıca ürünlerin 2016-2019 yılları arasındaki ekilen alan büyüklükleri (ha) (TÜİK, 2021)

Bitki	2016	2017	2018	2019
Şeker Pancarı	7.317,2	8.180,5	7.491,6	10.939,1

Şekil 4. Kuyulardaki yer altı su seviyesi düşüşü ve toplam bitki su ihtiyacı miktarının artışındaki yüzdelik değişimler (%)

Doğdu ve ark. tarafından 2007 yılında yapılan bir çalışmada, Konya-Karapınar ilçesinde 1982-2007 yılları arasında yer altı su seviyesinin yıllık ortalama 0.7 m azaldığı bildirilmektedir. Bu çalışmada ise 2016-2019 yılları arasında Akören ve Akçayazı kuyularında yer altı suyu seviyesi yıllık ortalama olarak sırasıyla 1.75 m ve 2.5 m azaldığı tespit edilmiştir. Elde edilen sonuçlardan hareketle, ilçede 35 yıl içerisinde gerçekleşen yer altı su seviyesindeki azalma, iklim değişikliği ve küresel ısınmaya bağlı olarak 4 yılda yaklaşık 2.5-3.0 katına çıkmıştır. Hatta Konya Kapalı Havzası'ndaki yıllık 1 m'lik yer altı suyu çekilmesinin bile birçok sorunu beraberinde getireceği öngörülmüştür (Üstün ve ark., 2007).

Yer altı suyunun çekilmesi ile obruk oluşum süreci bir miktar hızlanmakta olup Karapınar ilçesinde obruk sayısı büyük bir hızla artmaktadır. Karapınar-Eskil arasındaki bölgede, 2017 yılı sonu itibariyle 299 obruk oluşumu tespit edilmesine rağmen, 2021 yılı sonu itibariyle 700'ü 1 m'den daha derin ve 1850 civarında çapları birkaç m'den 50-60 m'ye değişen 1 m'den daha sığ obruklar tespit edilmiştir. Oluşan obrukların büyüklükleri, yer altı su seviyesine bağlı olduğu için, seviye derinlere gittikçe obrukların büyüklüğü de artmakta ve çevreyi ciddi derecede tehdit etmektedir (Anonim, 2022d).

SONUÇ

Konya ili Karapınar ilçesinde bulunan iki yer altı su seviyesi gözlem kuyusundan 2016-2019 yılları arasında alınan ölçüm değerleri baz alındığında, yıllık seviye düşüşünün geçmiş yıllara nazaran daha fazla olduğu tespit edilmiştir. Bu durumun ivme kazanmasının başlıca sebebi, ihtiyaç duyulan sulama suyu miktarının artması ve yıllık ilçeye düşen yağış miktarının giderek azalmasıdır. Özellikle suyu fazla tüketen bitkilerin (şekerpancarı, mısır başta olmak üzere) ekilen alanlarının artıp, hububat alanlarının azalması daha fazla suyun tarımda kullanılması sonucunu doğurmaktadır. Fakat, şeker pancarı ve mısır gibi bitkilerin üretimi açısından Karapınar ilçesinin, Türkiye'de oldukça önemli bir konuma sahip olduğu biliniyorken, bir anda bu bitkilerin ekiliş alanlarının azaltılması da sağlıklı sonuçlar vermeyebilir. Bu yüzden hem bitki üretiminin sürdürülebilirliğinin sağlanması hem de mevcut su kaynaklarının daha verimli kullanılabilmesi adına tarım alanında uzman kişi ya da kuruluşlar tarafından, uzun yılları kapsayacak bir üretim planlaması ortaya konulmalıdır.

Yer altı su seviyesinin düşmesi sonucu, suyun bitki kök bölgesine olan uzaklığı artacağı için, suyun yer yüzeyine ulaşabilmesi gereken enerji miktarı da artacaktır. Yer altı kuyularından sulama yapabilmek amacıyla, havzada çoğunlukla elektrik enerjisinden faydalanılmaktadır. Elektrik şebekesinin kurulumu ve sondaj gibi masraflarla birlikte, çiftçilerin elektrik için ödedikleri tutar, yer altı su seviyesinin düşmesiyle daha da artacaktır. Dizel yakıt kullanılarak sulamanın yapıldığı kuyularda da aynı durum söz konusudur. Maddi kaybın yanı sıra, fazladan harcanan enerji neticesinde başta CO_2 olmak üzere, çeşitli sera gazlarının emisyonunun artmasına ve son dönemlerde etkisi artan küresel ısınmanın daha da şiddetlenmesine sebep olacaktır.

Harcanan fazla enerjinin yanı sıra, su kaynağının debisinde de azalmalar yaşanabileceğinden dolayı, sulama süresi artmakta ya da bazı noktalarda sulama yapılamamaktadır. Yağışların giderek azalıyor olması ise, Konya bölgesinde hububat gibi tamamen ya da kısmen yağışa dayalı şekilde yetiştirilen ürünlerde verim kayıplarına sebep olacaktır. Bu gibi durumların olumsuz etkisi son yıllarda daha net bir şekilde hissedildiği için, öncelikle bir planlama yapılmalı ve ona göre hareket edilmelidir. Su kaynaklarının bu bağlamda, gelişigüzel ya da kişi ya da kurumlar arasında bir bağlantı olmadan, bağımsız bir şekilde kullanılması, su kullanımının kontrol altına alınamamasına sebep olacaktır. Bu nedenle; doğru bitki deseninin tespit edilmesi, uygun sulama yöntemlerinin uygulanması ve gereksiz sulamadan kaçınılması gibi önerilerin, üretici ve bu konuda söz sahibi kurum ve kuruluşların koordinasyonunun sağlanılarak, planlı ve geleceğe dönük bir şekilde uygulanması gerekmektedir.

Suyun dünya genelinde yaklaşık %70'lik oranda büyük bir kısmının tarımda kullanıldığı düşünüldüğünde, mevcut yağışlara karşılık ihtiyaç duyulan toplam sulama suyunun azaltılamıyor olması, yer altı su seviyelerinin olumsuz bir tablo çizmesini sürekli hale getirecektir. Bunun bir sonucu olarak, sayıları giderek artmakta olan obruk gibi oluşumlar da hem verimli toprakların kaybolmasına sebep olmakta, hem de insan hayatı için bir tehdit unsuru olarak karşımıza çıkmaktadır. Ülkemizde, Karapınar gibi düşük yağış almasına rağmen yoğun bir şekilde tarımsal faaliyetlerin sürdürüldüğü tarım potansiyeli yüksek olan bölgelerde veya ilçelerde, sulamada yer altı sularının etkin kullanılması adına gerekli planlama yapılarak koordineli bir şekilde ve vakit kaybetmeden uygulamaya geçirilmelidir.

Özet

Dünya'da çok uzun zamandır etkisi hissedilen iklim değişikliğinin olumsuz etkileri, özellikle yarı-kurak iklim kuşağında bulunan Türkiye için tehlike arz etmektedir. Ortalama sıcaklıklar 1860'tan günümüze kadar yaklaşık 0,5-0,8 ºC artmıştır ve eğer gerekli önlemler alınmazsa 21. Yüzyılın sonunda küresel sıcaklıkların ortalama 2 ºC artması beklenmektedir. Küresel sıcaklıkta bu artışlarla birlikte 2100 yılına kadar ortalama yüzey sıcaklıklarının dünya genelinde 1,4-5,8 ºC arasında artacağı öngörülmektedir (Kadıoğlu ve Dokumacı, 2005; Öğüt, 2008). Küresel ısınma ve bunun sonucunda oluşan iklim değişikliği ile birlikte meteorolojik olaylarda dengesizlikler (sel baskınları, yağış düzensizlikleri, aşırı kuraklık) ortaya çıkmakta olup bu değişikliklerden en çok etkilenen faaliyet alanı ise tarımdır. İklim değişikliğinden hem etkilenen hem de bu değişimi etkileyen tarımsal faaliyetler ile artan dünya nüfusunun gıda ihtiyacını karşılayabilmek için yeni tip tarımsal uygulamaların geliştirilmesi ve mevcut su kaynaklarının etkin ve verimli bir şekilde kullanılmasını zorunlu kılmaktadır. İnsan beslenmesinde günlük enerji miktarının %55-60'ını oluşturan ve günlük diyette olmazsa olmaz karbonhidratlar açısından en zengin besin kaynağı tahıllardır ve ayrıca hayvan yemi olarak ve sanayide hammadde olarak kullanılmaktadır. 2021 yılında dünyada 2226 milyon ton hububat üretimi gerçekleşmiş olup bu üretimin yaklaşık %86'sı mısır ve buğdaydan oluşmaktadır. Dünya nüfusunun %1,06'sını oluşturan ülkemizde ise 2021 yılında 35,2 milyon ton hububat üretilmiştir ve bu üretimin yaklaşık %55'ini tek başına buğday oluşturmaktadır. Yürütülen araştırmalara göre son on yıl içerisinde kişi başına hububat tüketimi Dünya'da yaklaşık %23 artarak 263kg'dan 323 kg'a yükselmesine rağmen Türkiye'de 477 kg'dan 480 kg'a (%0,6 artış) ulaşmıştır (IGC, 2021; TÜİK 2021). Bu çalışmada insan beslenmesinde enerji kaynağı olmasının yanı sıra hayvancılık sektöründe yem, sanayi sektöründe hammadde kaynağı olarak tüketilen tahılların, Dünya ve Türkiye'deki durumu ve iklim değişikliğinin bu ürünlerin üzerine etkilerinin ne olacağı ile ilgili bilgiler verilecektir.

Anahtar Kelimeler: İklim değişikliği, Küresel ısınma, Hububat, Buğday, Mısır

The current situation of cereals in the world and in Turkey and the effect of climate change on cereals

Abstract

The negative effects of climate change, which have been felt in the world for a long time, pose a danger especially for Turkey, which is located in the semi-arid climate zone. Average temperatures have increased by about 0.5-0.8°C since 1860, and global temperatures are expected to increase by an average of 2°C by the end of the 21st century if necessary precautions are not taken. With these increases in global temperature, it is predicted that the average surface temperatures will increase between 1.4-5.8 ºC worldwide until 2100 (Kadıoğlu and Dokumacı, 2005; Öğüt, 2008). With global warming and the resulting climate change, imbalances (floods, precipitation irregularities, extreme drought) occur in meteorological events, and as for the field of activity most affected by these changes is agriculture. With agricultural activities that are both affecting and affected by climate change, make compulsory the development of new types of agricultural practices and the effective and efficient use of existing water resources in order to meet the food needs of the increasing world population. Grains are the richest food source in terms of carbohydrates, which constitute 55-60% of the daily energy amount in human nutrition and are indispensable in the daily diet, and are also used as animal feed and as raw materials in the industry. In 2021, 2226 million tons of cereals were produced in the world and approximately 86% of this production consists of corn and wheat. In Turkey, which constitutes 1.06% of the world's population, 35.2 million tons of cereals were produced in 2021 and wheat alone constitutes approximately 55% of this production. According to the researches, although the per capita consumption of cereals has increased by 23% in the world from 263 kg to 323 kg in the last decade, it has

reached 480 kg from 477 kg (0.6% increase) in Turkey (IGC, 2021; TUIK 2021). In this study, information about will be given the situation in the world and in Turkey of grains consumed as feed in the livestock sector and raw material in the industry sector in addition to being a source of energy in human nutrition and the effects of climate change on these products.

Keywords: Climate change, Global warming, Cereals (grain), Wheat, Maize

GİRİŞ

Son yıllarda sürekli artan bir eğilimde olan küresel iklim değişikliğinin etkisi özellikle su kaynaklarının azalması ile tarımsal üretimde rekolte kayıpları yaşanmasına ve hatta tarımın yoğun yapıldığı bazı bölgelerde ise su teminin güçleşmesi veya maliyetinin artmasından dolayı istenen ölçekte ve yeterli düzeyde tarla tarımının yapılamamasına sebep olmakta hatta gıda güvencesini de tehlikeye sokmaktadır. Hem Dünya'da hem de Türkiye'de iklim değişikliğinin tarımsal üretime yansıması, Kadıoğlu ve ark. (2017) tarafından yapılan bir çalışmada, ürün veriminde azalma, sulama suyuna talebin artması, su kaynaklarının azalmasıyla sulama maliyetinin artması, ekim-dikim-hasat dönemlerinde kaymalar, hastalık ve zararlı türlerde artışlar olarak ifade edilmektedir.

Dünyada, toplam 3,2 milyar hektar olan işlenebilir tarım arazisi vardır ve son yıllarda kişi başına düşen tarım arazisi miktarı gelişmiş ülkelerde yaklaşık %14 azalmasına rağmen gelişmekte olan ülkelerde bu oran %40'lara kadar çıkmaktadır. Kişi başına 0,23 hektar olan tarım arazisinin küresel ısınma ve iklim değişikliğine bağlı olarak 2050 yılında 0,15 hektara düşeceği ve özellikle küresel ısınmanın etkisinin daha şiddetli olduğu bölgelerde tarımsal üretimin %50 azalacağı tahmin edilmektedir (Yönten, 2007; Filinte, 2007; Ateş, 2008).

Bölgesel farklılara ve zamana bağlı olarak iklim, tarımsal üretim ve verimi etkileyen en önemli faktördür. Küresel iklim değişikliğinin sonucu olarak sıcaklıkların artması ile özellikle kuzey yarım kürede bulunan yüksek rakımlı ülkelerde veya bölgelerde bitkilerin büyüme sezonunun geçen her 10 yılda 1,2-3,6 gün uzayacağı tahmin edilmektedir (Gitay ve ark., 2001). Foley ve ark., (2011)'na göre tarım, insan yaşamının devamı için gerekli temel besin maddelerini sağlamakla kalmayıp, suyun ve toprağın kullanımına, dolayısıyla tüm ekosistemi bütüncül olarak işleyen yaşamsal bir döngüdür. Küresel iklim değişikliğinin tarımsal üretim üzerine olumsuz etkilerini tamamen önlemek belki mümkün olmayabilir. Ancak bu zararı en az düzeye indirmek amacıyla tarımsal üretim desenini iklim değişikliğine en iyi şekilde adapte edebilecek uygun bir planlama yapılması gerekmektedir. Dünya nüfusunun 2030 yılı itibariyle 8 milyara ulaşacağı ve bu nüfusun beslenebilmesi için de bugünkü gıda üretiminin %60'ı kadar artırılması gerektiği FAO (2017) ve Zaimoğlu (2019) tarafından yapılan çalışmalarda ifade edilmektedir.

Dünya'da ve Türkiye'de Hububat Üretimi-Tüketimi

Dünya'da 2021 yılı itibariyle 616 tonu önceki yıldan olmak üzere 2827,8 milyon ton hububat üretimi olduğu tahmin edilmektedir. Toplam hububatın 737,1 milyon tonu (%26) gıda, 1007 milyon tonu (%36) yem hammaddesi, 359,7 milyon tonu (%13) endüstriyel ve 122 milyon tonu (%4) ise diğer amaçlarla kullanılmıştır ve toplam tüketim 2225,28 milyon olarak gerçekleşmiş olup 602 milyon tonunun (%21) ise stoklandığı tahmin edilmektedir (IGC, 2021). Dünyada toplam hububat üretiminin yıllara göre değişimi Tablo 1 ve Şekil 1'de verilmiştir. Dünya'da hububat üretimi son 10 yılda %18,5 artarak, 1879 milyon tondan 2226 milyon tona ulaşmıştır (Tablo 1, Şekil 1). Tablo 1 incelendiğinde, Dünyadaki toplam hububat üretiminin yaklaşık %86'sını oluşturan mısır ve buğdayın üretim oranları sırasıyla yaklaşık %51 ve %35'tir.

Tablo 1. Dünyada hububat üretiminin yıllara göre değişimi (Milyon Ton)

	2011/12	2012/13	2013/14	2014/15	2015/16	2016/17	2017/18	2018/19	2019/20	2020/21

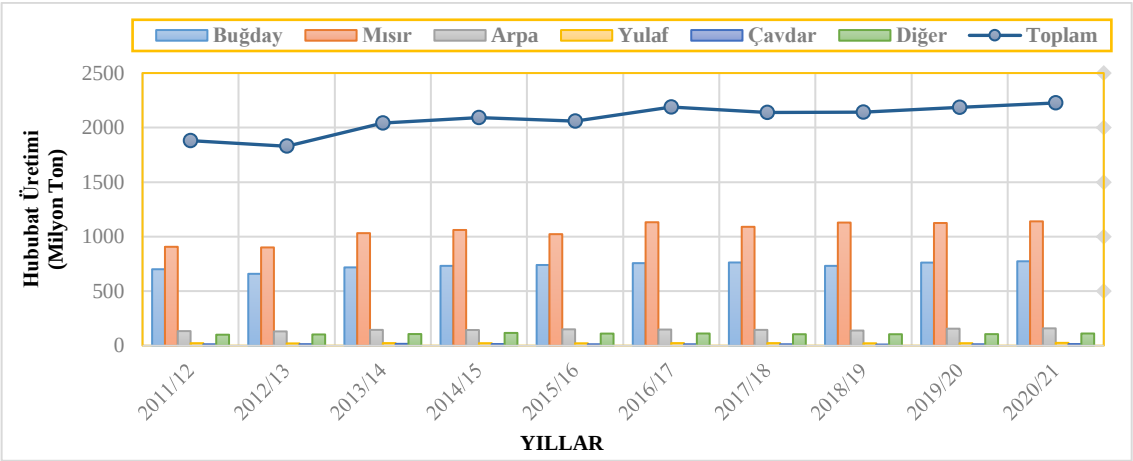
Toplam	1879	1829	2043	2092	2058	2189	2139	2141	2185	2226



Şekil 1. Dünyada toplam hububat üretimi ve üretimin yıllara göre değişimi

IGC (2021) ve TÜİK (2021) verilerine göre, 2021 yılında Türkiye'nin toplam hububat varlığının 53,9 milyon ton (7,2 milyon ton önceki yıldan, 11,5 milyon tonu ithal ve 35,2 milyon tonu üretim) olduğu tahmin edilmektedir (Tablo 2, Şekil 2). Ülkemizde hububat varlığının 18,2 milyon tonu gıda, 17,7 milyon tonu yem hammaddesi, 1,4 milyon tonu endüstriyel amaçla ve 3,1 milyon tonu diğer amaçlar için tüketilmiş olup, toplam hububat tüketimi 40,4 milyon ton olarak gerçekleşmiştir. IGC (2021) tahminlerine göre ülkemizde toplam 6,9 milyon ton hububat ihraç edilmiş ve 6,6 milyon ton hububat stoklanmıştır. Türkiye'de ise 2011-2021 yılları arasında hububat üretimi %2,5 artarak 34,3 milyon tondan 35,2 milyon tona ulaşmıştır (Tablo 2).

Tablo 2. Türkiye'de hububat üretiminin yıllara göre değişimi

	2011/12	2012/13	2013/14	2014/15	2015/16	2016/17	2017/18	2018/19	2019/20	2020/21
Buğday	21,8	20,1	22,1	19	22,6	20,6	21,5	20	19	19,5
Mısır	4,2	4,6	5,9	6	6,4	6,4	5,9	5,7	6	6,5
Arpa	7,6	7,1	7,9	6,3	8	6,7	7,1	7	7,6	8,3
Yulaf	0,2	0,2	0,2	0,2	0,2	0,2	0,2	0,2	0,3	0,3

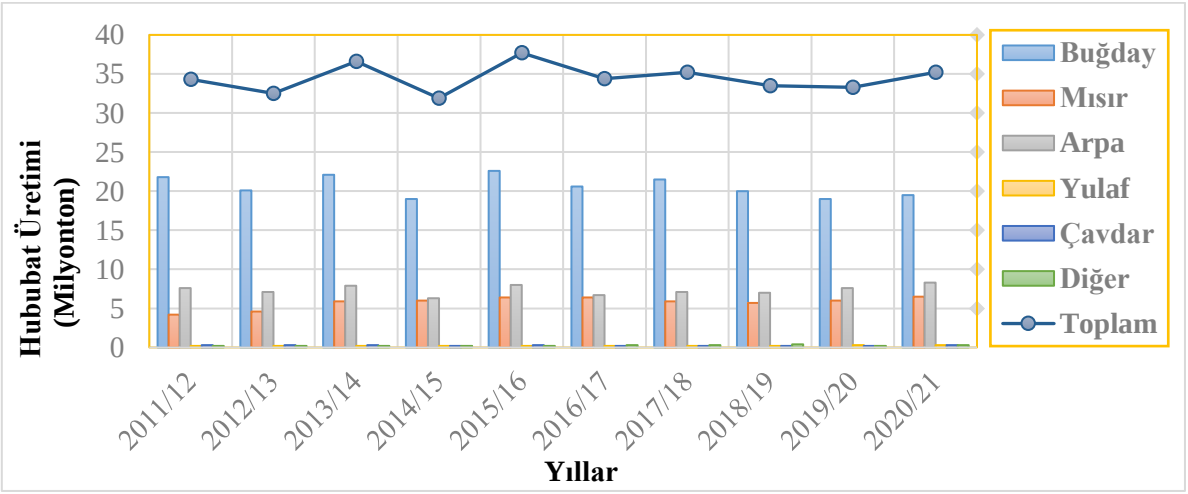
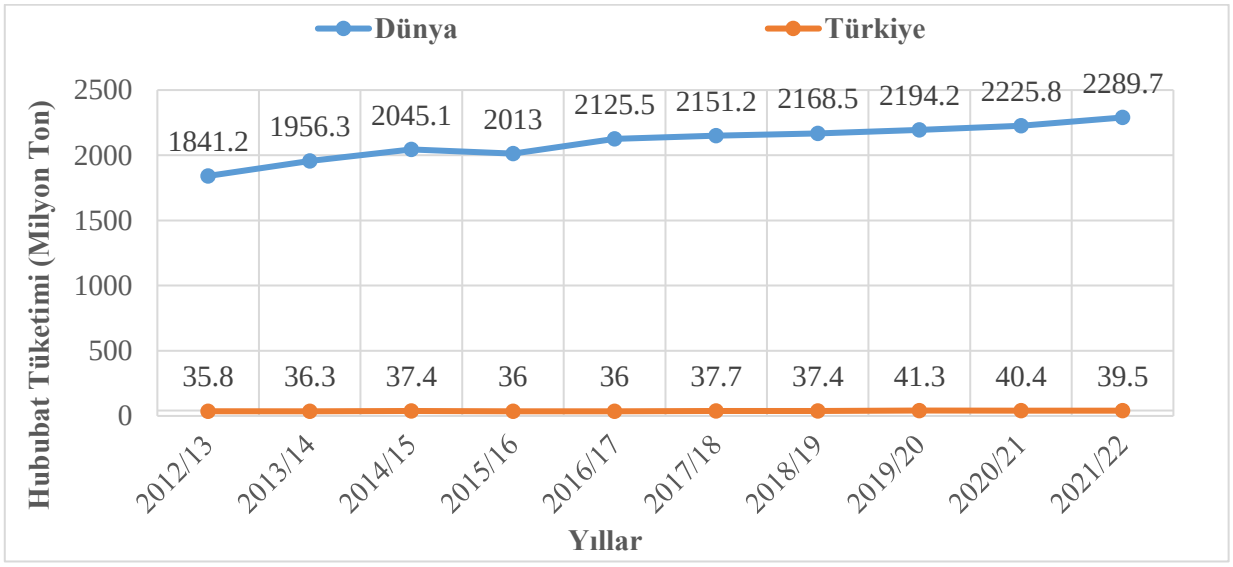
Diğer	0,2	0,2	0,2	0,2	0,2	0,3	0,3	0,4	0,2	0,3
Toplam	34,3	32,5	36,6	31,9	37,7	34,4	35,2	33,5	33,3	35,2



Şekil 2. Türkiye'de toplam hububat üretimi ve üretimin yıllara göre değişimi

Dünya nüfusunun yaklaşık %1'ini oluşturan Türkiye'de, 2021 toplam hububat tüketimimiz dünyadaki toplam tüketimin yaklaşık %1,73'üne karşılık gelmesine rağmen, hububat üretimimiz toplam üretimin yaklaşık %1,6'sına karşılık gelmektedir (Tablo 1-2, Şekil 3). Dünya'da kişi başına hububat tüketimi son on yılda nüfus artışıyla orantılı olarak 263 kg'dan 323 kg'a yükselmesine rağmen Türkiye'de son on yılda kişi başına hububat tüketimi 477 kg'dan 480 kg'a ulaşmıştır (IGC, 2021; TÜİK 2021).

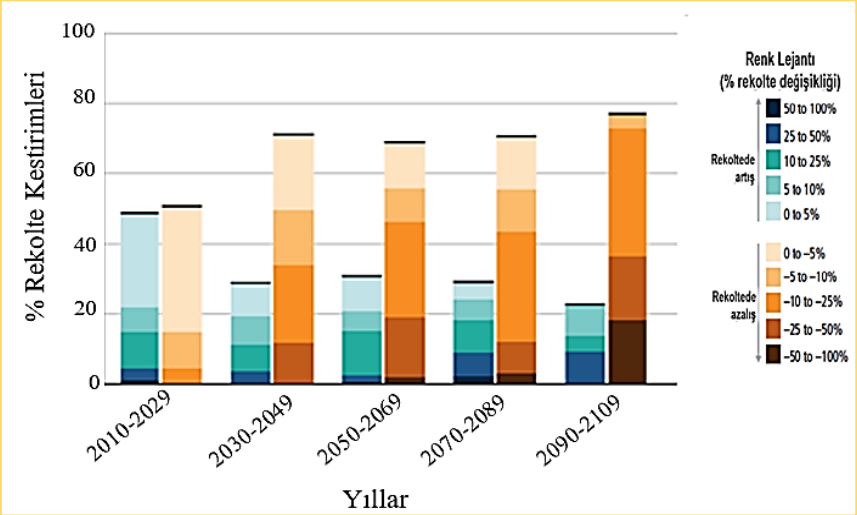


Şekil 3. Dünya ve Türkiye'de toplam hububat tüketiminin yıllara göre değişimi

İklim Değişikliğinin Hububat Üzerine Etkileri

Dünya nüfusunun artışıyla birlikte gıda talebindeki artış buna karşın tarımsal üretim miktarındaki kayıplar, gıda fiyatlarının artmasına ve sonuç olarak da her bireyin güvenli ve yeterli düzeyde sağlıklı gıdaya erişim daha kritik bir noktaya gelecektir. Yapılan bir çalışmada, tarımsal üretim miktarında düşüşler nedeniyle tarım sektöründeki fiyat artışlarının diğer tüm sektörlere göre daha yüksek olacağı, hatta gerekli politik önlemler alınmazsa tarımsal gıda maddelerindeki fiyat artışlarının %250'ye ulaşabileceği tahmin edilmektedir (Voyvoda, 2017). Hasegawa ve ark. tarafından 2018 yılında yürütülen bir çalışmanın sonuçlarına göre, farklı iklim modelleri uygulansa bile 2050 yılında tarımsal ürünlerin verimlerinin %17 oranında düşmesi, buna karşın gıda fiyatlarının ise %20 artması beklenmektedir.

IPCC (2014) ve Porter ve ark. (2014) tarafından yapılan bir çalışmada 21. Yüzyılda ürün rekoltelerinde öngörülen değişiklikler Şekil 4'te verilmiştir. Yapılan çalışmaya göre 2030'a kadar dünya çapında ürün rekoltelerinde meydana gelen artış ve azalış miktarları birbirlerini dengeleyebilmesine rağmen 2109 yılına kadar %50'nin üzerindeki rekolte kayıplarının artacağı tahmin edilmektedir.



Şekil 4. İklim değişikliği sebebiyle 21. Yüzyılda ürün rekoltelerinde öngörülen değişiklikler

Ülkemizde iklim değişikliği ile birlikte, buğday, arpa ve mısır gibi tarımsal ürünlerde rekolte kayıplarının artacağı ve verimlerinin azalacağı, verim düşüşünün arpa ve mısırda 2020'li yılların başından itibaren, buğdaydaki verim artış trendinin ise 2030'lu yılların başından itibaren duraksayacağı hatta 2050 yılında mısır üretiminde %10'a varan kayıplar olacağı Voyvoda ve ark. (2017) tarafından yapılan bir araştırmada vurgulanmaktadır.

Lobell ve arkadaşları tarafından 2011 yılında uzun yıllar dünyada iklim eğilimleri ve tarımsal ürün verimini belirlemek için yaptıkları bir çalışmada, hava sıcaklığının 30 ºC'nin üzerine çıkması ile buğday ve mısırda bitkilerinin sıcaklığa karşı duyarlılığının arttığını ve özellikle büyüme döneminde bu sıcaklıkların görülmesi ile sulama yapılan koşullarda yaklaşık %1'lik, kurak koşullarda ise %1,7'lik verim kaybı meydana geldiği tespit edilmiştir.

Daha önceki çalışmalara da göz önünde bulundurulduğunda, IPCC (2014) tarafından yayınlanan beşinci değerlendirme raporunda birçok bölgede özellikle de buğday ve mısır üretiminin iklim değişikliği ve kuraklıktan olumsuz bir şekilde etkilenebileceği belirtilmektedir. Ayrıca raporda, Akdeniz havzasında bulunan Türkiye gibi ılıman iklim kuşağında olan ülkelerde bu etkilerin daha şiddetli olabileceği vurgulanmaktadır.

İklim değişikliğinin Türkiye'deki tarım üzerindeki ekonomik etkilerinin değerlendirilmesi amacıyla Dellal ve ark. (2011) tarafından yapılan bir çalışmanın sonuçlarına göre, ülkemizde bazı tarım ürünlerinde (arpa, buğday, mısır ve ayçiçeği) %5 ile %12,5 arasında düşüşler olabileceği öngörülmektedir (Tablo 3). Ürünlerin tamamına bakıldığında ortalama verim kayıpları %9,2 ile en fazla Doğu Anadolu Bölgesi'nde olmasına rağmen tarım arazisi varlığı bakımından ülkemiz topraklarının büyük oranını oluşturan İç Anadolu Bölgesi'ndeki verimde %8,5'luk kayıp çok daha önemli olmaktadır. Bölgelerin ortalamasına bakıldığında en fazla verim kaybının mısırda (%10,14) olması beklenmekte iken %7,56 verim kaybı ile mısırı buğday ve arpa takip etmektedir (Tablo 3).

Tablo 3. Türkiye'de bölgesel olarak bazı tarımsal ürünleri verimindeki değişimler (%)

	Karadeniz (%)	Marmara (%)	Ege (%)	Akdeniz (%)	İç Anadolu (%)	Doğu Anadolu (%)	Güneydoğu Anadolu (%)	ORTALAMA
Buğday	-6.0	-10.3	-7.2	-6.5	-7.4	-8.3	-7.2	-7.56
Mısır	-7.4	-7.9	-11.0	-10.9	-12.5	-12.1	-9.2	-10.14
Arpa	-7.0	-8.5	-7.2	-6.0	-8.2	-8.5	-7.5	-7.56
Ayçiçeği	-5.0	-5.9	-6.6	-6.8	-7.3	-7.9	-6.3	-6.54
ORTALAMA	-6.35	-8.15	-8.0	-7.55	-8.85	-9.2	-7.55	-7.95

SONUÇ

Sonuç olarak tarımsal üretim, küresel kuraklık ve iklim değişikliğinden en çok etkilenen sektörlerden birisidir ve bölgesel farklılıklara göre kısa veya uzun vadede verim kayıpları kaçınılmazdır. İklim değişikliği, tarımsal faaliyetlerin devamlılığını ve insanların temel besin ihtiyaçlarının karşılanabilme düzeyini ve dolayısıyla gıda güvenliğini de etkilemektedir. Tarımsal üretimde anlık alınan önlemler ile birim alandan elde edilen ürün miktarı (verimi) artmasına rağmen etkisini giderek artıran küresel ısınmadan dolayı bu önlemler yetersiz kalacaktır. Özellikle insanların günlük diyetlerinin çok önemli bir bölümünü karşılayan ancak hasadından pazarlanmasına kadar %50-60 kayba uğrayan tahılların üretiminde birim alandan veriminin artırılması tek başına yeterli olamayacak aynı zamanda üretilen tahılın tüketilinceye kadar sağlıklı bir şekilde muhafazası da önemli olacaktır. Uygun depolama yapılarında ve depolama koşullarında muhafaza edilen tarımsal ürünler, besin değerlerini mümkün olan en üst seviyede koruyabilecek ve fire oranları azaltılarak daha fazla ve daha kaliteli ürün insanlara ulaştırılacaktır. 21.Yüzyılın sonlarına kadar küresel sıcaklığın 2 ^{o}C daha yüksek olacağı tahminlerinden hareketle, sıcaklıkların yükselmesiyle ekosistemde var olan denge negatif yönde bozulacak ve insanların dengeli beslenebilmeleri için yeterli miktarda ve kaliteli gıda maddelerine ulaşmaları da zorlaşacaktır. Küresel ısınmanın zararlı ve yıkıcı etkilerini mümkün olabilecek en alt seviyeye indirebilmek için kuraklığın ne gibi risklere sebep olabileceğini iyi anlamak, analiz etmek ve süreci etkin bir şekilde yönetebilmek ve hem anlık hem de uzun vadeli çözüm önerileri sunabilecek eylem planları yapılmalıdır.

Abstract

This study includes in vitro antiproliferative and tyrosinase inhibitor effects of methanol extracts of 21 plant species collected from Erzincan against HT-29 cell line. It was determined that it had different IC_{50} values ranging from 0.18 to 0.87 mg/mL against tyrosinase enzyme. According to the cytotoxicity results, it was concluded that the plant extracts of *Inula heterolepis, Trachomitum venetum, Ebenus macrophylla, Ziziphora tenuior* and *Plantago euphratica* showed activity against HT-29 cancer cell as a potential anti-cancer agent. In addition, it was determined that *Thymus convulutus, Thymus vulgaris* and *Tanacetum balsamita* extracts had high inhibitory effects against tyrosinase enzyme.

Keywords: Plant extracts, Antidiabetic, Anticancer, HT-29 Cell culture, Tyrosinase enzyme

INTRODUCTION

Plant chemistry has been an indicator of how and how much to use plants because of the therapeutic effects of plants. Knowing the chemical compositions of plants leads to a better understanding of their medicinal properties. Modern chemistry has defined the role of primary metabolites in basic life functions such as cell division, respiration, growth, storage and reproduction. Primary metabolites include sugars, amino acids, tricarboxylic acids or small molecules such as Krebs cycle intermediates, proteins, nucleic acids and polysaccharides. As a result, primary metabolites are similar in all living cells (Seigler et al. 1995). Secondary plant metabolites contain many chemical compounds that are derived by the plant cell starting from the primary metabolic pathways and continued to be produced by these pathways. The concept of secondary metabolite was first defined by Albrecht Kossel in 1910 and added to the literature (Jones and Kossel 1953). In the middle of the twentieth century, with the development of analytical techniques, these molecules were obtained and formed the basis of the science of phytochemistry. Since history, many ancient societies have used medicinal plants and shed light on the fact that these plants have various biological effects that provide a scientific basis today. Secondary metabolites are defined as antibiotics, antifungal, anticancer and antiviral agents because they have many effects. They can protect plants from many diseases and pathogens. They can also prevent leaf damage in plants by absorbing harmful UV light. Secondary metabolites found in some plant species are thought to have effects on animal fertility (Bennets et al. 1946).

The first step of modern drug discovery from plants is to find right candidates and right biological activities which is applicable *in vivo*. Cancer is one of the most leading causes of death and effective drug treatment is limited because of their high side effects (Altay et al. 2019). Considering of their side effects, interest in natural compounds from medicinal plants related to anticancer activity increasing day by day. Improvement of modern

analytical techniques have also allowed the identification of chemical compounds responsible for this action. Thus, various natural products have been studied for their anticancer activity over different cancer types both *in vivo* and *in vitro* (Altay and Bozoğlu 2017).

Tyrosinase is a vital enzyme in melanin biosynthesis in mammals, fungi, plants, and bacteria, therefore, its inhibitor can use some applications area as a skin whitener, and as an anti-browning agent. Inhibitory effects of many plant extracts on tyrosinase have been reported (Chang et al. 2009). The increase in tyrosinase activity in cancer cells for some cancer types has drawn attention to the importance of tyrosinase in the treatment of these cancer types (Maeda ve Fukuda, 1991). According to this result, there is a great need for strong tyrosinase inhibitors in agriculture and nutrition.

The importance of some natural tyrosinase inhibitors has emerged due to the toxic nature of some drugs used in cancer treatment and tyrosinase inhibitors. In this study, the antiproliferative and inhibitory effects of extracts prepared from various plants collected from the Erzincan region against HT29 cancer cells on tyrosinase enzyme activity were investigated.

MATERIALS AND METHODS

Plant materials and extraction

All plant materials were collected from different points within the provincial border of Erzincan and the species identification was made by Prof. Dr. Ali KANDEMİR. Accordingly, the plant species used in the study*Onobrychis galegifolia, Onobrychis nitida, Ebenus macrophylla, Inula heterolepis, Thymus convulutus, Scorzonera aucherina, Helichyrsum arenarium, Trachomitum venetum, Chrysathesium stellerioides, Achillea teretifolia, Ziziphora tenuior, Helichyrsum arenarium* subsp. *erzincanicum, Helichrysum plicatum, Thymus pectinatus, Origanum acutidens, Rhinanthus angustifolius, Thymus vulgaris, Alchemilla erzincanensis, Scrophularia libanotica, Tanacetum balsamita, Salvia pachystachys*.

To obtain the plant extracts, 100 g of the aerial parts of each plant were weighed, ground and extracted with 100 mL of methanol in an ultrasonic bath for one hour. The extraction process was repeated three times for each plant. The solvents were evaporated under vacuum at 35°C with a rotary evaporator. Extracts were stored in the refrigerator until their working time.

Tyrosinase activity assay

Enzyme activity was carried out using a micro plate reader in a total volume of 180 µL using the previously mentioned method (Yırtıcı et al. 2022). The reaction mixture contains 80 µL of 100 mM phosphate buffer, 20 µL of 5 mM L-dopa, 10 µL of enzyme, and 80 µL of distilled water. The inhibitory effect of the extracts was tested by adding different concentrations to the reaction medium in the range of 1-1000 µg. The enzyme activity without the extract was considered as control, and IC_{50} values were calculated by plotting the concentration plot against percent inhibition effects.

In vitro anticancer activity

Cell line and culture

The colorectal adenocarcinoma cell line (HT-29) was obtained from the ATCC (American Type Culture Collection, LGC Promochem, UK). HT-29 cells were grown in McCoy's 5A medium, including L Glutamine and HEPES buffer (25 mM). The basal medium was supplemented with 10% heat inactivated fetal bovine serum, 1% penicillin–streptomycin and 1% Na-pyruvate (BI, USA). Incubation of the cell culture was performed in CO_2 incubator (5%) with humidity (%95) at 37°C (Nuve, Turkey). The cell culture studies were carried out in Class II Safety Cabinet.

2,3-bis (2-methoxy-4-nitro-5-sulfophenyl)-2H-tetrazolium-5-carboxanilide (XTT) assay

XTT assay was carried out to investigate the antiproliferative capacity of the plant extracts by using XTT kit according to the manufacturer's instructions (BI, Israel). Briefly, 100 µL of the cell suspension (10.000 cells/well) was added into 96 well culture plates and incubated overnight in a CO_2 incubator. After incubation, the medium was removed and the cell culture plate was washed with 50 µL of PBS. After removing the PBS, 100 µL of each plant extract at 100 µg/mL were added into each well and incubated for 48 hour. At the end of the incubation time, the medium in each well was refreshed with 100 µL of new medium and then 50 µL of XTT reagent was added and incubated for further 5 hour in CO_2 incubator. After incubation, the cellular metabolic activity was measured at 470 nm, spectrophotometrically using a microplate reader (BioTek, USA).

The cells in complete medium containing 0.5% DMSO was evaluated as negative control. 5 Fluorouracil was used as a reference drug. All measurements were carried out at least three times.

RESULTS and DISCUSSION

The XTT assay is a fast and convenient method used to measure the cytotoxicity of natural or synthetic substances on cancer cell lines. This assay is dependent on the extracellular reduction of XTT tetrazolium salt by Nicotinamide Adenine Dinucleotide (NAD+) in the mitochondria of living cells.
In this study, the anticancer activities of the methanol extracts of 21 plants from Erzincan were tested on HT-29 cells by XTT assay. The results showed that after 24 hours of incubation, methanol extracts of twelve plant species namely *Onobrychis nitida, Ebenus macrophylla, Inula heterolepis, Plantago euphratica, Trachomitum venetum, Chrysothesum stellerioides, Ziziphora tenuior, Helichrysum plicatum, Helichyrsum arenarium, Scrophularia libanotica, Tanecetum baisamita and Paeonia mascula* inhibited the growth of HT-29 cells at different rates at different rates (Figure 2). The highest anticancer activity was exhibited from *Inula heterolepis* with 30% inhibition at 100 µg/mL while *Chrysothesum stellerioides* displayed the lowest activity with 1% inhibition at the same concentration. The other tested 9 plant species did not show considerable anticancer activity against HT-29 cells. On the other hand, it was observed that the toxic effect of the tested plants was far from that of chemotherapeutic drug 5-FU. In another study, cytotoxic activities of methanol and water extracts of *Onobrychis* species against HCT-116 cells were reported with IC_{50} values ranging from 0.98 to 3.75 mg/mL. In addition, apoptotic and necrotic effects of *Onobrychis albiflora* extract on HCT-116 cells were evaluated by caspase activation (Bülbül et al. 2018). It has been reported that *Inula lineariifolia* extracts show good cytotoxicity, inhibition of cell cycle progression and induction of apoptosis against MCF-7 and MDA-MB-231 cancer cell lines (Qin et al. 2013). Beara et al. HeLa reported that treatment of MCF7, HT-29 and MRC-5 cell lines with *Plantago strains* showed a strong antiproliferative activity with different IC_{50} values in the range of 172.3 and 551.7 µg/mL (Beara et al . 2012). In another literature study, it was reported that ethanol extract of *Paeonia suffruticosa* induced apoptosis in human gastric AGS cancer cell (Choi et al. 2012). Aydemir et al. reported strong cytotoxic and apoptotic activities of water-ethanol extracts of *Ebenus boissieri* in human lung cancer cell line A549 (Aydemir et al. 2015) . The antiproliferative activity of the ethanol extract of *Ziziphora clinopodioides* has been demonstrated to have high activity on human lymphocytes (Ahmadi et al. 2021).

In vitro inhibition effects of extracts against tyrosinase enzyme are shown in Figure 1. *Thymus convulutus*, *Thymus vulgaris* and *Tanacetum balsamita* showed a strong inhibitory effect with IC_{50} values of 0.180 mg/mL. *Inula heterolepis*, *Scorzonera aucherana*, *Chrysathesium stellerioides*, *Helichrysum plicatum*, *Thymus pectinatus*, *Alchemilla erzincanensis*, and *Salvia pachystachys* showed inhibition effect with IC_{50} values in the range of 0.190-0.220 mg/mL.

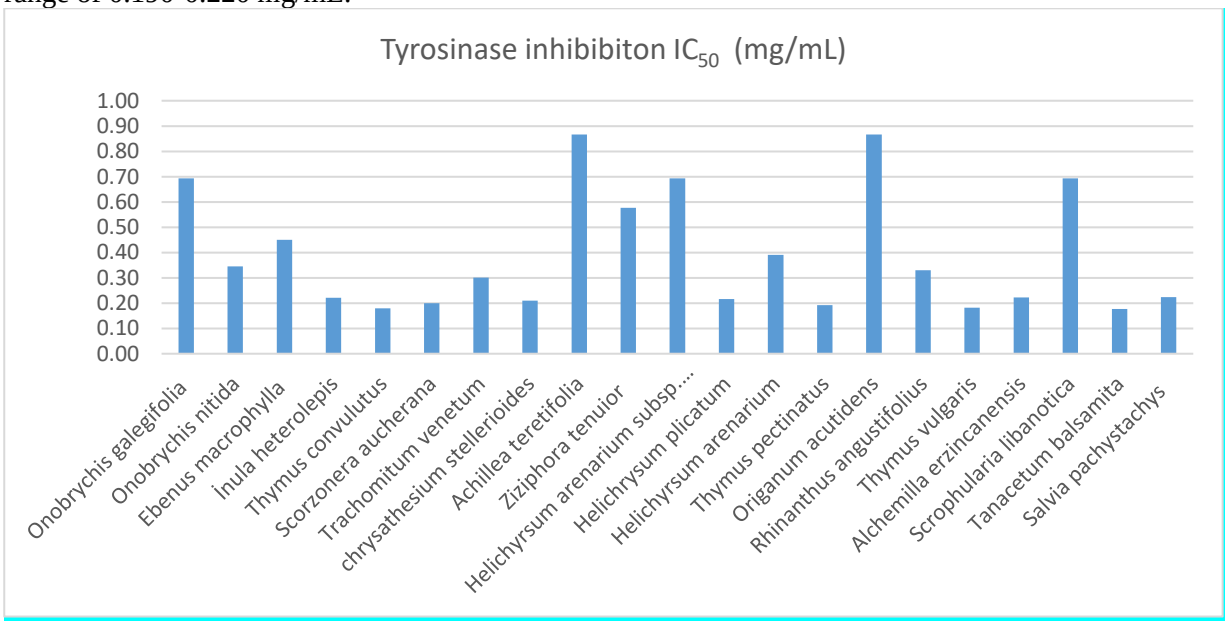

Figure 1 in vitro inhibitory effect of extracts against tyrosinase enzyme

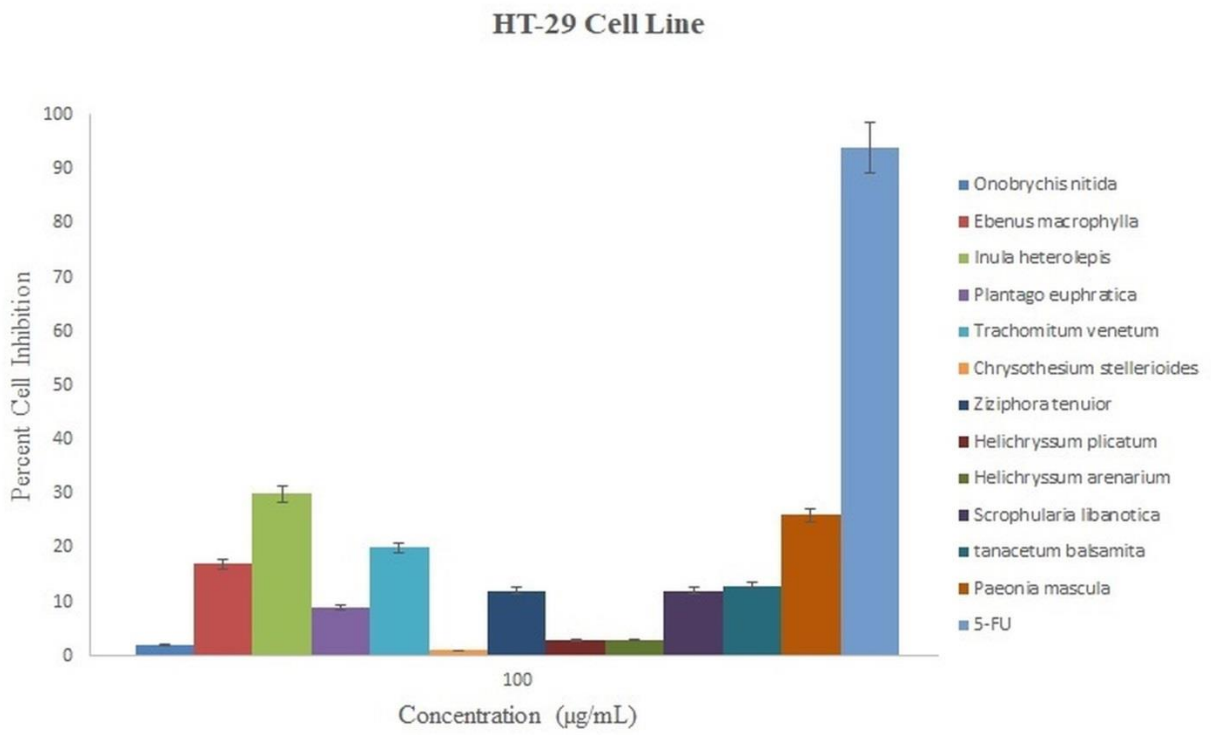

Figure 2. *In vitro* antiproliferative activities of methanol extracts of 12 plant species against HT-29 cell line by XTT colorimetric assay.

CONCLUSION

Due to the serious damage of chemotherapy drugs to human living cells in the treatment of anticancer and the very serious side effects of synthetic drugs, the scientific world carries out very serious studies on the use of natural resources. According to the results of cytotoxicity activity, methanol extracts of *Inula heterolepis*, *Trachomitum venetum*, *Ebenus macrophylla*, *Ziziphora tenuior* and *Plantago euphratica* plants show activity against HT-29 cell line, revealing that it will be evaluated as a potential anti-cancer agent for colon cancer treatment. According to the tyrosinase enzyme activity results, in addition to *Thymus convulutus*, *Thymus vulgaris*, *Tanacetum balsamita* plants, *Inula heterolepis*, *Scorzonera aucherana*, *Chrysathesium stellerioides*, *Helichrysum plicatum*, *Thymus pectinatus*, *Alchemilla erzincanenchys* and *Salvia pachysta* plants were determined to have high enzyme activity. In order to inhibit this enzyme, which is suspected to be associated with cancer, more detailed studies are needed in terms of the use of these natural plants and the determination of the bioactive components they contain.

Özet
Bal arıları ürettikleri bal, propolis, arı sütü gibi ürünlerle ekonomik ve tıbbi katkılar sunarlar. Bitkisel tozlaşma ve ekosistemdeki biyoçeşitliliğin devamında bal arıları vazgeçilmez polinatörler olarak kabul edilir. Bal arısı koloni sağlığı yüksek verim açısından çok önemlidir. Farklı tanımları olan koloni kayıpları ve arı ölümleri yanında ani koloni çöküş bozukluğu da arı yetiştiriciliğinde ekonomik kayıplara yol açan sorunlardır. İklim bozukluğu ve küresel ısınma gibi anormal çevresel faktörler, ruhsatsız ürünler ve pestisitlerin kontrolsüz, bilinçsiz şekilde ilaç yerine kullanılması neticesinde artan direnç sorunu ve patojenler de arı kolonisi kayıplarında etkilidir. Bu araştırmada Kuzey Marmara Bölgesi'ndeki 2020-2021 yılları arasında yaşanan koloni kayıplarında bazı bal arısı virüslerinin ve parazitlerinin araştırılması amaçlandı. Bu amaçla koloni kayıpları yaşanan arılıklar örneklendi. Örneklerde; arı virüslerinden ABPV, BQCV, CBPV, DWV, KBV, LSV, SBV varlığını araştırmak için patojen spesifik PCR reaksiyonları kullanıldı. Varroa ve Nosema sp. varlığı yönünden örneklemeler yapıldı. Koloni kayıplarının yaşandığı dönemlere ait iklimsel veriler, yetiştiricilik türü ve besleme düzeni incelendi. Arılıklarda patojen varlığı noktasında kolonilerin birden fazla virüs türü ile enfekte olduğu tespit edildi. Koloni kaybı yaşanan ve yaşanmayan arılıklar arasında özellikle farklı türlerdeki virüsler, *Nosema spp*. ve yüksek düzeyde varroa enfestasyonu varlığının koloni kaybı yaşanmayan arılıklara göre daha fazla rastlandığı tespit edilmiştir. Sonuç olarak; arılıklarda patojenlerin mücadele ve tedavi stratejilerinin düzenli olarak uygulanması, ilkbahar ve kış koloni yönetiminin zamanında yapılması arıcılıkta başarılı olmak için önemlidir.

Investigation of Honeybee Colony Losses in Thrace Region

Abstract
Honey bees make economic and medical contributions with the products they produce, such as honey, propolis, and royal jelly. Honeybees are considered indispensable pollinators for plant pollination and the continuation of biodiversity in the ecosystem. Honey bee colony health is very important for high productivity. Colony losses and bee deaths, which have different definitions, and sudden colony collapse are problems that cause economic losses in beekeeping. Abnormal environmental factors such as climate disorder and global warming, uncontrolled and unconscious use of pesticides instead of drugs, increased resistance problem,s and pathogens are also effective in bee colony losses. This study aimed to investigate some honeybee viruses and parasites in colony losses between 2020-2021 in the Northern Marmara Region. For this purpose, apiaries with colony losses were sampled. In the examples, pathogen-specific PCR reactions were used to investigate the presence of ABPV, BQCV, CBPV, DWV, KBV, LSV, and SBV from bee viruses. Varroa and Nosema sp. Sampling was done in terms of presence. Climatic data of the periods when colony losses were experienced, breeding type, and feeding order were examined. At the point of presence of the pathogen in apiaries, it was determined that the colonies were infected with more than one virus species. It was determined that the presence of different types of viruses, Nosema spp, and high levels of varroa infestation was found to be significantly more common in apiaries with and without colony loss than in apiaries without colony loss. As a result; It is important to be successful in beekeeping that the control and treatment strategies of pathogens are applied regularly in apiaries, and the spring and winter good colony managments is performed in time.
Keywords: Honey bee, Colony loss, Thrace, Türkiye

GİRİŞ

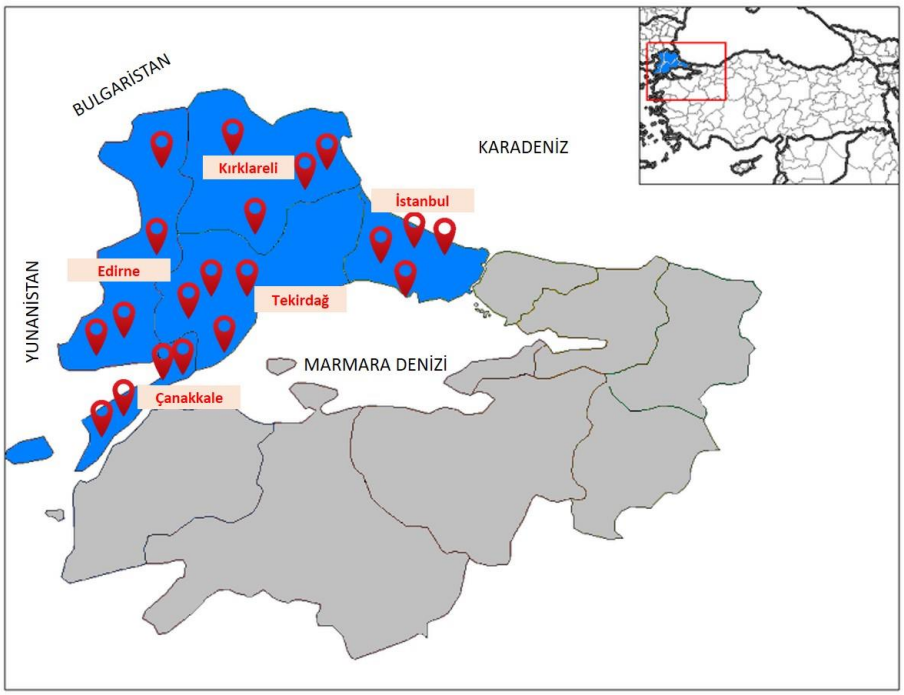
Bal arıları, ürettiği bal, propolis, perga, arı sütü, apilarnil gibi ürünler sosyoekonomik ve tıbbi değere sahiptir. Polinatör arılar arasında ticari açıdan en fazla yararlanılan hayvanlar olan bal arıları ayrıca doğal tozlaşma ve ekosistemdeki sürdürülebilir biyoçeşitlilik noktasında da eşsiz işler başarır. Koloni düzeyinde sosyal yaşam süren bal arılarının verimi koloni düzeyinde sağlık durumunun sürdürülebilirliğiyle ilişkilidir. Bu noktada bölgelere göre değişen ölçekte rastlanılan beklenmeyen koloni kayıpları, ani gelişen arı ölümleri ve koloni sönmeleri arı yetiştiriciliğinde artan maddi sorunlara neden olmaktadır. Son yıllarda daha sık şekilde görülen bal arısı koloni kayıpları küresel bir arıcılık sorunu haline gelmiştir (Neumann, 2010).
Türkiye sahip olduğu bal arısı koloni sayısı ve ürettiği farklı arı ürünleri ve bal miktarıyla dünyada önemli yere sahiptir. Ancak tüm dünyada 2006 yılı itibariyle yaşanan koloni kayıpları ve koloni çökme sendromu (CCD) benzer olarak Türkiye'de de kaaydedilmiştir. Yaşanan ani koloni kayıpları toplumsal kaygıya yol açmıştır (Muz, 2008). Genel olarak hastalık ve patojenlerin yol açtığı beklenmeyen bal arısı koloni kayıpları CCD'nin en önemli sebepleri arasında yer almaktadır. Bulaşıcı hastalıklara bağlı kayıplar yanında farklı patojenlerin sürekli artan yükü nedeniyle, bal arısı kolonileri zayıflayarak ölüme sürüklenir. *Varroa destructor,* arılarının yaşam döngüleri içerisinde onlara saldıran, hemolenfleri ve "fat body" kısmıyla beslenen kolonilerinin en ciddi zararlısıdır. Ektoparazit akar *Varroa destructor* beslenirken bal arısı yavru gözlerindeki arıların ölümüne neden olur ve çoğu arı virüsünün koloniye bulaşmasına aracılık yapar. *Varroa destructor* koloni kayıplarının önemli nedenlerden biri olarak kabul edilir (Ramsey ve ark., 2019). Arıların doku sıvıları, yağ doku ve hemolenfiyle beslenen akarların erkek bal arılarının uçuş performansını, sperm miktar ve kalitesini azalttıkları tespit edilmiştir (Rinkevich ve ark., 2017). Tarlacılık faaliyeti yapan bal arılarının, yoğun akar enfastasyonu sonucunda, oryantasyon uçuşundaki yavruların ve kovana geri dönmeye çalışan işçi arıların hedef bulma yeteneğinin bozulduğu, bu nedenle arıların koloniye geri dönmek için daha fazla zamana ve besin tüketimine ihtiyaç duyduğu veya hiç dönemediğine dair araştırmalar bulunmaktadır (Peck ve ark., 2016). Bugüne kadar arı kolonilerinde 70'in üzerinde virüs tanımlanmış olmakla birlikte, bazı virüsler koloni kayıplarında önemli rol oynar ve arı kolonisi sağlığını tehdit eder. *Akut arı felci virüsü* (ABPV), *Siyah kraliçe hücre virüsü* (BQCV), *Kronik arı felci virüsü* (CBPV), *Deforme kanat virüsü* (DWV), Kaşmir arı virüsü (KBV), *Lake Sinai Virüsü* (LSV), *Sacbrood virüsü* (SBV) arılıklarda sıklıkla tespit edilen arı virüsleridir. Bu virüsler *Picornaviridae* ailesinde sınıflandırılan pozitif tek iplikçikli RNA genomuna sahip zarsız virüslerdir. Bazıları genellikle bir hastalığa neden olmadan veya herhangi bir klinik belirti göstermeden arının vücudunda kalabilir. Öte yandan, daha öldürücü ve bulaşıcı olan bazı virüsler bal arısı kolonilerinde önemli kayıplara ve koloni sağlığında, veriminde olumsuz etkiye neden olabilir (Genersch ve Albert, 2010). Bazı virüsler, yalnızca uygun çevresel koşullar altında patojenite gösterir. Bunun dışında microsporodia ailesindeki patojen bir mantar olan *Nosema spp*., bal arılarının zorunlu hücre içi parazitleridir. Microsporidia'nın işçi arıların, ana arıların ve erkek arıların orta bağırsak epitel hücrelerini işgal ettiği, şiddetli ishale neden olduğu, farklı dokulara da yerleşerek koloni kayıplarında etkili oldukları bildirilmiştir (Papini ve ark., 2017). Nosemosis'in koloni seviyesindeki olumsuz etkisinin boyutu, yetişkin arıların yaşam süresinin kısalması, ana arılar, kuluçka yetiştirme, polen toplama ve diğer arı davranışları dahil olmak üzere bal arısı kolonilerinin üretkenliği ve hayatta kalmasıyla bağlantılıdır (Botias ve ark., 2013).
Bu araştırmada Kuzey Marmara Bölgesi'ndeki 2020-2021 yılları arasında yaşanan koloni kayıplarında bazı bal arısı virüslerinin ve parazitlerinin araştırılması amaçlandı.

MATERYAL METOD

Örnekleme Alanı ve Örnek Toplanması

Araştırmada örnekleme alanı olarak İstanbul boğazının batı kıyılarından itibaren Yunanistan ve Bulgaristan sınırına kadar uzanan alanı kapsayan Kuzey Marmara Bölgesi seçildi. Kuzey Marmara Bölgesi'nde Çanakkale, Edirne, Kırklareli, Tekirdağ ve İstanbul olmak üzere toplam beş il örneklendi. Bölgenin kuzey ve iç kesimlerinde karasal iklime rastlanırken güney yani deniz kıyılarında Akdeniz ve Karadeniz iklimine benzerlik göstermektedir. Araştırma örneklemesi 2020-2021 yıllarının Mayıs - Eylül ayları arasında yapılmıştır. Örnekleme koloni kayıpları görülen ve görülmeyen arılıklarda yapılmıştır. Buna göre her ilde koloni kaybı yaşanan iki adet ve kayıp yaşanmayan iki adet arılık yani toplam dört arılık olmak üzere beş ili temsilen yirmi adet arılık tespit edilmiştir. Her arılıkta kayıp yaşanan sekiz ve yaşanmayan sekiz adet olmak üzere toplam 16 koloni olmak üzere toplamda 80 koloni örneklenmiştir. Bu amaçla örneklenen arılıklardan her koloniden 15 adet canlı işçi arı (10 adet nosema tanısı için, 5 adet virüs tanısı için) ve kapalı yavru dolu petek örnekleri (15 cm x 15 cm ebatlarında) ile kovan dip tahtasından beşer adet ölü arı örnekleri toplandı. Koloni kayıplarının yaşandığı dönemlere ait iklimsel veriler, yetiştiricilik türü ve besleme düzeni incelendi. Her arılıkta toplanan

işçi, larva, pupa arı örnekleri moleküler analizlerde kullanılmak üzere steril tüplere aktarıldı. Moleküler testlerde kullanılacak arı örnekleri analiz edilene kadar -80 ºC'de muhafaza edildi. Arıcıların demografik özellikleri ve karşılaştıkları önceki sorun ve kış kayıpları kaydedildi.



Şekil1. Örnekleme yapılan illeri ve örneklenen arılıkları gösteren harita.

Homojenizasyon, Nükleik Asit Ekstraksiyonu ve PCR Metodu

Moleküler analizlerde kullanılmak üzere arı örneklerinden RNA izolasyonu yapıldı. Kısaca; canlı olarak dondurulmuş beşer adet arı bulunan farklı numune havuzlarının her birisi 5 ml PBS içerisinde homojenize edildi. Daha sonra 3000 rpm'de 5 dk santrifüj yapılan örneklerden alınan homojenat sıvısı ekstraksiyon protokollerinde kullanıldı. RNA ekstraksiyonu için ticari bir kit (GeneJET RNA Purification Kit, Thermo) kullanıldı. Kitin kendi protokolüne uygun olarak RNA örnekleri hazırlandı. RNA örneklerinden cDNA sentezi ticari sentez kiti (RevertAid First Strand cDNA Synthesis Kit) kullanılarak, kitin kendi protoküne göre reaksiyon gerçekleştirildi. Elde edilen cDNA örneklerine arı virüslerinden ABPV, BQCV, CBPV, DWV, KBV, LSV, SBV tespiti için PCR testleri uygulandı. Kullanılan PCR karışımı 5u Taq polimeraz, 10x Taq buffer, 3mM $MgCl_2$, 300 pmol dNTP miks ve steril su toplamda 30 µl olacak şekilde hazırlandı. Her patojen için literatürde daha önce bildirilen ABPV, BQCV, CBPV, DWV, KBV, LSV, SBV spesifik forward ve reverse primerler karışıma eklendi (Stoltz ve ark., 1995; Chen ve ark., 2004; Berenyi ve ark., 2006). PCR reaksiyon şartları 95 ºC'de5 dk ön denatürasyonu takiben 40 siklus içeren 95 ºC'de 30sn denatürasyon, 48-55 ºC aralığında 30 sn annealing aşaması, 72 ºC'de 30 sn uzama aşaması içeriyordu. PCR'da çoğaltılan DNA ürünleri agaroz elektroforez yöntemi kullanılarak ethidium bromide içeren %1'lik jelde yürütüldü. UV ışığı altında UV transmitter kullanılarak pozitif örnekler tespit edildi.

***Varroa destructor* tespiti:** Varroa akar tespiti için 100 adet canlı bal arısı kavanoza alınarak içerisine %70'lik etil alkol eklenip, çalkalanarak dipteki varroalar sayılarak gerçekleştirilmiştir. Her kolonide ayrıca 20 adet kapalı yavru gözü açılarak Varroa kontrolleri yapılmıştır. Buna göre toplam 120 adet arı örneğinde 7 adet üzerinde akar bulunanlar yoğun, 4-6 adet tespit edilenler orta düzeyde enfeste, 1-3 adet tespit edilenler hafif düzeyde enfeste kabul edilmiştir.

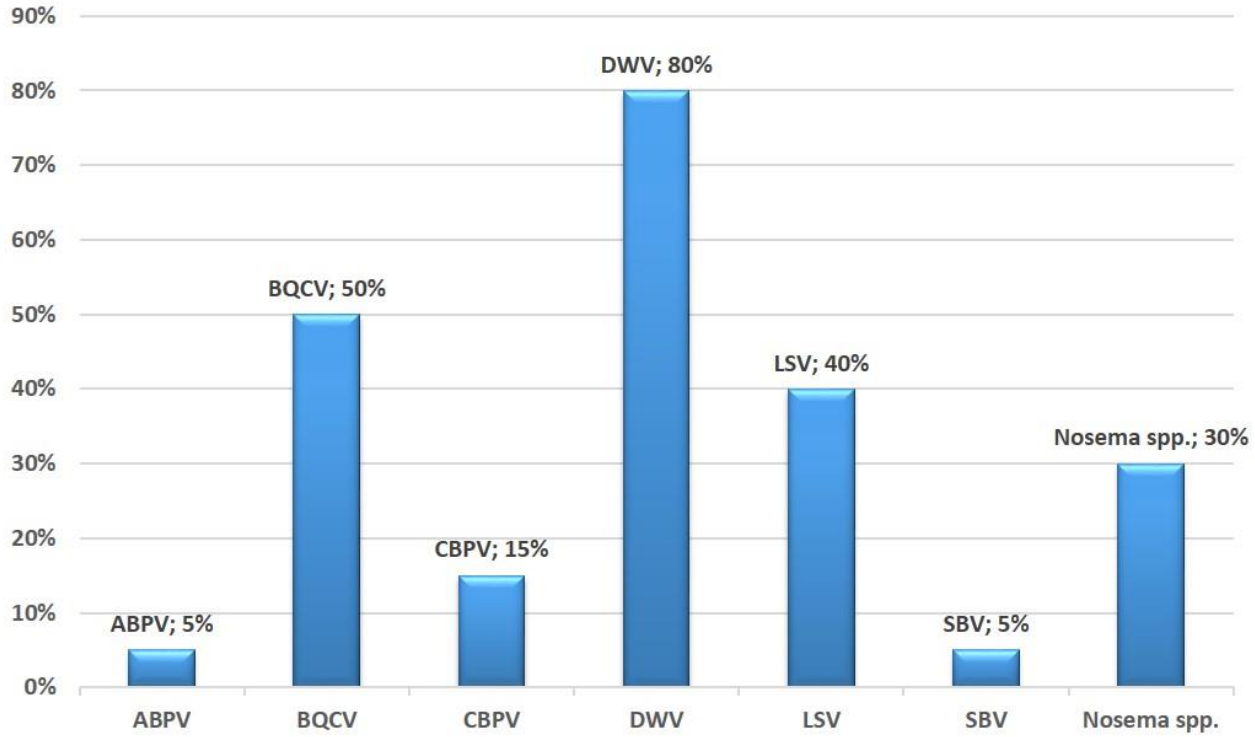
***Nosema sp.* tespiti:** Her koloniden 10 adet tarlacı yaşlı canlı arı örneklendi. Kuru buz üzerinde tutularak derin sedasyona alınan arıların iğne kısımları pensle tutularak dışarıya doğru kademeli şekilde çekildi, total barsak (sindirim sistemi) rezeksiyonu gerçekleştirildi. On adet bal arısı sindirim sistemi cam tüp içerisine alınarak 10 ml distile su ile homojen hale getirildi, mermerşahiden süzüldü. Cam tüplere alınan eşit miktarlardaki homojenat 1000 g'de 2 dakika santrifüj edildi. Tüpün en üst kısmından pipetle bir damla sıvı alınarak lam lamel arasında, mikroskopta *Nosema* sporları bakımından muayene edildi. Spor sayımı yapılmamış sadece mevcut durumuna bakılmıştır.

Koloni kaybı yaşanan kovanların tespiti: Arıcılar ile yapılan görüşmeler esnasında sorulan sorular ve yerinde yapılan koloni muayeneleriyle koloni kayıpları araştırılmıştır. Buna göre kış kaybı çok düşük veya hiç

olmayan, bahar başlangıcında oldukça hızlı ve sağlıklı görünümde gelişen ancak kısa süre içerisinde kat atılması planlanırken, takip eden günlere yavrulu alan varlığı, bal stoğu ve tarlacı arı mevcudu beklenmedik şekilde azalan, tanımlanamayan sorun yaşanan kolonilerin incelenmesine öncelik verilmiştir. Her arılıkta yukarıdaki özelliklerde olduğu tespit edilen sorunlu koloniler arasından arıcıların verdiği bilgilere göre en hızlı gerileyen ve yoğun kayıp veren koloniler kullanılmıştır.

BULGULAR ve TARTIŞMA

Test edilen toplam 20 arılıkta PCR testleri sonucunda, araştırılan yedi virüsten altısına ait pozitiflik tespit edildi. Tüm arılıklar KBV yönünden negatif bulundu (Şekil 2). Arılıkların 16 (%80)'sında en yüksek pozitiflik oranıyla DWV varlığı tespit edildi. Onu takiben BQCV, LSV, CBPV, SBV ve ABPV pozitifliği sırasıyla %50 (n=10), %40 (n=8), %15 (n=3), %5 (n=1) ve %5 (n=1) olarak belirlendi. *Nosema spp.*,kayıp yaşanan 6 arılıkta pozitif, diğerlerinde negatif olarak kaydedildi. Varroa enfestasyonu arılıkların tümünde farklı düzeylerde (Hafif- Orta- Yüksek) mevcut olduğu tespit edilmiştir.



Şekil 2: Yapılan moleküler testlerde tespit edilen arı virüsleri ve *Nosema spp.* pozitiflik oranları.

Koloni kaybı yaşanan arılıklarda özellikle farklı türlerdeki virüsler, *Nosema spp.* ve yüksek düzeyde varroa enfestasyonu varlığının koloni kaybı yaşanmayan arılıklara göre anlamlı olarak daha fazla rastlandığı tespit edilmiştir (Tablo 1). Özellikle birden fazla virüsün varlığı, yoğun varroa enfestasyonları koloni kaybı görülen arılıklarda daha sıklıkla tespit edildi. DWV ve BQCV koloni kaybı görülen arılıklarda en yaygın görülen arı virüsleri olarak kaydedildi. *Nosema spp*. ve arı virüslerinin birlikte bulunması arı sağlığı açısından riski arttırmaktadır ve CCD vakalarında rol aynayabilir (Muz ve ark., 2010). Yoğun varroa enfestasyonları sadece arılarda doku kayıpları değil aynı zamanda vektörlük yaptıkları virüsleri aktarması ile koloni sağlığını tehdit eder (Ramsey ve ark., 2019).

Tablo1: Beklenmedik koloni kayıpları görülen ve görülmeyen arılıklardaki tespit edilen patojenler.

Arılık No	Tespit edilen patojen	Varroa enfestasyonu	Koloni Kaybı
1	ABPV, BQCV, DWV, LSV	Yoğun	Var
2	ABPV	Hafif	Yok
3	BQCV	Hafif	Yok
4	BQCV, DWV, *Nosema spp.*	Yoğun	Var
5	DWV, LSV	Hafif	Yok
6	CBPV, DWV	Orta	Yok
7	BQCV, DWV	Orta	Var
8	BQCV, DWV, *Nosema spp.*	Yoğun	Var
9	BQCV, DWV, LSV	Yoğun	Var
10	DWV, LSV	Hafif	Yok

16	BQCV, LSV, *Nosema spp.*	Orta	Var
17	BQCV, DWV, LSV	Yoğun	Var
18	DWV	Hafif	Yok
19	LSV, Nosema spp.	Hafif	Yok
20	BQCV, DWV, LSV	Hafif	Var

Türkiye eko-coğrafik olarak Asya, Avrupa ve Afrika kavşağında biyolojik bir köprü konumundadır. Farklı iklim özellikleri gösteren yedi coğrafi bölgeyi barındırmasıyla birlikte artan iklim değişikliklerinden de etkilenmektedir. Bu bağlamda iklim değişiklikleri canlıların sağlıklı yaşam dinamikleri üzerinde etkili olmaktadır. Pek çok arthropod ve hastalık vektörlerinin popülasyon yoğunluğu, değişen çevre şartlarıyla birlikte farklı coğrafyalara yayılma eğilimine girmiştir. Bal arısı kolonilerinin tümünde farklı oranlarda tespit edilen virüsler ve onların vektörlüğünü yapan varroa akarı da bu bağlamda küresel sorun haline gelmiştir (Muz, 2008). Artan akar enfestasyonuyla mücadele en fazla ve genellikle kimyasal metotlar tercih edilmektedir. Akara karşı kullanılan farklı ilaç ve uygulamalar aynı zamanda koloni düzeyinde öneme sahip bağışıklık sistemi sorunlarına yol açarak artan oranlarda latent enfeksiyonlar oluşturabilmektedir (Ramsey ve ark., 2019). Patojen varlığında latent enfekte halde kış salkımına giren koloniler ilkbahara kadar zayıflamaktadır (Muz ve ark., 2012). Farklı virüslerle enfekte koloniler genç bal arılarının tarlacılık faaliyetlerinde ihiyaç duydukları başta sağlıklı kanatlar olmak üzere hayati öneme sahip diğer biyolojik aktivitelerinde de sorunlara yol açarak koloni düzeyinde tıbbi problemler doğurmaktadır (Muz ve ark., 2019). Arıcıların nektar akımı dönemi dışında destek amacıyla kullandıkları fondan, kek ve şerbet gibi yemlerin yeterli veya zamanında verilememesi popülasyon yoğunluğunun kış sonuna doğru azalmasına, erken ilkbaharın artılarından faydalanılamamasına yol açmaktadır. Birçok arıcı kış öncesi yeterli polen, bal ve yavru stoğu bulunmayan, farklı hastalık etkenlerini taşıyan kolonileri kışlatmaya çalışırken başarısız olmaktadır.

Sonuç olarak; arıcılık ekonomik açıdan getirisi olan ancak düzenli olarak patojenlerle mücadele konusunda gerekli kontrol ve tedavi stratejilerini uygulanmasını zorunlu kılan bir iş koludur. Kolonilerin ilkbahar ve kış bakımlarının eksik ve zamanında yapılması arıcılıkta başarılı olmak için önemlidir.

Özet

Nükleolin, *NCL* geni tarafından kodlanan çok işlevlsel bir nükleolar fosfoproteindir. Birçok kanser tipinde yüksek düzeylerde nükleolin ekspresyonu belirtilmiştir. Bu nedenle nükleolin, kanser için potansiyel bir hedef olarak önerilebilir. Nükleolin hücrede yüzey molekülleri ile etkileşime girerek internalizasyona aracılık eder. Sisplatin, kanserde önemli kemoterapötik ajanlardan biridir. Geniş bir klinik kullanıma sahiptir. Ancak tedavi sürecinde akut ve kronik nefrotoksisite gibi ciddi yan etkilerle de ilişkilidir. Sisplatin sıklıkla çoklu ilaç direncine neden olur. Çoklu ilaç direnci, kanser tedavisinin etkinliğini sınırlar. Çalışmamızda, sisplatinin, lösemi hücrelerinde, nükleolin protein ekspresyonuna etkisi araştırılmıştır. Sisplatinin K562 hücre hatları üzerindeki antiproliferatif etkisi incelendi ve EC50 değerleri hesaplandı. Nükleolin ekspresyon düzeyleri western blot yöntemiyle belirlendi. Sisplatin uygulaması, kontrole kıyasla nükleolin ekspresyon seviyesini artırmıştır.

Anahtar Kelimeler: Lösemi, Nükleolin, Sisplatin, İlaç Direnci

Effect Of Cisplatin On Nucleolin Expression In Human Leukemia Cells (K562)

Abstract

Nucleolin is a multifunctional nucleolar phosphoprotein is encoded by the *NCL* gene. Nucleolin overexpression has been described in a variety of cancer types. Therefore, nucleolin can suggest as a potential target for cancer. Nucleolin interacts with different types of surface molecules and mediates cell internalization. Cisplatin is one of the important chemotherapeutic agents on cancer. It has a wide clinical use. However, it is also associated with serious side effects such as acute and chronic nephrotoxicity during the treatment process. Cisplatin often induces multi drug resistance. Multidrug resistance limits the effectiveness of cancer therapy. In the present study, the effect of cisplatin on nucleolin protein expression in leukemia cells was investigated. Antiproliferative effect on K562 cell lines after treatment with cisplatin was examined and EC50 values were calculated. Nucleolin expression levels were determined by western blot method. Cisplatin treatment was increased nucleolin expression level compared with the control.

Key Words: Leukemia, Nucleolin, Cisplatin, Drug Resistance

GİRİŞ

Nükleolin, hücre nükleusunun önemli bir bileşenidir. Ribozom biyogenezi, gen ekspresyonu ve hücre büyümesi gibi çeşitli temel hücresel fonksiyonlarda önemli roller oynar. Nükleolin, kanser hücrelerinde sağlıklı hücrelere göre yüksek oranlarda eksprese edilmektedir. Yüksek nükleolin ekspresyonu, meme kanseri, hepatoselüler karsinom, akut miyeloid lösemi, küçük hücreli olmayan akciğer kanseri gibi kanser tiplerinde hastaların kötü prognozu ile ilişkilendirilmiştir (Fonseca vd, 2015). Yüksek nükleolin ekspresyonunun akut lenfoblastik lösemide ilaç direncini desteklediği gösterilmiştir (Joo VD, 2018). Bununla birlikte, nükleolin işlevlerinin altında yatan kesin mekanizmalar tam olarak anlaşılamamıştır (Salvetti vd, 2016).

Sisplatin klinikte yaygın olarak kullanılan sitotoksik antikanser ilaçları arasındadır. Sisplatin, tümör hücrelerinde, DNA-platin komplekslerinin oluşturulması ile antimitotik etki gerçekleştiren bir kemoterapi ajanıdır. Kanser hücrelerinde sisplatine karşı direnç elde edilmesi, tümör mikro ortamının sisplatin direncinin gelişiminde, önemli bir rol oynadığını göstermektedir (Chen vd, 2019). İlaç direnci, anti kanserojen ilaçların birçok maligniteye karşı iyileştirici potansiyelini önemli ölçüde engellemektedir. Bu nedenle çoklu ilaç direnç mekanizmalarının anlaşılması, DNA onarım kapasitesinin desteklenmesi ve tedavi etkinliğinin artırılması açısından çok önemlidir.

Bu çalışmada, K562 lösemi hücrelerinde sisplatin ve nükleolin arasındaki ilişki protein ekspresyon düzeyinde araştırılmıştır. Sisplatin uygulanmış hücrelerin nükleolin ekspresyon düzeylerinde artış gözlemlenmiştir. Sonuçlarımız, nükleolin proteininin K562 hücrelerinde sisplatin direnç mekanizması için potansiyel bir hedef olabileceğini göstermektedir.

MATERYAL VE METOD

Hücre Kültürü

Çalışmada, insan lösemi hücre hattı (K562) kullanılmıştır. Hücre hattı % 10 FBS, penisilin/streptomisin takviyeli besiyeri ortamında kültürlenmiştir. Hücreler 37 °C'de %5 CO_2'de inkübe edilmiştir.

Hücre Proliferasyon Testi

Her bir grup için hücreler (5×10^3) 3 tekrarlı olarak 96 kuyucuklu plaklara ekilmiştir. Gece boyu inkübasyon uygulanmıştır. Yapışmış olan hücrelerin besiyeri, 10 µM sisplatin içeren besiyerleri ile değiştirilmiştir. İlaç içeren besiyeri 48 saatlik inkübasyon sonrası çıkarılıp kuyucuklar 1xPBS ile yıkanmıştır. Sonrasında hücre canlılığını belirlemek için %10 uL CCK-8 çözeltisi içeren 100 uL besiyeri her kuyuya ilave edilmiştir. Dört saatlik inkübasyon sonunda plaka okuyucu kullanılarak 450 nm de absorbans değerleri belirlenmiştir. Hesaplamalarda, işlenmiş hücrelerin canlılığı, kontrol hücrelerinin yüzdesi olarak ifade edilmiştir.

Western Blot

Deney öncesi hücreler yapışmaları için gece boyunca bekletilmiştir. Ertesi gün hücre besiyeri 10 µM sisplatin içeren besiyerleri ile değiştirilmiştir. Hücrelere 48 saatlik inkübasyon sonrası, RIPA tamponu ile hücre parçalama işlemi uygulanmıştır. Örnekler 14000 rpm'de 15 dakika boyunca santrifüj edilmiştir. Santrifüj sonrası süpernatant toplanıp BCA yöntemi ile protein konsantrasyonu ölçülmüştür. Bu işlem sonrası proteinler %10'luk SDS-jel ile moleküler ağırlıklarına göre ayrılmış ve blotlama işlemine geçilmiştir. Jelde bulunan proteinler nitroselüloz membrana aktarılmış ve 1 saat bloklama uygulanmıştır. Bloklama sonrası membran primer antikorla 1 saat boyunca inkübe edilmiştir. Yıkama işlemlerini takiben membran, peroksidaz konjuge sekonder antikorlarla 1 saat inkübe edilmiştir. Yıkama işleminin ardından bantların görüntülenme işlemi filme aktarılarak gerçekleştirilmiştir.

BULGULAR VE TARTIŞMA

Çalışmada insan lösemi hücrelerine (K562) antikanserojen sisplatin uygulanması sonrası nükleolin ekspresyon değişimleri incelenmiştir.

Farklı miktarlarda sisplatin uygulanan K562 hücrelerinin canlılık oranları

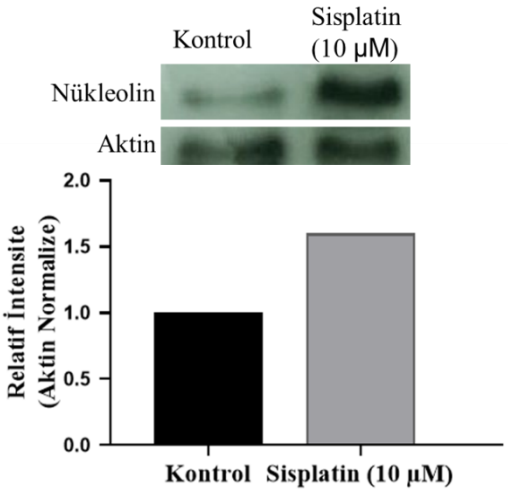
Çalışmada öncelikle sisplatinin lösemi hücrelerine antiproliferatif etkisinin belirlenmesi için sisplatin doz yanıt eğrisi çizilmiş ve EC50 değerleri bulunmuştur (Şekil 1). Bu bulgulara göre sisplatin 10 µM düzeyinde uygulandığında hücreler için medyan efektif doz oranlarına ulaşılmıştır. Sisplatin birçok kanser tipinde kemoterapi ajanı olarak kullanılan etkili bir antimitotiktir. İlaca karşı hücrelerin kemoresistans oluşturması sisplatinin tedavi etkinliğini sınırlamaktadır. Bu nedenle sisplatin etkinliğini artırmak için çalışmalar mevcuttur. Bir çalışmada, sisplatin konsantrasyonu 4,5 µM'ye kadar arttırılarak K562 hücreleri sisplatine dirençli hale getirilmiş ve bu hücrelere uygulanan paladyum komplekslerinin K562 hücre hattına karşı dikkate değer sitotoksik etkiler gösterdiği bildirilmiştir (Jahanian vd, 2019).

	Sisplatin
EC50	1.022e-005

Şekil 1. K562 hücrelerinde sisplatin doz yanıt eğrisi, EC50 değeri.

K521 hücre hattı nükleolin ekspresyonları ve sisplatinin etkisi

Çalışmada, K562 hücrelerine sisplatin uygulamasının, nükleolin protein ekspresyonları üzerine etkisi western blot yöntemi ile incelenmiştir. Antimitotik sisplatin 10 µM düzeyinde uygulanmış ve 48 saat sonra hücrelerden protein ekstraksiyonu yapılarak immunblotlama işlemi gerçekleştirilmiştir. Bulgulara göre sisplatin uygulanan grup, kontrol grubu ile karşılaştırıldığında nükleolin ekpresyon düzeylerinde önemli bir artış gözlemlenmiştir (Şekil 2).



Şekil 2. Aktin'e normalize edilmiş K562 nükleolin proteininin western blot analizi. Sisplatin uygulanmış grup ile kontrol grubu nükleolin ekspresyon oranları gösterilmiştir.

Nükleolin proteini tümör gelişiminde, çeşitli tümör hücrelerinde yüksek ekspresyon göstermesi nedeni ile onkolojide dikkat çeken bir proteindir. Nükleolin, farklı hücresel yolaklar üzerindeki etkisiyle tümör hücrelerinin proliferasyonunu, invazyonunu ve göçünü destekler (Yamada vd, 2014). Sisplatin resistant, Hela/DDP hücrelerinde nükleolin protein seviyesinin arttığı ve nükleolinin sisplatin direnci ile yüksek oranda ilişkili olduğunu gösterilmiştir (Ke vd, 2021). Etoposit ve mitoksantrona direnç gelişmiş meme kanseri hücrelerinde nükleolin ekspresyonunun önemli ölçüde arttığı bulunmuştur (Fu vd, 2005).

SONUÇ

K562 lösemi hücrelerinde sisplatin için EC50'ye uygun dozlarda ilaç uygulandığında, sisplatinin indüklediği antimitotik etkiye karşı nükleolinin protein ekspresyonundaki değişimler, çoklu ilaç direnci mekanizmasının incelenmesi ve anlaşılması açısından önemli hücresel yanıtlardır.

Özet

Boy-ağırlık ve boy-boy ilişkileri çalışmaları balıkçılık biyolojisinde oldukça önemli bir yer tutmaktadır. Bu çalışmada Türkiye'nin Akdeniz ve Ege Denizleri'nden örneklenen ve ekonomik değeri yüksek olan sardalya (*Sardina pilchardus*) balığının boy-ağırlık ve boy-boy ilişkilerinin değerlendirilmesi amaçlanmıştır. Sardalya balığı örnekleri Akdeniz (N=50 birey) ve Ege Denizleri'nde (N=54 birey) avcılık yapan ticari balıkçılardan temin edilmiştir. Örneklenen bireylerin ortalama total, çatal, standart boyları (±0,1 cm) ve ağırlıkları (±0,01 g) sırası ile Akdeniz için; 22,84 cm, 19,26 cm, 17,83 cm, 101,51 g ve Ege Denizi için; 12,88 cm, 11,74 cm, 10,74 cm ve15,21 g olarak belirlenmiştir. Örneklenen bireylerin cinsiyet tayinleri makroskobik olarak gerçekleştirilmiş olup, Akdeniz'de 24 dişi ve 26 erkek birey, Ege Denizi'nde 31 dişi ve 23 erkek birey olduğu tespit edilmiştir. Analiz sonuçlarına göre Akdeniz örnekleri için cinsiyetler arasında boy (P=0.989) ve ağırlık (P=0.718) bakımından istatistiksel anlamda önemli bir farklılık saptanamazken, Ege Denizi örneklerinde cinsiyetler arasında ağırlık (P=0.012) bakımından fark bulunmuştur. Ege Denizi örneklerinin boy-ağırlık ilişkisi denklemi $W=0{,}015TL^{2{,}691}$ (r^2= 0,778, P<0,001), Akdeniz örneklerinin boy-ağırlık ilişkisi denklemi $W=0{,}006TL^{3{,}094}$ (r^2= 0,862, P<0,001)' dir. Boy-boy ilişkilerinin regresyon katsayıları (r^2) %59,1-%96,6 (Akdeniz) ile %86,1- %95,4 arasında değişim göstermektedir ve istatistiksel anlamda önemlidir (P<0,001). Akdeniz (%95 güven aralığı; 2,740-3,448) ve Ege Denizi (%95 güven aralığı; 2,296-3,086)'nden örneklenen sardalya balığı populasyonları izometrik büyüme göstermektedir. Bu çalışmadan elde edilen sonuçların sardalya balığı ile ilgili olarak bundan sonra gerçekleştirilecek olan ekoloji ve büyüme çalışmalarına katkı sağlayacağı düşünülmektedir.

Anahtar Kelimeler: *Sardina pilchardus*, Ege Denizi, Akdeniz, boy-ağırlık ilişkisi, boy-boy ilişkisi

Evaluation of length-weight and length-length relationships of European pilchard, *Sardina pilchardus* (Walbaum, 1792) sampled from the Mediterranean and Aegean Seas.

Abstract

Length-weight and length-length relations studies have a very important place in fisheries biology. In this study, it was aimed to evaluate the length-weight and length-length relationships of European pilchard (*Sardina pilchardus*) which have high economic value sampled from the Mediterranean and Aegean Seas of Turkey. Fish samples were obtained from commercial fishermen fishing in the Mediterranean (N=50 individuals) and Aegean Seas (N=54 individuals). The mean total, fork, standard length (±0.1 cm) and weight (±0.01 g) of the sampled individuals for the Mediterranean Sea and Aegean Sea were determined as 22.84 cm, 19.26 cm, 17.83 cm, 101.51 g and 12.88 cm, 11.74 cm, 10.74 cm and 15.21 g, respectively. The sex determination of individuals was performed macroscopically, and it was determined that there were 24 female and 26 male individuals in the Mediterranean, and 31 females and 23 males in the Aegean Sea. According to the results of the analysis, no statistically significant difference was found between the sexes in terms of total length (P=0.989) and weight (P=0.718) for Mediterranean samples, while a difference was found between the sexes in terms of weight (P=0.012) in Aegean Sea samples. The equation of length-weight relationship of Aegean Sea samples is $W=0.015TL^{2.691}$ (r^2= 0.778, P<0.001), the equation of length-weight relationship of Mediterranean samples is $W=0.006TL^{3.094}$ (r^2= 0.862, P<0.001). The regression coefficients (r^2) of the length-length relationships range from 59.1% to 96.6% (Mediterranean Sea) to 86.1% to 95.4% (Aegean Sea) and are statistically significant (P<0.001). Sardine fish populations sampled from the Mediterranean (95% CI; 2,740-3,448) and Aegean Sea (95% CI; 2,296-3,086) show isometric growth.

It is thought that the results obtained from this study will contribute to the ecology and growth studies to be carried out in the future regarding sardine fish.

Keywords: *Sardina pilchardus*, Aegean Sea, Mediterranean Sea, length-weight relationship, length-length relationship

GİRİŞ

Avrupa sardalya balığı, *Sardina pilchardus* (Walbaum, 1792) hızlı büyüyen ve kısa ömürlü küçük bir pelajik balık türüdür. Akdeniz ve Karadeniz de dahil olmak üzere Kuzey Denizi'nden Senegal kıyılarına kadar kuzeydoğu Atlantik boyunca en önemli balık kaynaklarından biri olarak değerlendirilmektedir (Castalago ve Palomera, 2014). Türkiye denizleri içerisinde en çok Ege Denizi'nden avlanan sardalya balıklarının yakalandıkları denize göre büyüklüğü farklılık arz etmektedir. Üretimi ile dünyanın pek çok ülkesinde ekonomiye olan katkısının yanı sıra bu tür, denizlerimizin biyolojik çeşitliliği ve ekolojik dengesi açısından önemli bir etkiye sahiptir (Smal, 2002; Williams, 2003). Sardalya balığının büyümesi, yaşı, üremesi, populasyon özellikleri gibi farklı konularda gerçekleştirilmiş olan birçok çalışma mevcuttur (Sever ve ark., 2005; Abderrazik ve ark., 2014; Castalago ve Palomera, 2014; Silva ve ark., 2015; Mustač ve Sinovčić, 2018). Sardalya balığının IUCN kriterlerine göre koruma statüsü "LC-Asgari Endişe" olarak belirlenmiştir (The IUCN Red List of Threatened Species, Version 2022-1).

Üç tarafının denizlerle kaplı olması sebebi ile zoocoğrafik açıdan oldukça değerli bir konumda olan Türkiye de diğer dünya ülkeleri gibi git gide alternatif besin ihtiyaçlarının ortaya çıkmasından dolayı balıkçılık yönetiminin ve balıkçılık biyolojisinin etkili bir şekilde koordineli olarak yürütülmesi gerçeğiyle karşı karşıya bırakmıştır. Sucul ekosistemin sürdürülebilirliğinin en iyi şekilde sağlanması için bu habitatlarda yayılış gösteren balık stoklarının düzenli olarak incelenmesi ve takibinin yapılması hem balıkçılık yönetimi ve hem de balıkçılık biyolojisi açısından oldukça önemlidir (Avşar, 1996; Froese ve ark., 2011). Boy-ağırlık ilişkisi parametreleri, balık biyolojisi, balıkçılık yönetimi ve populasyon dinamiği çalışmaları için son derece önemli veriler olarak değerlendirilmektedirler (Garcia ve ark., 1989; Haimovici ve Velasco, 2000). Boy-ağırlık ilişkileri, (a) balık boyundan ağırlığının tahmin edilmesine, (b) farklı bölge ya da lokaliteler arasında balık büyümesinin karşılaştırılmasına, (c) boy frekans verilerinden biyomas hesaplanmasına, (d) farklı zaman dilimlerinde incelenen örneklerin sağlık durumlarının karşılaştırılması gibi araştırmalara katkı sağlar (Petrakis ve Stergiou, 1995; Goncalves et al., 1997; Kautrakis ve Tsikliras, 2003; Neserabad ve ark., 2022). Boy-boy ilişkileri farklı boy uzunluğu kullanılarak yapılan çalışmaların karşılaştırılmasında önem taşımaktadır (Moutopoulos ve Stregiou, 2002) ve büyüme tiplerinin standardize edilebilmeleri için kullanışlıdırlar (Simon ve Mazlan, 2008).

Bu çalışmada Türkiye'nin Akdeniz ve Ege Denizleri'nden örneklenen ve ekonomik değeri yüksek olan sardalya (*Sardina pilchardus*) balığının boy-ağırlık ve boy-boy ilişkilerinin değerlendirilmesi amaçlanmıştır. Bunun yanı sıra bu çalışmayla türün Akdeniz ve Ege Denizi populasyonları için hesaplanan boy-ağırlık, total boy-standart boy, total boy-çatal boy, çatal boy-standart boy ilişkileri sardalyanın gerek yurtiçi gerekse yurtdışında yapılan çalışmalar ile karşılaştırma yapılmasına imkân sağlayacaktır.

MATERYAL VE METOD

Bu çalışmada; sardalya balıkları 2019 avcılık sezonunda Akdeniz (N=50) ve Ege Deniz (Altınoluk) (N=54) lerinde ticari avcılık yapan balıkçılardan temin edilmiştir. Örneklenen bireyler Ondokuz Mayıs Üniversitesi, Fen Fakültesi, İhtiyoloji Araştırma Laboratuvarı'na getirilmiştir. Örneklerin total boy (TL), çatal boy (FL) ve standart boyları (SB) ölçülmüş (±0,1 cm) ve de ağırlıkları tartılmıştır (±0,01 g). Eşey tayini gonadların makroskobik olarak incelenmesiyle yapılmıştır. Tüm boy-ağırlık ilişkilerinin hesaplanmasında aşağıdaki formül kullanılmıştır (Bagenal ve Tesch, 1978)

$$W = a.L^b \quad (1)$$

Bağıntıda W= balık ağırlığı (g), a ve b ilişki sabitleri, L= balık boyudur (cm). Boy-ağırlık ilişkisi parametreleri Log W= Log a + b Log TL doğrusal regresyon eşitliği ile belirlenmiştir. b değerinin 3'ten farklı olup olmadığını tespit etmek için t-testi uygulanmıştır (b=3, izometrik büyüme; b>3, pozitif allometrik büyüme; b<3, negatif allometrik büyüme) (Zar, 1999). Boy-boy ilişkileri doğrusal regresyon analizi kullanılarak hesaplanmıştır.

Boy-ağırlık ve boy-boy ilişkileri dişi, erkek ve tüm bireyler için ayrı ayrı tespit edilmiştir. İstatistiksel karşılaştırmalarda SPSS ve MİNİTAP paket programları kullanılmıştır.

BULGULAR

Akdeniz ve Ege Denizleri'nden örneklenen *S. pilchardus* bireylerinin ortalama total boy ve ağırlık değerleri sırasıyla 22,84±0,16 ve 101,51±2,41 ile 12,88±0,12 ve 15,21±0,45 arasında değişmektedir. Örneklere ait tanımlayıcı istatistikler Tablo 1'de gösterilmiştir.

Tablo 1. Lokasyonlara göre *S. pilchardus* bireylerinin tanımlayıcı istatistikleri

		Akdeniz			Ege Denizi		
	Değişken	**Min**	**Maks**	**Ort±sh**	**Min**	**Maks**	**Ort±sh**
Tüm populasyon	Total boy	20,4	25,6	22,84±0,16	11,0	15,5	12,88±0,12
	Çatal boy	17,0	22,1	19,26±0,14	9,0	14,0	11,74±0,12
	Standart boy	16,0	20,7	17,83±0,13	8,0	13,0	10,75±0,12
	Ağırlık	69,03	141,11	101,51±2,41	9,52	25,41	15,21±0,45
Dişi	Total boy	20,4	25,6	22,84±0,27	11,1	15,5	13,02±0,17
	Çatal boy	17,9	22,1	19,47±0,21	10,2	14,0	11,91±0,16
	Standart boy	16,5	20,7	18,10±0,19	9,4	13,0	10,93±0,15
	Ağırlık	71,59	141,11	100,58±3,74	9,52	25,41	16,11±0,69
Erkek	Total boy	20,7	24,6	22,84±0,19	11,0	14,0	12,70±0,17
	Çatal boy	17,0	21,4	19,08±0,18	9,0	12,9	11,51±0,18
	Standart boy	16,0	19,5	17,60±0,16	8,0	11,9	10,50±0,18
	Ağırlık	69,03	128,62	102,37±3,16	9,95	17,05	14,00±0,41

Akdeniz populasyonunda dişi ve erkek bireyler total boy (t testi; P=0,989) ve ağırlık (t testi; P=0,718) değerleri açısından karşılaştırıldığında istatistiksel anlamda bir fark olmadığı sonucu ortay çıkmıştır. Ancak Ege populasyonu değerlendirildiğinde total boy (t testi; P=0,184) bakımından dişi ve erkek bireyler arasında fark bulunmazken ağırlık (t testi; P=0,012) bakımından fark olduğu belirlenmiştir. Akdeniz populasyonu için populasyon genelinde boy-ağırlık ilişkisi denklemi $W=0{,}006TL^{3{,}094}$ (r^2= 0,862, P<0,001), Ege popülasyonunda $W=0{,}015TL^{2{,}691}$ (r^2= 0,778, P<0,001) olarak belirlenmiştir. İki populasyona ait örneklerin boy-ağırlık ilişkileri parametreleri ve büyüme tipleri Tablo 2'de gösterilmiştir.

Tablo 2. Lokasyonlara göre boy-ağırlık ilişkisi parametreleri ve büyüme tipleri

Lokalite		**Boy-Ağırlık İlişkisi Parametreleri**			**R^2**	**P değeri**	**Büyüme tipi**
		a	**b**	**% 95 güven aralığı**			
Akdeniz	Tüm populasyon	0,006	3,094	2,740-3,448	0,862	<0,001	İzometrik
	Dişi	0,010	2,953	2,587-3,319	0,924	<0,001	İzometrik
	Erkek	0,003	3,311	2,633-3,989	0,801	<0,001	İzometrik
Ege Denizi	Tüm populasyon	0,015	2,691	2,296-3,086	0,778	<0,001	İzometrik
	Dişi	0,007	3,016	2,503-3,529	0,827	<0,001	İzometrik
	Erkek	0,095	1,961	1,440-2,482	0,731	<0,001	(-) Allometrik

Her iki lokasyona ait *S.pilchardus* populasyonlarının linear regresyon modeli kullanılarak hesaplanan boy-boy ilişkileri istatistiksel anlamda önemli bulunmuştur (P<0.001). Tablo 3 ve Tablo 4'de boy-boy ilişki dönüşüm katsayıları belirtilmiştir.

Tablo 3. Akdeniz'den örneklenen sardalya balığı populasyonunun total, çatal ve standart boyları arasındaki boy-boy ilişkileri

Cinsiyet	Denklem	N	a	b	r^2	P
Tüm populasyon	TL = a + b FL	50	3,06	1,03	72,9	<0,001

TARTIŞMA

Balıkçılık biyolojisinde stok çalışmaları, balık stoklarının yönetimi ve korunması için gerekli olan bilimsel bilgiyi sunmaktadır. Boy-ağırlık ilişki parametreleri balık biyolojisi ve balıkçılık yönetiminde oldukça önemli olan verilerdir (Garcia ve ark., 1989). Ayrıca, boy-boy ilişki denklemleri de farklı boy tipleri kullanılarak gerçekleştirilen çalışmaların karşılaştırılmasında oldukça önemli bir yer tutmaktadır (Moutopoulos ve Stergiou, 2002; Hossain ve ark., 2006; Singh ve Serajuddin, 2017).

Bu çalışmada, Akdeniz ve Ege Denizleri'nden örneklenmiş olan *S. pilchardus* populasyonlarının boy-ağırlık ve boy-boy ilişkileri incelenmiştir. Akdeniz populasyonunda dişi ve erkek bireyler arasında total boy ve ağırlık bakımından fark bulunmazken (P>0,05), Ege Denizi populasyonunda cinsiyetler arasında ağırlık bakımından fark gözlenmiştir (P<0,05). Balık populasyonları arasında boy ve ağırlık verileri arasında gözlenen varyasyonlar ekolojik şartların farklı olmasından kaynaklanmaktadır (Nikolsky, 1963). Le Cren (1951)'e göre balıklarda ideal balık büyümesi izometrik büyümedir ve "b" değeri 3 olarak kabul edilmektedir. Gerçekleştirilen bu çalışmada Akdeniz popülasyonunda hem dişi hem erkek bireylerde izometrik büyüme söz konusu iken, Ege popülasyonunda dişilerde izometrik erkek bireylerde ise (-) allometrik büyüme belirlemiştir. Literatür incelendiğinde sardalya balığı ile ilgili olarak gerçekleştirilen çalışmalarda elde edilen boy ağırlık ilişki parametreleri ve büyüme tipleri Tablo 5'te özetlenmiştir.

Tablo 5. Faklı lokalitelerde sardalya balığı ile ilgili gerçekleştirilen çalışmalardan elde edilen boy-ağırlık ilişki parametreleri ve büyüme tipleri

Boy-boy ilişkileri çalışmaları literatürde farklı boy tiplerinin kullanıldığı çalışmalar ile karşılaştırmaların gerçekleştirilmesi, biyomas hesaplanması ve büyüme verileri ile ilgili bilgilerin elde edilmesi için oldukça önemlidirler (Ault ve ark., 2005; Aburto-Oropeza ve ark., 2011). Karachle ve Stergiou (2008), Kuzey Ege Denizi'nde sardalya balıklarının boy-boy dönüşümünü incelemişler ve tüm ilişkileri oldukça kuvvetli bulmuşlardır. Her üç dönüşüm için de r^2 değerleri 0,99 olarak hesaplanmıştır. Bu çalışmada da boy-boy ilişkileri istatistiksel anlamda önemli bulunmuştur.

SONUÇ

Balıklarda boy-ağırlık, boy-boy ilişkileri gibi çalışmalarda elde edilen veriler sabit olmayıp beslenme yeterliliği, gonad gelişimi, beslenme hızı ve üreme dönemleri gibi birçok faktöre bağlı olarak değişebilmektedir. Parametreler ayrıca genetik yapı, vücut şekli ve kondisyon faktörü gibi birçok faktöre bağlı olarak türler ve populasyonlar arasında farklılık gösterebilir. *S. pilchardus* türü de Akdeniz ve Ege Denizi'nde ekonomik değeri oldukça yüksek olan bir balık türüdür. Bu çalışmadan elde edilen sonuçların tür ile ilgili olarak bundan sonra gerçekleştirilecek olan çalışmalara katkı sağlayacağı düşünülmektedir.

Özet

Yüzey modifikasyonu, mekanik işlevselliği geliştirme ve malzemenin çevre ile etkileşimini modüle etme konusundaki yüksek potansiyeli nedeniyle artan ilgi görmektedir. Mekanik yüzey işlemleri arasında, bilyalı dövme, etkinliği, çevre dostu olması, görece düşük maliyeti ve minimum geometrik kısıtları dikkate alındığında, son zamanlarda yüzey tane yapısını inceltmek ve yüzeyaltı mekanik dayanımı arttırarak olası hasarları önleyici/geciktirici olması sebebiyle umut verici bir yöntemdir. Bu çalışma, bilyalı dövmenin, el aletlerinden kesme makası olarak tercih edilen uygulamaların yanı sıra özellikle alaşımlı çeliklere göre çok daha uygun fiyatlı olan, mil, aks ve şaft gibi zorlamalı parçalarda kullanılan AISI1060 çeliğinin yüzey durumu üzerindeki etkilerini değerlendirmektedir. Farklı bilya çapları kullanılarak çoklu bilyalanmış 1060 numuneler mikroyapı, yüzey pürüzlülüğü, yüzey topografyası ve mikrosertlik açısından incelenmiştir. Sonuçlar, bilyalı dövülmüş malzemelerin yüzey altında tane incelmesi ile mikrosertlikte bir miktar artış ve yüzey pürüzlülüğünün bir çizgi hattı boyunca değerlendirilmesi ile ortalamada bir artış gösterirken, AFM ile bir alan tarandığında homojen bir yüzey durumu oluşturulduğu ortaya konmuştur.

Anahtar kelimeler: Bilyalı dövme, AISI1060 çeliği, yüzey pürüzlülüğü, mikrosertlik

Surface modification of AISI steel by shot peening

Abstract

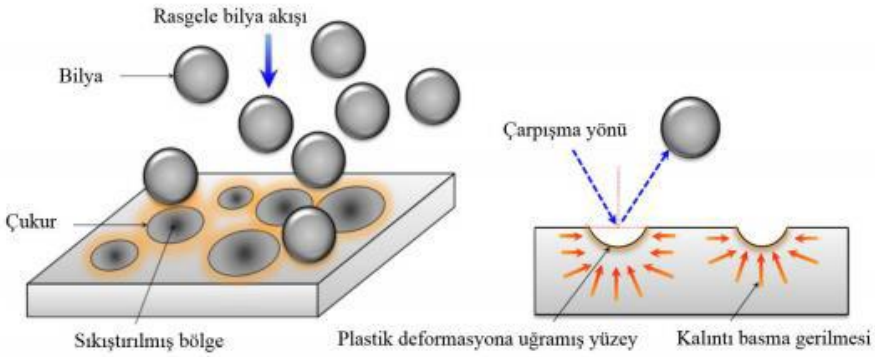
Surface modification aims increasing attention due to its high potential to improve mechanical functionality and modulate the material's interaction with the environment. Among the mechanical surface treatments, shot peening is a promising method due to its effectiveness, environmental friendliness, relatively low cost and minimal geometrical constraints, recently surface grain refining and increasing the subsurface mechanical strength, preventing/retarding possible damages. This study evaluates the effects of shot peening on the surface condition of AISI1060 steel, which is used in forced parts such as shafts and axles, which is much more affordable than alloy steels, as well as preferred applications such as cutting shears from hand tools. Multiple shot peened 1060 samples using different ball diameters were examined in terms of microstructure, surface roughness, surface topography and microhardness. The results showed that the subsurface grain refinement of the peened materials showed an increase in microhardness and an average increase in the evaluation of the surface roughness along a line, while a homogeneous surface condition was created when an area was scanned with AFM.

Keywords: Shot peening, AISI1060 steel, surface roughness, microhardness

1. GİRİŞ

Modern endüstrinin hızlı gelişimi, pek çok komponentin yüzey kalitesi ve yorulma ömrü konusunda daha fazla talepte bulunmaktadır. Çeşitli yüzey kimyasal işlemlerinin yanı sıra bilyalı dövme ve ezerek parlatma gibi yöntemler, giderek artan mühendislik uygulamalarında ürünlerin yüzey performansını ve yorulma ömrünü iyileştirebilir. Bunlar arasında bilyalı dövme, bir plastik deformasyon tabakası oluşturmak üzere yüzey tabakasını plastik olarak deforme etmek için yüzeyi tekrar tekrar vurarak, yüksek hızlı hareketli atışlar yoluyla malzeme yüzeyine bilya püskürtme işlemidir. Malzeme yüzey özelliklerinin iyileştirilmesinin beklendiği önemli miktarda basma artık gerilmesi bu işlemle yaratılmaktadır. Çelik malzemelerde bilyalı dövme, artan sertlik, daha ince taneler ve artan basma kalıntı gerilimi meydana getirilerek, yorulma, aşınma ve korozyon

gibi yüzeyden ilerleyen hasarları önler veya geciktirir (Foss et al., 2013; Meo & Vignjevic, 2003; Miková et al., 2013; Widmark & Melander, 1999; Wu, Liu, Wei, Zhu, et al., 2020; Zhan et al., 2013). Bilyalı dövme bir soğuk işlem prosesidir. Bilyalı dövmede yüksek hızlarla tekrarlı bir şekilde malzeme yüzeyine çarpan bilyalar, malzemenin hem yüzey hem de yüzey altı bölgesinde olumlu değişimler meydana getirir (Avcu, 2018). Bilyalı dövme işlemi için kullanılan bilya malzemeleri; çelik bilyalar, seramik bilyalar, cam küreler olabilmektedir (Ünal et al., 2011). Bilyalı dövme esnasında tekrarlanan her bir darbenin altındaki kalıntı gerilim alanı, benzer şekilde üretilmiş komşu alanlarla etkileşir ve nihayetinde, yüzeye paralel, derinlik boyunca değişen bir artık gerilim dağılımı üretir (Al-Hassani, 1982). Bilyalı dövme, yapısal parçaların, çentikli makine elemanlarının veya kaynaklı bağlantıların mekanik davranışını iyileştirmek için yaygın olarak kullanılmaktadır. Yararlı etkileri, esas olarak, bilyanın birden fazla darbesinden kaynaklanan malzemenin yüzey tabakasının plastik deformasyonunun neden olduğu dislokasyon artışı, tane yapısının küçülmesi ve latislerde mikro-gerinimlerin oluşmasından kaynaklanır (Guagliano, n.d.). Bilyalı dövme hakkında bugüne kadar yapılan çalışmalar bir dizi faydalı içgörü üretmiştir, ancak uygun işleme parametrelerinin belirlenmesi için güvenilir bir metodoloji hala zordur (Wu, Liu, Wei, Lin, et al., 2020). Bilyalı dövme işleminin malzeme özelliklerini belirleyen birçok parametresi vardır. Parametreler; bilyanın cinsi ve boyutu, püskürtme basıncı, püskürtme debisi, püskütme mesefasi ve püskürtme açısı olarak söylenebilir. Bilyalı dövme parametreleri uygun seçilmediğinde (büyük atış, yüksek hız, aşırı dövme vb.), üst üste binme, mikro çatlaklar ve yüzey pürüzlülüğünde aşırı artış, heterojen nihai yüzey durumu gibi yüzeysel kusurlara sebep olabilir ve bunlar bilyalı dövülmüş yüzeyin bütünlüğünü bozabilmekte veya değiştirebilmektedir. Bu sorun işlem görmüş malzemenin yüksek devir yorulma mukavemetinde önemli oranda bir azalışa sebep olmaktadır (Frija et al., 2006). Bilyaların etkileri yüzeyde birçok çukur oluşturur. Şekil 1, bilyalı dövme işleminin şematik gösterimini ve oluşan plastik deformasyonları sunar (Maleki et al., 2018).



Şekil 1. Bilyalı dövme işlemi sonrası oluşan deformasyon ve gerilmeler (Maleki et al., 2018)

2. MATERYAL VE METOT

2.1. Materyal

AISI 1060 çeliği otomotiv, imalat ve inşaat gibi pek çok sektörde kullanım yeri bulan, kesici makaslar, bilezikler, toprak işleme takımları, aks, rot, şaft gibi çok zorlamalı komponentlerde tercih edilen, alaşımlı çeliklere göre daha düşük fiyata sahip olması sebebiyle cazip sade karbonlu bir çeliktir. Bu çalışmada ısıl işlem uygulanmış (yağda sertleştirilmiş) AISI1060 malzemesine ait 2 mm kalınlığında standart çekme test numuneleri kullanılmıştır. Malzemenin kimyasal kompozisyonu Tablo 1'de verilmiştir. Kullanılan numunenin görüntüsü ise Şekil 2'de verilmiştir.

Tablo 1. 1060 çeliğinim kimyasal kompozisyonu

0.57-0.65	Maks 0.4	0.6- 0.9	Maks 0.4	Maks 0.03	Maks 0.035	Maks 0.4	Maks 0.1

Şekil 2. Deneylerde kullanılan AISI1060 numunesi örneği

2.2. Bilyalı dövme

Bilyalı dövme işlemi 1060 numunelerinin her iki yüzeyine de uygulanmıştır. Yapılan hesaplamalara göre 1 bilyalı dövme turu yaklaşık 2 dakika 20 saniye sürmüştür. Tüm numunelerin yüzeyleri önce ort. 0.8 mm çaplı S330 bilya ile üzerine ort. 0.6 mm çaplı S230 bilya ile çoklu olarak bilyalı dövülmüştür. Tablo 2'de kullanılan bilyalı dövme parametreleri verilmiştir.

Tablo 2. Kullanılan bilyalı dövme parametreleri

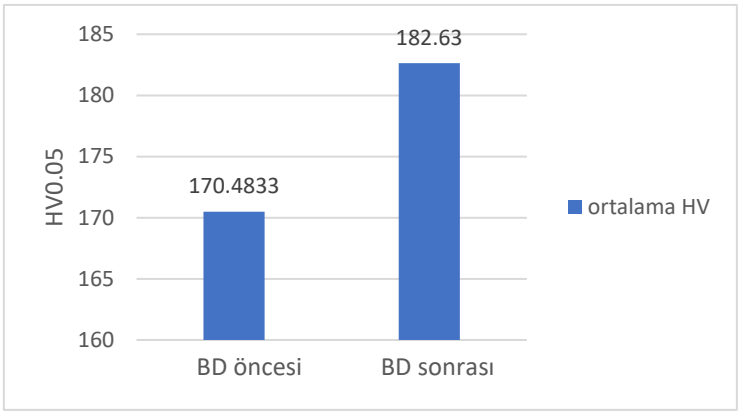
Hız Rpm	Total tur	Mesafe mm	Bilyalama Süresi	Bilyalama Açısı	Bilya boyutu
60	14	150	Sabit	Sabit	S330+S230

Kullanılan numuneler optik mikroskop incelemeleri için kesitten bakalite alınmış numune yüzeyleri 320-1200'lük zımpara aralığında zımparalanmış ve sonrasında ise sırasıyla 3µm ve 1µm'lik elmas süspansiyonlar ile parlatma işlemleri uygulanmıştır. Parlatılan yüzeyler %3 Nital çözeltisiyle dağlanmış ve Nikon Eclipse LV150N mikroskobu kullanılarak incelenmiştir. Numunelerin yüzey pürüzlülükleri 1mm' lik hat boyunca Mitutoyo Surf Test SJ – 301 profilometre cihazı ile şekilde minimum 3 kez ölçülmüştür. Ayrıca kesitten mikrosertlik araştırması Future-Tech FM700 mikrosertlik cihazında Vickers indenter kullanılarak 50gf yük altında gerçekleştirilmiştir. Mikrosertlik ölçümleri için numune yüzeyinden kesit boyunca her 50 µm' de bir ölçüm alınarak gerçekleştirilmiştir.

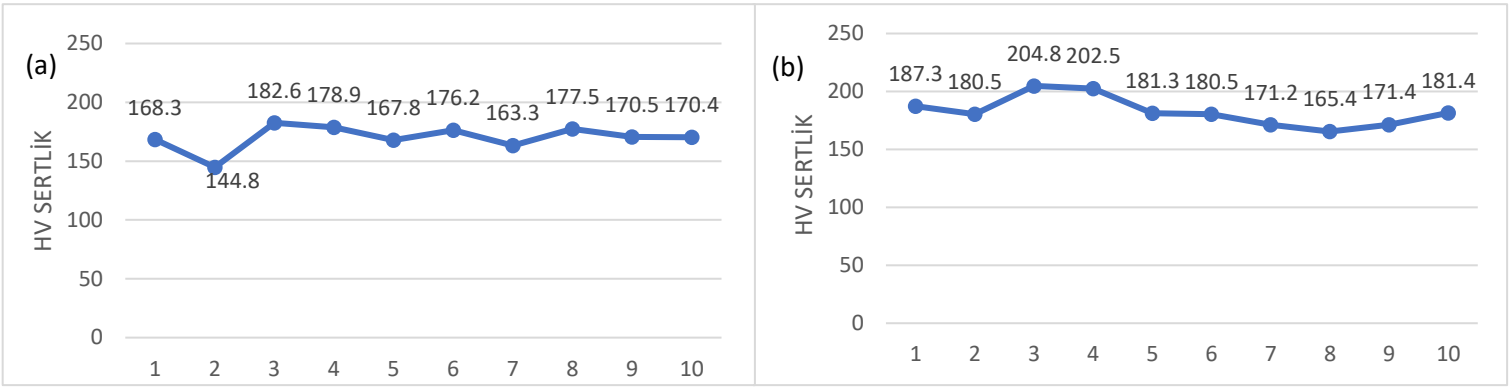
3. SONUÇLAR VE TARTIŞMA

3.1. Mikrosertlik ölçümleri

Metal üzerinde doğru bir hat boyunca hesaplanan sertlik değerlerinin her bir numune için ortalaması alınıp Şekil 3'de grafik olarak verilmiştir. Şekil 4' de ise metal üzerinde doğrusal bir hat boyunca 0-600 µm aralığında alınan her mikro sertlik ölçümü verilmiştir. 1060 çeliğinin işlemsiz olarak ölçülen ortalama sertlik değeri bilyalı dövme sonrası deformasyon sertleşmesi etkisi ile artmıştır. Yapılan çalışma sonucunda mikrosertlik değerinde bilyalı dövme ile %7,12' lik bir artış meydana gelmiştir. Şekil 4' de görüldüğü üzere numunenin yüzeyinde bilyalı dövme ile %11,29' luk bir artış gerçekleşmiştir. Bu durum yüzeydeki bilyalı dövme işlemi yoluyla üst yüzeydeki tabakaya daha büyük plastik gerinimler ve gerinim hızları etki etmesi ile açıklanabilir (Yan et al., 2012).



Şekil 3. Ortalama mikrosertlik değerleri



Şekil. 4 (a) BD öncesi (b) BD sonrası numunelerin 0-600 µm boyunca kesitten mikro sertlik değişimleri

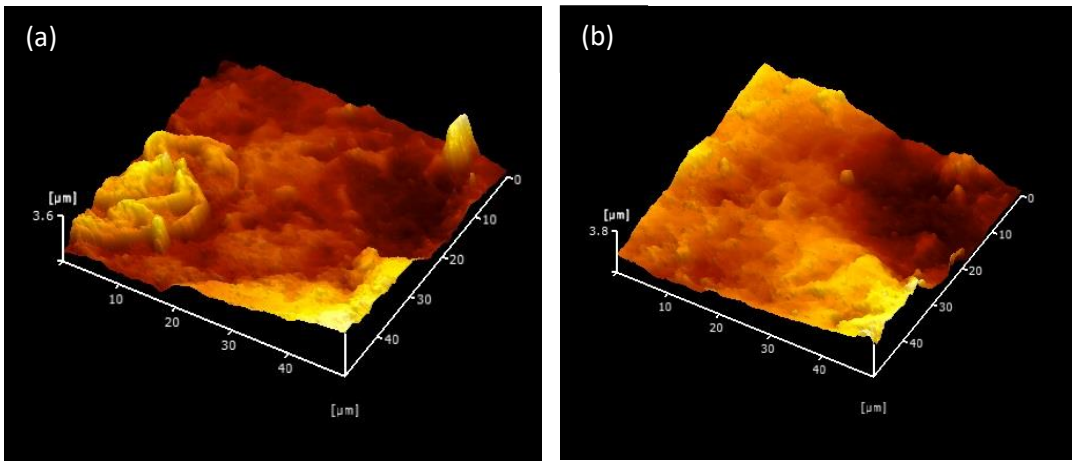
3.2. Yüzey durumu incelemeleri

Bilyalı dövme, yüzey pürüzlülüğü artışında kritik bir rol oynar (Mylonas & Labeas, 2011). Metal parçaların yorulma/aşınma/korozyon gibi hasarları dikkate alınırsa özellikle yük taşıyan mekanik parçalar için yüzey pürüzlülüğünün kontrol edilmesi faydalıdır (Bagherifard et al., 2012) . İşlemsiz ve bilyalı dövülmüş 1060 çeliğinin ortalama yüzey pürüzlülükleri Tablo 3'de verilmiştir. Hesaplanan ortalama yüzey pürüzlülüğü değerlerinde %50,4 değerinde bir artış gözlemlenmiştir.

Tablo 3. BD öncesi ve sonrası numunelerin yüzey pürüzlülüğü değerleri

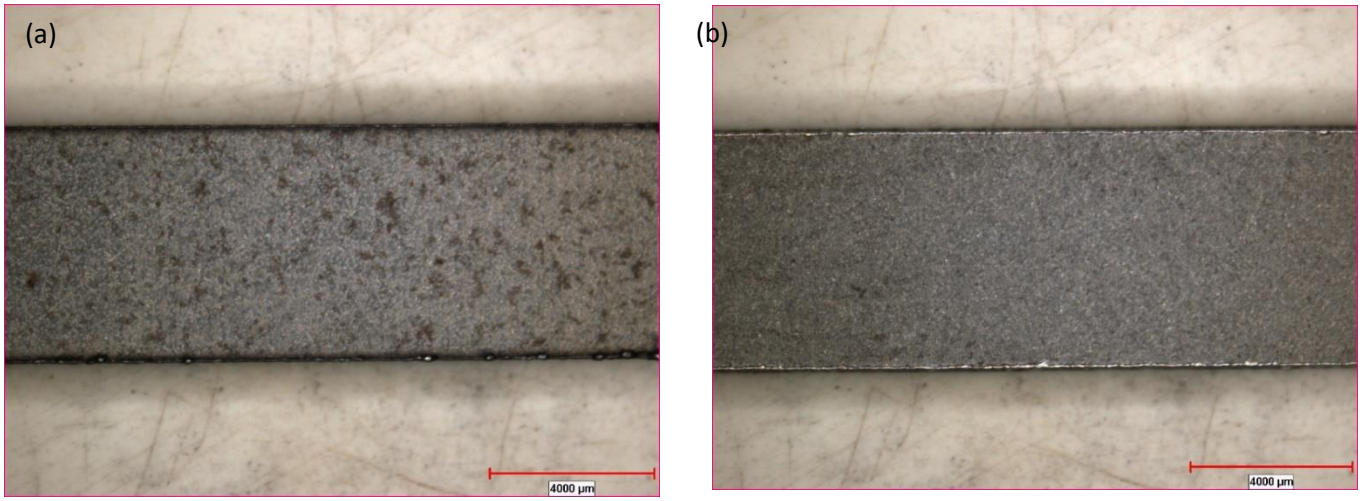
	BD öncesi (µm)	BD sonrası (µm)
R_a	1,01	1,53
R_z	8,08	11,505

Mekanik profilometre ile bir hat boyunca ölçülen pürüzlülük değerlerine göre bilyalı dövme sonrası değerler elde edilmiş ancak, işlemin homojenliğini tayin etmek adına bir alan üzerinde yüzey durumu değerlendirmesi yapılmıştır. Böylece mikro ölçekte pürüzlülükler hakkında veri sağlamak için alanlar üzerinde AFM ile ölçümler gerçekleştirilmiştir. AFM ölçümleri, yüzeyin BD sonrası durumunu tayin etmek adına kullanılmıştır. Üç boyutlu AFM görüntüleri Şekil 5'de gösterilmektedir . AFM grafiği kullanılarak BD öncesi ve sonrası numunelerin yüzey morfolojisi incelenmiştir. BD öncesi numunenin AFM görüntüsüne bakıldığında grafiğin maksimum noktasının 3.6 µm olduğu ve bilyalı dövme işleminin ise 3.8 µm olduğu görülmektedir. AFM sonuçlarına göre; BD işlemi ile bir alan boyunca yüzey pürüzlülüğünde bir miktar artış ortadadır. Burada asıl dikkati çeken, çoklu uygulanan BD işlemi ile homojen bir yeni yüzey durumu oluşturulmuş olmasıdır.



Şekil 5. BD öncesi (a), BD sonrası (b) numunelerinin AFM görüntüsü

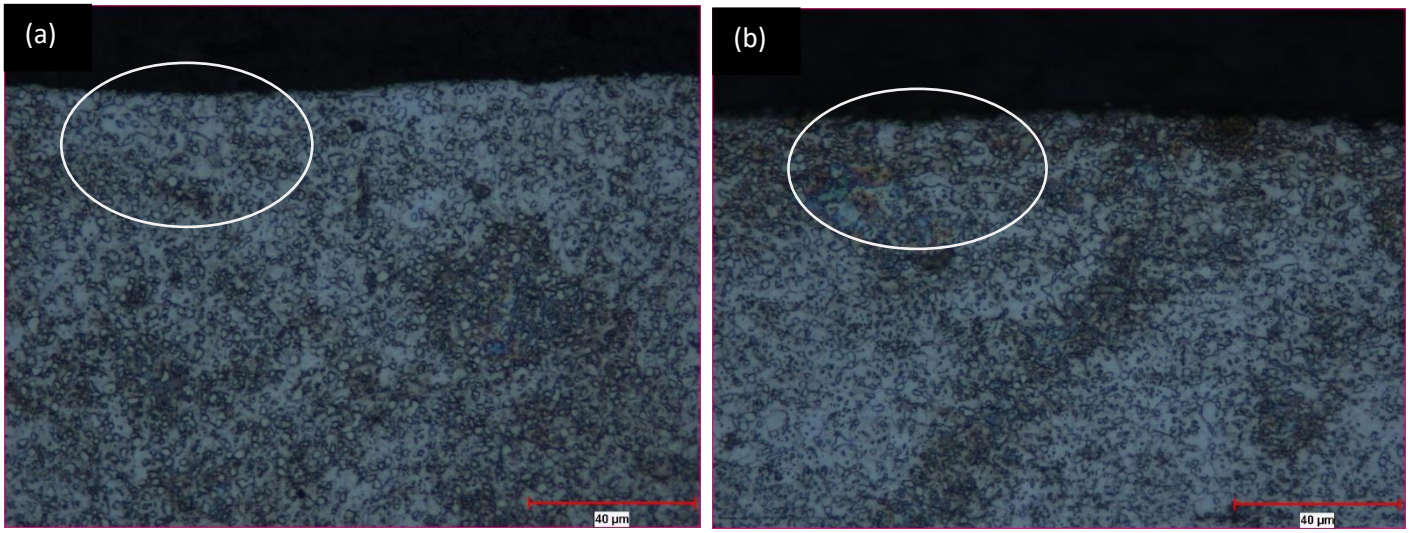
1060 numunelerinin makro görüntüleri incelenmiştir. Şekil 6'da BD öncesi ve sonrası numunelerin stereo mikroskop görüntüleri verilmiştir. Bilyalı dövme, numunenin tüm yüzeyini homojen şekilde kaplamıştır.



Şekil 6. (a) BD öncesi (b) BD sonrası numunenin makro görüntüleri

3.3. Mikroyapı incelemesi

Şekil 7'de gösterildiği gibi bilyalı dövme ile 1060 malzemesinin tane yapısında yüzey altı bölgelerde küçülmeler meydana gelmiştir. Ayrıca numunenin bilyalı dövme bölgesinde de plastik deformasyon etkisi ile çukurcuklar meydana gelmiştir böylece işlem bölgesi gözlenebilir. Yüksek bilyalı dövme şiddetinin etkisi daha fazla deformasyonu ve potansiyel tane küçülmesini meydana getirir (Bagherifard et al., 2016).



Şekil 7. (a) BD öncesi (b) BD sonrası numunelerin mikroyapıları

4. GENEL SONUÇLAR

Bu çalışma; AISI1060 malzemesine uygulanan çoklu bilyalı dövmenin yüzey üzerindeki etkilerini incelemiştir.

- Bilyalı dövme işlemi sonucunda malzemenin ortalama mikrosertlik değerinde %7,12 lik bir artış meydana gelmiştir. Ayrıca sadece malzemenin yüzey mikrosertik değeri incelendiğinde bilyalı dövme ile %11,29 bir artış gerçekleşmiştir.
- Bilyalı dövme işlemi sonucunda hesaplanan bir çizgisel hat boyunca taranan yüzeylerin ortalama yüzey pürüzlülüğü değerlerinde %50,4 değerinde bir artış elde edilmiştir.
- Bilyalı dövme işlemi sonrasında yüzeydeki alanlardan gerçekleştirilen AFM sonuçları dikkate alındığında işlemin malzeme yüzeyini homojenleştirdiği raporlanmıştır.
- Sonuçlar, bilyalı dövme işlemi sonrası yüzey bölgesinde tane incelmesinin teşvik edildiğini, sertlik ve deformasyon sertleşmesi açısından mekanik özelliğin iyileştiğini gösterir.

Abstract
In this paper, broadband a metasurface-based reflective type polarization converter is proposed for both linear and circular polarization conversions. Firstly, the proposed design shows linear polarization (LP) conversion feature with more than 90% polarization conversion ratio (PCR) in two frequency ranges (12.4-14.64 GHz and 16.2-25.4 GHz). Secondly, the proposed design shows the performance of right-handed circular polarization (RHCP) conversion with from linear polarization to circular polarization (LP-CP) conversion feature in one frequency range (11.52-11.68 GHz), and left-handed circular polarization (LHCP) conversion with the LP-CP conversion feature in one frequency range (27.12-27.6 GHz). Thirdly, the proposed design has a PCR value of more than 98% for the LP conversion in the frequency ranges 12.8-13.48 GHz and 18.12-24.7 GHz. The proposed polarization converter, consisting of metasurface on the front and metal ground layer on the back of the FR-4 substrate, can find its place in different microwave applications such as antenna, satellite, radar, navigation, and 5G communication, thanks to its ability to perform three functions (LP, RHCP, and LHCP) over a single layout.
Keywords: Metasurface, Multi-Band, Polarization

INTRODUCTION

Polarization converters have been widely applied at microwave, terahertz, and even optical frequencies because of their ability to change the polarization state of an electromagnetic wave (Zheng et al., 2018a). However, conventional structures to manipulate polarization require a much greater thickness compared to the working wavelength and thus limit practical applications (Zhao and Alu, 2011). To overcome this problem, metasurface-based reflective type polarization converters (Zhang et al., 2016; Zheng et al., 2018b) have been proposed recently. Metasurface, a planar metamaterial, has been used in excellent polarization conversion with strong anisotropy and wide bandwidth for multiple plasmon resonances (Feng et al., 2013). Since higher efficiency can be obtained due to the total reflection of the incoming waves, reflective polarization converters, which are generally preferred in the reflection operating mode, are produced on metal-supported dielectric layers. Either uniform (Jia et al., 2018; Xu et al., 2018) or multiple polarization conversion (Lin et al., 2019; Zheng et al., 2020) of electromagnetic waves has been reported with the help of a single metasurface.

In this study, with the proposed polarization design using metasurface-based structure, linear polarization (LP) conversion in two frequency ranges and circular polarization (CP) conversion (right-handed circular polarization (RHCP) conversion and left-handed circular polarization (LHCP) conversion together) in two frequency ranges were obtained in X- (8-12 GHz), Ku- (12-18 GHz), K- (18-27 GHz), and Ka-bands (27-40 GHz). The remainder of this work is designed as follows. Firstly, in the section of design, the unit cell structure of the proposed metasurface-based design for the polarization of electromagnetic waves is given, secondly, in the section of simulation results and analysis, the simulation results of the proposed polarization converter are given and the results are analyzed, and finally in the section of conclusion, the important points of the proposed design are restated.

DESIGN

The schematic and dimensioning of the unit cell of the proposed polarization converter is shown in Figures 1(a)-1(b). The unit cell design consists of three parts, the metasurface metal structure at the top, the dielectric substrate in the middle, and the metallic ground plate at the bottom. As the dielectric substrate, the easily available FR-4 material with a square shape and a side of 9 mm (a), a thickness of 1.7 mm (d), a loss tangent of 0.025, and a relative dielectric constant of 4.3 was used. The bottom and top metal material is copper with a thickness of 35 μm (t) and a conductivity of 5.8×10^7 S/m. The top metasurface structure consists of two metasurfaces on a diagonal. This metasurface structure was created by subtracting a square with a side of 3

mm (b) from a 4.25 mm diameter (R) circle and removing a 0.3 mm wide (g) strip across the diagonal. Also, the distance (c) between the two metasurface structures is 2.11 mm.

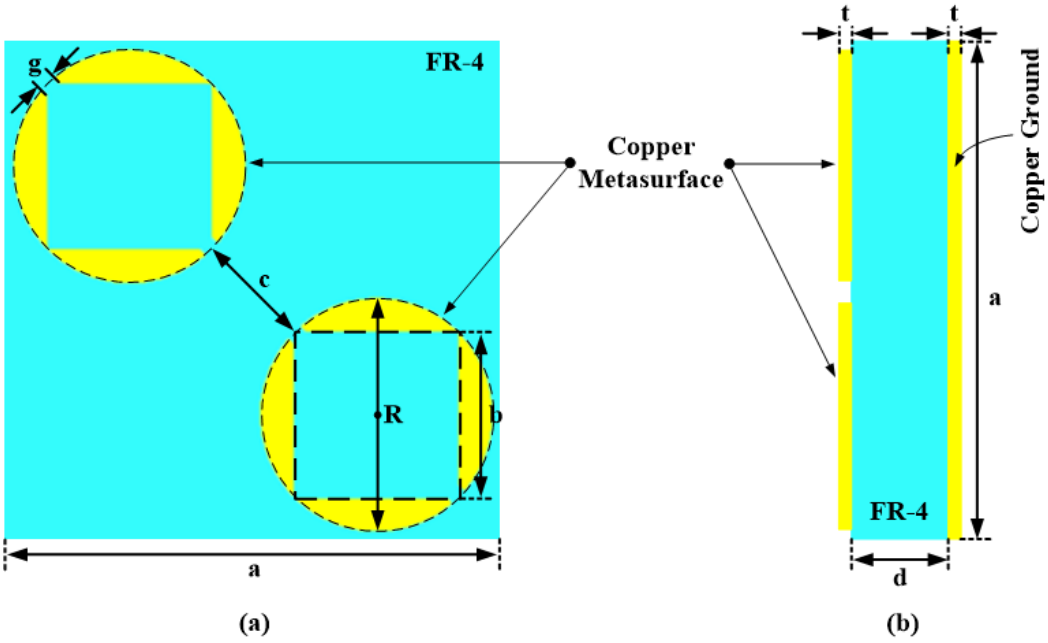

Figure 1. Unit cell schematic and dimensioning of the proposed polarization converter design: (a) Front view and (b) side view

SIMULATION RESULTS AND ANALYSIS

The proposed metasurface-based polarization converter design, whose geometry is shown in Figure 1, was designed and simulated with the CST Microwave Studio 3D full-wave electromagnetic simulation program. The dB (R_{yy} and R_{xy} respectively) and magnitude ($|R_{yy}|$ and $|R_{xy}|$ respectively) values of the co- and cross-reflection coefficients obtained as a result of the simulation for the incoming y-polarized wave under normal incidence are given in Figure 2(a) and Figure 2(b), respectively, in the 7-28 GHz frequency range.

From Figure 2(a), it can be seen that resonance occurs at three frequency points as 13.12 GHz, 19.44 GHz, and 23.92 GHz. This means that at these resonant frequencies, the incoming y-polarized wave turns into a fully x-polarized wave when reflected from the metasurface. It can be seen from Figure 2(b) that the value of $|R_{xy}|$ is around 0.9 around the frequency range of 12-25 GHz and the value of $|R_{yy}|$ is below 0.2 around the almost same frequency range.

A good measure of the LP conversion capability of a polarization converter is the polarization conversion ratio (PCR). This is calculated mathematically as follows (Hao et al., 2007).

$$PCR = \frac{\left|R_{xy}\right|^2}{\left|R_{xy}\right|^2 + \left|R_{yy}\right|^2} \quad (1)$$

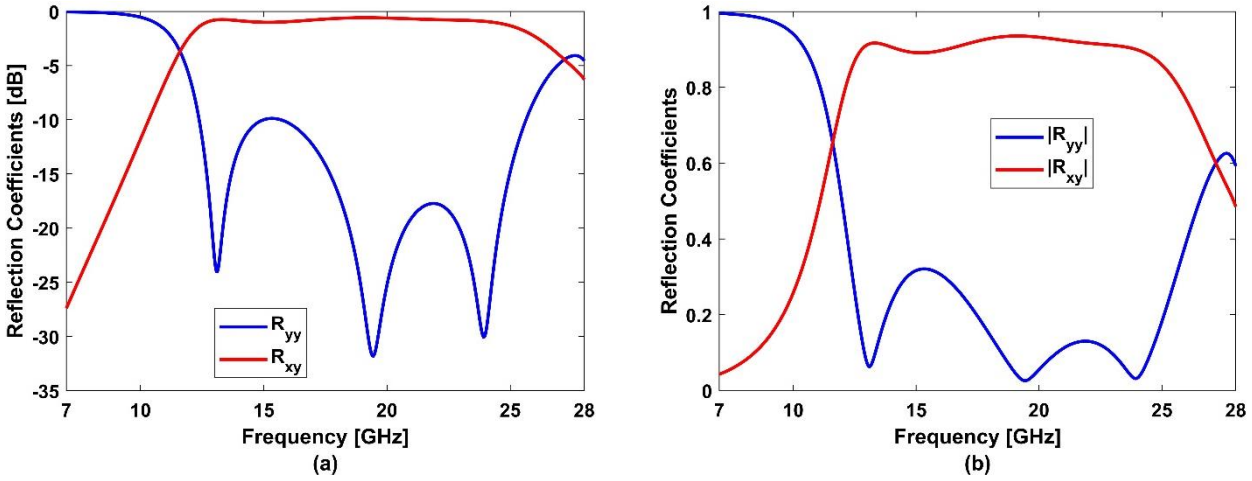

Figure 2. Reflection coefficients: (a) In dB and (b) in magnitude

Accordingly, the variation of the calculated PCR value of the proposed design for the incoming y-polarized wave in the 7-28 GHz frequency range is given in Figure 3. From Figure 3, the following dependencies are noted. First, the PCR value reached 100% at three resonance frequencies. Secondly, the PCR value is more than 90% in the frequency ranges 12.4-14.64 GHz in the Ku-band and 16.2-25.4 GHz in the Ku- and K-bands. Thirdly, the PCR value is more than 98% in the frequency ranges of 12.8-13.48 GHz in the Ku-band and 18.12-24.7 GHz in the K-band. Accordingly, the proposed converter works efficiently as a LP converter in the specified frequency ranges.

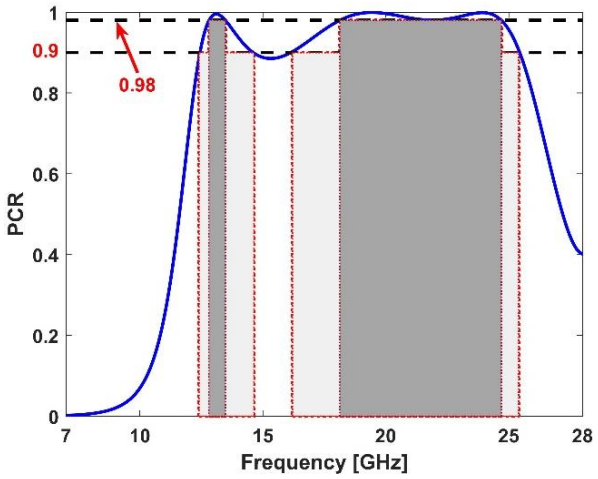

Figure 3. PCR variation of the proposed design

The parameter that gives information about the CP conversion of the electromagnetic wave is the ellipticity (e) value and this value is obtained from Stoke's parameters. Stoke's parameters are given below (Pfeiffer and Grbic, 2014).

$$S_0 = |R_{yy}|^2 + |R_{xy}|^2, \qquad S_1 = |R_{yy}|^2 - |R_{xy}|^2$$
$$S_2 = 2|R_{yy}||R_{xy}|\cos\Delta\varphi, \quad S_3 = 2|R_{yy}||R_{xy}|\sin\Delta\varphi \tag{2}$$

Here, $\Delta\varphi = \varphi_{yy} - \varphi_{xy}$ is the phase difference (φ_{yy} and φ_{xy} indicate the phases of R_{yy} and R_{xy}, respectively). Accordingly, the value of e is as given below.

$$e = S_3/S_0 = \frac{2|R_{yy}||R_{xy}|\sin\Delta\varphi}{|R_{yy}|^2 + |R_{xy}|^2} \tag{3}$$

If the value obtained from Equation (3) is e = +1, it is understood that CP takes place as RHCP conversion, and if e = -1, CP occurs as LHCP conversion. Accordingly, the variation of the calculated e value for the proposed design in the 7-28 GHz frequency range is given in Figure 4. From Figure 4, the following

dependencies are noted. Firstly, e = +1 in the frequency range 11.52-11.68 GHz in the X-band, and the proposed design shows the performance of the RHCP conversion with from linear polarization to circular polarization (LP-CP) conversion feature. Secondly, e = -1 in the Ka-band frequency range of 27.12-27.6 GHz, and the proposed design shows LHCP conversion performance with the LP-CP conversion feature.

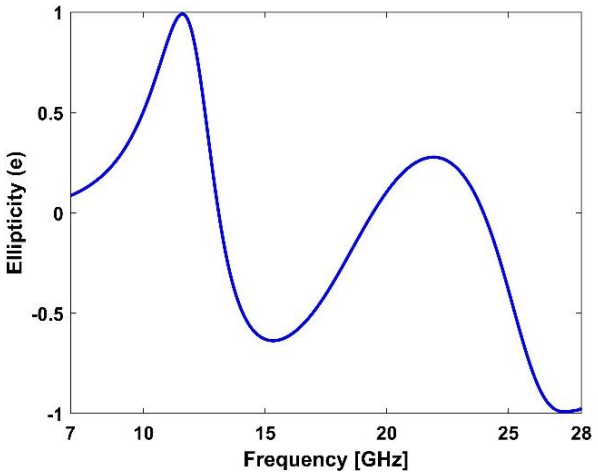

Figure 4. e value variation of the proposed design

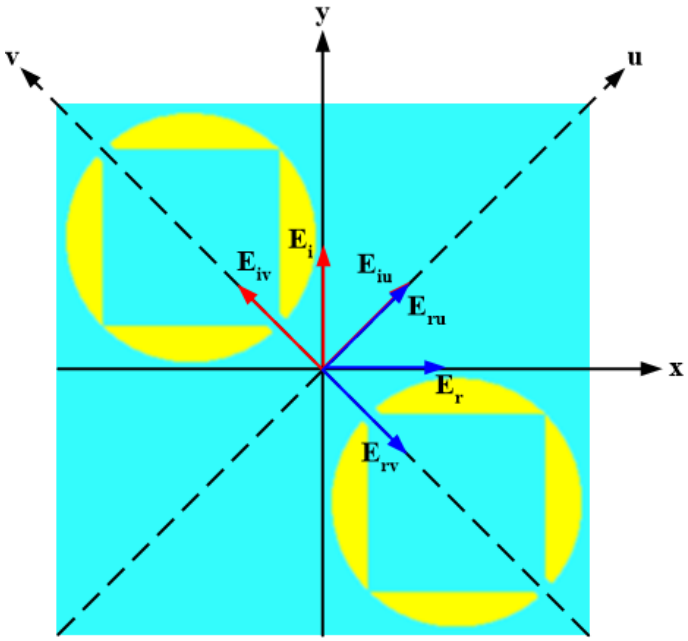

Figure 5. Splitting the incoming y-polarized wave into u − v components

To discuss the polarization conversion mechanism in more detail, the y-polarized incident wave is split into u − v axes as seen in Figure 5. Accordingly, the electric field components of the incident and reflected wave (E_i and E_r respectively) are obtained as follows.

$$E_i = \hat{u}E_{iu} + \hat{v}E_{iv} \tag{4}$$

$$E_r = \hat{u}R_{uu}E_{ru} + \hat{v}R_{vv}E_{rv} \tag{5}$$

Here, $\hat{u}$ and $\hat{v}$ are the unit vectors in the u- and v-directions, respectively, E_{iu} and E_{iv} are the electric field components in the u- and v-axes of the incident wave, respectively, E_{ru} and E_{rv} are the electric field components in the u- and v-axes of the reflected wave, respectively, R_{uu} (= E_{ru}/E_{iu}) and R_{vv} (=E_{rv}/E_{iv}) also represent the reflection coefficients in the u- and v-axes, respectively.

As seen in Figure 5, for the x-polarized reflection of the y-polarized incoming wave, the +u direction component of the incoming wave must be reflected with the same amplitude in the +u direction and the +v directed component of the incoming wave must be reflected with the same amplitude in the −v direction. So

for the LP conversion, $|R_{uu}| = |R_{vv}|$ and the phase difference should be $\Delta\varphi = \varphi_{uu} - \varphi_{vv} = \pm\pi$ (here, φ_{uu} and φ_{vv} are the phases of the co-reflection coefficients in the u- and v-axes, respectively). In addition, the $|R_{uu}| = |R_{vv}|e^{\pm\pi/2}$ condition for CP conversion must be met mathematically [12]. So for CP, $|R_{uu}| = |R_{vv}|$ and $\Delta\varphi = \varphi_{uu} - \varphi_{vv} = \pm\pi/2$. If $\Delta\varphi = +\pi/2$ here, the conversion is RHCP, and if $\Delta\varphi = -\pi/2$, the conversion is LHCP.

Figure 6(a) and Figure 6(b) show the magnitude and phases of the reflection coefficients splitted into the u − v axes of the incident wave, respectively.

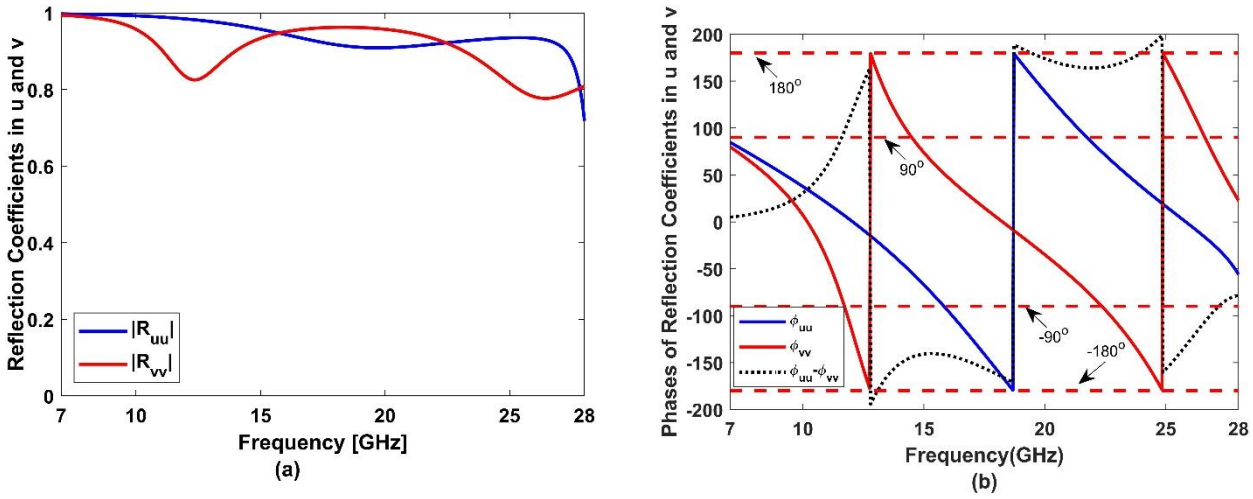

Figure 6. (a) Magnitude and (b) phases of the reflection coefficients in the u- and v-directions

As seen in Figure 6(a), the amplitude of the reflection coefficients in the u − v directions is approximately 1 in the frequency ranges where LP and CP conversions occur. As seen in Figure 6(b), the phase difference converges to approximately ±180° in the frequency ranges (12.4-14.64 GHz and 16.2-25.4 GHz) where LP conversion takes place, to +90° in the frequency range (11.52-11.68 GHz) where RHCP takes place, and to -90° in the frequency range (27.12-27.6 GHz) where LHCP takes place.

CONCLUSION

In summary, in this study, a polarization converter that performs LP conversion in the frequency ranges 12.4-14.64 GHz and 16.2-25.4 GHz, RHCP conversion in the frequency range 11.52-11.68 GHz with the LP-CP conversion feature, and LHCP conversion in the frequency range 27.12-27.6 GHz with the LP-CP conversion feature at X-, Ku-, K-, and Ka-bands in the microwave frequency regime has been realized and verified with a commercial electromagnetic simulation program. While the PCR value of the proposed converter is more than 90% in the specified frequency ranges (12.4-14.64 GHz and 16.2-25.4 GHz), the PCR value is more than 98% in the frequency ranges of 12.8-13.48 GHz and 18.12-24.7 GHz. In addition, the proposed polarization converter design is metasurface-based and designed by choosing easily accessible FR-4 dielectric material.

Özet
Beynin bir kısmı olan hipokampüs bölgesinde meydana gelebilecek bir şekil değişikliği tıbbi açıdan çok önemlidir. Özellikle Alzheimer ve epilepsi gibi hastalıkların erken teşhisi için hipokampüs bölgesindeki şekil değişikliği hassas derecede takip edilmelidir. Bu sebeple hipokampüs bölgesinin yerinin ve şeklinin tespiti önem arz etmektedir. Bu işlem, uzmanlar için çoğu zaman zorlu ve zaman alıcıdır. Bu çalışmada amaç bu görevi derin öğrenme yöntemleriyle başaracak yeni bir mimari ortaya koymaktır. Önerilen mimaride, literatürde U-Net olarak bilinen tekniğin bu çalışmada ele alınan verilere uygun olarak özelleştirilmesi sağlanmıştır. Geliştirilen derin öğrenme ağı ile elde edilen sonuçlar üzerinde son işlemler de yapılarak %90.59'luk dice benzerlik değerine ulaşılmıştır.

Semantic segmentation of the brain hippocampus region from 3D MR images

Abstract
A shape change that may occur in the hippocampus region, which is a part of the brain, is very important from a medical point of view. Especially for the early diagnosis of diseases such as Alzheimer's and epilepsy, the shape change in the hippocampus region should be followed sensitively. For this reason, it is important to determine the location and shape of the hippocampus region. This process is often challenging and time consuming for experts. The aim of this study is to present a new architecture that will achieve this task with deep learning methods. In the proposed architecture, the technique known as U-Net in the literature has been customized in accordance with the data discussed in this study. A dice similarity value of 90.59% was reached by performing post-processing on the results obtained with the developed deep learning network.
Keywords: 3D Segmentation, 2D U-Net, hippocampus

GİRİŞ

Anısal hafıza için kritik bir öneme sahip olan hipokampal oluşum yaşlanma, şizofreni, Alzheimer hastalığı, epilepsi ve benzeri durumlardan etkilenir (Van Leemput ve ark., 2009). Bu sebeplerle hipokampüs bölgesindeki şekil ve hacim değişikliğinin takibi çeşitli hastalıkların tespiti ve değerlendirilmesi için oldukça önemlidir. Bu değişiklikler genellikle anatomik manyetik rezonans **(**MR) görüntüleri üzerindeki hacimsel çalışmalarla tahmin edilir ve manuel olarak yapıldığında çok zaman alabilen bir bölütleme süreci gerektirir (Coupé ve ark., 2012). Bu süreç, her bir MR görüntüsü için ayrı ayrı değerlendirme gerektirir, özneldir ve zaman alıcıdır (Coupé ve ark., 2012). Ayrıca medikal görüntülerde, hastalar arasındaki anatomi farklılığı ve odaklanılan dokunun çevreleyen dokularla arasındaki düşük kontrast bölütleme açısından zorluk sebebi olmaktadır (Roth ve ark., 2018). Bu kısıtlamaları aşmak için otomatik bölütleme yöntemleri geliştirilmektedir. Otomatik bölütleme işlemi için daha önceleri görüntü işleme ve klasik algoritmalar kullanılmaktaydı. Günümüzde bu iş için makine öğrenmesi yöntemleri geliştirilmektedir. Makine öğrenmesi ile geliştirilen yöntem ve algoritmalar medikal görüntüler üzerinde yapılan çalışmalara hız katmıştır ve bu alandan beklentileri de gün geçtikçe artırmaktadır.

Makine öğrenmesi kapsamında geliştirilen Evrişimsel Sinir Ağları (ESA), örüntü tanıma ve görüntü sınıflandırmada ortaya koyduğu başarı sebebiyle, medikal görüntü bölütlemesi için yaygın bir şekilde uygulanır hale gelmiştir (Hesamian ve ark., 2019). Tam bağlı ESA'lar semantik bölütleme üzerine yapılan çalışmalar için önemli bir avantaj sağlamıştır (Long ve ark., 2015). Daha sonraki çalışmalarda ESA'larda 2 boyutlu (2B) görüntülere 2B filtreler uygulanmaya başlanmıştır (Zhang ve ark., 2015). Medikal görüntülerin

3 boyutlu (3B) olması sebebiyle ESA'lar 3B olarak kullanılmak üzere değiştirilmiş ve geliştirilmiştir. 3B ESA ile yapılan ilk çalışmalardan birinde keyfi boyuttaki beyin tümörünün bölütlere ayrılabildiği başarıyla gösterilmiştir (Vaidhya ve ark., 2015). Daha sonra bölütlemeye özgü geliştirilmiş olan ve bölütlemede başarılı sonuçlar sunan 2B U-Net geliştirilmiştir (Ronneberger ve ark., 2015). Ayrıca 3 Boyutlu görüntülerde bölütleme için 2B U-Net ağının uyarlanmasıyla 3B U-Net mimarisi geliştirilmiştir (Çiçek ve ark., 2016).

3B Bölütleme işlemi için 2B U-net kullanmak, z ekseni boyunca oluşan veri değişimini gözardı etmek anlamına gelmekte olup sezgisel bakış açısıyla yorumlanırsa bu kötümser bir yaklaşımdır (Isensee ve ark., 2019). Fakat bu durumun aksine 3B bölütleme yöntemlerinin daha başarısız olduğuna dair bulgular vardır (Engelhardt ve Maier-Hein, 2018).

Bu çalışmada hipokampüs bölgesine ait 3B MR görüntüleri üzerinde derin öğrenme yöntemleri ile 3B semantik bölütleme hedeflenmektedir. Bunun için 2B U-net özelleştirilerek kullanılmıştır. Fakat bölütleme işlemi 3B olarak gerçekleştirilmiştir. Başarı ölçümü beş-katlamalı çapraz-doğrulama denemelerinden elde edilen ortalama dice benzerlik katsayısı ile hesaplanmıştır. Ön işleme, derin öğrenme ve son işleme aşamaları sonrasında aynı veri seti için literatürde açıklanan sonuçlardan daha iyi bir başarı elde edilmiştir.

MATERYAL VE METOD

Bu çalışmada medikal görüntüler üzerinde genellenebilir 3B semantik bölütleme amacı taşıyan "Tıbbi Segmentasyon Decathlon Yarışması" adlı yarışmada sunulan veri setlerinden "Hippocampus" veri seti kullanılmıştır. Vanderbilt Üniversitesi Tıp Merkezi uzmanlarınca hazırlanan veri seti 390 adet 3B MR görüntüsünden oluşmaktadır. MR Görüntülerinin 260 adedi eğitim ve 130 adedi test için ayrılmıştır (Antonelli ve ark., 2021). İşaretli görüntüler incelendiğinde her bir 3B MR görüntüsünün yaklaşık olarak %6.35'lik kısmı hipokampüs bölgesine aittir.

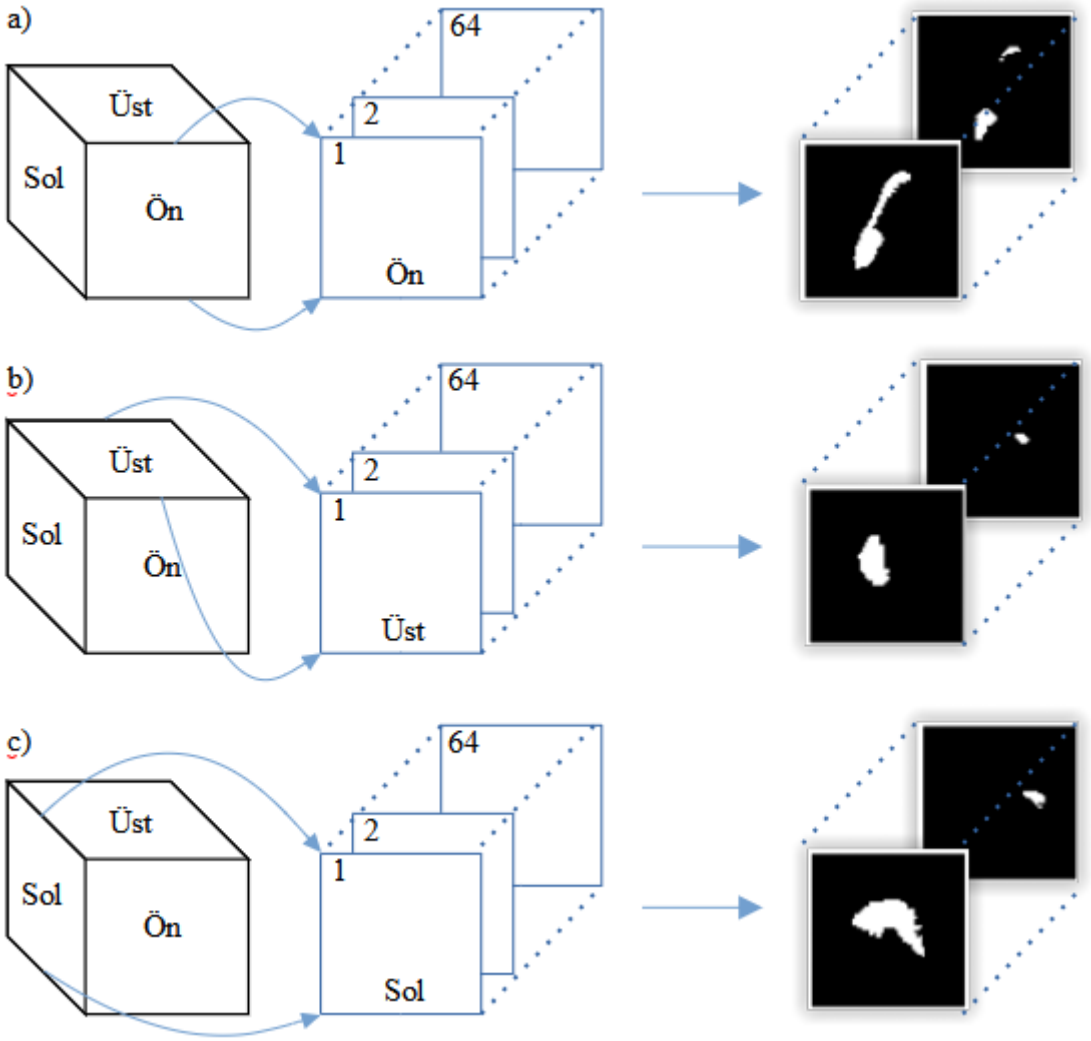
Önişleme

MR Görüntülerinde hipokampüsün, oldukça küçük boyutlu bir parça olması, gri madde yapısında olması, çevre dokularla geçişlerinde düşük kontrasta sahip olması, düzensiz şekilli olması, anatomik olarak bireysel farklılıklara sahip olması ve kenarlarında belirgin bir sınırı olmaması, bölütleme işlemini zorlaştırmaktadır (Shi ve ark., 2020). Dolayısıyla bölütlemeye çalışılan kısmın orijinal boyutlarıyla işlenmesi daha doğru gözükmektedir. Çünkü boyut ölçekleme sebebiyle oluşan interpolasyon verileri, bahsedilen zorlukları artırmaktadır.

Veri setinde her bir MR görüntüsünün boyutları birbirinden farklıdır. Ölçeklemede, yukarıda bahsedilen sebepler dolayısıyla, başarılı bir sonuç alınamadığından boyut eşitleme için sıfır-dolgulama tercih edilmiştir. MR Görüntülerinin boyutlarını karşılayacak şekilde en uygun ölçeğin 64*64*64 olduğu tespit edilerek buna göre sıfır-dolgulama yapılmıştır. Ayrıca, MR görüntülerindeki voksel değerleri arasında ciddi farklılıklar tespit edilmiştir. Bu sorunu çözmek için normalizasyon yapılmıştır. Bunun için (1) denkleminde verilen formülle tüm voksel değerleri 0 ile 1 aralığına orantılanmıştır.

$$X' = \frac{X - Xmin}{Xmax - Xmin} \quad (1)$$

Öğrenme süreci 2B olarak planlanmıştır. Dolayısıyla görüntülerin derin ağa 2B olarak verilmesi gerekir. Bu sebeple 3B olan her bir MR görüntüsü Şekil 1'de görüldüğü gibi önce önden dilimlenerek eğitim için hazırlanmıştır. İkinci durumda üstten, üçüncü durumda da soldan dilimleme yapılmıştır. Böylece üç ayrı yönden dilimleme ile elde edilen 2B görüntüler eğitim setini oluşturmaktadır.

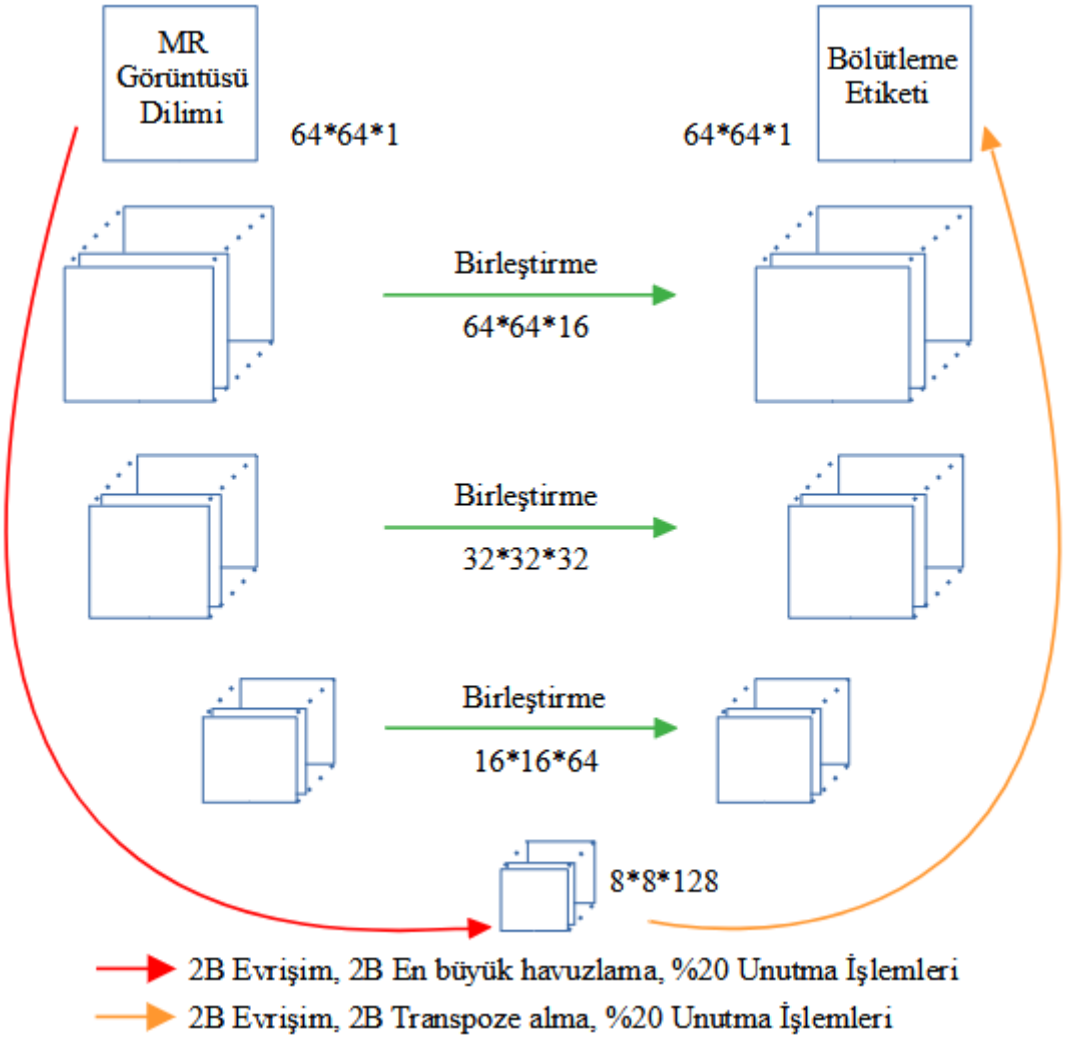


Şekil 1. 3B MR Görüntülerinin; a) önden dilimlenmesi, b) üstten dilimlenmesi, c) soldan dilimlenmesi

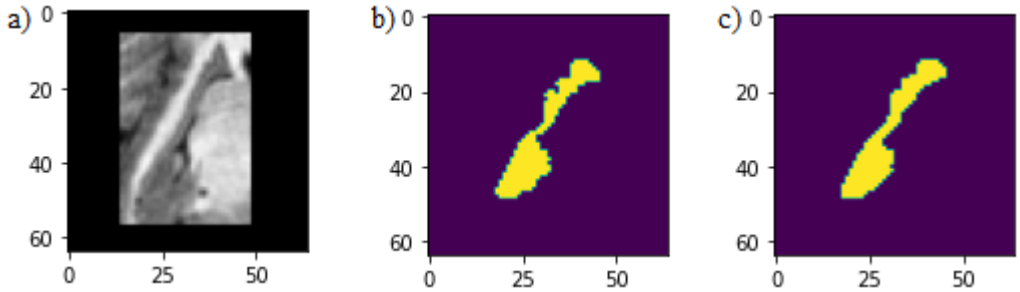
Derin Öğrenme Ağı

Derin öğrenme süreci için 2B U-Net ağının Şekil 2'de gösterildiği haliyle özelleştirilmiş bir varyasyonu uygulanmıştır. Özellik çıkarımı için 2B evrişim katmanlarından yararlanılmıştır. Aşırı öğrenmeyi engellemek üzere unutma katmanı kullanılmıştır. U-net tekniğinin akışına uygun olarak daha detaylı özellik çıkarımı için havuzlama ve bunun karşılığında boyut kaybını engellemek için evrişimli transpoze katmanları uygulanmıştır. Detaylı ve kaba tüm özellikleri bir arada değerlendirmek üzere birleştirme katmanlarından faydalanılmıştır.

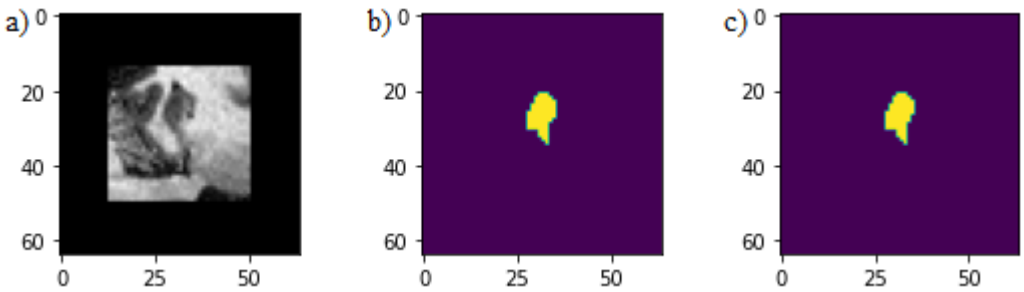
Öğrenme ağında doğrulama ölçeği olarak öncelikle dice benzerlik katsayısı kullanılmıştır. Fakat hipokampüs bölgesinin 64*64*64 boyutlu bir görüntü içinde ortalama 3300 voksel ile temsil edilmesi yani %1,26'lık çok küçük bir hacmi kapsaması sınıf dengesizliğine sebep olmakta ve başarısız bir sonuç elde edilmektedir. Bu sebeple derin ağda öğrenme sürecinde performans ölçümü için Kategorik Çapraz Entropi kullanılmıştır. Fakat orijinal etiket ve tahmin edilen etiketlerin karşılaştırılması için dice benzerlik katsayısından yararlanılmıştır. Derin ağ çıktısı için arka plan ve bölütlenen kısım olarak, iki sınıflı olacak şekilde planlanma yapılmış olup sınıf olasılığı için "softmax" aktivasyon fonksiyonu kullanılmıştır. Eğitilen ağın öğrendiği ağırlıklarla yapılan bölütleme sonuçlarının görsel örnekleri olarak Şekil 3'te önden dilimlenmiş görüntüler için, Şekil 4'te üstten dilimlenmiş görüntüler için ve Şekil 5'te soldan dilimlenmiş görüntüler için yapılan tahminler sunulmuştur.



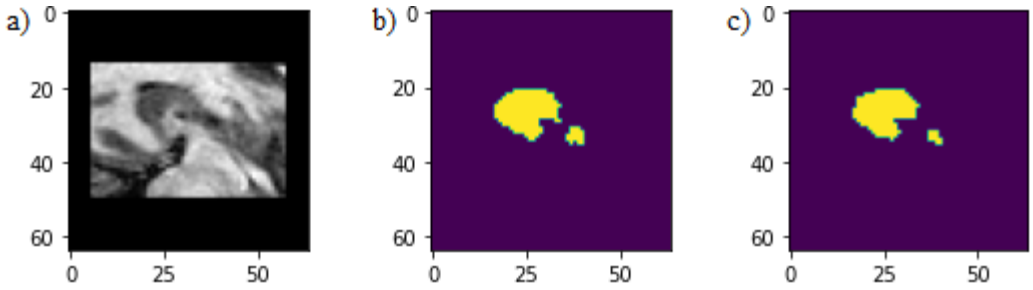
Şekil 2. 2B U-net'ten tasarlanan öğrenme ağı



Şekil 3. A) Önden dilimli MR görüntüsü, b) işaretlenmiş görüntü, c) tasarlanan ağ tahmini



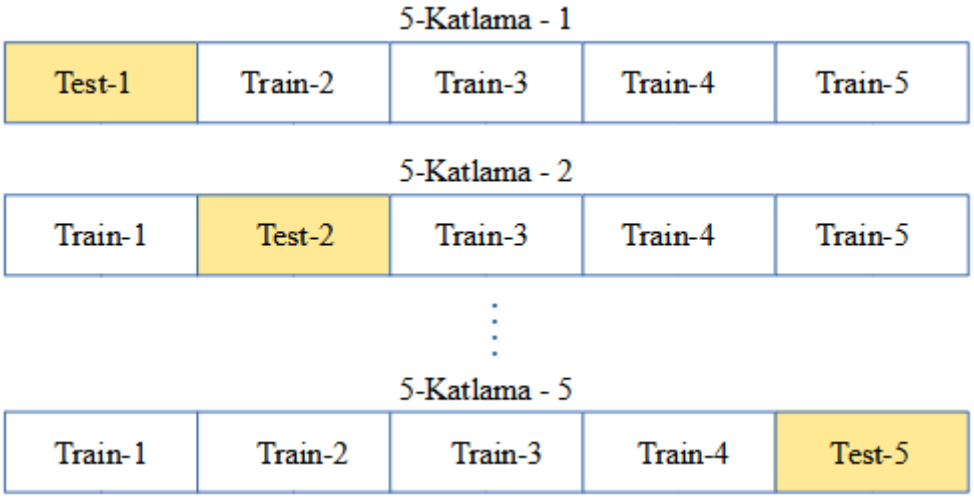
Şekil 4. A) Üstten dilimli MR görüntüsü, b) işaretlenmiş görüntü, c) tasarlanan ağ tahmini



Şekil 5. A) Soldan dilimli MR görüntüsü, b) işaretlenmiş görüntü, c) tasarlanan ağ tahmini

K-Katlamalı Çapraz Doğrulama

Tasarlanan derin öğrenme ağının test edilmesi amacıyla veri seti rastgele dağılımlı 5 kısma ayrılarak öğrenme ağına verilmiştir. Her seferinde 4 kısımla eğitilen sistem eğitime katılmayan diğer kısımla test edilmiştir. Şekil 6'da gösterildiği gibi uygulanan 5-katlamalı çapraz doğrulamada sonuçların tutarlı olduğu, ağın farklı verilerle uygulanması durumunda da birbirine yakın sonuçlar verdiği görülmüştür. Bu sonuçlar "Bulgular ve Tartışma" kısmında sunulmuştur.



Şekil 6. Veri setinin 5-Katlamalı çapraz doğrulama uygulanışı için kısımlara ayrılması

Son İşleme

Bu kısımda Önden Dilimleme ile Eğitim (ÖDE), Üstten Dilimleme ile Eğitim (ÜDE) ve Soldan Dilimleme ile Eğitim (SDE) sonuçlarının nasıl birleştirileceği değerlendirilmiştir. Farklı boyutlardan dilimleme ile yapılan eğitimlerin sonuçları ve birleştirilmesi örnek olarak K-katlama-1 testi için Tablo 1'de gösterilmiştir. Burada verilen tensor işlemleri element-wise olarak uygulanmıştır. Görüldüğü gibi en başarılı sonuç 3 eğitimin en az 2'sinde bölütleme ile sonuçlanmış olanıdır ve tabloda kalın harflerle gösterilmiştir.

Tablo 1. 5-Katlama - 1 İçin Test Sonuçlarının Son İşleme ile Değerlendirilmesi

Eğitim Test Sonuçları	Dice Benzerlik Katsayısı
ÖDE	% 88.80
ÜDE	% 89.19
SDE	% 88.39
ÖDE * ÜDE * SDE	% 88.98
(ÖDE + ÜDE + SDE) > 0	% 86.94
(ÖDE + ÜDE + SDE) > 1	**% 90.65**
(ÖDE + ÜDE + SDE) > 2	% 88.98

BULGULAR ve TARTIŞMA

Bu çalışmada 3B bölütleme için 2B U-net'ten tasarlanan derin öğrenme ağı 5-katlamalı olarak uygulandığından 5 farklı test sonucu elde edilmiştir. Bu sonuçlar Tablo 2'de gösterilmiş olup sistemin başarısı olarak dice benzerlik katsayısı %90,59 olarak hesaplanmıştır. Ayrıca tahmin değerlerini gösteren karışıklık matrisi Tablo 3'te verilmiştir.

Tablo 2. Önerilen 2B U-net varyasyonunu kullanarak 5-Katlamalı çapraz doğrulama ile hesaplanan dice benzerlik katsayıları ve modelin başarısı

5-Katlama Aşaması	Dice Benzerlik Katsayısı (%)
5-Katlama – 1	90.65
5-Katlama – 2	90.73
5-Katlama – 3	90.45
5-Katlama – 4	90.51
5-Katlama – 5	90.60
Ortalama	**90.59**

Tablo 3. Önerilen 2B U-net varyasyonunu kullanarak elde edilen test sonuçlarının karışıklık matrisi

Karışıklık Matrisi		Tahmin edilen voksel değeri	
		0	1
Gerçek voksel değeri	0	67.216.550 (TN)	84.136 (FP)
	1	77.773 (FN)	778.981 (TP)

3B U-net kullanarak yapılan eğitimlerde dice benzerlik katsayısı kullanıldığında %86.46'lık dice skoruna ulaşılmıştır. Yine 3B U-net ağı kategorik çapraz entropi ile uygulandığında ulaşılan dice skor % 88.31 olmuştur. Bu sonuçlardan görüldüğü üzere 3B U-net kullanıldığında Tablo 2'de verilen ve önerilen 2B U-net varyasyonu ile yapılan uygulamada elde edilen başarıya ulaşılamamıştır. MR görüntülerine üç farklı yönden 2B U-net uygulanması başarıyı artırmış olup, sonuçta elde edilen üç farklı değerin Tablo 1'de gösterildiği gibi son işleme aşamasında birleştirilmesi ile daha iyi bir skor elde edilmiştir.

Beynin hipokampüs bölgesinin tespiti için literatürde yer alan çalışmalarda ulaşılan en iyi dice benzerlik katsayısı değeri %90.38 olmuştur (Shi ve ark., 2020). Önerilen mimari ile ulaşılan sonuç ise %.90.59'dur. Çalışma kapsamında kullanılan veri seti ile yapılan bölütleme işlemlerinde elde edilen literatür değerleri ve ayrıca bu çalışma kapsamında ulaşılan değerler tablo 4'te gösterilmiştir.

Tablo 4. Önerilen yöntemin dice benzerlik katsayısı değerleri ve literatürdeki sonuçlar

Yöntem	Dice Benzerlik Katsayısı (%)
Ronneberger ve ark., 2015	83.17
Zhou ve ark., 2018 (U-net++)	85.93
Önerilen 2B U-net (dice benzerlik katsayısı ile)	86.46
Oktay ve ark., 2018 (Attention U-net)	87.45
Önerilen 2B U-net (kategorik çapraz entropi ile)	88.31
Isensee ve ark., 2019 (nnU-net)	89.01
Shi ve ark. 2020	90.38
Önerilen Mimari	**90.59**

Burada ayrıca belirtmek gerekir ki Shi ve ark. (2020) 3B MR görüntüleri için 3B bölütleme yapmamışlardır. MR Görüntülerinin arasından ardışık 3 dilim seçerek 3-kanallı 2B görüntü elde etmiş ve sonuçta 2B bölütleme yapmışlardır. Tablo 4'teki diğer değerler verilen mimarilerin yine Shi ve ark. (2020) tarafından kendi görüntüleri üzerinde denemeleri ile elde ettikleri 2B sonuçlardır. Fakat bu çalışmada önerilen mimaride sonuç 3B olarak elde edilmiştir.

SONUÇ

Bu çalışma kapsamında önerilen mimari, 3B U-net mimarisine kıyasla daha iyi sonuç veren bir 2B U-net varyasyonunu içermektedir. Dolayısıyla görüntüler 2B olarak dilimlenmiştir. Fakat dilimleme işlemi üç ayrı boyuttan yapılmış olup üç ayrı yönden ulaşılan 2B sonuçları son işleme aşamasında uygun birleştirilerek 3B sonuç elde edilmiştir. Böylece yapılan testler sonucu %90.59'luk dice benzerlik katsayısı ile başarılı bir sonuç elde edilmiştir.

*Sorumlu yazar e-mail: atahanguven @kayseri.edu.tr

Özet

İnşaat sektöründe yaygın olarak kullanılan malzemelerden birisi olan çimento harcına, atık malzeme olarak lastik, talaş ve cam katılarak harç numuneleri üretilmiştir. Kum-bağlayıcı oranı 3, su-bağlayıcı oranı 0,5 olacak şekilde kontrol harcı ve atık lastik, talaş ve cam katkılı harç numuneler hazırlanmıştır. Atık malzemelerin agrega olarak kullanılabilirliğinin araştırıldığı bu çalışmada, 40x40x160 mm boyutlarında hazırlanan numuneler 28 gün kür edildikten sonra, TS EN 1015-11 standartlarına uygun olarak eğilme dayanımı tayini ve basınç dayanımı tayini deneyleri yapılmıştır. Deney sonucunda atık lastiğin eğilme dayanım değeri 7,6 MPa, basınç dayanım değeri 46,6 MPa olarak belirlenmiştir. Atık lastikli harç numunelerin eğilme ve basınç dayanımı değerlerinin talaşlı ve camlı harç numunelerin eğilme ve basınç dayanımı değerlerinden daha yüksek olduğu görülmüştür. İkinci aşama deneyde ise bağlayıcı olarak çimento yerine atık malzeme olan cüruf ve aktivatör olarak bağlayıcı miktarının %10 oranında Na^+ içeren toz halde $Na_2SİO_3$ (sodyum metasilikat) kullanılmıştır. Farklı oranlarda (%5, %10, %15, %20, %25) atık lastik ile agrega yer değiştirilerek karışıma katılmıştır. Her karışım için 40x40x160 mm boyutlarında numuneler hazırlanmıştır. Hazırlanan numunelerin eğilme ve basınç dayanım değerleri TS EN 1015-11 standardına uygun olarak belirlenmiştir. Hazırlanan numuneler arasında en yüksek eğilme dayanım değeri 4,3 MPa, en yüksek basınç dayanımı değerleri 43,1 MPa olarak belirlenen %5 oranında atık lastik içeren numuneden ve eğilme dayanım değeri 3,5 MPa, basınç dayanımı değerleri 32,9 MPa olarak belirlenen %10 oranında atık lastik içeren numuneden elde edilmiştir. Yapılan üçüncü aşama deneyde ise en yüksek eğilme ve basınç dayanım değerlerini veren %5 ile %10 oranında atık lastik içeren numuneler referans alınarak %6, %7, %8, %9 oranlarında atık lastik ile agrega yer değiştirilmiştir. Hazırlanan numunelerin eğilme ve basınç dayanım tayini değerleri TS EN 1015-11 standardına uygun olarak yapılmıştır. Üçüncü aşama deneyden elde edilen verilere göre, %6 oranında atık lastik içeren numunenin eğilme ve basınç dayanım değerleri sırasıyla 4,2 MPa ve 41,5 MPa olarak hesaplanmıştır. Elde edilen değerlere göre üçüncü aşama deneyde en yüksek eğilme ve basınç dayanımına sahip numune, %6 oranında atık lastik katkısı içeren numune olmuştur.

Anahtar Kelimeler: Atık lastik, agrega, harç

The effect of the use of different waste materials as binders and aggregates on the strength of the mortar

Abstact

Mortar samples were produced by adding rubber, sawdust and glass as waste material to cement mortar, which is one of the materials commonly used in the construction industry. Control mortar and waste rubber, sawdust and glass-added mortar samples were prepared with a sand-binder ratio of 3 and a water-binder ratio of 0.5. In this study, in which the usability of waste materials as aggregate was investigated, the samples prepared in 40x40x160 mm dimensions were cured for 28 days, and flexural strength and compressive strength tests were carried out in accordance with TS EN 1015-11 standards. As a result of the experiment, the bending strength value of the waste tire was determined as 7.6 MPa, and the compressive strength value was determined as 46.6 MPa. It was observed that the flexural and compressive strength values of the waste rubber mortar samples were higher than the flexural and compressive strength values of the sawdust and glazed mortar samples. In the second stage experiment, instead of cement, slag, which is waste material, was used as binder, and Na_2SiO_3 (sodium metasilicate) in powder form containing 10% Na^+ of binder amount was used as activator.

Different proportions (5%, 10%, 15%, 20%, 25%) of waste tire and aggregate were added to the mixture by replacing them. Samples of 40x40x160 mm dimensions were prepared for each mixture. The bending and compressive strength values of the prepared samples were determined in accordance with the TS EN 1015-11 standard. Among the prepared samples, the highest flexural strength value was determined as 4.3 MPa, the

highest compressive strength value was determined as 43.1 MPa, the sample containing 5% waste rubber, and the flexural strength value was determined as 3.5 MPa and the compressive strength value was determined as 32.9 MPa. It was obtained from a sample containing 10 percent of waste rubber. In the third stage test, 6%, 7%, 8%, 9% waste tire and aggregate were replaced with 6%, 7%, 8%, 9% by taking samples containing 5% to 10% of waste tire as reference, which gives the highest flexural and compressive strength values. The flexural and compressive strength determination values of the prepared samples were made in accordance with the TS EN 1015-11 standard. According to the data obtained from the third stage experiment, the flexural and compressive strength values of the sample containing 6% of waste tire were calculated as 4.2 MPa and 41.5 MPa, respectively. According to the values obtained, the sample with the highest flexural and compressive strength in the third stage test was the sample containing 6% waste rubber additive.

GİRİŞ

Türkiye nüfusunun ve lastik kullanım alanının artmasıyla birlikte atık madde miktarının da bir artış meydana gelmiştir. 2022 yılı Haziran ayında TUİK verilerine göre motorlu taşıtların sayısı 25.810.799'dir (url 1). Motorlu araçların artmasıyla beraber lastik kullanımı da artmaktadır. Motorlu araçlarda kullanılan lastikler belirli bir süre sonra özelliklerini kaybederek ömrünü tamamlamış lastikler haline gelmektedir. Ömrünü tamamlamış olan lastikler yığıldığı ve atıldığı yerlerde, şiddetli yangınlar meydana gelmesi ve bu yığınlarda rahatça çoğalma fırsatı bulan böcekler nedeniyle toplum sağlığı açısından risk oluşturmaktadır (Pacheco-Torgal ve ark., 2012). Ömrünü tamamlamış lastiklerin hangi sebeple olursa olsun vadi veya çukurlarda dolgu malzemesi olarak kullanılması, katı atık depolama tesislerine kabulü ve depolanması, ısınmada kullanılması, gösteri ve benzeri fiilleri kapsayacak şekilde her ne amaçla olursa olsun yakılması yasaktır (url 2). Kullanılmış lastiklerin, bütün halden toz hale kadar çeşitli boyutlar için geri kazanılması/yeniden kullanımı mümkündür (Sugözü ve Mutlu, 2009).

Atık lastiğin, betonda agrega yerine kullanılması ile ilgili daha önce bazı araştırmalar yapılmış olup, sertleşme özelliklerinin iyileştiği (eğilme dayanımı) ve ses yalıtım özelliklerinin arttığı görülmüştür (Eldin ve Senouci, 1993).

Son yıllarda kentleşmenin artmasıyla harcın kullanımı artmıştır. Kullanım alanı geniş olan harç değişik alanlarda kullanılmakta ve üretim teknolojisi her gün daha da gelişmektedir. Ömrünü tamamlamış olan lastikler atıldığı yerlerde atık olarak görüleceklerdir. Bu görüntüyü ortadan kaldırmak için ömrünü tamamlamış olan lastikler toz haline veya ince agrega boyutuna getirilerek harç içerisinde kullanılabilir. Bu şekilde hem kötü bir görüntüden kurtulmuş olunur hem de lastiklerin içerisine böcekler yerleşmemiş olur ve böylelikle daha temiz bir çevre bırakılmış olur.

Bu çalışmada, agrega içerisinde bağlayıcı olarak kullanılması düşünülen cüruf ve farklı oranlarda agrega olarak kullanılan atık lastiğin harcın mekanik özelliklerine etkisi incelenmiştir.

MATERYAL VE YÖNTEM

Çalışma üç farklı deney üzerinden hazırlanmıştır. İlk deneyde atık malzeme olarak lastik, cam ve talaş kullanılmıştır. Bu deneyde ince agreganın yaklaşık olarak %75'i kum %25'i atık malzeme olarak belirlenmiştir. Bağlayıcı olarak TS EN 197-1'e uygun CEM I 42,5 N grubu çimento kullanılmıştır. İnce agreganın üzerine bağlayıcı olarak 450 gram çimento ve 225 gram su karışıma eklenerek harç numuneleri elde edilmiştir. Elde edilen numuneler K1 referans numunesini, K2 atık lastik numunesiyle yapılmış harcı, K3 atık talaş numunesiyle yapılmış harcı ve K4 atık cam numunesiyle yapılmış harcı temsil etmektedir (Tablo 1). Elde edilen harç numuneler 40x40x160 mm'lik kalıplara konulmuştur. Numuneler 28 gün suda bekletildikten sonra sudan çıkarılan numunelere basınç dayanımı tayini ve eğilme dayanımı tayini deneyleri yapılmıştır.

Tablo 1. Birinci deneyde harç karışımı içerisinde kullanılan malzeme miktarı

Numune	Malzeme	Miktar
K1 (Referans)	Kum	1350 gr
	Çimento	450 gr
	Su	225 gr
K2 (Lastik)	Kum	1000 gr
	Lastik	350 gr
	Çimento	450 gr
	Su	225 gr
K3 (Talaş)	Kum	1000 gr
	Talaş	350 gr
	Çimento	450 gr
	Su	225 gr
K4 (Cam)	Kum	1000 gr
	Cam	350 gr
	Çimento	450 gr
	Su	225 gr

Yapılan ikinci deneyde ise birinci deney sonuçlarına göre eğilme dayanımı tayini ve basınç dayanımı tayini en yüksek olan atık lastik malzemesi kullanılmıştır. Harç karışımlarında 225 gr su, bağlayıcı olarak 450 gr cüruf ve cürufun %10'u kadar Na^+ içerecek şekilde toz $Na_2SİO_3$ kullanılarak alkali ile aktive edilmiş harç numuneler elde edilmiştir. Agrega malzemesi olarak toplamda 1350 gr agrega malzemesi kullanılmıştır. Bu agrega malzemesinin içerisinde %5, %10, %15, %20 ve %25 oranlarında atık malzeme (lastik) kullanılmıştır. Hazırlanan malzemeler N1, N2, N3, N4 ve N5 olarak isimlendirilmiştir (Tablo 2). Elde edilen numuneler 40x40x160 mm'lik kalıplara konulmuştur. Numuneler 24 saat 75ºC sıcaklıkta etüvde bekletildikten sonra çıkarılarak oda sıcaklığına gelinceye kadar beklenmiştir ve daha sonra numuneler kalıplardan çıkarılmıştır. Kalıplardan çıkarılan numunelere basınç dayanımı tayini ve eğilme dayanımı tayini deneyleri yapılmıştır.

Tablo 2. İkinci deneyde harç karışımı içerisinde kullanılan malzeme miktarı

Numune	Malzeme	Miktar
N1 (%5 atık malzeme)	Kum	1282.5 gr
	Lastik	67.5 gr
	Su	225 gr
	Cüruf	450 gr
N2 (%10 atık malzeme)	Kum	1215 gr
	Lastik	135 gr
	Su	225 gr
	Cüruf	450 gr
N3 (%15 atık malzeme)	Kum	1147.5 gr
	Lastik	202.5 gr

	Cüruf	450 gr

Yapılan üçüncü deneyde ise ikinci deney sonuçlarına göre eğilme dayanımı tayini ve basınç dayanımı tayini en yüksek iki atık lastik malzemesi arasındaki değerler alınarak yapılmıştır. Hazırlanacak harç karışımlarında 225 gr su, bağlayıcı olarak 450 gr cüruf ve cürufun %10'u kadar $Na_2SİO_3$ kullanılmıştır. Agrega malzemesi olarak toplamda 1350 gr agrega malzemesi kullanılmıştır. Bu agrega malzemesinin içerisinde %6, %7, %8 ve %9 oranlarında atık malzeme (lastik) katılmıştır. Hazırlanan malzemeler V1, V2, V3 ve V4 olarak isimlendirilmiştir (Tablo 3). Elde edilen numuneler 40x40x160 mm'lik kalıplara konulmuştur. Numuneler 24 saat 75ºC sıcaklıkta etüvde bekletildikten sonra çıkarılarak oda sıcaklığına gelinceye kadar beklenmiştir ve daha sonra numuneler kalıplardan çıkarılmıştır. Kalıplardan çıkarılan numunelere eğilme dayanımı tayini ve basınç dayanımı tayini deneyleri yapılmıştır.

METOT

Kayseri Üniversitesi Tomarza Mustafa Akıncıoğlu Meslek Yüksekokulu Yapı Malzemeleri Laboratuvarı`nda eğilme dayanım tayini deneyi ve basınç dayanım tayini deneyleri yapılmıştır.

Eğilme Dayanımı Tayini

Eğilme deneyleri, 40x40x160 mm'lik numuneler üzerinde 28. günde 3 nokta eğilme deneyi yapılmıştır. Betonların eğilme dayanımlarının aşağıda verilen eşitlik yardımıyla sonuçlar hesaplanmıştır. Deney sonuçları bulguları bölümünde belirtilmiştir.

Basınç Dayanımı Tayini

Basınç deneyleri, 40x40x160 mm'lik küp numuneler üzerinde yapılmıştır. Yapılan bütün basınç deneyleri, sabit yükleme hızı altında gerçekleştirilmiş ve yükleme hızı TS EN 12390–3'e 0,4 MPa/s olarak alınmıştır. Basınç dayanımı deneylerinde elde edilen sonuçlar bulguları kısmında verilmiştir.

BULGULAR

Çalışma kapsamında atık maddelerin harçlar üzerinde yapılan 28 günlük numunelerin mekanik dayanımları Tablo 4'te verilmiştir.

Tablo 4. Birinci Deneydeki Numunelerin Mekanik Deney Sonuçları

Numune adı		Eğilme Dayanımı (MPa)	Eğilme Dayanımı Ortalama (MPa)	Basınç Dayanımı (MPa)		Basınç Dayanımı Ortalama (MPa)
				1.Numune	2. Numune	
K1 (Referans)	K1-1	7,7	7,8	40,0	40,3	43,8
	K1-2	8,1		44,2	44,5	
	K1-3	7,7		47,0	46,5	
K2 (Lastik)	K2-1	7,0	7,6	47,4	48,7	46,6
	K2-2	7,6		45,0	48,3	
	K2-3	8,1		44,7	45,6	
K3 (Talaş)	K3-1	0,7	0,6	0,7	0,8	0,8
	K3-2	0,6		0,7	0,8	
	K3-3	0,6		0,9	1,0	
K4 (Cam)	K4-1	6,3	6,5	32,8	38,0	37,3
	K4-2	7,3		35,6	39,2	
	K4-3	5,9		37,7	40,5	

Birinci deney numuneleri üzerinde yapılan eğilme dayanımı deneyi bulguları Tablo 4'de verilmiştir. Deney sonuçlarına göre eğilme dayanımı en yüksek olan numune ortalama 7.8 MPa ile K1 referans numunesidir. Referans numunesine en yakın olan numune 7.6 MPa ile K2 lastik numunesidir. Lastik numunesini sırasıyla 6.5 MPa ile K4 cam numunesi ve 0.6 MPa ile K3 talaş numunesi takip etmektedir.

Birinci deney numuneleri üzerinde yapılan basınç dayanımı deneyi bulguları Tablo 4'de verilmiştir. Deney sonuçlarına göre basınç dayanımı en yüksek olan numune ortalama 46.6 MPa ile K2 lastik numunesidir. Daha sonra 37.3 MPa ile K4 cam numunesi ve basınç dayanımı en düşük olan numune 0.8 MPa ile K3 talaş numunesi olmuştur.

Bu sonuçlara göre, atık lastik ile hazırlanan harç numunesinin basınç dayanımını olumlu yön de etkilediği, atık cam ve talaş malzemeleriyle hazırlanan harç numunelerinin ise basınç dayanımında olumlu bir etkisinin olmadığı görülmüştür. Bu deney sonuçlarına göre ikinci deneyde sadece atık lastik kullanılmıştır.

İkinci deney numuneleri üzerinde yapılan eğilme deneyi ve basınç deneyi bulguları Tablo 5'de verilmiştir.

Tablo 5. İkinci Deneydeki Numunelerin Mekanik Deney Sonuçları

Numune adı		Lastik Oranı	Eğilme Dayanımı (MPa)	Eğilme Dayanımı Ortalama (MPa)	Basınç Dayanımı (MPa)		Basınç Dayanımı Ortalama (MPa)
					1.Numune	2. Numune	
N1	N1-1	%5	4,3	4,3	43,4	42,8	43,1
	N1-2		4,4		42,6	43,7	
	N1-3		4,2		42,1	43,5	
N2	N2-1	%10	2.8	3,5	33,2	33,9	32,9
	N2-2		3,7		33,7	31,6	
	N2-3		4,0		31,9	33,2	
N3	N3-1	%15	3,3	3,2	16,8	17,7	18,5
	N3-2		3,2		19,2	19,1	
	N3-3		3,1		18,3	19,7	
N4	N4-1	%20	2,5	2,3	10,8	10,5	10,6
	N4-2		2,2		10,5	10,4	
	N4-3		2,2		10,5	10,7	
N5	N5-1	%25	1,4	1,3	3,6	3,7	3,9
	N5-2		1,0		3,6	3,9	
	N5-3		1,5		4,3	4,2	

İkinci deney numuneleri üzerinde yapılan eğilme dayanımı deneyi bulguları Tablo 5'de verilmiştir. Deney sonuçlarına göre eğilme dayanımı en yüksek olan numune ortalama 4.3 MPa ile %5 atık lastik içeren N1 numunesidir. N1 numunesine en yakın olan numune 3.5 MPa ile %10 atık lastik içeren N2 numunesi olmuştur. Bu numuneleri sırasıyla 3.2 MPa ile %15 atık lastik içeren N3, 2.3 MPa ile %20 atık lastik içeren N4 ve 1.3 MPa ile %25 atık lastik içeren N5 numuneleri takip etmiştir.

İkinci deney numuneleri üzerinde yapılan basınç dayanımı deneyi bulguları Tablo 5'de verilmiştir. Deney sonuçlarına göre basınç dayanımı en yüksek olan numune ortalama 43.1 MPa ile N1 numunesi numunesidir. N1 numunesinin basınç dayanımına en yakın numune 32.9 MPa ile N2 numunesi olmuştur. Bu numuneleri sırasıyla 18.5 MPa ile N3, 10.6 MPa ile N4 ve 3.9 MPa ile N5 numuneleri takip etmiştir.

Bu sonuçlara göre, farklı oranlarda atık lastik ile hazırlanan harç numunelerinde, atık miktarı artıkça eğilme dayanımında ve basınç dayanımında azalma meydana gelmiştir. En iyi eğilme dayanımı ve basınç dayanımı değeri N1 ve N2 numunelerinde meydana gelmiştir. Burada bağlayıcı olarak çimento yerine cüruf kullanılması da bir başka atık malzemesinin geri dönüşümü olmuştur. Deney sonuçlarına göre en iyi değerler %5 atık malzeme içeren N1 ve %10 atık malzeme içeren N2 numuneleri arasında meydana geldiği için üçüncü deney ise bu değerler arasındaki eğilme dayanım tayini ve basınç dayanım tayini belirlenmiştir.

Üçüncü deney numuneleri üzerinde yapılan eğilme deneyi ve basınç deneyi bulguları Tablo 6'da verilmiştir.

Tablo 6. Üçüncü Deneydeki Numunelerin Mekanik Deney Sonuçları

Numune adı		Lastik Oranı	Eğilme Dayanımı (MPa)	Eğilme Dayanımı Ortalama (MPa)	Basınç Dayanımı (MPa)		Basınç Dayanımı Ortalama (MPa)
					1.Numune	2. Numune	
V1	V1-1	%6	4,2	4,2	41,7	40,8	41,5
	V1-2		4,0		43,5	41,3	
	V1-3		4,4		42,2	39,2	
V2	V2-1	%7	4,1	3,9	36,9	34,4	35,0
	V2-2		3,8		35,8	33,2	
	V2-3		3,8		33,4	36,1	
V3	V3-1	%8	3,9	3,6	33,6	34,1	33,7
	V3-2		3,8		34,5	34,7	
	V3-3		3,2		32,4	33,2	
V4	V4-1	%9	3,6	3,5	32,5	30,1	33,1
	V4-2		3,4		33,5	34,6	
	V4-3		3,6		33,4	34,6	

Üçüncü deney numuneleri üzerinde yapılan eğilme dayanımı deneyi bulguları Tablo 6'da verilmiştir. Deney sonuçlarına göre eğilme dayanımı en yüksek olan numune ortalama 4.2 MPa ile %6 atık lastik içeren V1 numunesidir. V1 numunesine en yakın olan numune 3.9 MPa ile %7 atık lastik içeren V2 numunesi olmuştur. Bu numuneleri sırasıyla 3.6 MPa ile %8 atık lastik içeren V3, 3.5 MPa ile %9 atık lastik içeren V4 numuneleri takip etmiştir.
Üçüncü deney numuneleri üzerinde yapılan basınç deneyi bulguları Tablo 6'da verilmiştir. Deney sonuçlarına göre basınç dayanımı en yüksek olan numune ortalama 41.5 MPa ile V1 numunesi numunesidir. V1 numunesinin basınç dayanımına en yakın numune 35.0 MPa ile V2 numunesi olmuştur. Bu numuneleri sırasıyla 33.7 MPa ile V3 ve 33.1 MPa ile V4 numuneleri takip etmiştir.

SONUÇLAR

Yapılan çalışmada atık malzeme olarak kullanılan lastik, talaş ve camın inşaat sektöründe kullanılabilirliği araştırılmıştır.
Deneysel çalışmanın birinci aşamasında, atık malzemeler (lastik, talaş, cam) kullanılarak elde edilen harç numunelerin eğilme ve basınç dayanımı değerleri araştırılmıştır. Su, çimento ve agrega kullanılarak referans numuneler üretilmiştir. Atık malzemeli numunelerin üretiminde ise, %75 oranında agrega, %25 oranında ise atık malzeme kullanılmıştır. Her atık malzeme için ayrı ayrı harç numuneleri üretilmiştir. Üretilen numuneler 28 gün suda kür edildikten sonra kuru yüzey doygun duruma getirilerek eğilme ve basınç dayanımı değerleri belirlenmiştir.
Üretilen harçlardan, en yüksek eğilme dayanımı değeri 7,6 MPa, en yüksek basınç dayanımı değeri ise 46,6 MPa olarak atık lastikli harç numunesinden elde edilmiştir. Atık lastik numunesinden sonra, 6,5 MPa eğilme dayanımı, 37,3 MPa basınç dayanımına sahip atık camlı harç numunesi gelmiştir. Son olarak ta 0,6 MPa eğilme dayanımı, 0,8 MPa basınç dayanımı ile atık talaşlı harç numunesi eğilme ve basınç dayanımı en düşük olan harç numunesi olmuştur.
Elde edilen deney sonuçlarına göre, atık lastikli harç numunelerinin eğilme ve basınç dayanımı değerleri, atık talaş ve cam katkılı harç numunelerin eğilme ve basınç dayanımı değerlerinden daha yüksek olduğu belirlenmiştir.
Deneysel çalışmanın ikinci aşamasında, bağlayıcı olarak çimento yerine atık bir malzeme olan cüruf, aktivatör olarak Na_2SiO_3, su ve agrega kullanılmıştır. Agrega miktarının %5, %10, %15, %20, %25'si oranlarında atık lastik agregayla ikame edilerek karışımlar hazırlanmıştır. Hazırlanan numuneler 24 saat 75 ^oC'de etüvde kür edildikten sonra oda sıcaklığına gelene kadar bekletilerek eğilme ve basınç dayanımları belirlenmiştir.
Üretilen harç numunelerden eğilme ve basınç dayanım değerleri en yüksek olan numune 4,3 MPa eğilme dayanımı, 43,1 MPa basınç dayanımı ile %5 oranında atık lastik içeren harç numunesi olmuştur. %5 oranında

atık lastik içeren harç numunesini, 3,5 MPa eğilme dayanımı, 32,9 MPa basınç dayanımına sahip %10 oranında atık lastik içeren harç numunesi takip etmektedir.

Bu deney sonucuna göre, %5 ve %10 oranında atık lastikli harç numunelerin dayanım değerleri, diğer harç numunelerinin eğilme ve basınç dayanım değerlerinden daha yüksek olduğu belirlenmiştir.

Deneysel çalışmanın üçüncü aşamasında, cüruf, $Na_2SİO_3$, su ve agrega kullanılmıştır. İkinci deney sonuçlarına göre en yüksek dayanım gösteren %5 ve %10 atık lastik içeren harçların agrega miktarları değiştirilerek (%6, %7, %8, %9) yeni harç numuneleri hazırlanmıştır. Hazırlanan numuneler 24 saat 75 ^oC'de etüvde bekletildikten sonra oda sıcaklığına geldiğinde eğilme ve basınç dayanımları belirlenmiştir.

Bu deney sonucuna göre, eğilme ve basınç dayanım değeri en yüksek olan numune, 4,2 MPa eğilme dayanımı, 41,5 MPa basınç dayanımı ile %6 oranında atık lastik içeren harç numunesidir.

Genel olarak sürekli olarak artış gösteren inşaat sektöründe atık malzemelerin kullanılabilirliği farklı bir boyut kazandıracaktır. Bu çalışmada hem bağlayıcı hem de agrega içerisinde atık malzemeler kullanılmıştır ve inşaat sektöründe kullanılabilirliği araştırılmıştır.

Abstract
Impact tests were carried out on prismatic specimens with lateral notches of different depths of a composite material with a polyester matrix reinforced with three layers of bidirectional jute fibers corresponding to a rate of 40%. Three distances between supports were tested: 40 mm, 60 mm and 70. The tests were carried out in 3-point bending at an impact speed of 3.85 m/s with a pendulum of 7.5 Joules. The method of J.G. Williams based on the principles of linear elastic fracture mechanics was used to interpret these results and made it possible to obtain an estimate of the fracture energy or toughness GIC intrinsic parameter of this material from the total energy U dissipated during the impact. The measurement results of U as a function of BWϕ for all the notched specimens tested for the 3 distances between supports used are characterized by a significant dispersion of the experimental points around the linear regression lines. This characteristic dispersion of composite materials is the consequence above all of the heterogeneity of the material on the path of cracking, as well as of the dispersion of the mechanical test itself. GIC tenacity decreases with increasing distance between supports.
Keywords: Composite, Jute-polyester, Toughness, Fracture energy

INTRODUCTION

Natural fiber reinforced polymer matrix composite materials are receiving increasing attention, both from academia and various industries. Jute fiber is among the best natural fibers used in the mass market composite materials industry due to its properties and availability. This fiber has high specific properties, less abrasive behavior for processing equipment and good dimensional stability. Thus, composite materials reinforced with jute fiber can be used as an alternative to replace those reinforced with fiber glass in many applications that do not require very high loads (Sarikaya, et al., 2019). Many works have been published in recent years concerning the development and characterization in statics and fatigue of composite materials with plant fibers or biofibers, but their behavior in Charpy impact tests remains little studied (Vijaya Ramnath., 2013, Joshi et al., 2022, Sabeel Ahmed., 2008). (Amanda and Torrones 2007)show that the incorporation of jute fabric in polyethylene resin completely changes the fracture characteristics of these materials and increases their resistance to impact. (Rana et al., 2007) show that there is an increase in the impact energy of a composite material with a polypropylene matrix reinforced with short jute fibers with the increase in the percentage of jute fibers. This increase in impact resistance is no longer significant beyond a rate of 50%. (Wambua et al. 2003) examining and comparing the mechanical properties of different composite materials with a polypropylene matrix reinforced with natural fibers such as sisal, kenaf, hemp, jute and coconut fibers, show that the latter display a low impact resistance. Another comparison was made with the corresponding properties of composite materials with a polypropylene matrix reinforced with glass mats. The natural fiber composites examined show low impact strength unlike hemp and sisal fiber composites which show strength comparable to that of glass fiber reinforced composite materials. The specific properties of natural fiber composite materials are sometimes better than those of glass fiber composite materials. Achouri and Redjel (2011) using fracture mechanics concepts to characterize in impact glass-perlon-polyester composite materials for orthopedic use and glass-carbon-polyester show that the impact test is very dispersive in its results but remains a rapid means of evaluation of the toughness parameters of composite materials for their classification Thus, the carbon-perlon-polyester composite has better resistance to dynamic cracking than the glass-perlon-polyester composite.
The objective of this work is to interpret the results of impact tests carried out on notched specimens of a composite material with a polyester matrix reinforced with bidirectional jute fibers using the method of J.G. Williams based on the principles of mechanics linear elastic rupture.

MATERIALS AND METHODS

The material used in this study is a polyester matrix composite reinforced with three layers of bidirectional jute fiber. The test specimens used in impact are prismatic in shape, 10 mm wide and 4 mm thick on average, with a single edge notch type lateral notch. These specimens were cut out of 300x210 mm^2 plates then notched in the middle, at different depths as shown in figure 1. A pre-notch is first made using a special saw then the notch is continued with a rigid blade in order to have an acute shape of the crack tip. The notch lengths are included in the ratio $0.2 < a/D < 0.6$, a and D are respectively the notch length and the width of the specimen.

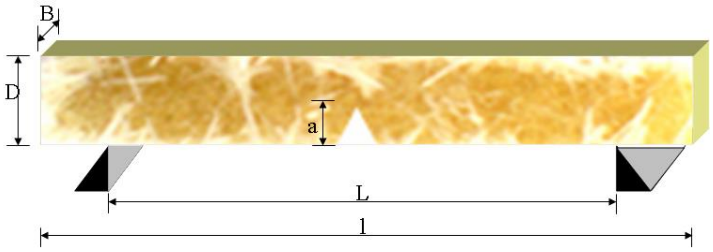

Figure 1. Test specimen used in impact

The impact Charpy tests were carried out on a Charpy Zwick 5113 Pendulum impact testers in 3-point bending in accordance with ASTM D6110. The release angle of the machine is 160° and the impact speed is 3.85 m/s. The pendulum used in the case of the study materials has an energy of 7.5 J. Figure 2 shows the experimental device used as well as the data acquisition and processing device by a microcomputer equipped "with an expert test software". Three distances between supports were tested : 40 mm, 60 mm and 70 mm.

Figure 2. Zwick/Roell type Charpy impact machine used

The Williams method based on the principles of linear elastic fracture mechanics has been used to interpret the results of impact tests on notched specimens Sakin, and Ay (2008), Djeghader, and Redjel, (2017). This method makes it possible to obtain an estimate of the energy or toughness G_{IC} intrinsic parameter of the material from the total energy dissipated U during the impact according to the equation:

$$U = G_{IC} BD\phi \qquad (1)$$

B and D represent the thickness and width of the specimen, respectively, and ∅ is a calibration factor which depends on the geometry of the specimen and which was tabulated by Williams for various lengths of notches (equation 3). Thus, the recording of the energy lost by the hammer at the moment of impact for each notch plotted on a diagram U a function of (BD∅) gives a straight line whose slope measures G_{IC}.

$$\phi = \frac{1}{2}\left(\frac{a}{D}\right) + \frac{1}{36\pi}\left(\frac{L}{D}\right)\frac{1}{\left(\frac{a}{D}\right)} \qquad (2)$$

Where a and L represent the notch length and the distance between supports, respectively.

RESULTS AND DISCUSSION

The graphical representation of the measurement points of the total fracture energy lost by the hammer U as a function of the area of the ruptured cracks for the three distances between supports used are shown in figures 3, 4 and 5. The dispersion is important for all the cases tested as indicated by the calculated correlation coefficients which are well below one (1). This dispersion, also characteristic of composite materials, is the consequence above all of the heterogeneity of the material on the path of cracking, of the mode of manufacture of the notches as well as the dispersion of the mechanical test itself on experimental points around the linear regression lines.

The results show that the increase in total fracture energy with the increase in fractured surfaces results in the fact that fracture is an energy-consuming phenomenon, therefore the increase in fractured surfaces requires more fracture energy. important.

The linear regression for the distances between supports 40mm, 60mm and 70mm is given with correlation coefficients well below 1, reflecting a strong dispersion of the experimental points around the linear regression line. This dispersion is a characteristic of heterogeneous materials and is the consequence above all of the heterogeneity of the material on the path of cracking, of the method of manufacture of the notches as well as of the dispersion of the mechanical test itself. The presence of defects during the manufacture of the specimens is also a parameter favoring the variability of the measurement. Indeed, the distribution of the rate of jute fibers in the polyester matrix as well as their orientation is not uniform within the volume of the material, which causes often tortuous fracture paths which do not necessarily follow the direction and the plane. of the initial notch and which are different from one specimen to another.

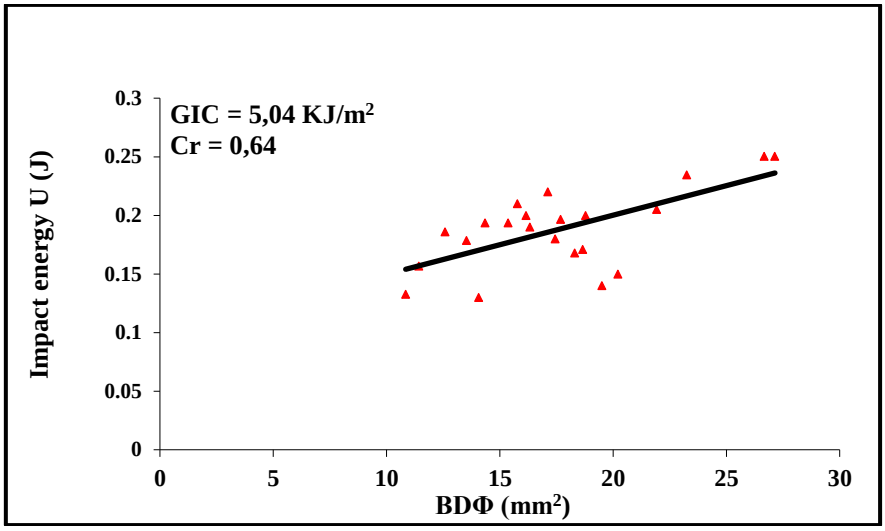

Figure 3. Total fracture energy as a function of broken areas BD ϕ (L= 40cm)

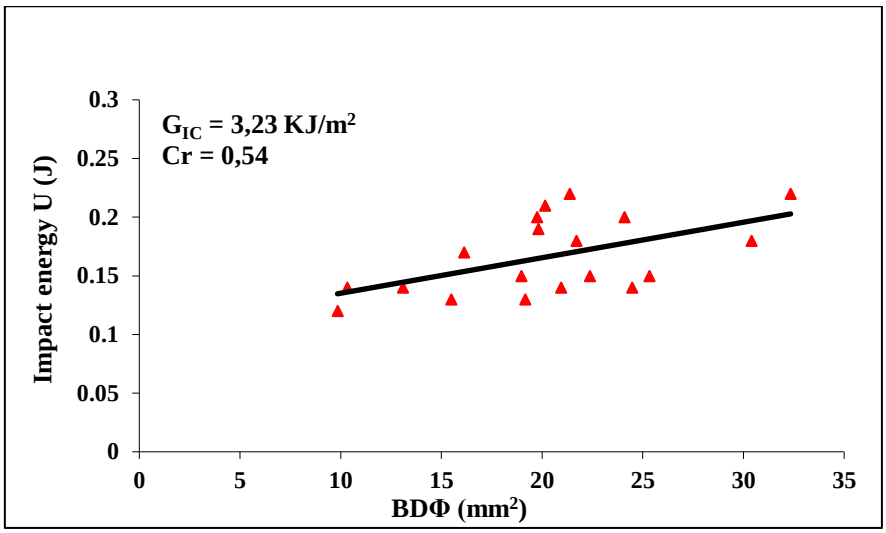

Figure 4. Total fracture energy as a function of broken areas BD ϕ (L= 60cm)

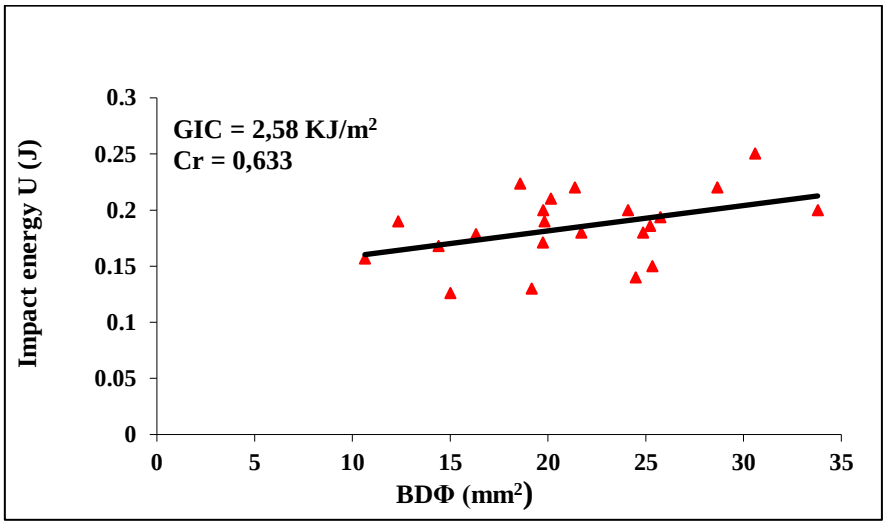

Figure 5. Total fracture energy as a function of broken areas BD ϕ (L= 70cm)

The results of measuring the dynamic toughness as a function of the distance between supports in 3-point bending are illustrated in the histogram in figure 6 for all the specimens tested. These results show that the effect of the distance between supports for materials with jute fibers is significant compared to that observed on other composite materials such as polyester glass for example. Indeed, the toughness in G_{IC} decreases with the increase of the distance between supports.

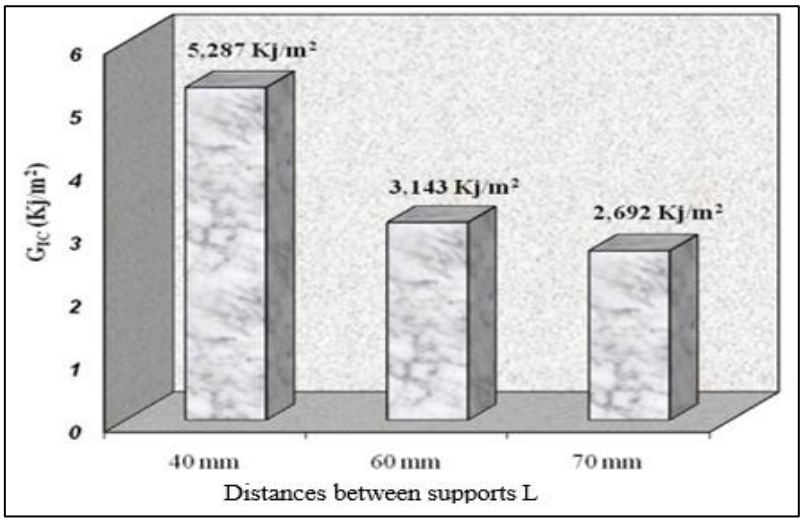

Figure 6. G_{IC} tenacity as a function of the distance between supports L

CONCLUSION

The following conclusions can be drawn from the study:

- The tested specimens of jute/polyester composite material broke brittle on impact.
- The measurement of the critical fracture energy G_{IC} determined by the method of Williams using the impact pendulum is characterized by a strong dispersion. This is mainly due to the heterogeneity of the material.
- The dynamic impact toughness of jute-polyester composite materials decreases with the increase in the distance between supports in 3-point bending.

Abstract
In this work, two flexible graphene-based materials were prepared by electrochemically depositing FeCoP and FeZnP on graphene sponges (GS) as self-standing and flexible electrodes for high-performance electrochemical capacitors. The structural and morphological properties of FeCoP/GS and FeZnP/GS electrodes were characterized using different techniques. As a result, two asymmetric supercapacitors were fabricated with FeCoP/GS and FeZnP/GS electrodes and GS; FeCoP/GS//GS and FeZnP/GS//GS circuits displayed a specific capacitance of 1100 and 780 F/g at 1.0 A/g and an outstanding energy density of 185 and 98 Wh/kg at a high-power density of 5.6 and 3.8 kW/kg, respectively. Therefore, the as-fabricated electrodes hold great potential in the field of energy storage.
Keywords: Graphene sponge, Flexible material, Binary metal phosphite, Supercapacitor

INTRODUCTION

Due to industrial activities, climate changes, and depleting fossil fuels have brought about an ever-rising and urgent demand for inexpensive, light, and high-performance energy conversion and storage devices. The electrode material is the most important factor determining the performance of SCs (Çepni and Öznülüer, 2022). And flexible and ultralight supercapacitors (SCs) have attracted great interest with the rise of wearable electronic devices. Recently, owning many pores, superior electrical conductivity, mechanical strength, and flexible structure, graphene-based sponges (GSs) have been encountered in many applications such as SCs (Erçarıkcı et al., 2022) and sensor (Dağcı Kıranşan and Topçu, 2020). In addition to, lately, transition metal phosphides such as CoP (Zhang et al., 2020) and FeP and ZnP (Erçarıkcı et al., 2022) have emerged as attractive electrode materials for improve the performance of SCs, due to their outstanding electroconductivity, high electrochemical activity, together with good thermal and chemical stability (Li et al., 2019). Unfortunately, the reported monometallic phosphides-based electrode materials exhibited poor rate capacity and low long-term cycling stability (Wan et al., 2020). To overcome this situation, binary metal phosphides-based electrode materials can be developed.

In this study, we report a flexible and ultralight FeCoP or FeZnP/graphene sponge electrode material (FeCoP/GS or FeZnP/GS) for utility in supercapacitor applications. GS was prepared by applying a foaming sol-gel method from the dispersion of GO. By using the produced GS as an electrode at electrochemical cell, FeCoP/GS and FeCoP/GS electrode material was produced by electrochemical deposition, which is an easy-to-apply and environmentally friendly method. As-prepared 3D ultralight and flexible FeCoP/GS and FeZnP/GS were used as an electrode material in cyclic voltammetry (CV) experiments. Thus, flexible ASC circuits with high capacitive performance prepared from FeCoP/GS and FeZnP/GS electrodes were developed.

MATERIALS AND METHODS

Synthesis of Graphene Oxide (GO)

The modified Hummers' method was used to synthesize GO (Kovtyukhova 1999). GO solution was prepared at optimum concentration.

Synthesis of Graphene Sponge (GS)

GS was prepared by applying a foaming sol-gel method from the dispersion of GO (Yang et al., 2018). 15 mL of GO aqueous dispersion containing ascorbic acid (AA) (as reducing agent) and 2.0 mL of sodium dodecyl sulfate (SDS) was foamed at 2500 rpm for 30 min and graphene hydrogel (GH) was obtained after the reaction of this mixture at 75°C for 1 h. GH was frozen at -18°C for 5 h and completely thawed under atmospheric

conditions. Then GH was dried at 90°C for 5 h and washed 1-3 times with deionized water to remove excess AA. Finally, after annealing the GS at 350°C for 4 h, 3D freestanding GS was obtained (Erçarıkcı et al., 2022).

Preparation of FeCoP/GS Electrode Material (FeCoP/GS or FeCoP/GS)

The FeCoP nanostructure were electrodeposited on GSEM surface from $Na_2H_2PO_2$ solution consisting of separately $Co(NO_3)_2$ or $Zn(NO_3)_2$ and $FeSO_4$ by using constant potential electrolysis at -1.2 V and for 7.0 and 5.0 min into electrodeposition cell system, respectively (Fig. 1).

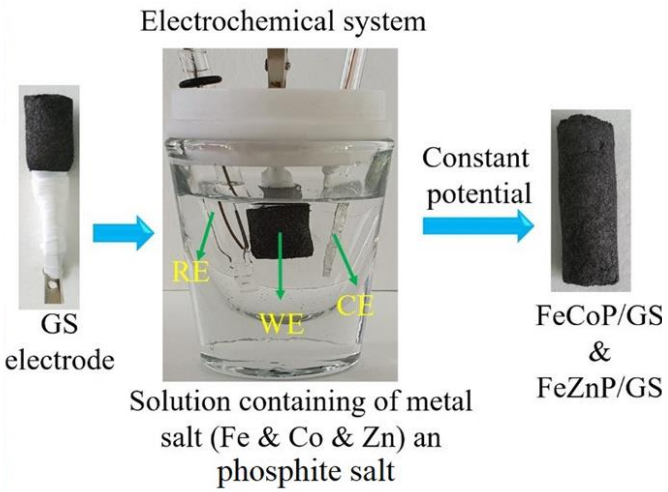

Fig. 1. Preparation process of FeCoP/GS or FeZnP/GS.
(RE: Reference electrode; WE: Working electrode; CE: Counter electrode).

Fabrication of the ASC devices

The ASC devices were fabricated sandwiching PVA-H_2SO4 gel electrolyte (Yang et al., 2018) coated FeCoP/GS or FeZnP/GS and GS electrodes among the graphene paper (GP) on the basis of our previous report (Erçarıkcı et al., 2022). When the FeCoP/GS or FeZnP/GS were separately used for the positive electrode, the GS is used as the negative electrode to design the two-electrode system of ASC. Scotch tape worked as the substrate. Thus, 3D ASC device was fabricated and denoted as FeCoP/GS//GS and FeZnP/GS//GS.

Apparatus

Powder XRD was carried out using a Rigaku TTR III X-ray diffractometer equipped with monochromatized Cu Kα radiation (λ=1.5406 Å). X-ray photoelectron spectroscopy (XPS) measurements were carried out with a Spect-Flex spectrometer, standard Al X-ray source SEM images results were acquired using a Zeiss brand field emission scanning electron microscopy (FE-SEM) instrument. All the electrochemical experiments were performed with Gamry (600+) potentiostat system connected to a three-electrode cell. 3D, flexible and ultralight FeCoP/GSEM electrode directly used as the working electrode (20 mm×5 mm). In this electrochemical cell, an Ag/AgCl (saturated KCl) and a Pt wire served as reference electrode and counter electrode, respectively. The capacitance performance of the prepared samples was carried out in 1.0 M H_2SO_4 aqueous solution and calculated by

$$Cs,CV = \int I\,(V)\,\Delta V / m \times \Delta V \times \nu \quad (1)$$

$$Cs,GCD = I \times \Delta t / m \times \Delta V \quad (2)$$

where Cs,CV and Cs,CD are the specific capacitances (F/g) performed through CV and CD. ΔV refers to the potential range of the charge and discharge (V); m is the total mass of the samples (g); ν is the scan rate (V s−1); I refers to the capacitive current (A); Δt is the charge/discharge time (s) (Çepni and Öznülüer, 2022).

Chemicals

All the chemicals were of analytical reagent grade, purchased from Sigma-Aldrich and used without any further purification. Double distilled water was used through the experiments.

RESULTS and DISCUSSION

The photograph of the resulting GS is presented in Fig. 2. The GS appears to be ultralight.

Fig. 2. Photographs of ultralight GS.

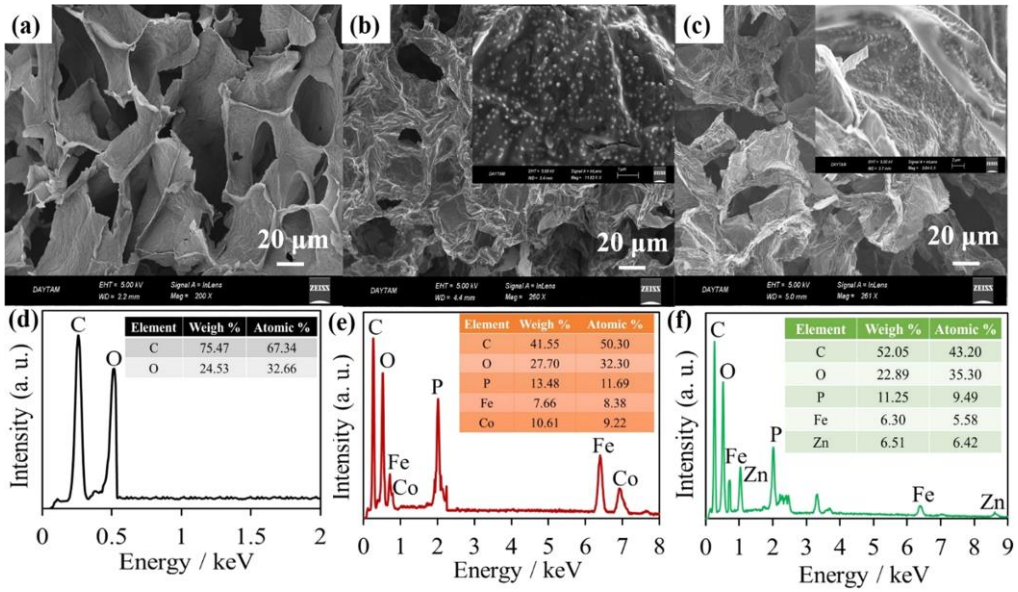

Fig. 3. SEM images of (a) GS, (b) FeCoP/GS, and (c) FeZnP/GS. Inset of b and c, high magnification of corresponding images. EDX spectrum of (d) GS, (e) FeCoP/GS, and (f) FeZnP/GS.

The surface morphologies of the GS, FeCoP/GS, and FeZnP/GS were characterized using SEM, as illustrated in Fig. 3. It can be seen from Fig. 3a, GS has numerous folds and 3D pores formed of graphene sheets, which provides a large specific surface area. Fig. 3b displayed ball-like particles of FeCoP anchored on the graphene sheets of GS. Similarly, FeZnP particles were deposited along the pores of GS in Fig. 3c. The elemental compositions of the samples were identified with the EDX spectra, as shown in Fig. 3d–f. The peaks corresponding to C, O, Fe, Co, Zn, and P were clearly observed confirming the presence of FeCoP/GS and FeZnP/GS particles onto the GS surface.

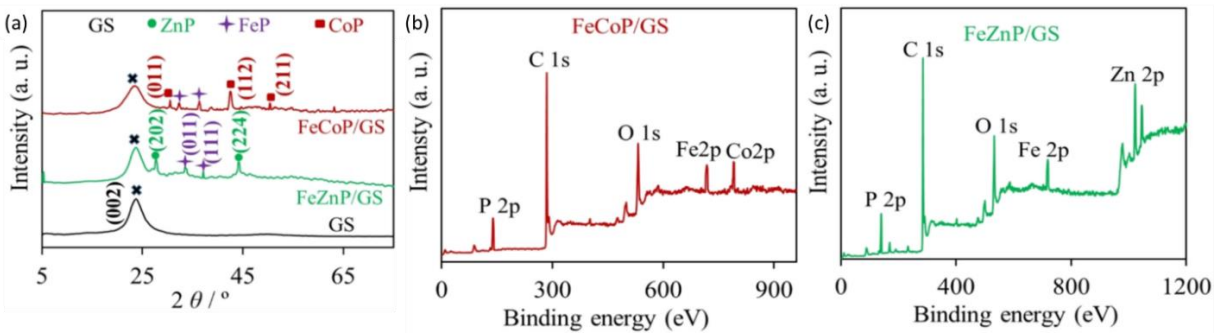

Fig. 4. XRD patterns of GS, FeCoP/GS, and FeZnP/GS and XPS spectra (b) FeCoP/GS, and (c) FeZnP/GS.

The crystal structure and phase confirmation of samples were characterized by using XRD and XPS (Fig. 4). In the XRD patterns of GS in Fig. 4a, a broad peak at 25° correspond to the characteristic crystal diffraction of (002) planes of graphene (JCDPS No:75-1621). The diffraction peaks at 33.8° and 37.2° correspond to (011) and (111) the phase structures of FeP (JCDPS No. 78-1443), while peaks at 30.6°, 42.3°, and 50.5° correspond to (011), (112), and (211) (JCDPS No. 29-0497) the phase structures of CoP, respectively. Similarly, the diffraction peaks at 27.9° and 44.3° corresponding to (202) and (224) phase structures of ZnP (JCDPS No. 01-073-4212) were observed besides the (011) and (111) planes of FeP in XRD patterns of FeZnP/GS. All these diffraction peaks indicated that the GS has successfully modified with the FeCoP/GS and the FeZnP/GS structures.

XPS was employed to further analyze the nature of the samples. Both FeCoP/GS and FeZnP/GS displayed characteristic peaks of C 1s and O 1s, indicating the presence of carbon, and oxygen elements (Fig. 4b and c). Besides these two elements, the existence of iron, cobalt, zinc and phosphorus species can be proved by the survey spectrum of FeCoP/GS and FeZnP/GS in Fig. 4.b and c. The results of the XPS measurements confirmed the formation of FeCoP and FeZnP structures in FeCoP/GS and FeZnP/GS.

The digital camera photograph of the design of the ASCs was presented in Fig. 5a. CVs of asymmetric FeCoP/GS//GS and FeZnP/ GS//GS circuits at different scan rates (Fig. 5b and c) showed that these ASCs present PC behavior due to the fast reversible redox reactions occurring on the electrode surface for charge deposition owing to FeCoP/GS and FeZnP/GS. Fig. 5d and e presented GCD curves of the ASC circuits at different current densities. Higher specific capacitance value was obtained at low current density because the porous structure of sponge electrodes could facilitate the rapid transport of electrolyte ions during the charge/discharge process. The specific capacitances were calculated as 1100, 780 F/ g and 350, 263 F/g at the current density of 1 and 10 A/g for FeCoP/GS//GS and FeZnP/GS//GS, respectively. So, 3D sponges and FeCoP and FeZnP structures can serve as an active material to improve the conductivity of the electrodes, therefore significantly increasing the cycling stability of these ASCs.

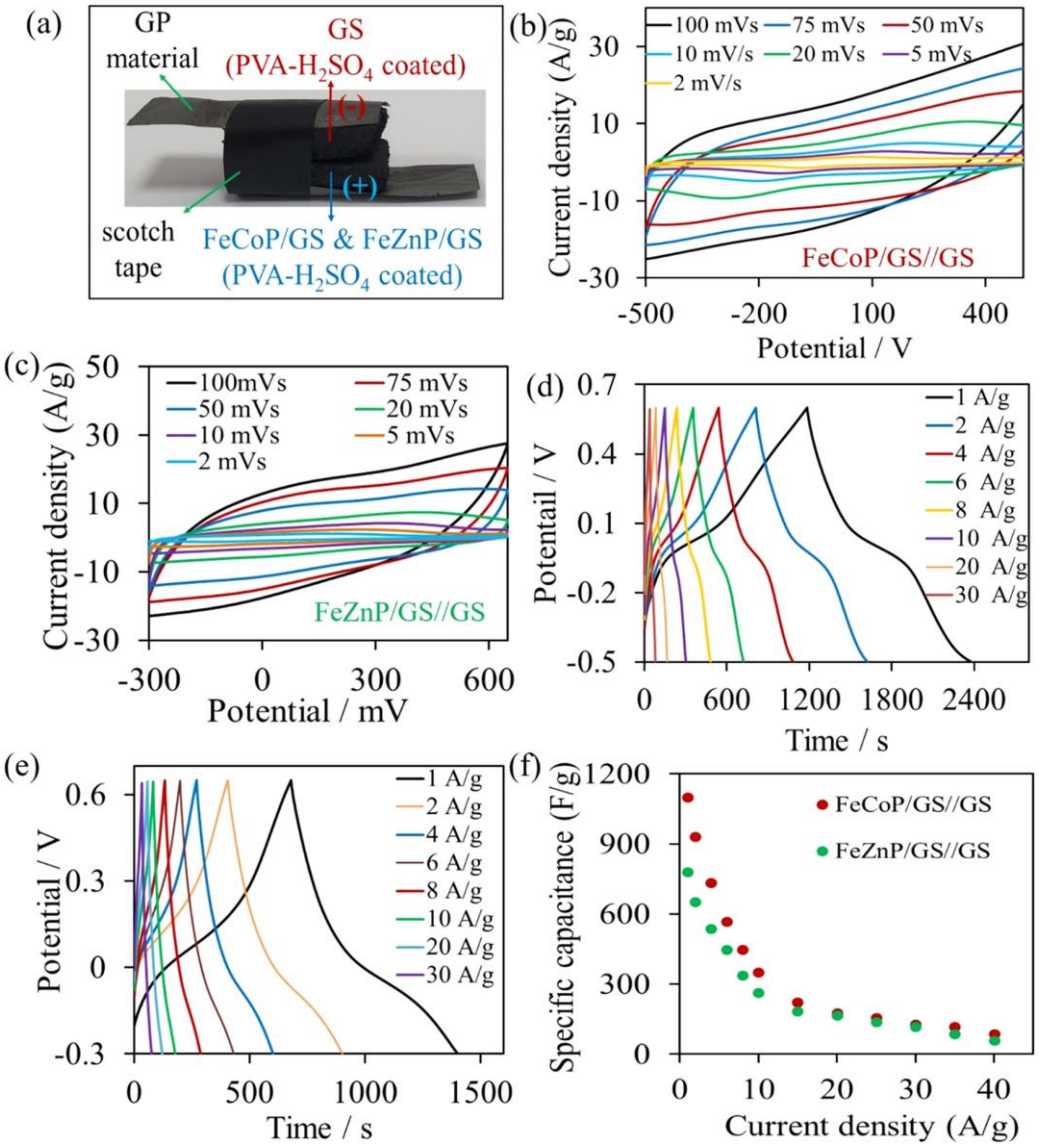

Fig. 5. (a) Digital camera photograph of FeCoP/GS//GS and FeZnP/GS//GS circuits. CV curves of (b) FeCoP/GS//GS and (c) FeZnP/GS//GS at different scan rates. GCD curves of (d) FeCoP/GS//GS and (e) FeZnP/GS//GS at different current densities. (f) The specific capacitance of FeCoP/GS//GS and FeZnP/GS//GS against current density.

CONCLUSION

In summary, novel flexible FeCoP/GS and FeZnP/GS electrodes were successfully prepared by decorating the mechanically durable GSs with binary metal phosphites through electrodeposition following a simple foaming-drying method. The structure of FeCoP and FeZnP particles supported the rapid transfer of ions, while the flexible 3D GS provided an enhanced electroactive surface area. The designed FeCoP/GS//GS and FeZnP/GS//GS ASC devices demonstrated excellent electrochemical performance with energy density of 185 and 98 Wh/kg at power density of 5610 and 3885 W/kg and good cycle stability up to 80 % and 78 % retention after 10.000 cycles, respectively, indicating their promising potential application in high-performance SCs.

Abstract

Electric energy is used in many aspects of life and the consumption amount of electrical energy has been a significant indicator in terms of industrialization and the development of the counties. Since incorrect and inefficient use of this energy, losses occur in power system from generation to consumer which means there are serious problems in both technical and non-technical losses in the electrical networks. Transmission and distribution (T&D) loss rate in Turkey is around 15% which is much more than OECD members with the rate of 6%. However, large amount of technical losses (TL) and non-technical losses (NTL) come from distribution network that accounts for around 12%. İn this paper, an overview of the distribution losses and efficiency of distribution system in Turkey is evaluated. 7 selected loss reduction approaches based on technical analysis and successful experiences in different countries, in addition a remote monitoring system design is presented to decrease loss and thefts can be the key solutions for increasing energy efficiency in the Turkish distribution network.

Keywords: Loss reduction, Theft, Efficiency, Distribution network.

INTRODUCTION

Global electricity demand has grown rapidly over the last decades due to the economical and technological developments. Electricity is using in many aspects of daily life and becomes more important because electricity spreads to new end-uses, such as electric vehicles and heat pumps. The electricity is a secondary energy source and produced by primary sources of energy such as, oil, natural gas, hydro, nuclear, solar, coal and wind energy. As of 2019, the annual gross production of electricity was dominated by fossil fuels (including coal, natural gas and oil) contribute 63% of global electricity generation. It is continuously increasing the importance of renewable energy sources for the future of the countries by the reason of the limited fossil fuels and reduction of CO2 with a greater respect for the environment. Since electrical energy is a type of energy obtained from the conversion of other energy sources, losses occur in the generation, transmission, distribution and consumption stages due to the incorrect and inefficient use of this energy, and these losses also affect other energy sources[1, 2].

The electrical system consists of the generation, transmission and distribution systems has a large network of power generating plants which connected to the consumer loads. One of the main objective of electric grid is to conduct the necessary generating capacity to meet with the demand in the presence of planned and unplanned outages and unexpected variations in the grid load. Another important objective is the convenient transmission network in order to transfer the energy to load centers from generated electricity. Eventually, sophisticated distribution network is required in order to suply the available energy to the consumers from the load centers.

In a power system, the electricity is generated in production centers at voltages of several kilovolts from 6 to 20 kV and production centers transform this power to voltages of hundred of kilovolts as common values of relatively common values 66, 132, , 138, 154, 220, 230, 345, 380, 400, 500 and 700 kV to perform long

distance transmission over electric lines to the areas where consumption is most required. In a power system, a typical structure of electric grid including subsystems is shown in Figure 1. Raise of the voltage levels is required for transmitting of electric power over long distances in large amounts, Transmission lines are interconnected at communication nodes called as substations and lower voltages transformed from the substations and feed local distribution grids which deliver electricity to consumers at less hazardous voltages [3].

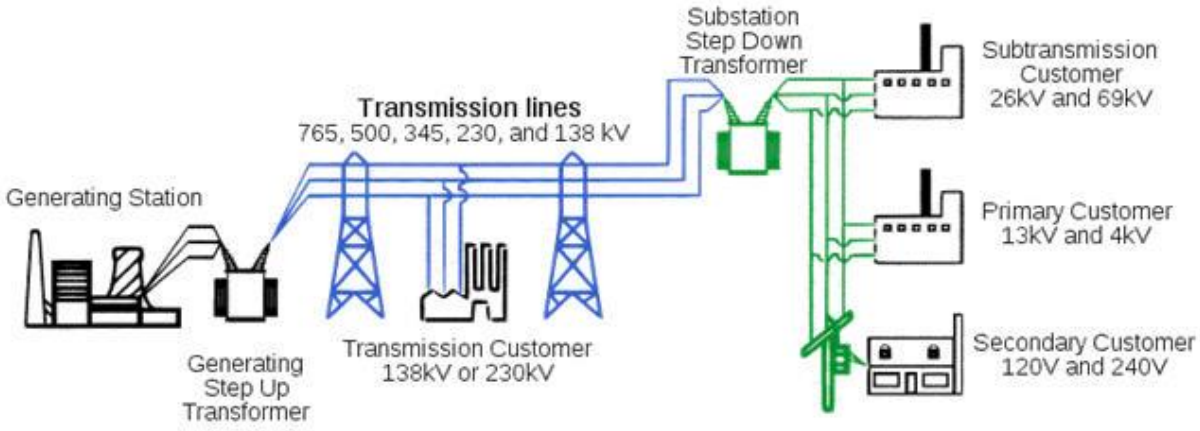

Figure 1. Typical schematic of electric network [20].

Losses occur in all processes of the power system from production to the consumer. They are defined as the energy produced but not commercialized and are identified as TL such as heat or copper losses, magnetic losses, or transformation losses and NTL in other words, commercial losses, metering failures and thefts. Three types of energy losses which are known as joule effect, magnetic loss, and the dielectric effect occur in transformers and cables during the T&D of electrical energy. The major part of losses occurs in transformers and lines come from joule effect. Furthermore, the joule effect losses have about 2,5% in transmission cables while there is a range between 1% and 2% losses in transformers which depends on the transformer type and ratings. For instance, in a power plant there is a 1000 megawatts (MW) produced energy, there will be minimum 10 MW transmission to consumers and we can supply 1000 - 2000 more homes with the same energy [9].

Some different studies have been found in the literature on losses in electrical distribution network. It was emphasized about the role of distributed generation to reduce technical loss and smart meters to reduce non-technical loss in increasing energy efficiency of transmission and distribution grid in Turkey [4]. A district in Ankara was determined as the sample residential area and distribution system losses were evaluated [5]. Alternative designs of underground and overhead systems in a distribution network were compared and suggested the implementation of underground systems [6]. Overview of T&D Losses in Pakistan [7]. Cost and benefits of every stage and application of approaches was determined according to the application of 7 selected approaches of loss reduction based on studies carried out in Iran, USA, and Canada [8]. For greater energy efficiency, it was emphasized the importance of standardizing the transmission and distribution of electricity [9]. The study illustrates various cases, issues and setbacks in the design, development, deployment, operation, and maintenance of electricity theft controlling devices in the perspective of defining electricity theft in social, economical, regional, political, literacy, criminal, and corruption [10]. It was shown that geographical conditions to reduce technical losses in the network directly affect efficiency and operating costs [11]. The use of measurement-based data in the design of the electricity distribution network allows to reduce investment costs and reduce electrical energy losses was analysed [12]. A review study on solutions for detection of non-technical losses in the electricity grid [13].

MATERIALS AND METHODS

In this paper, the main contributions are analysing the existing solutions for the TLs and NTLs in a systematic way and providing solution methods to reduce distribution network losses in Turkey. The first step included the theoretical contextualization of research related to electrical system from generation to consumer including transmission and distribution system. Second step presents the aspects to be considered in the analysis and definition of technical and non-technical electrical energy losses. Then identifying the leading published

researches, regulations and legislation in Turkey related to distribution system and evaluating the efficiency of Turkish distribution system. Eventually, the application of selected approaches of loss reduction based on technical analysis and successful experiences in different countries, in addition a remote monitoring system design is presented due to benefits with considering current status of Turkish distribution system.

LOSSES

Losses describes the energy efficiency among production and consumers of the power network including transmission and distribution. Loss percentages almost 50% in distribution are generally higher than transmission losses with the share about 17% due to the lower current results by higher voltages in transmission and this shows that the weakest link in the entire power sector is considered as distribution sector [23]. Losses can be categorized by dividing them into TLs and NTLs and TLs of the system can be examined under fixed and variable losses.

Technical Losses

Hysteresis and eddy current losses in the cores of transformers, leakage current losses in overhead line insulators and dielectric losses in cables are fixed technical losses that depend on system quality and increases in proportion to the square of the voltage, regardless of the load flow. TLs depend on the grid characteristics and the mode of operation, which accounts for 22,5%. Distribution losses have the large amount of losses in the power system compared to transmission losses that have only about 30%. These figure out that distribution system including primary and secondary subsystems in the entire system should be properly planned [23].

On the other hand, variable TLs are losses proportional to the resistance of the relevant section and square of the current. In addition, the distance from the source of production and demographic structure are other important factors that increase costs and losses. Variable losses have amount between 2/3 and 3/4 of technical losses on distribution network [23]. For decreasing losses, cross sectional area of cables are required to be increased.

The main reasons of distributions system TLs are:

1. Lengthy distribution lines and inadequate size of conductors of distribution lines.
2. Installation of distribution transformers away from load centers.
3. Low power factor of primary and secondary distribution systems due to high impedance.
4. Low quality of works.
5. Transformer sizing and selection switching off transformers [18].

Non-Technical Losses

NTLs occur when electricity is effectively distributed by the supplier but not paid by end users. These losses are at 16.6%, and include components such as billing of customer energy consumption, lack of administration, defective meter and error in meter reading, financial constraints and estimating unmetered supply of energy as well as energy thefts. Main reasons for NTLs are as fallows; power metering inaccuracies, unmetered losses for very small load, theft, unmetered supply and error in meter reading [18].

ENERGY EFFICIENCY OF TURKEY'S DISTRIBUTION NETWORK

Electricity is the third-largest energy source in total final consumption after oil and gas with demand increasing across all sectors in Turkey [17]. At the end of 2021, Turkish electricity installed power capacity was 99.819,6 MW with an increase of 4,1% compared to the previous year [22]. The consumption of annual gross electricity in Turkey increased by 8,74% to 332,9 TWh, compared to the previous year as of 2021. In electricity generation in 2021, the shares of resources come from as follows: Coal: 30.9%, Natural gas: 33,2 %, Hydropower: 16,7%, Wind: 9,4%, Solar: 4,2%, Geothermal: 3,2 %, Other Sources: 2,4% [21]. The incorrect and inefficient use of this electrical energy causes losses in all stages of the production, transmission, distribution and consumption

since electrical energy is obtained from other energy sources, and these losses also affect other energy sources. The reduction of losses lies entirely in determining the causes of the losses and how they are distributed at each stage of the system.

The average values of power losses at the different steps in a typical power network are as follows; 1-2% in step up transformers, 2-4% in transmission lines, 1-2% in step down transformers from transmission line to distribution network and 4-6% losses in distribution network transformers and cables. Total system losses occur from generation to end-use custom during the transmission and distribution of electricity, typically range between 7% -10% in developed countries [18] while in recent years they are almost 15% losses in Turkey which are more than not only developed countries but also World average value of about 8% losses as shown below Figure 2 from 1971 to 2014 according to World Bank analysis [19].

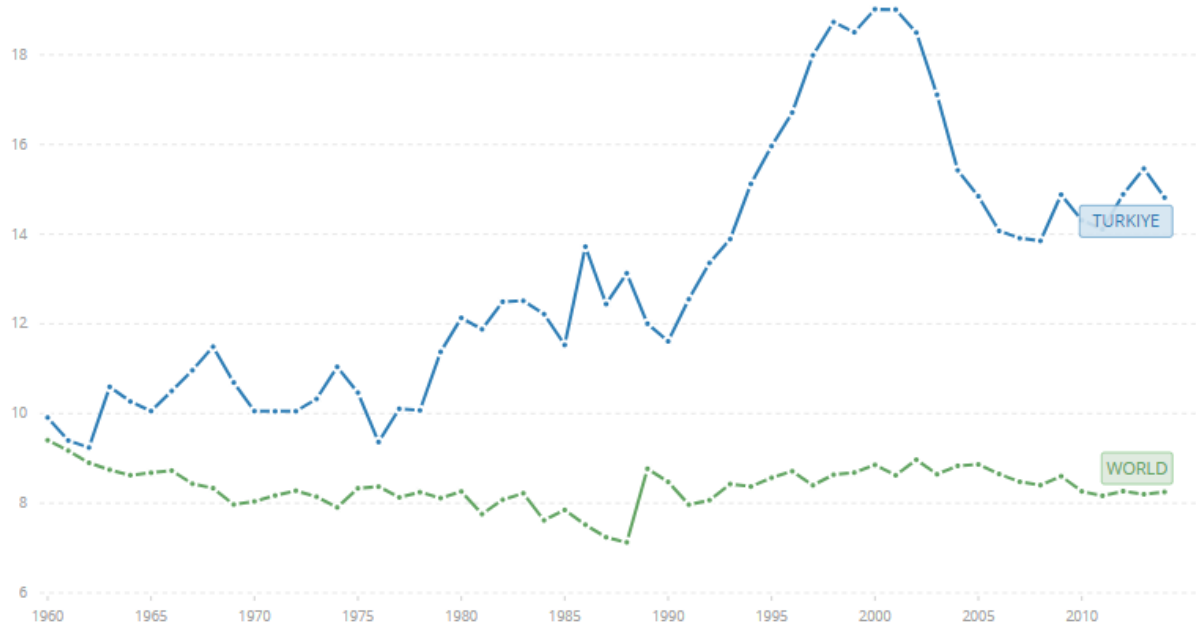

Figure 2. Percentage of T&D losses in Turkey & World [19}.

By the end of 2021, the major part of transformer centers in the transmission system operate at 154 kV voltage level. There are 1.245 substations, 737 of which are owned by Turkish Electricity Transmission Company (TEİAŞ) and 508 are privately owned. Transformer capacity was reached to 249.050 MVA. Of this capacity, 207.516 MVA is owned by TEİAŞ and remaining 41.534 MVA is in private ownership [15]. 065.75% of the total 72.272 km transmission lines consist of 154 kV lines. Almost all of the remaining part is 380 kV however voltage levels of 220 kV and 66 kV lines are only 99,03 km. Load flows, demand, temperature and investments are the factors affecting he transmission system loss and the transmission system loss rate in Turkey was 1,94% in 2020, it became 1,89% in 2021 [15].
In the distribution system, low voltage (0-1 kV) and medium voltage (1-36 kV) networks can be found in different structures in different countries. In the distribution system of Turkey, the low voltage (LV) level is 400 V between phases and 230 V between phases and neutral, the system frequency is 50 Hz as well. Nominal voltages of 6,3 kV, 10,5 kV, 15,8 kV, 31,5 kV, 33 kV and 34,5 kV are used in the medium voltage (MV) network in Turkey [16].

The distribution activities for voltages of 36 kV and lower are carried out through the 21 electricity distribution companies and distribution-licensed industrial zones. Turkish Electricity Distribution Company (TEDAŞ) owns the distribution facilities whose operating rights are in distribution companies. The total length of distribution lines is 1.363.320 km, 77,97% consists of overhead lines with the length 1.062.990 km and the rest 300.329 km was underground lines by the end of 2021. This shows that the distribution lines are vulnerable to external conditions. The average national technical and non-technical loss level is around 12%, though the actual levels vary between distribution regions [15].

As of 2021, the total number of consumers using the distribution system increased by 2,67% compared to the previous year and reached 47.311.976 and the total invoiced consumption amount in the regions of the distribution companies was 189,27 TWh and there were 508.880 transformers. Billed consumption by type of consumer, industrial consumption has the highest share with 44,09%, commercial consumption is in the second place with 24,25% and residential consumption is in the third place with 24,24%. The total electricity consumption used in lighting and agricultural irrigation was 7,42% [15].

The loss rates in the distribution network are targeted by Energy Market Regulatory Board (EMRA). Loss and theft rates in some distribution regions, high levels are observed as shown in Table 1.

Table 1. 2021 Loss rates of distribution companies (%) [15].

Distribution Company	Actual Loss Rate	Target Loss Rate	Distribution Company	Actual Loss Rate	Target Loss Rate
ADM	6,18%	6,49%	**AYEDAŞ**	6,22%	6,62%
AKDENİZ	7,67%	6,80%	**KAYSERİ**	6,56%	6,90%
AKEDAŞ	5,62%	6,67%	**MERAM**	5,76%	6,86%
ARAS	20,08%	22,53%	**OSMANGAZİ**	6,91%	7,08%

DİCLE	46,19%	55,36%	**VANGÖLÜ**	38,07%	48,48%
FIRAT	9,34%	10,19%	**YEŞİLIRMAK**	6,89%	7,45%
GDZ	6,36%	7,32%			

LOSS REDUCTION APPROACHES

Losses in the distribution of electricity cannot be totally eliminated, but it is possible to minimize losses by a proper planning of the distribution systems to ensure that power remain within limits. When 21 distribution companies are compared on a technical component basis, it has been observed that their levels are different from each other because of economic and regional conditions and loss rates of some distribution companies have high rates as shown in Table 1. The current applications of selected loss reduction approaches and a remote monitoring system design should be carried out carefully by each distribution company, taking into account their own planning and needs.

Balancıng 3 Phase Loads

Balancing current along three phase circuits and feeders is an easy way to save efficiency by reducing losses in the distribution system such that efficiency decreases, circuit breaker trips and useful life of equipment reduces are the results of an unbalanced system. Balancing feeders has a considerable value which can be achieved by preparing instructions, appropriate design and continuous monitoring. On the other hand, periodically three phase load balancing has an impact on cost effective loss reduction throughout a network that can be done relatively easily on overhead networks [18].

Rebalancıng Length of LV and MV Lıne

It is possible that large consumer gets direct power line from feeder due to design of the distribution network. Many distribution pockets of low voltage (400V) in town are surrounded by higher voltage feeders. More conductor current flows for the same power delivered, resulting in higher I^2R losses at this lower voltage [18]. In 2020, the ratio of MV network size to LV was equal to 0.69 since MV line has a length of 486.886,2 km and LV length is 707.881,1 km according to TEDAŞ as shown in Table 2 [16]. Based on economic studies,

this ratio is suggested to be 2 [8]. Therefore, the length of 44% of LV feeders should be reduced due to approach of increasing MV and decreasing LV networks [18].

Table 2. 2020 Distribution network line lengths (km) [16].

VOLTAGE LEVELS	OVERHEAD LINES	UNDERGROUND LINES	TOTAL LENGTH
33 kV	391.778,3	67.484,9	459.263,
15,8 kV	17.770,0	3.137,7	20.907,7 4
10,5 kV	144,4	3.988,7	4.133,1
6,3 kV	1.636,1	936,3	2.572,4
OTHERS	9,7	0,1	9,9
MV TOTAL	411.338,5	75.547,7	486.886,2
0,4 kV	553.218,1 9	154.663,0	707.881,1
TOTAL	964.556,5	230.210,8	1.194.767,3

Improving Transformers Efficiency

High efficiency distribution transformers can make a large impact on reduction of distribution losses since transformers are responsible for almost half of network losses. Distribution losses increases in the case of overloading of distribution feeders. It has been suggested that optimal average utilization rate of cables in the distribution network should be as low as 30% of its maximum capacity if the cost of losses is taken into account [18].

Increasing Underground and Decreasing Overhead Lines

Overhead lines are 77,97% of the total 1.363.320 km distribution lines, and the share of underground lines is 22,03% by the end of 2021 [15]. This shows that the distribution lines are vulnerable to external conditions such as natural disasters, climate, or human. Particularly, heavy rains and heavy winds can directly or indirectly cause damage to the distribution lines. Overhead system is more advantageous in terms of cost compared to the underground system, but there is about 3 times more losses on an annual basis compared to the underground system. Although the installation of the overhead system is easier and more affordable, it is known that it is more dangerous than the underground system. It should be preferred to install underground systems because it is dangerous to draw energy illegally from overhead systems, more losses occur, and visual pollution. Thus, the illegal use of energy by people will be partially prevented [6].

Reactive Power Compensation

Reactive power is the form of power that flows back to network from a destination and it is essential due to supporting real power in the power grids. Reactive Power Compensation (RPC) or VAR has two main issues which are described as load compensation and voltage support, aims to enhance the performance of power in the grid. To keep the inductive reactive power demand by the loads below the legal limits is done for purposes such as increasing the active power usage capacity by reducing the reactive energy demands. With RPC the reactive power demands from the grid is provided by another reactive power generator, thus reducing the apparent power demands from the grid. Compensation is done at load side by generating reactive power and has contributions especially compensating voltage regulation, balancing real power, correcting power factor and eliminating the harmonic current components drawn by nonlinear loads. However, voltage support provides voltage fluctuation reduces at bus for bringing energy to grids. The end user problems due to the

power quality problems is solving by load compensation and voltage support, in terms of power quality, real power balance and harmonic current elimination in the distribution side [24].

Due to increase of reactive power demand in the distribution system causes increases in I^2R and I^2X losses related to serious current flow increment. The power losses can be reduced which are produced by reactive currents, by installing power devices and capacitors into the grid. Furthermore, the power loss reduction is important especially in increasing line loading capacity, decreasing sag problems and reducing heat effect [24].

Advanced Metering System

Smart meter systems are remotely connected between the measurement systems at energy consumption points and the central data system, consisting of hardware, software and communication infrastructures can reliably and securely communicate the data back to the local utility for monitoring and billing purposes. Smart meter systems, according to one-way and two-way communications are handled in a separate topology and are named differently. Advanced Metering Infrastructure (AMI), enables two-way communication between the meter and the supplier, collects meter data as well as giving possibility to technologic applications by commanding such as remote power cuts can be done by using meters cut-off feature while Automatic Meter Reading Systems using in Turkey, communication is one-way, only transmits obtained data to the central system [25]. Since Smart meter investments makes electricity consumption more visible and provide control. It helps to save energy, reduces NTLs by increasing the penetration of smart meters, minimize errors in billing and allows labor costs to be lowered [4].

Distributed Generation

In the literature, there are different terms of Distributed Generation (DG) such as embedded generation, decentralised generation and dispersed generation. DG describes the generation of electricity for use near or on-site such as PV panels and connects distribution network, instead of delivering energy from a centralized plant and supplies clean power related to usage of large scale renewable energy sources including biogas, geothermal hydro, solar, biomass and wind energy. DG provides a reliable electrical energy to the consumer due to its proximity to the consumption center while reducing costs and losses of distribution lines by considering location and capacity of DG [26].

Loss and Theft Detection System in Overhead Lines

An application design has been planned to carry out to read the currents remotely over the electric distribution system and to detect loss and thefts in overhead lines. Receiver and transmitter modules will be placed on the overhead lines and the last receiver module will be placed in the area where remote monitoring system will be performed. Thus, a safe remote measuring system will be provided without the need for external hardware and extra wiring. A self energized hardware including a microcontroller will be installed separately on each phase between poles which is symbolized in red colour box as shown in Figure 3.

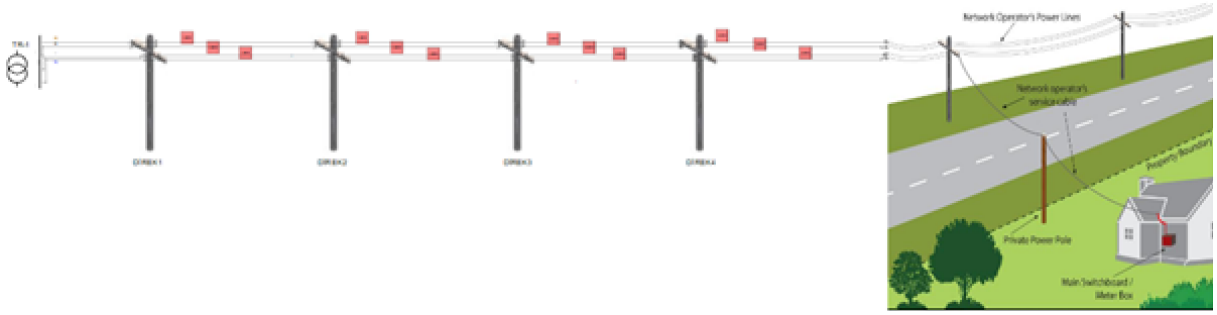

Figure 3. Typical schematic of loss and theft detection system in overhead lines.

The current values will be collected in the microcontrollers which have receiver and transmitter modules and each phase data will be transferred to next pole via radio frequencies (RF). Eventually, all current values will be taken by the receiver microcontroller which will be located in the remote monitoring system point and transfer to the workstation via USB.

These values will be displayed in the object oriented interface program in line with the determined algorithm. The currents passing through the phases of each pole will be read and compared via the interface program, and the detection of losses and thefts on a point basis will be provided in real time and instantaneously. The system will have significant effect in the distribution system for reducing loss and thefts.

CONCLUSION

The major amount of TLs and NTLs in a power system exists in distribution network and represent a significant fraction in terms of power quality, financial issues, network structure, and which cause damage to the electricity sector and legal consumers. Turkish distribution network loss rate is much more than OECD members and this paper finds that losses can be decreased from current level to lower levels by proper investments. By considering Turkish distribution system, 7 selected loss reduction approaches based on technical analysis and successful experiences in different countries, and a remote monitoring system design is suggested to be implement as a key solution in order to increase energy efficiency by reducing loss and thefts.

Abstract

This paper presents an implementation of an inverse Pascal filter. In relative to conventional filter approximating methods, such as Butterworth and Chebyshev, Pascal filters that are based on Pascal polynomials are recently discovered and their suitability for analog filtering has been shown in the literature. On the other hand, inverse Pascal filters, which can be generated by using normal Pascal filters, are not fully investigated. Moreover, to the best knowledge of the author, the literature is lacking their actual circuit realizations with active analog blocks. Therefore, in this study, a fourth order inverse Pascal filter is designed with operational transresistance amplifiers (OTRAs) as the active blocks. General theory of Pascal filters and inverse Pascal filters have been supplied in the paper. Their features have been discussed. To validate the presented theory, OTRA blocks, realized by commercially available off the shelf integrated circuits, and the overall filtering circuit has been simulated using SPICE program. Corresponding simulation results are accompanied with the figures. According to the results, it is found that the filter circuit including OTRA blocks is suitable for the realization of the fourth order inverse Pascal filter approximation, and it can be used as a promising alternative to standard analog filtering methods.

Keywords: Analog filters, Pascal filters, Inverse Pascal Filters, OTRA

INTRODUCTION

Analog filtering is a very important part of analog signal processing which is used for shaping the frequency response of a circuit according to some predefined specifications. Although digital approaches mainly dominate today's signal processing applications, even in digital hardware, it is possible to find some form of analog circuitry to interface with the analog world (Van Valkenburg, 2001). Furthermore, increasing demand for low power consumption will lead to more widespread usage of power efficient analog hardware and increase the necessity of analog circuits. Even archaic analog computing has about to complete its comeback for specified circuitry such as deep learning hardware (Haensch et al, 2019).

The ideal analog filter cannot be realized, and therefore, the approximations are necessary. Butterworth, Chebyshev and Cauer are some of the well-known approximation methods for which numerous realizations are available in the literature (Van Valkenburg, 2001), (Deliyannis et al, 1993). One recent and promising approximation method, Pascal filters, based on Pascal polynomials, have been presented in (Goodman and Aburdine, 2008). Later, the information about these filters have been extended in some papers (Dimopoulos, 2007), (Dimopoulos, 2012a) to enrich the literature. Similar to inverse Chebyshev filters, their inverse approximations have been shown and the design methods with several tables have been demonstrated in (Dimopoulos, 2012b). However, as far as the author know, the actual circuit realizations using analog active blocks are not available, that is also the motivation for this study. The paper is organized as follows. First, Pascal polynomials and the necessary modifications to them for realizing analog filters is discussed. Second, the method for inverse filtering is described for Pascal filters. Then, the OTRA block has been given with its defining equations. The actual design employing commercially available AD844 ICs has been presented with SPICE simulation results. Corresponding figures are supplied and the comparisons to the ideal response have been made with related discussion. Finally, the results have been summarized in the conclusion section.

PASCAL FILTERS

The general equation for all pole analog filter approximations is given in Eq. (1) where $T(j\omega)$ is the filter transfer function given by using $s=j\omega$ and ε is used for the ripple factor. The $K(j\omega)$ function is called as the characteristic function of the approximation and according to the type of the polynomials used, it generally

determines the name of the filter. For instance, Chebyshev filters use Chebyshev polynomials as in the place of characteristic function.

$$|T(j\omega)|^2 = \frac{1}{1+\varepsilon^2|K(j\omega)|^2} \quad (1)$$

For Pascal filters, similarly Pascal polynomials are used in the place of the characteristic equation (Goodman and Aburdine, 2008). Pascal polynomials of a degree n can be written as

$$P_n(x) = (-1)^n(n!)^{-1}x(x-1)(x-2)\dots(x-n+1) \quad (2)$$

These polynomials need to be modified, or in other words, to be shifted for analog filtering applications by changing x with x+(n-1)/2 as shown in Eq. (3)

$$P_n(x) = (-1)^n(n!)^{-1}(x+\tfrac{n-1}{2})\left(x+\tfrac{n-1}{2}-1\right)\left(x+\tfrac{n-1}{2}-2\right)\dots\left(x+\tfrac{-n+1}{2}\right) \quad (3)$$

After aforementioned modifications, a few of the low order Pascal polynomials are obtained as given in Table 1.

Table 1. The shifted Pascal polynomials

n = 0	$P_0(x) = 1$
n = 1	$P_1(x) = -x$
n = 2	$P_2(x) = \frac{1}{2}x^2 - \frac{1}{8}$
n = 3	$P_3(x) = -\frac{1}{6}x^3 + \frac{1}{6}x$
n = 4	$P_4(x) = \frac{1}{24}x^4 - \frac{5}{48}x^2 + \frac{3}{128}$

They are written in a more compact form as in Eq. (4).

$$P_n(x) = (-1)^n(n!)^{-1}\prod_{k=1}^{n}(x+\tfrac{n-1}{2}-k+1) \quad (4)$$

The shifted polynomials can also be scaled appropriately, and they can be further modified to "filter-appropriate" form. Additional details can be found in (Dimopoulos, 2012b).

The plots of some of these polynomials for up to fourth degree are also shown in Figure 1. As seen from the figure, for large values of x, polynomials quickly get large values with increasing order of the degree n but they have relatively small values for small x.

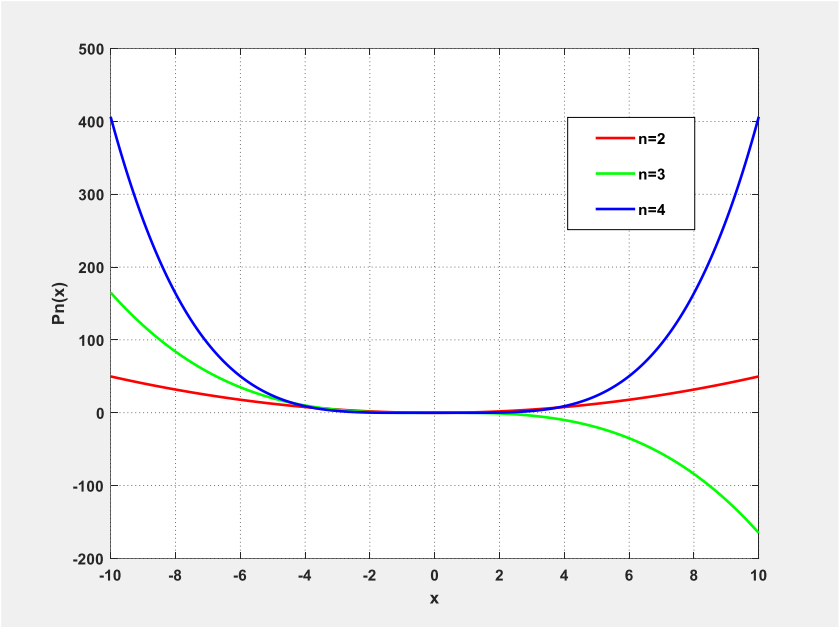

Figure 1. The shifted Pascal polynomials for the degree n = 2, 3, 4

INVERSE PASCAL FILTERS

Inverse filtering might be done in a few steps if the transfer function in Eq. (1) for a specific approximation is known (Corral, 2005). First, the magnitude squared function is subtracted from unity as in Eq. (5)

$$1 - |T(j\omega)|^2 = \frac{\varepsilon^2|K(j\omega)|^2}{1+\varepsilon^2|K(j\omega)|^2} = \frac{1}{1+[\varepsilon^2|K(j\omega)|^2]^{-1}} \tag{5}$$

Then, frequency variable is inverted as $\omega \rightarrow 1/\omega$ and this results in the inverse filter given in Eq. (6)

$$|T_{inv}(j\omega)|^2 = \frac{1}{1+\left[\varepsilon^2\left|K\left(j\left(\frac{1}{\omega}\right)\right)\right|^2\right]^{-1}} \tag{6}$$

Similar method was used in (Dimopoulos, 2012b) for inverse Pascal filter which is used for the approximation in this study. One importing thing to mention here, and for disambiguation, is the existence of another type of inverse filters in the literature. Those filters are used to compensate the distortions of signals caused due to the frequency response of the overall system by behaving exactly reciprocal to it. However, this is clearly different from the inverse filtering terminology used here. For further information about the subject, the reader is encouraged to look at the reference, (Senani, et al. 2022).

THE FOURTH ORDER INVERSE PASCAL FILTER EMPLOYING OTRAs

Operational transresistance amplifier (OTRA) is a versatile analog active building block. Its defining equations are given in Eq. (7) in matrix form where Rm is the transresistance and for ideal operation, it should be infinite which, forces the input currents to become equal (Cakir et al, 2005) Its circuit symbol is given in Figure 2.

$$\begin{bmatrix} V_1 \\ V_2 \\ V_Z \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ Rm & -Rm & 0 \end{bmatrix} \begin{bmatrix} I_1 \\ I_2 \\ I_z \end{bmatrix} \tag{7}$$

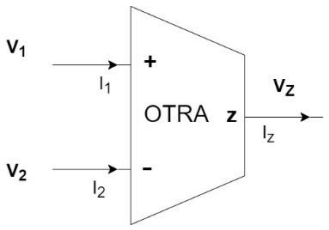

Figure 2. OTRA circuit symbol

Using two commercial AD844 IC as shown in (Pandey et al, 2014), it is possible realize OTRA block for actual circuit realizations. In this study, to realize the fourth order inverse Pascal filter, the circuit topology in (Chang and Swamy, 2013) is used. The circuit is shown in Figure 3. The circuit was actually proposed for a fourth order Cauer filter in (Chang and Swamy, 2013) but it is possible to use it for an inverse Pascal filter with changing the transfer function parameters and adjusting the matching conditions accordingly.

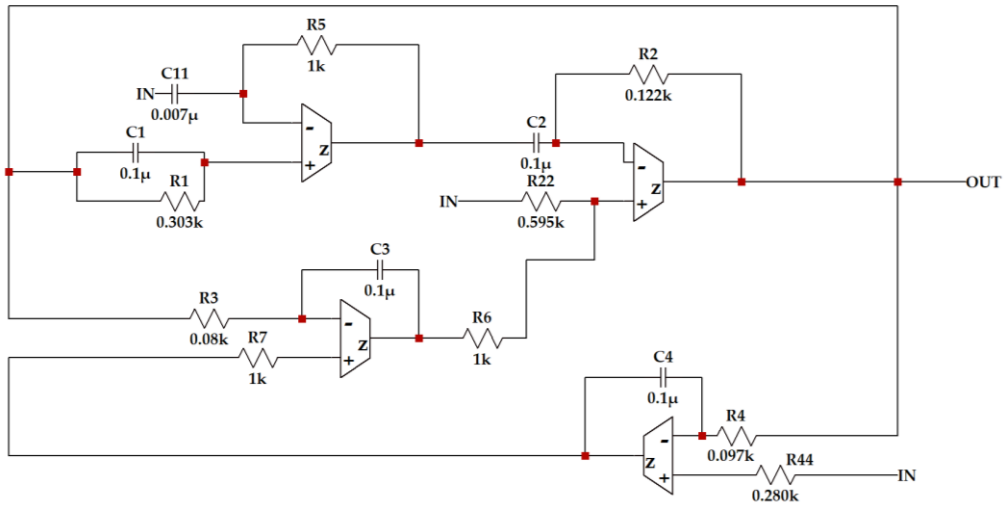

Figure 3. The fourth order inverse Pascal filter

The transfer function in Eq. (8), which is given in (Dimopoulos, 2012b), is a transition band optimized fourth order inverse Pascal filter approximation with the design specifications α_{max} = 1.0 dB and α_{min} = 18.0 dB. For the actual circuit application, it has been frequency scaled suitably.

$$T(s) = \frac{0.0712013\,s^4 + 1.68045\,s^2 + 3.56949}{s^4 + 3.29847\,s^3 + 8.17311\,s^2 + 12.3464\,s + 10.3261} \tag{8}$$

The passive element values are calculated according to relations in (Chang and Swamy, 2013). The SPICE simulation result for the frequency response is given in Figure 4.

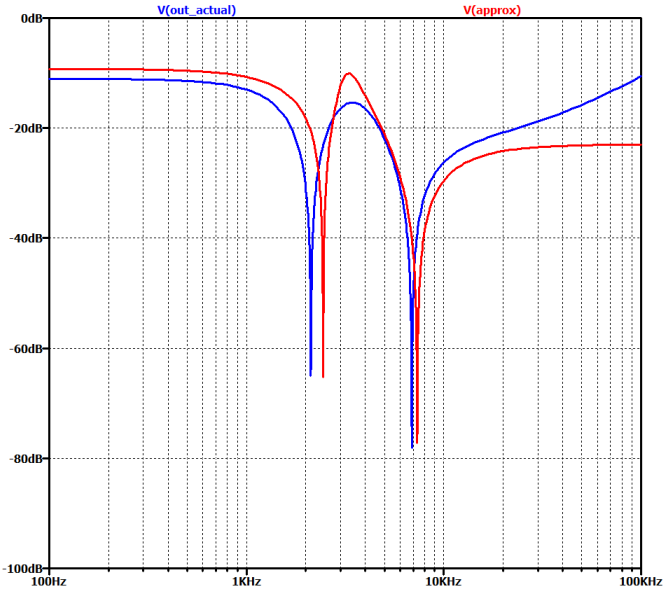

Figure 4. The fourth order inverse Pascal filter

In the figure, red shows the ideal approximating function and the blue shows the real circuit comprising OTRAs made from AD844 ICs. For the model of AD844 ICs, foundry SPICE model from Analog Devices has been used in the simulations. The deviations in the figure from the ideal one is expected due to the parasitics of AD844. Another reason is the rounding of the passive element values. If tuning is necessary, adjusting the passive element values would result in a more accurate result. The behavioral model of an ideal OTRA with exact passive element values, without any rounding, has also been simulated and it has given the exact ideal result without any deviation.

CONCLUSION

The inverse Pascal polynomials for analog filtering have been investigated in this study. An active filter circuit has been designed using a fourth order, transition band optimized approximation. For the active elements, OTRA blocks have been employed. The actual circuit simulations have been carried out in SPICE program for the validation of the theoretical study and it has been found that using AD844 ICs for the design to realize OTRAs and the filter circuit, it is attainable to implement an analog active fourth order inverse Pascal filter. According to SPICE, the theoretical study agrees well with the simulation results.

Abstract

Infections caused by multi-drug-resistant bacteria cause important health problems today. This situation has led to an increase in the number of research conducted to develop new antibiotics in recent years. The World Health Organization (WHO) reports that the efficacy of antibiotics against multidrug-resistant infectious agents, especially methicillin-resistant *Staphylococcus aureus* (MRSA) strains, is gradually decreasing. The aim of this study was investigated antibacterial activity of 3 different benzoyl thiourea compounds (N-((2-chloropyridin-3-yl) carbamothioyl) thiophene-2-carboxamide (L-31), N-(morpholine-4- carbonothioyl) benzamide (EHL-90) and N-(diphenylcarbamothioyl) benzamide (EHL93)) against to MRSA by disc diffusion and MIC test. As a result of this study, EHL31 and EHL90 chemicals at a dose of 4.5 mg/disc did not form an inhibition zone but EHL 90 chemical was created between 11-14mm of inhibition zone against MRSA isolates in disc diffusion test. However, with broth micro dilution method, it was determined that the L31 chemical had MIC levels at a dose range of 18.75 mg/mL and 37.5mg/mL, the L90 chemical at a dose range of 4.68mg/mL to 9.37mg/mL and the L93 compound at a dose of 2.34mg/mL. With this study 3 benzoyl thiourea compounds used have the potential to be used as antibacterial agents at different concentrations.

Keywords: Antibiogram, Antibiotic, Broth microdilution, Disc Diffusion, MRSA

INTRODUCTION

MRSA has become widespread in hospitals worldwide, causing bacteremia, pneumonia, surgical site infections, and other nosocomial infections. The Centers for Disease Control and Prevention states that of all healthcare-associated *S.aureus* infections reported that almost 60% were due to MRSA (CDC 2007). Among the first reports of MRSA from 1961 to the 1990s, the infection was often described as healthcare-acquired hospital-acquired MRSA (HA-MRSA), although from the 1990s to the present it has been referred to as community-acquired MRSA (CA-MRSA) (Turner et al. 2019). All MRSA strains carry a mobile genetic element called the staphylococcal cassette chromosome (SCC), which houses the *mec*A gene. This gene encodes penicillin-binding protein 2a, which confers resistance to β-lactam antibiotics. The mecA gene is responsible for antibiotic resistance in MRSA and is often absent in MSSA, although in some cases the mecA gene is present in MSSA but is not expressed (Foster and Geoghegan 2014). In various studies, the biological activity role of benzoyl thiourea derivatives has been demonstrated as antimicrobial, antiparasitic, anti-tumour, diuretic, platelet aggregation inhibitor, H2- antagonist, antidiabetic, insecticide and herbicide (Müller et al. 2009), anticancer (Shing et al. 2014), anticonvulsant (Kaymakçıoğlu et al. 2005) Some biological effects such as antioxidant (Saturnino et al. 2003), antibacterial (Ngini et al. 2012), antifungal (Saeed et al. 2010) and anti-HIV (Küçükgüzel et al. 2008) have been defined and in the pharmaceutical industry.

The aim of this study was investigated antibacterial activity of 3 different benzoyl thiourea compounds (N-((2-chloropyridin-3-yl) carbamothioyl) thiophene-2-carboxamide (L-31), N-(morpholine-4- carbonothioyl) benzamide (EHL-90) and N-(diphenylcarbamothioyl) benzamide (EHL93)) against to 10 MRSA clinic isolate by disc diffusion and MIC test.

MATERIALS AND METHODS

The disc diffusion test (CLSI-2012) reported by the Institute of Clinical and Laboratory Standards was used to investigate the antibacterial activity of benzoyl thiourea compounds against 10 MRSA clinic isolates. It is taken from the bacterial colonies grown on nutrient agar with a loop, and it is turbid in 0.9% saline. Bacterial suspensions adjusted to McFarland 0.5 ($1.5x10^8$cfu/mL) were obtained. In these bacterial suspensions, swabs were spread on the Mueller-Hinton agar surface in a short time. Subsequently, 30µL (5mg/disc) of each of the substances previously prepared as 150mg/mL by dissolving in dimethyl sulfoxide (DMSO) were absorbed into blank discs and dried at 37°C. Then, the discs were placed on the Mueller-Hinton agar surface with the help of sterile forceps. In the study, methicillin (5µg) discs were used as a reference antibiotic used. The media were incubated at 37°C for 20-24 hours, after which zones of inhibition greater than 7 mm were recorded. Analyzes were made in three parallels.

The broth microdilution method reported by the Clinical and Laboratory Standards Institute was used to determine the minimum inhibitory concentration of benzoyl thiourea compounds against MRSA isolates and to confirm the disc diffusion test results (CLSI-2012b) was used. The active ingredients were dissolved with DMSO at 150 mg/mL, and two-fold serial dilutions were made in microplates between 75mg/mL and 1.17 mg/mL. Bacteria were cultivated in each well with a final concentration of $1.5x10^5$ cfu/mL. Gentamicin (Sigma) at a concentration of 0.01 mg/mL was used as a reference antibiotic in the study. For each bacteria, one well without a complex for growth control, one well with Mueller-Hinton broth and a complex for sterility control were used for the purpose. In addition, the number of bacteria in the wells was controlled by making 1:1000 dilution from the growth control wells and inoculating them into 0.1 mL nutrient agar has been done.

Disc diffusion results were analyzed by one-way analysis of variance (ANOVA). The difference at the $p < 0.05$ was considered to be at significance level. Statistical analysis was performed using Minitab 16 Statistical Software package (Minitab Inc. State College, PA).

RESULTS

Growth inhibition zone diameter values and one-way analysis of variance (ANOVA) results were obtained in the disk diffusion test to investigate the antibacterial activity of three different benzoyl thiourea compounds (EHL 31, EHL90 and EHL 93) against 10 MRSA clinic isolates. These results were given in Table 1. According to these data; it was determined that EHL31 and EHL90 compounds did not form an inhibition zone against MRSA isolates at a dose of 4.5 mg/disc, but the L93 compound formed between 11mm-14mm inhibition zone. The obtained inhibition zone diameter image is given in Figure 1.

Table 1. Growth inhibition zone diameters formed by the compounds according to the disc diffusion method

S.No	MRSA Isolates	Antibacterial inhibition zone diameters (mm)			Methicillin (5µg)
		L31	L90	L93	
1	S1	R	R	12 ± 2^A	R
2	S6	R	R	$14\pm2,6^B$	R
3	S9	R	R	$12\pm2,6^A$	R
4	S10	R	R	13 ± 2^B	R
5	S11	R	R	$14\pm1,7^B$	R
6	S13	R	R	$11\pm0,5^A$	R
7	S15	R	R	$12\pm1,5^A$	R
8	S16	R	R	$13\pm1,7^B$	R
9	S21	R	R	$12\pm1,5^A$	R
10	S22	R	R	$14\pm1,5^B$	R

R: Resistant. Values; mean ± standard deviation **A-B:** Differences between groups in the same column, significant at the $p<0.05$ level.

Figure 1. MRSA growth inhibition zone image of L31, L90 and L93 benzoyl thiourea compounds

Broth microdilution test was performed to determine the minimum inhibitory concentration of compounds on 3 MRSA clinic isolates. The results obtained are given in Table 2 According to these results, it was determined that the L31 compound had MIC levels between 18.75 mg/mL and 37.5 mg/mL, the L90 compound at the dose range of 4.68mg/mL and 9.37mg/mL, and the L93 compound at the dose of 2.34mg/mL. The lowest MIC values among all complexes against MRSA bacteria were determined as L93, L90 and L31, respectively. These results were found to be compatible with the disc diffusion results.

Table 2. Minimum inhibitory concentration values (MIC) results

S.No	MRSA Isolates	Chemicals		
		L31 (mg/mL)	L90 (mg/mL)	L93(mg/mL)
1	S1	37,5	9,37	2,34
2	S2	18,75	4,68	2,34
3	S3	37,5	4,68	2,34

Samples were taken from the wells of the broth microdilution plate and cultivated on nutrient agar plates. These plates were incubated for 18-24 hours at 37°C. At the end of the period, the wells in which no bacterial growth was observed were determined as the minimum bactericidal concentration. The results obtained are given in Table 3. According to these results, it was determined that the L31 compound at a dose of 75 mg/mL, the L90 compound at a dose of 18.75 mg/mL, and the L93 compound at a dose of 9.37 mg/mL had MBC levels. The lowest MBC value among all complexes against MRSA bacteria was determined as L93, L90 and L31, respectively. These results were found to be compatible with the MIC results.

Table 3. Minimum bactericidal concentration values (MBC) results

S.No	MRSA Isolates	Chemicals		
		L31(mg/mL)	L90(mg/mL)	L93(mg/mL)
1.	S1	75	18,75	9,37
2.	S2	75	18,75	9,37
3.	S3	75	18,75	9,37

DISCUSSION

As a result of disc diffusion, MIC and MBC studies related to the antibacterial activity of benzoyl thiourea compounds, L93 chemical was determined as the chemical with the largest inhibition zone diameter and the lowest MIC and MBC values. According to the disk diffusion results, L93 (4.5mg/disk) created an inhibition zone in the range of 11-14mm on 10 different clinic isolates, while L31 (4.5mg/disk) and L90 (4.5mg/disk) chemicals were found to be ineffective. As a result, the tests performed to confirm these results and to determine the MIC and MBC values, respectively; L93 MIC at a dose of 2.34mg/mL in all 3 isolates, MBC at a dose of 9.37mg/mL, 4.68 mg/mL on L90 S6 and S16 isolates, 9.37 mg/mL on S1 isolates, 18 MICs on 3 isolates It was determined that it had an MBC value of 75mg/mL. It was determined that L31 had a MIC value of 18.75 mg/mL on S3 isolates, 37.5 mg/mL on S1 and S2 isolates, and a MIC value of 75 mg/mL on all isolates. The results obtained in the disk diffusion and microdilution method were found to be compatible. Emen et al. (2005) reported that 2 different benzoyl thiourea compounds and some of their metal complexes have antibacterial effects, Patrick-Armand et al. (2021) reported that some of the benzoyl thiourea compounds they synthesized had antibacterial activity on *S. aureus* at a dose of 1mg/mL. Ablo et al. (2022) reported that 1mg/mL of the benzoyl thiourea compounds they synthesized were effective on *P.aeuroginosa* but ineffective on *S. aureus.* Studies have shown that benzoyl thiourea compounds have antibacterial activity in general. The fact that the chemicals used in the studies have too many subcomponents and the doses used are different also affects the results. The importance of the search for new antibacterial agents due to the increase in resistance to existing antibacterial agents in bacteria will lead to many new types of research in which more chemicals are investigated in the coming years.

CONCLUSION

In conclusion, antibacterial activities of 3 new benzoyl thiourea compounds on MRSA hospital isolates were investigated. The effectiveness of the 3 new benzoyl thiourea compounds used on multidrug-resistant MRSA isolates was determined as L93, L90, and L31, respectively. The obtained in vitro antibacterial activity results are supported by cytotoxicity and in vivo studies and used in health, cosmetics, industrial, etc. its usability in various sectors should be supported by new studies.

Abstract

The effects of globalization have been felt all over the world, as well as in the trade of wood-based forest products. Türkiye's relations with Romania, one of the countries with which Türkiye interacts in foreign trade of forest products, are discussed in this study. Forest assets, forest products production amounts and temporal trends of foreign trade of Türkiye and Romania have been revealed. Food and Agriculture Organization of the United Nations (FAO) and Turkish Statistical Institute (TUIK) data were used in the study. As a result of this study, it has been observed that Türkiye generally shows an increasing trend in the production of forest products. In addition, a positive trend was observed in the general merchandise foreign trade between Romania and Türkiye, while a negative trend was observed in the foreign trade of wood-based forest products.

Keywords: wood based forest product, import, export, trade

INTRODUCTION

The basis of the ongoing globalization in the world is the economic and technological developments and the associated changes in the social and cultural structure (Kamacı 2018). Also, globalization gains momentum with "*knowledge*" (Teeple 2000). The globalizing world is now briefly defined as "*the world that gets smaller as it increases*" (Altıner et al. 2018). Indeed, humans, whose population is increasing rapidly, have become easier to reach over large distances with the acceleration they have gained in technology. By this way, the process of meeting and merging many civilizations with each other and hence being influenced by each other has started. In this process, especially economic mobility has heightened competition and at the same time dependence on each other. The beginning of this mobility in the world economy dates back to the industrial revolution. (Altıner et al. 2018).

The production and trade of wood-based forest products have been impacted by the globalization trend (Akkaya et al. 2020). According to FAO figures, 1.486 billion m^3 of industrial forest products in 1993, whereas 1.983 billion m^3 of industrial wood in 2020 generated in the world. The amount of industrial forest products imported internationally increased from 76.25 million m^3 in 1993 to 136.15 million m^3 in 2020 (FAOSTAT, 2022a). Türkiye is one of the nations that engages in the export of wood-based forest products, and a variety of factors, including production costs, marketing opportunities, the management of forest assets, and changes in the economic structure, have an impact on this trade (Akkaya et al. 2020, Akkaya et al. 2021, Yıldırım, et al. 2015, Akyüz et al. 2003, Gültekin et al. 2009). At the same time, the fact that forest products are a voluminous commodity negatively affects the "*distribution*" factor in trade. For this reason, the proximity of industrial establishments to the raw material source is described as a "*strength*" (Keskin et al. 2009). However, today forest products are a commercial product that is traded on an international scale. While the production of forest products in the world has increased by 33% in a period of approximately 30 years, the amount of imports between countries has increased by 78.55% (FAOSTAT, 2022a).

Türkiye and Romania are two countries with intense economic relations. Both Romania and Türkiye are the two countries that have a coast on the Black Sea and are members of the Black Sea Economic Cooperation Organization (BSEC). Türkiye and Romania have foreign trade relations in many sectors. When the studies on these relations are examined; Romania is among the countries with the highest export similarity indexes with Türkiye, in the among the members of the BSEC (Erkan and Batbaylı 2017). Türkiye and Romania have been in cooperation in forest products trade for many years. In this study, in the world; evaluations were made regarding the foreign trade of forest products of the two countries, which are in the wood-based forest products market. The productions of wood base forest products and the foreign trade of forest products of Türkiye and

Romania has been evaluated, and the time trend of wood-based forest products trade between countries has been revealed.

MATERIALS AND METHODS

In the evaluation of foreign trade of forest products, the example of Türkiye and Romania has been discussed. The locations of the countries are given in Figure 1.

Figure 1. Location of Romania and Türkiye (taken from Arcgis Basemap)

The temporal data of wood-based forest products, which are the subject of foreign trade relations between Türkiye and Romania, are taken from the official web page of TUIK (TUİK 2022). In order to facilitate the comparison of forest assets of Türkiye and Romania, information on forest assets and forest products production was obtained from FAOSTAT. In the study, the forest assets, forest products production and trade of Türkiye and Romania were presented comparatively. Forest products production, import and export values of countries (both with each other and with other countries) were evaluated temporally and their trends were observed.

RESULTS

When the forest assets of countries in the world are examined as of 2020 (Figure 2), Türkiye and Romania are in different categories is seen.

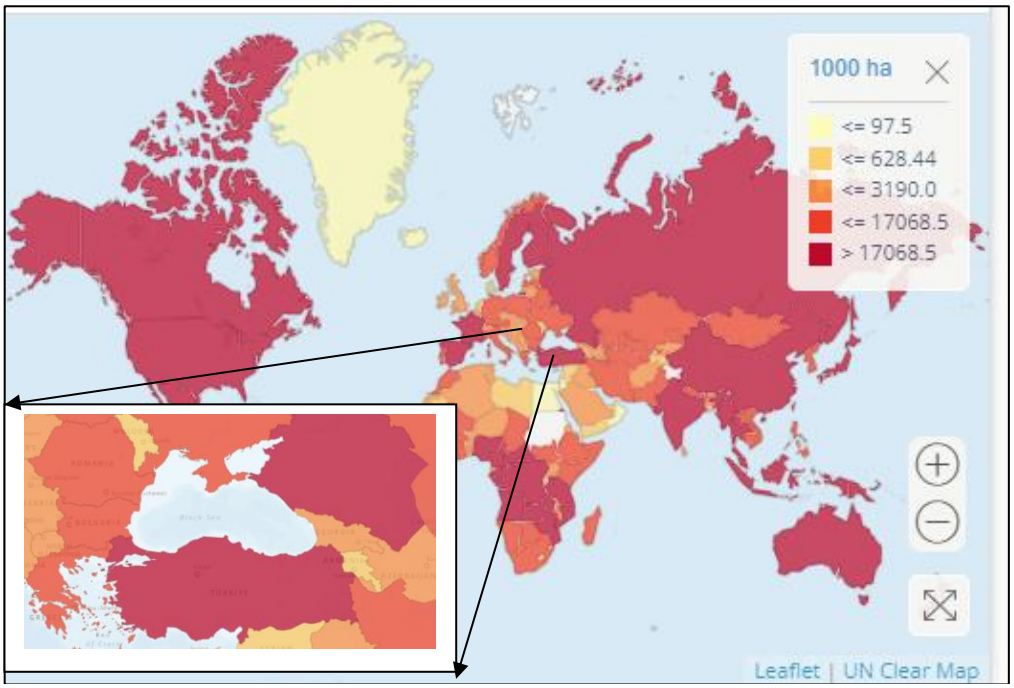

Figure 2. Forest land - Area by country (1000 ha) year 2020 (FAOSTAT, 2022b)

In order to make a general assessment of forest assets and forest products, the forest asset and population data of the countries (FAOSTAT, 2022c) and the values derived from these data are given in Table 1.

Table 1. Forest and population data (FAOSTAT, 2022c) for Romania and Türkiye

	Forest Land	Country area	Total Population - Both sexes	Rural population	Urban population	General area ratio of forest area	Amount of forest area per capita	Ratio of rural population to total population	Ratio of urban population to total population
	a	b	c	d	e	a/b*100	a/c	d/c*100	e/c*100
Data Year	2020	2020	2018	2018	2018				
Unit	1000 ha	1000 ha	1000 person	1000 person	1000 person	ha	ha/person	%	%
Romania	6929,05	23840	19506,114	9007,54	10573,10	29,06	0,36	46,18	54,20
Türkiye	22220,36	78535	82340,088	20362,183	61554,688	28,29	0,27	24,73	74,76
*Columns a-b-c-d-e were obtained from the FAOSTAT web page and other columns were derived from these data.									

Table 1 shows that Romania and Türkiye have similar ratios of forest assets to total country area. In this regard, the amount of forest area per capita was determined as 0.36 ha/person for Romania and 0.27 ha/person for Türkiye. In comparison to Türkiye, Romania has a more balanced distribution of people living in cities and rural areas.

The amount of products Türkiye and Romania obtained from forests were taken from FAOSTAT by product categories (round-wood, industrial round-wood, pulpwood, round and split, sawlog and veneer logs and wood fuel) and their temporal changes and trends are shown at Figure 3.

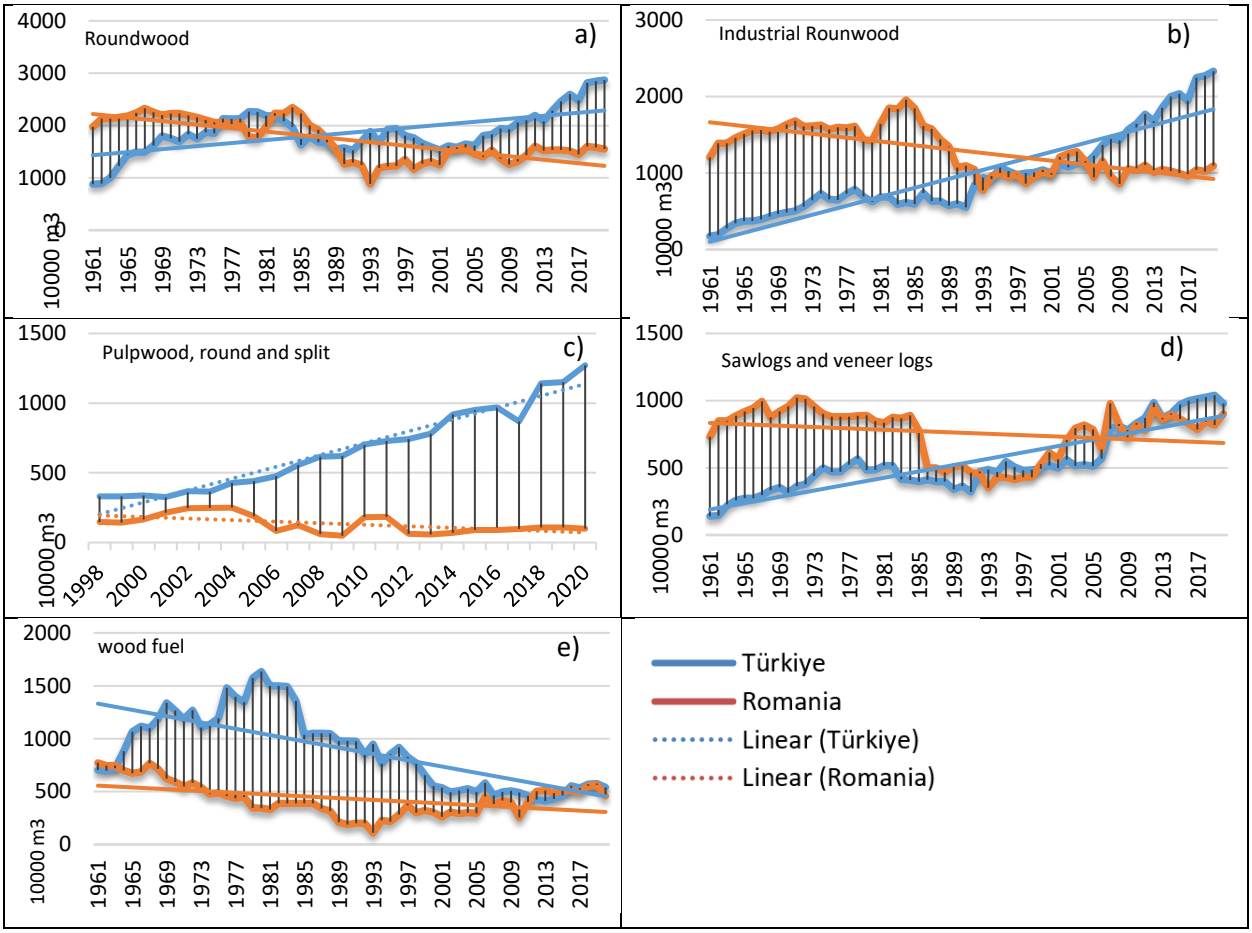

Figure 3. Wood-based forest products production quantities and temporal trend of Romania and Türkiye (FAOSTAT 2022d) a) Round-wood (1961-2020), b) Industrial round-wood (1961-2020), c) Pulpwood, round and split, all species (1998-2020), d) Sawlogs and veneer logs (1961-2020), e) wood fuel (1961-2020).

Figure 3 shows that according to FAO data; between 1961 and 2020, Türkiye's round-wood production increased over time. Türkiye could not sustain its rise in round-wood production between 1961-1980 for a long time and it had an increasing trend again in 2005 and after. On the other hand, Romania's production was demonstrated to have been largely steady from 1961 and 1985, followed by a downward trend from 1985 to 1995 and then a relative increase in production. In general, Romania follows a downward trend in Round-wood production.

Türkiye produced industrial round-wood with a growing trend during the years 1961 and 2020. In addition, Romania's industrial round-wood production amount between 1961 and 2020 was more stable between 1961-1985, while a decreasing trend between 1985-1995 and fluctuating in a narrow range after 1995, is observed.

In the pulpwood, round and split category, it is seen that between 1998- 2020, both Romania and Türkiye produced with an increasing trend. While Türkiye's production in 1998 was 2.2 times of Romania's, it reached 12.86 times in 2020.

While Romania's production of sawlogs and veneer logs was 5.22 times more than Türkiye's in 1961, today Türkiye and Romania are producing in almost the same amount. Sawlog and veneer logs production in Türkiye between 1961 and 2020 shows a positive trend. While Romania's sawlog and veneer logs production was in balanced between 1961-1985, a negative trend was observed between 1985-1995 and a positive trend after 1995.

When the countries' respective wood fuel production is compared, both Türkiye and Romania has a declining tendency between 1961-2020. Between 1975-1985, Türkiye realized the highest wood fuel production. After 1985, wood fuel production began a decreasing trend.

FAOSTAT trade data was used to evaluate the wood-based forest products foreign trade relations of Türkiye and Romania. The import and export amounts of Romania and Türkiye with other countries in terms of some

product categories (round-wood, industrial round-wood, pulpwood, round and split, sawlog and veneer logs and wood fuel) of Türkiye and Romania are given in Figure 4-5-6 and 7.

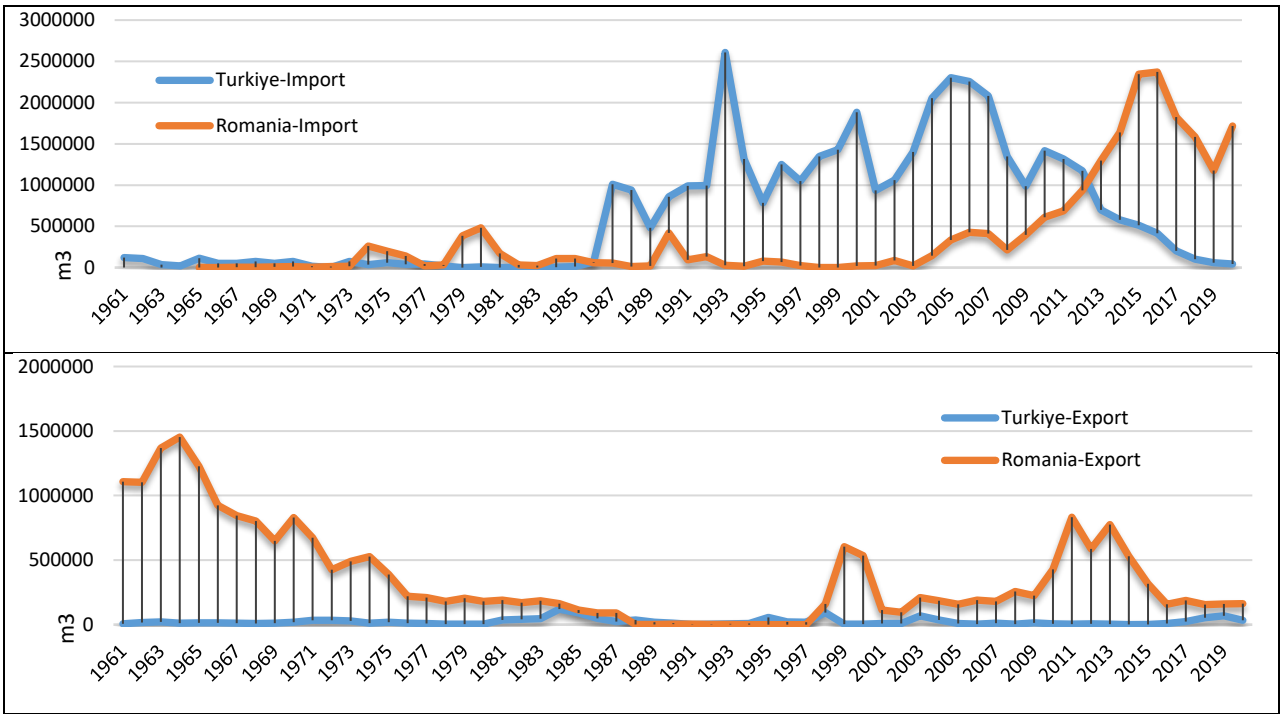

Figure 4. Total round-wood import and export of Türkiye and Romania with the countries of the world 1961-2020

As Figure 4 is examined; it is seen that Türkiye's import amount of round-wood increased dramatically after 1985, however it has decreased rapidly in recent years. Romania's round-wood import amount started to increase in the early 2000s and generally shows a positive trend. There are fluctuations in the round-wood export amounts of both Türkiye and Romania. Romania's round-wood export amount showed a decreasing trend between 1961-1985 and then followed a fluctuating course.

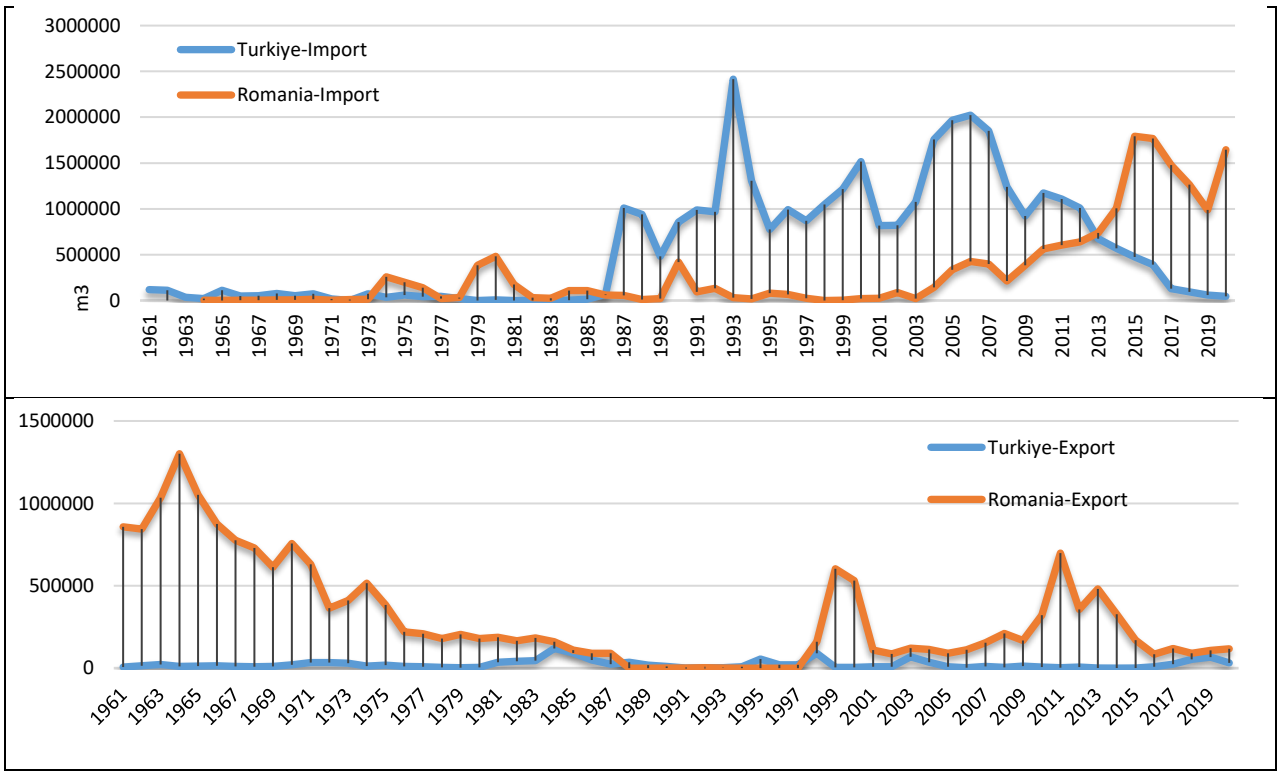

Figure 5. Total industrial round wood imports and exports of Türkiye and Romania with the countries of the world 1961-2020

Türkiye increased its industrial round-wood imports after 1985 and Romania as of the early 2000s. After 2005, Türkiye's industrial round-wood imports are in a decreasing trend. Between 1961-1985, Romania's industrial round-wood exports entered a negative trend and then followed a fluctuating course. Compared to Romania, Türkiye's industrial round-wood export is at very low levels and it is observed that it follows a fluctuating course.

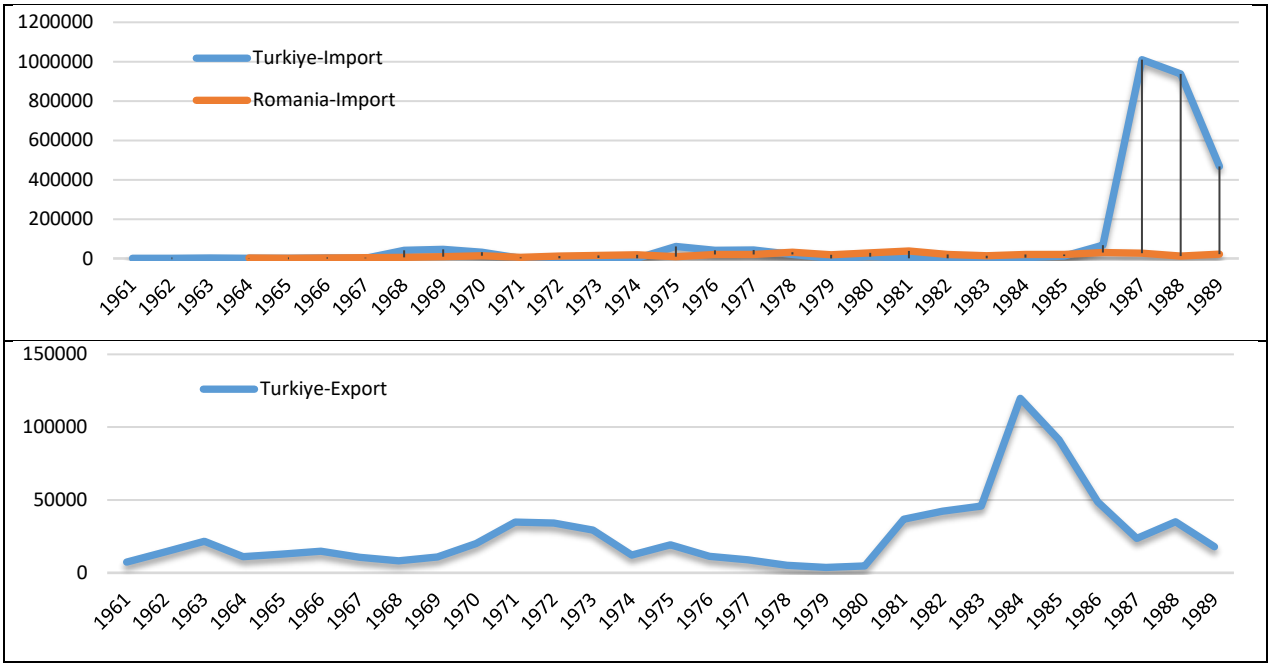

Figure 6. Total sawlogs and veneer logs import and export of Türkiye and Romania with the countries of the world 1961-1989

The import of sawlogs and veneer logs was realized at very low levels in Romania and Türkiye, and the imports increased in Türkiye after 1985, is seen in Figure 6. Romania has no FAO data record regarding the exports of sawlogs and veneer logs. Türkiye has a trend that increased in the early 1980s between 1961-1989, peaking in 1985 and decreasing in the second part of the 80s.

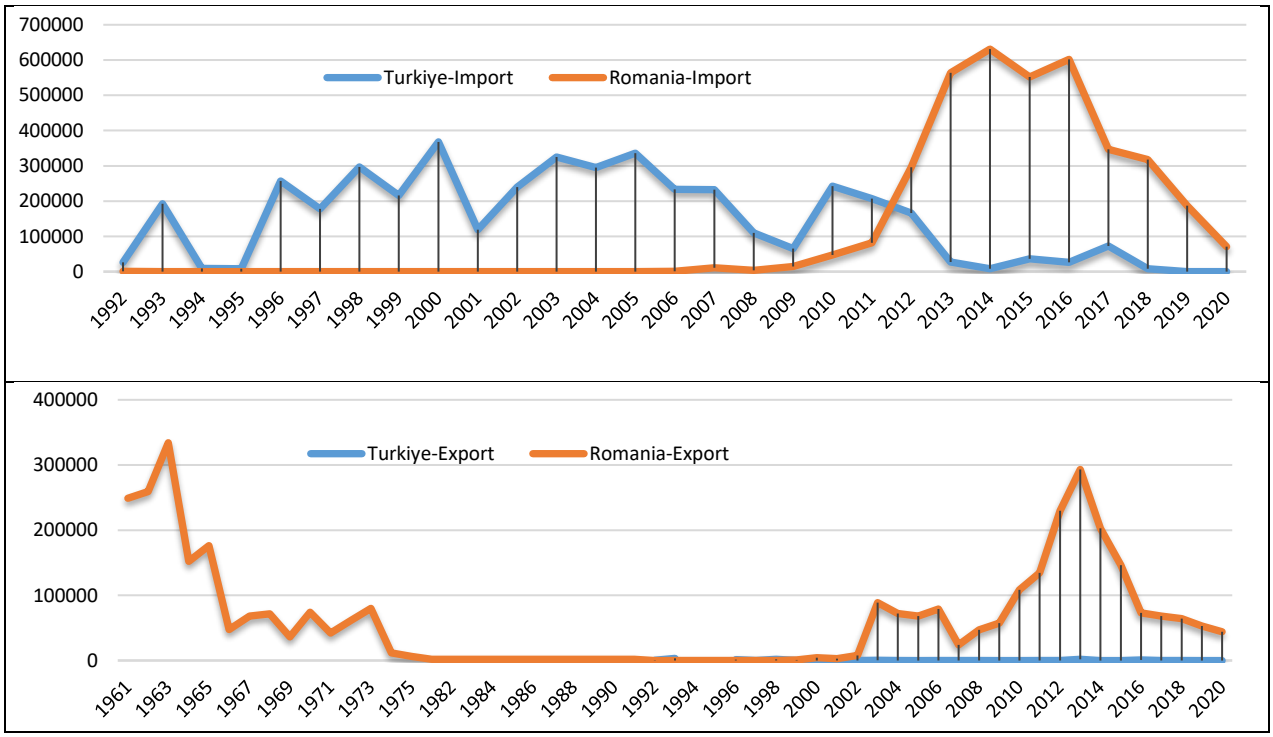

Figure 7. Total wood fuel import and export of Türkiye and Romania with the countries of the world 1961-2020

According to FAO data, data on wood fuel imports of Türkiye and Romania start from 1992. Romania's wood fuel import between 1992-2010; compared to after 2010, is in very low amounts. Türkiye's wood fuel import amount shows a fluctuating structure. Wood fuel exports of Romania showed a decreasing trend between 1961-1975, then Romania realized very low amounts of wood fuel exports between 1975-2002. Wood fuel exports of Romania first increased between 2002-2013 and then started a downward trend between 2013-2020.

In order to give a general idea about the foreign trade relations of Türkiye and Romania according to TUIK data (TUİK 2022), the temporal change in terms of the value of all the merchandise exported to and imported by Türkiye between 2013-2022 is given in Figure 8.

	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
Import	37169.0	35406.1	27180.5	23889.9	25964.8	27209.6	27709.1	27692.5	34344.3	25175.0
Export	27838.0	31415.1	29246.6	28016.9	33151.3	41373.4	40730.7	38939.8	51750.2	52455.4

Figure 8. All merchandise subject to foreign trade between Türkiye and Romania (2013-2022)

There is a certain level of foreign trade relations between Türkiye and Romania. In recent years, in general, a positive trend has been observed in terms of the value of the products imported by Türkiye from Romania. On the other hand, a negative trend is observed in terms of the value of the all the merchandise exported by Türkiye to Romania.

According to ISIC Rev 4 Level 1; the temporal variation in terms of the value of the products Türkiye exports to and imports from Romania in the "*agriculture, forestry and fisheries*" category is given in Figure 9.

	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
Import	1786.3	2407.7	1893.8	1515.3	1726.5	2711.9	3760.5	1554.9	2880.0	1420.0
Export	886.3	1152.4	1128.8	1451.3	1656.4	1927.3	1530.6	2147.3	2817.6	1714.3

Figure 9. According to ISIC Rev 4 Level 1; the temporal variation in terms of the value of the products Türkiye exports to and imports from Romania in the "*agriculture, forestry and fisheries*" category

Figure 9 shows that according to ISIC Rev. 4 Level 1; in terms of the value of products exported by Türkiye to Romania in the category of "agriculture, forestry and fisheries" and imported by Türkiye from Romania, an increasing trend is observed in the temporal plane. However, there are fluctuations in import values.

According to ISIC Rev.4 Level 2; Türkiye's foreign trade with Romania in "*the forestry and logging*" category is given in Figure 10.

	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
Import	1109.8	1040.0	913.0	682.3	406.8	374.8	251.0	226.2	295.1	390.7
Export	151.1	147.3	170.5	137.4	157.8	236.2	191.7	178.8	248.6	176.4

Figure 10. According to ISIC Rev.4 Level 2; Türkiye's foreign trade with Romania in "the *forestry and logging*" category

A moderate increase trend is observed between 2013-2022 in terms of the value of products exported by Türkiye to Romania in "*the forestry and logging*" category. In addition, Türkiye imports a very high amount of forest products from Romania compared to its exports. In Figure 10, a dramatic downward trend is observed in the amount of Türkiye's imports from Romania.

According to ISIC Rev 4 Level 3, Türkiye's foreign trade with Romania in "*the logging*" category is given in Figure 11.

	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
Import	547.7	412.9	413.3	222.3	171.1	227.9	196.3	150.0	47.2	44.4
Export	0.0	0.9	0.0	0.0	5.9	10.3	0.0	0.0	0.0	0.0

Figure 11. According to ISIC Rev 4 Level 3, Türkiye's foreign trade with Romania in "*the logging*" category

According to ISIC Rev.4 Level 3, the values of forest products imported by Türkiye from Romania in "*the logging*" category tend to decrease over time. In addition, Türkiye's exports of forest products to Romania are irregular and in very low quantities.

DISCUSSION and CONCLUSION

Both Türkiye and Romania are two countries with a coast to the Black Sea, which has forest assets. The data on the production and trade of forest products in the FAO and TUIK databases of these countries were analyzed with graphs and trend analysis. When evaluated in general, forest products production of Türkiye and Romania is increasing, excluding wood fuel. There is a general increase in the amount of forest products exports of Türkiye and Romania, is observed. After 1985 is seen as an important period for Türkiye, especially in terms of imported products. For Romania, accelerations were observed in foreign trade after 2005.

The data on the foreign trade relations between Türkiye and Romania were examined from general to specific. As a result of the study, it has been observed that there is a certain level of foreign trade relations between Türkiye and Romania in general. On the other hand, as forest products are detailed in foreign trade, there is a negative trend in forest products trade over the years is seen. It is thought that the decrease in the value of imported products from Romania and the increase in the amount of imported forest products in Romania are related. In general terms, there is a decrease in the trade value of forest products between Türkiye and Romania. The reasons for this situation could be evaluated on a global scale. In future studies, the new positions of countries in the trade of forest products on a global scale can be revealed and future projections can be formed.

Abstract

Pistacia vera L, a member of the Anacardiaceae (Gum tree) family, is the consumable species of the *Pistacia* genus. Especially the Eastern and Southeastern Anatolia regions of Turkey provide very suitable conditions for the production of *P. vera* L. due to its ecological conditions. In addition to its commercial importance, *P. vera* L. has a very rich content in terms of vitamins, minerals, carbohydrates, and fiber, and these rich contents allow its medicinal use. In this study, the anti-proliferative activity of the ethanol extract of the rosy hull of the *P. vera* L. fruit on the A-375 malignant melanoma cell line was investigated. The viability of A-375 cells was measured by the MTT method, which is a colorimetric method, and the IC_{50} value was determined statistically. The IC_{50} value of *P. vera* L. on A375 cells was determined as 72.34 µg/ml. The findings obtained as a result of the study show that this extract can be used in the inhibition of malignant melanoma cells. These data have the potential to provide preliminary information to pharmaceutical raw material studies.

Keywords: Pistachio, melanoma, cytotoxic activity, MTT, A-375

INTRODUCTION

Pistacia vera (Pistachio), a member of the Anacardiaceae family, is an economically important species and it can be used as the drug in traditional medicine or as a flavoring in the food industry around the world (Çağlar et al., 2017). Turkey, Iran and the USA are the main regions where pistachio is grown and traded commercially (Barut et al., 2019). *P. vera* is widely grown in the cities of the Southeastern Anatolia region of Turkey such as Şanlıurfa, Gaziantep and Siirt (Çağlar et al., 2017). It has been determined that *P. vera* is rich in vitamins A, C, E and B (Shi et al., 2010; Yahia, 2011; Çağlar et al., 2017). In addition, it has also a high antioxidant content (Bolling et al., 2011). The hull part remains as waste from *P. vera* (Abolhasani et al., 2017). As a result of the researches made with this hulls, it was determined that it has antioxidant (Sarac and Ugur, 2014; Barut et al., 2019), antimutagenic (Sarac and Ugur, 2014) and antimicrobial (İnci and Kırbağ, 2019) properties and contains a high amount of anti-cancer substances. (Barut et al., 2019). In addition to these activities, cytotoxic activity and anti-inflammatory effects were also examined (Orhan et al., 2006; Almehdar et al., 2012).

The cytotoxicity tests are used for investigation of measuring cell damage, cell proliferation and the other metabolic properties (Li et al., 2015). These tests can be achieved *in vivo* and *in vitro*. *In vitro* studies are preferred to *in vivo* tests because of their advantages such as easy implementation and cheap. The *in vitro* cytotoxicity tests are based on the ratio of dead and live cells. One of these colorimetric tests is 3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulphophenyl)-2H-tetrazolium (MTT) using tetrazolium salts (Tokur and Aksoy, 2017). MTT is a yellow formazan salt and turns purple as a result of increased cell proliferation. The MTT test is used for cell viability and proliferation measurements (Mossman, 1983; Morgan, 1998).

Malignant melanoma is one of the types of skin cancer that occurs with the transformation of aggressive melanocytes into malignant, and it usually occurs in the epidermis. It is seen only in the epidermis in the early stages, but metastasizes in the dermis in the later stages (Göl and Erkin, 2018). In malignant melanoma, as in other types of cancer, early diagnosis is of great importance. Although its incidence is low, it is a type of cancer with a high mortality rate. Of all skin cancers, malignant melanoma cancer is known to be the most fatal. Although melanoma has a rate of less than 3% among skin cancers, it is responsible for approximately 75% of skin cancer-related deaths (Kyrgidis, 2017). In a study on a melanoma cell line, SKMEL-3, the cytotoxic value of the methanol extract of *P. vera* fruit peels was found to vary depending on the dose, and the IC_{50} value was calculated (Sarkhail et al., 2017).

In the current study, it was aimed to investigate the effects of *P. vera* rosy hull on A375 human malignant melanoma cell line. The obtained data will be preliminary data for the further cancer studies.

MATERIAL AND METHODS

2.1. Plant material

Fresh *P. vera* fruits were commercially obtained from Gaziantep in September 2022. Then, the rosy hulls on the outside of the fruit was peeled off, dried in the in conditions out of direct sunlight and grinded into powder.

2.2. Extraction of fruit rosy hull

The powdered rosy hull was extracted with a Soxhlet apparatus for about 3 hours using ethanol (96%). After the extraction, the ethanol was removed and the extract was stored at +4°C in a dark bottle.

2.3. Determination of Cytotoxic Activity

Passaging of Cell Cultures

A375 human malignant melanoma cell line was cultured in 25-well flasks with DMEM medium containing 10% fetal bovine serum (FBS) and 1% antibiotic. The cells that reached sufficient development were removed with Trypsin-EDTA, after cell counting with trypan blue, they were transferred to 96-well microplates and incubated.

Determination of the antiproliferative activity

The antiproliferative activity of *P. vera* fruit peel extract on A375 cell lines was determined by the MTT method (Mossman, 1983). The cells were transferred to 96-well plates with 10 000 cells per well and incubated for 24 hours at 37°C in 5% CO_2. Then, serial dilutions of the extract were transferred to the wells and incubation was continued for 24 hours at 37°C with 5% CO_2. After 24 hours, 20 µl of MTT was treated to the wells and left to incubate for 3 hours. After incubation, 100 µl of dimethyl sulfoxide (DMSO) was added to the wells and the measurement was made at 540 nm in the spectrophotometer, which was kept at room temperature in a shaking incubator for 20 minutes. The test sample was used in the concentration range of 12.50-100 µg/ml. The IC_{50} value was calculated statistically.

RESULTS

In the current study, the antiproliferative activity of the rosy hull extract of the *P. vera* on *in vitro* A375 melanoma cells was determined by MTT test. The highest inhibition was achieved with 100 µg/*m*l from the tested concentrations. At this concentration, A375 cells were inhibited by 94.28% (Figure 1). The IC_{50} value of the extract was calculated as 72.34 µg/*m*l.

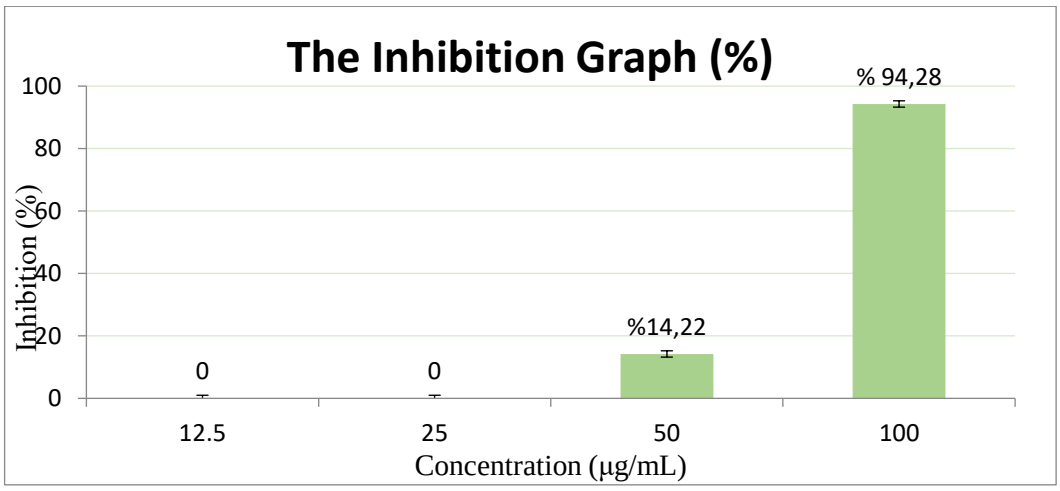

Figure 1. The percentages of inhibition determined by the MTT test

DISCUSSION

In the current study, the antiproliferative effect of the rosy hull extract of *P. vera* was investigated on the A375 human malignant melanoma cells. It has been determined that the inhibition rises in increasing doses of *P. vera* rosy hull extract. The malignant melanoma is the most fatal type of skin cancers (Kyrgidis, 2017). In a study achieved by Sarkhail et al (2017), the toxicity of methanol extract obtained from the hulls of *P. vera* plant on the SKMEL-3 cell line were investigated by MTT. The IC_{50} value in methanol was calculated as 137 µg/ml. In the current study, the IC_{50} value of the ethanol extract of *P. vera* rosy hull on A375 cells was calculated as 72.34 µg/ml. The different of IC_{50} values between the two studies may be due to the different solvents, the different cell lines and the different collection area of plant material The antiproliferative activity of *P. vera* rosy hull ethanolic extract, whose IC_{50} value was determined in this study, on cancer cells can be investigated in future studies. The IC_{50} value obtained from the current study will be used in further studies on the other different cancer cell lines.

CONCLUSION

As a result of the current study, it was observed that the inhibition percentages of *in vitro* A375 human malignant melanoma cells treated with *P. vera* rosy hull extract for 24 hours rised in increasing doses. According to the results of this study, the investigation of the effect of the *P. vera* rosy hull extract, which has a antiproliferative effect on melanoma cells, may be use on other cancer cells and it will be preliminary data for new drug designs.

Abstract

One of the most important subjects for the regeneration and repair of living tissues in the human body is tribology. Hydrogels show promise for cartilage regeneration because of their biocompatibility and functionality compatible with the lubricating processes in cartilage tissue. Because their structures resemble articular cartilage, PHEMA poly(2-hydroxyethyl methacrylate)-based hydrogels with various degrees of crosslinking and hydrophilicity have received special consideration. This study aims to approach articular cartilage's mechanical and physicochemical properties as close as possible to the polymeric hydroxylated fatty acid (Plina-OH) incorporated in the PHEMA hydrogels. It includes an application to control the physicochemical properties of new hydrogels synthesized depending on the change in their content. For this aim, the tribological properties of amphiphilic PHEMA-based hydrogels were examined. Abrasion tests were carried out on a pin-on-disc tester linked with the ASTM G99-05 standard. Also, the friction coefficient, abrasion, and 3D surface topography of hydrogels were investigated. In addition, the specific surface area measurements and hydrophobicity test for prepared cryogels were performed for this study. After the oil-adsorption experiments as hydrophobicity test, cryogels are defined as amphiphilic cryogels so that contain both hydrophilic and hydrophobic cavities.

Keywords: Hydrogels, Cryogels, Hydroxylated fatty acids, tribology, friction coefficient, worn surface

INTRODUCTION

Articular cartilage is a highly compatible rubbery surface due to low wear rate and friction coefficient parameters [1]. Pain and joint dysfunction may occur after many osteoarticular diseases affect the articular cartilage tissue and damage the cartilage [2]. Studies are carried out to relieve the pain, convert the original tissue to its former function with flour, or develop synthetic biomaterials that are alternatives to the existing tissue [3,4]. Prostheses or implants can be used as synthetic biomaterial types [5]. However, some side effects of these procedures may occur, such as tissue availability, the potential for disease transmission, size, and wear [6]. Many studies in the literature increase the interest in new-generation polymeric systems to replace articular cartilage or optimize joint replacements [7]. Hydrogels can be evaluated among polymers that mimic articular cartilage since their structure contains high water content [8]. Due to their biocompatibility, ease of manufacture, and viscoelastic properties, synthetic hydrogels are highly suitable biomaterials for replacement agents for articular cartilage [9]. Hydrogels are hydrophilic polymers with cross-linked and intertwined three-dimensional networks that can hold water and other biological fluids as much as their mass. Due to the intense cross-links they contain, they are not biodegradable or insoluble [10]. They also resemble human tissue due to their biocompatibility and low surface tension [11]. Thus, due to their significant water mass, hydrogels can be considered among polymers that can replace articular cartilage and mimic human tissue. In particular PHEMA-based hydrogels with various properties such as degree of crosslinking, biocompatibility, and hydrophilicity are suitable synthetic polymers that mimic articular cartilage [12,13]. Three-dimensional macroporous hydrogels that can be synthesized by the free radical polymerization method at a temperature below the solvent's freezing point are called cryo-hydrogels (cryogels) [14]. Cryogels show higher mechanical stability, biocompatibility, and elasticity than hydrogels [15,16]. Cryogels have many applications covering biotechnological areas such as environment, health, and food [17–19]. Examining the tribological properties of hydrogels is a critical test to determine whether they can be evaluated as synthetic tissue. Within the framework of this idea, the tribological behavior of HEMA-based cryo-hydrogels containing hydroxylated

polymeric linoleic acid (PLina-OH) was investigated. Thus, by examining the tribological behavior of these new cryo-hydrogels depending on the change in the polymeric fatty acid content included in the structure of PHEMA cryogels, it is aimed to have an idea about whether they can be an alternative to articular cartilage replacement agents. Also, spesific surface area measurements and hydrophobicity test for cryogels were performed.

MATERIALS AND METHODS

Preparation and characterizations of cryogels

The procedures for the synthesis and physicochemical characterization of cryogels are presented in detail previously our work [20]. In addition to these studies, surface pore analyzes of cryogels were examined in detail. The specific surface area of the cryogels was determined using the BET instrument (Quantochrome SI, ANOVA TOUCH LX4, USA) in Kastamonu University Central Research Laboratory (MERLAB). Firstly, cryogel samples were weighed and placed in the sample chamber. Then, the samples were degassed in a nitrogen atmosphere at 95°C for an hour. Gas adsorption was carried out at -210°C and desorption at room temperature. The results obtained in the desorption step were used for specific surface area calculations. In addition, oil adsorption experiments were carried out to determine the hydrophobicity capacities of cryogels containing hydroxylated fatty acids. For this purpose, the oil adsorption capacity was determined by absorbing the cryogels into the oil-containing solution for 2 hours. Calculations were made using the equations in Equation (Eq) 1. Still, instead of water, traditionally used for swelling tests of cryogels, this time, sunflower oil was decisive as the ambient matrix.

$$\text{Oil Adsorption Capacity (\%)} = \frac{W_s - W_d}{Wd} \times 100 \qquad \text{Eq (1)}$$

For this equation, W_s represents the weight of the oil-adsorbed cryogel. Also, W_d is not-oil adsorbed (dried) cryogel.

Determination of Tribological Characteristics

Friction and wear tests were performed in a Pin-on disc tester according to ASTM G99-17 standard. Test samples were prepared by cutting the synthesized cryogels with a diameter of 6 mm and a length of 10 mm. Ck45 steel disc with Ra 0.2, 62 HRC hardness was used in the experiments. The test parameters are as follows; rotation speed 200 rpm, test time 12 sec, load 1 N. Friction tests were carried out at room temperature. Each test was repeated three times, and the obtained values were averaged. In the experiments, the wear rate was calculated by measuring the weight loss of the samples. Weight changes were measured on a Redwag brand balance.

RESULTS and DISCUSSION

Optical images of the cryogels used in this study are presented in figure 1. Cryogels are highly flexible and spongy, reflecting their traditional characteristics. On the other hand, the opaque color of the cryogels started to turn yellow with the increase of the hydroxylated oil composition in the polymer matrix. The cryogels used in this study were coded as HM-2, HM-4, HM-6, HM-8, and HM-10 in proportion to the added hydroxylated oil content. The PHEMA cryogel without hydroxylated fatty acids was symbolized as HM-O. (2: 20 µL PLina-OH, 4: 40 µL PLina-OH, 6: 60 µL PLina-OH, 8: 80 µL PLina-OH and 10: 10 µL PLina-OH)

Figure 1. Optical images of amphiphilic cryogels in this study

BET analysis is one of the methods used to determine the surface and porosity properties of cryogels. According to the results obtained for this purpose, the specific surface areas, pore diameter, and pore volumes of the cryogels are shown in Table 1.

Table 1. Surface area measurements of amphiphilic cryogels

Cryogel	Spesific surface area (m^2/g)	Pore diameter (nm)	Pore volume (cc/g)
HM-0	2,50245	1,739	0,00564807
HM-2	1,68337	1,74545	0,00380184
HM-4	1,85013	1,50375	0,00442233
HM-6	1,38038	1,88424	0,00332755
HM-8	1,55951	1,74193	0,00249492
HM-10	1,27933	2,20048	0,00227587

The oil adsorption experiment was carried out to evaluate the hydrophobic behavior of cryogels. For this, the cryogels were incubated for 2 hours in an environment containing sunflower oil. After two hours, the amount of sunflower oil adsorbed (d: 0.93 g/mL) was determined from the differences between the masses of the cryogels. As seen from the findings in Table 2, the oil-holding capacity of the cryogels increased with the increase in the hydroxylated polymeric fatty acid content in the cryogel. Based on these results, it is thought that hydroxylated polymeric fatty acids may form a hydrophobic cavity in the structure. Since cryogels contain both hydrophilic and hydrophobic formations in the same polymer matrix, the cryogels in this study are defined as amphiphilic cryogels.

Table 2. Oil adsorption results for amphiphilic cryogels

Cryogel	Oil adsorption (%)
HM-0	78
HM-2	105,59
HM-4	123,51
HM-6	129,75
HM-8	180,25
HM-10	210.05

The test results for the determination of tribological properties are as follows:
The average friction coefficient graph of PLinaOH-HEMA series and pure HEMA cryogels obtained in friction tests performed on a pin-on-disc tester is given in Figure 2. The lowest coefficient of friction was achieved in the HC-0 cryogel. The friction coefficients of the other cryogels ranged from 0.4 to 0.5.

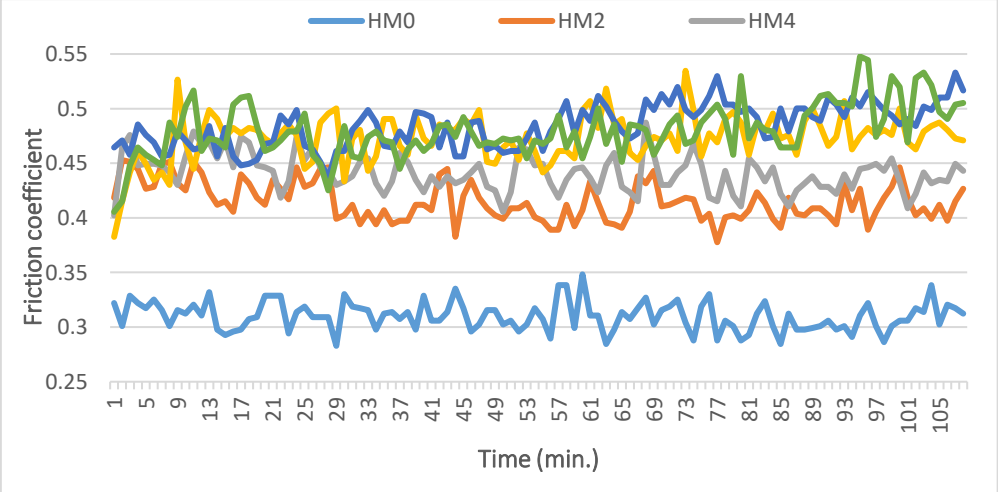

Figure 1. Average friction coefficient graph of HEMA-based amphiphilic cryogel series

The average friction coefficients of cryogels are given in Table 2. The friction coefficient of the HM-0 cryogel with the lowest friction coefficient was determined as 0.309969. The HM-8 cryogel has the highest friction coefficient, and the friction coefficient is 0.484278. The friction coefficient increased as the oil additive ratio to the cryogels increased. However, the friction coefficient of the HC-10 cryogel tended to decrease slightly.

Table 2. Friction coefficients of amphiphilic cryogels

Cryogel	Friction coefficient
HM-0 (plain HEMA)	0.309969
HM-2	0.414957
HM-4	0.44089
HM-6	0.473257
HM-8	0.484278
HM-10	0.479736

The average weight loss of cryogels obtained as a result of friction tests is given in Figure 3. The highest weight loss occurred in HM-0 samples. With the increase in the oil additive ratios to the cryogels, the friction coefficients increased slightly, but the weight losses decreased. From these results, it can be concluded that the oil additive to the cryogels contributes positively to the wear behavior of the cryogels. The decrease in the wear rate of oil-added cryogels results from the hydrophilic and hydrophobic nature of the hydroxylated polymeric fatty acid included in the system.

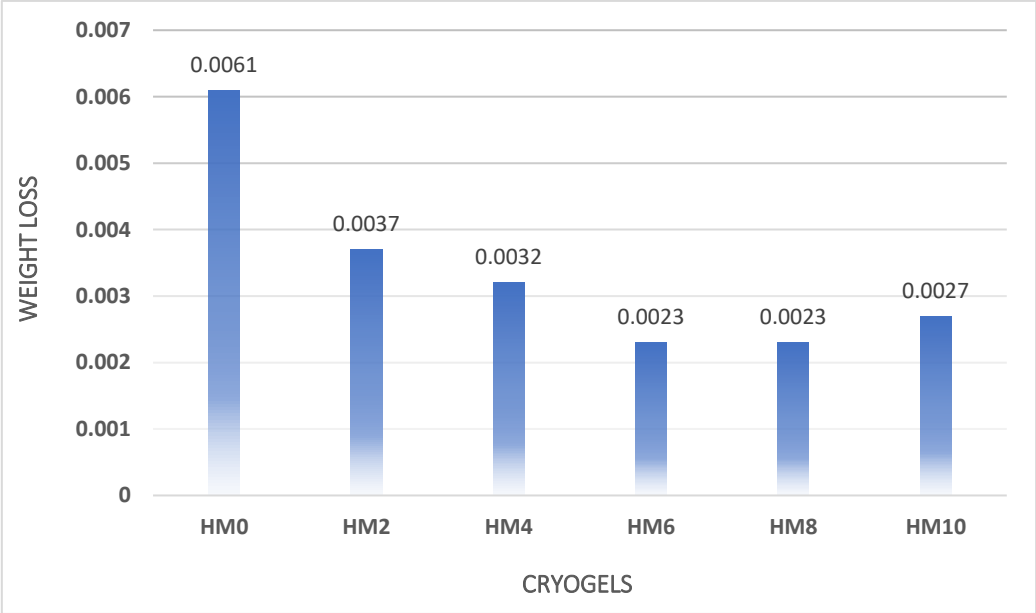

Figure 3. Average weight loss of cryogels

Worn surface images of PHEMA cryogels obtained as a result of friction tests are given in Figure 4. Figure 4.a shows the eroded surface images of HM-0 cryogels. SEM images of the HM-0 cryogel clearly show the formation of cracks. In these cryogels, wear was caused by the rupture of particles. It has been determined that the worn surface images formed by the debris show a rough characteristic with the broken particles. On the other hand, in HM-4 and HM-8 cryogels, it is seen that the eroded surface is tighter. It is seen that the smoothest surface is formed in the HM-8 cryogel. It was observed that the eroded surface became tighter and smoother with the increased oil content additive ratio added to PHEMA cryogel matrix.

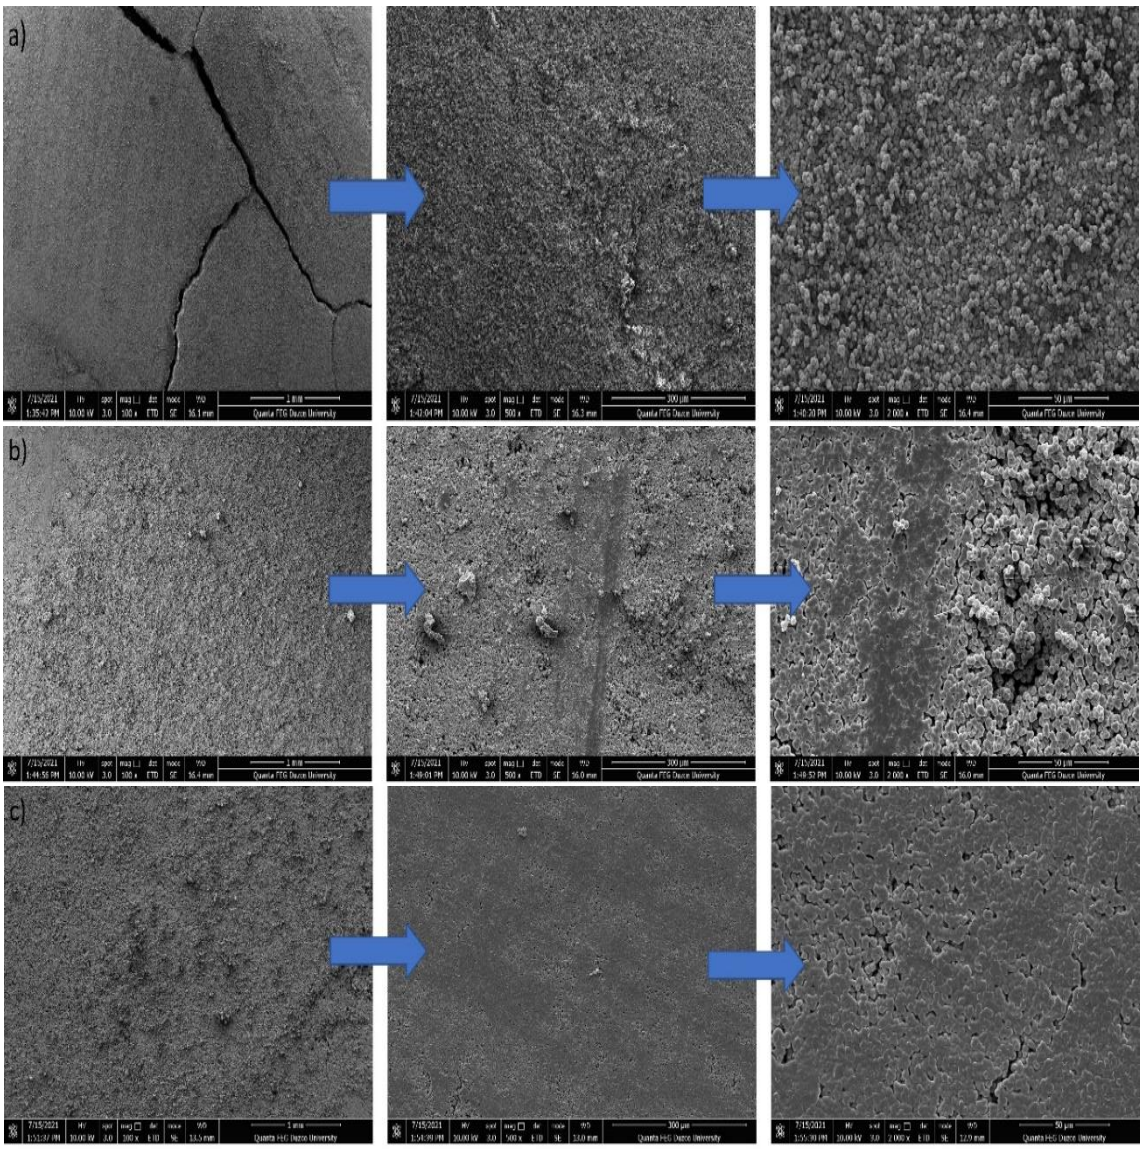

Figure 4. Worn surface images resulting from abrasion tests of amphiphilic cryogel series: a: HM-0, b: HM-4, c: HM-8.

CONCLUSION

Friction tests were performed to determine the tribological properties of HEMA-based amphiphilic cryogels, and it was determined that HM-0 had the lowest friction coefficient and HM-8 had the highest friction coefficient. However, a slight decrease was observed in the friction coefficient of the HC-10 cryogel. In general, it was concluded that the friction coefficient of the cryogels increased with the amount of hydroxylated fatty acids. In the impressions obtained from SEM images as a result of the wear tests, it was determined that the wearing surfaces of the HM-4 and HM-8 cryogels were more tightly-stacked, while the surface of the HM-8 cryogel was the smoothest. Therefore, it was generally concluded that the abraded surface was firmer and smoother with the increased amount of hydroxylated fatty acids.

Abstract
The design of flight controllers for unmanned aerial vehicles (UAVs) may be subject to parametric uncertainties. These can negatively impact the stability of the aircraft. Also, the longitudinal dynamics of a fixed-wing UAV are characterized by inherent oscillatory modes. To dampen out these undesirable oscillations, air vehicles are equipped with automatic flight controllers known as stability augmentation systems (SAS). The current work elaborates on the design of a robust SAS for a medium-altitude long-endurance (MALE) UAV given a set of specifications. The flight controller is implemented using modified proportional-integral-derivative (PID) controllers. Tuning is carried out by means of an advanced algorithm. Furthermore, the system response is studied by varying a few parameters. Upon assessment, the pitch attitude controller meets the requirements. Moreover, closed-loop stability is achieved for both the nominal and the uncertain plants.

Keywords: UAV, SAS, robust flight controller

INTRODUCTION

For certain missions, UAVs present many advantages over conventional aircraft. Today, UAVs are used across a wide range of applications including aerial photography, monitoring, surveillance as well as disaster response (Lashari et al., 2019). The design of a UAV is a challenging task due to model uncertainties which may arise from parameter estimation. Thus, flight control systems are essential in order to compensate for the effects of model uncertainties and achieve the desired performance. For a fixed-wing UAV, the longitudinal dynamics comprise two oscillatory modes: the phugoid mode and the short-period mode (Nelson, 1998). Therefore, to improve closed-loop stability, automatic flight controllers known as SAS are incorporated into the UAV's onboard flight controller.

Various control strategies can be used to stabilize the aircraft. Given their relative simplicity and practicality, PID controllers are widely used in flight control systems. For instance, a PID controller was used to stabilize the motion of a quadrotor UAV (Salih et al., 2010). While PID controllers are commonly used in commercial autopilots, their main drawbacks include a lack of robustness and tuning difficulties (Chao et al., 2010). Also, one of the major limitations of the conventional PID controller is a phenomenon called setpoint kick; when subjected to a change in step input, there is a spike in the response due to the pure derivative action (Ogata, 2010). In order to improve the performance of the controller, different architectures known as *modified or two-degree-of-freedom (2-DOF) PID controllers* can be considered. Such PID controllers comprise two weighting factors for better reference tracking and disturbance rejection. Szafranski and Czyba (Szafranski and Czyba, 2011) investigated the various modified PID architectures to control a quadrotor UAV. They found that having the PI-D structure yielded the best performance. Other notable implementations of modified PID controllers for UAVs can be found in (Chen et al., 2016).

Robustness is of paramount importance for air vehicles to address model uncertainties. Several techniques have been developed to tackle the issue. For instance, intelligent algorithms based on evolutionary techniques, fuzzy logic, neural networks or hybrid methods have been of significant interest for flight controllers (Santoso et al., 2017). The authors noted that these methods' disadvantages include computational demands, uncertainty in the dataset, and potential stability issues. In this study, the robust flight controller design is carried out using MATLAB®.

MATERIALS AND METHODS

Aircraft parameters

In this work, the UAV considered has the following technical specifications (Albatross 2.2, 2022):

Table 1. General characteristics

Property	Value
Length	6.6 m
Height	1.7 m
Wingspan	15 m
Wing area	12.26 m^2
Aspect ratio	18.3
Empty weight	3,629.7 N
Maximum take-off weight	8,338.5 N
Maximum payload weight	2,746.8 N
Fuel capacity	350 l

Flight conditions

The autopilot design is carried out assuming the UAV is under the following flight conditions:

Table 2. Cruise flight conditions

Property	Value
Cruise speed	55 m/s
Cruise altitude	4,000 m
Mass at the beginning of the cruise phase	825 kg

Design requirements

The SAS design is subjected to the following time-domain specifications:

- Settling time : $T_s < 3\ s$
- Rise time : $T_r < 1.5\ s$
- % overshoot : $<\ 5\ \%$
- Steady-state error : $e_{ss} < 1\%$

Linearized Equations of Motion

The motion of a fixed-wing UAV is governed by a system of 12 first-order nonlinear differential equations. For flight mechanics analysis, the aircraft motion around trim points is of particular interest. Using the *small disturbance theory*, the linearized longitudinal equations of motion are as follows:

$$\left(\frac{d}{dt} - X_u\right)\Delta u - X_w\,\Delta w + (g\ \cos\theta_0)\,\Delta\theta = X_{\delta_e}\Delta\delta_e + X_{\delta_T}\Delta\delta_T \quad (1)$$

$$-Z_u\,\Delta u + \left[(1 - Z_{\dot{w}})\frac{d}{dt} - Z_w\right]\Delta w - \left[(u_0 + Z_q)\frac{d}{dt} - g\ \sin\theta_0\right]\Delta\theta = Z_{\delta_e}\Delta\delta_e + Z_{\delta_T}\Delta\delta_T \quad (2)$$

$$M_u\,\Delta u - \left(M_{\dot{w}}\,\frac{d}{dt} + M_w\right)\Delta w + \left(\frac{d^2}{dt^2} - M_q\,\frac{d}{dt}\right)\Delta\theta = M_{\delta_e}\Delta\delta_e + M_{\delta_T}\Delta\delta_T \quad (3)$$

In the above equations, Δu, Δv and Δw represent the perturbed velocity components in the x, y and z directions respectively. The quantities $\Delta\delta_T$, $\Delta\delta_e$, denote the increments in the throttle and elevator deflections respectively, which are the inputs to the system.

Quantities such as X_u and Z_q are known as dimensional stability derivatives; parameters such as M_{δ_e} are called dimensional control derivatives. The dimensional aerodynamic derivatives are functions of non-dimensional coefficients. For instance:

$$M_{\delta_e} = \frac{C_{m_{\delta_e}} QSc}{I_y} \quad (4)$$

The control derivative $C_{m_{\delta_e}}$ denotes the change in pitching moment coefficient with respect to the elevator deflection. Q is the dynamic pressure and is defined as

$$Q = \frac{1}{2}\rho_\infty u_\infty^2 \quad (5)$$

u_∞ and ρ_∞ are the freestream velocity and density respectively; S is the planform wing area; c is the wing mean aerodynamic chord; and I_y is the mass moment of inertia about the y-axis.

The aerodynamic derivatives can be estimated in many ways. In this work, the Athena Vortex Lattice (AVL) code (Drela and Youngren, 2022) was used to compute these coefficients.

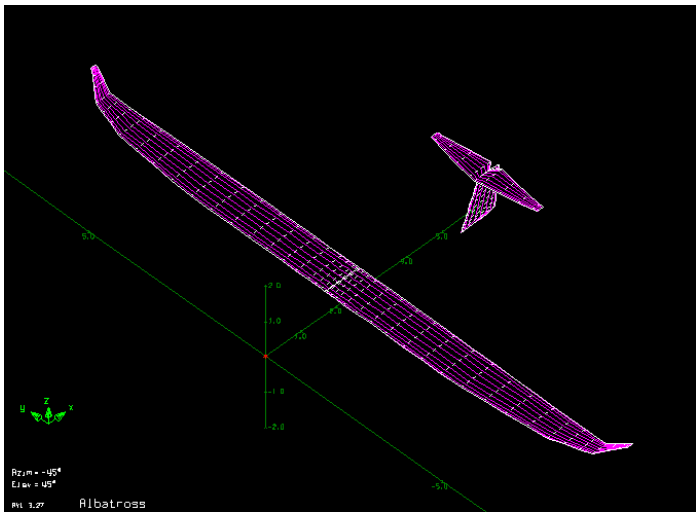

Figure 1. UAV aerodynamic model in AVL

The longitudinal dynamics of the aircraft can be expressed by the following state-space equations:

$$\dot{\boldsymbol{x}} = \boldsymbol{A}\boldsymbol{x} + \boldsymbol{B}\boldsymbol{\eta} \tag{6}$$

$$\boldsymbol{y} = \boldsymbol{C}\boldsymbol{x} + \boldsymbol{D}\boldsymbol{\eta} \tag{7}$$

In Eqs. (6) and (7), $\boldsymbol{A}$ denotes the state-space matrix, $\boldsymbol{B}$ the input matrix, $\boldsymbol{C}$ the output matrix and $\boldsymbol{D}$ the feedthrough matrix. $\boldsymbol{x}$ is the state vector, $\boldsymbol{\eta}$ the input vector, and $\boldsymbol{y}$ the output vector.

State-space representation

For the longitudinal dynamics of the aircraft:

$$\boldsymbol{A} = \begin{bmatrix} X_u & X_w & 0 & -g \\ Z_u & Z_w & u_0 & 0 \\ M_u + M_{\dot{w}}Z_u & M_w + M_{\dot{w}}Z_w & M_q + M_{\dot{w}}u_0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \tag{8}$$

$$\boldsymbol{B} = \begin{bmatrix} X_\delta & X_{\delta_T} \\ Z_\delta & X_{\delta_T} \\ M_\delta + M_{\dot{w}}Z_\delta & M_{\delta_T} + M_{\dot{w}}Z_{\delta_T} \\ 0 & 0 \end{bmatrix} \tag{9}$$

The state vector is defined as

$$\boldsymbol{x} = \begin{bmatrix} \Delta u \\ \Delta w \\ \Delta q \\ \Delta \theta \end{bmatrix} \tag{10}$$

The vector of control inputs is given by

$$\boldsymbol{\eta} = \begin{bmatrix} \Delta\delta_e \\ \Delta\delta_T \end{bmatrix} \tag{11}$$

In Eq. (10), Δq denotes the pitch rate increment and $\Delta\theta$ the pitch angle increment. The inputs to the plant are the elevator deflection angle $\Delta\delta_e$ and the throttle deflection $\Delta\delta_T$.
Assuming that these two quantities are measured, the output matrix is

$$\boldsymbol{C} = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \tag{12}$$

In this case, the feedthrough matrix is null.

$$\boldsymbol{D} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \tag{13}$$

Oscillatory modes

The characteristics of the longitudinal dynamics are summarized in the following table:

Table 3. Longitudinal modes

Eigenvalue pair	Mode	Undamped natural frequency ($\omega_n\ (rad/s)$)	Damping ratio (ζ)	Period ($T\ (s)$)
$\lambda_{1,2} = -2.593 \pm 4.34i$	Short-period oscillation	5.056	0.513	1.448
$\lambda_{3,4} = -0.005 \pm 0.210i$	Phugoid	0.211	0.0237	29.84

Aircraft transfer functions

Using the approximate short-period transfer function (Nelson, 1998), the elevator-deflection-to-pitch-rate transfer function is defined as

$$\frac{\Delta q(s)}{\Delta \delta_e(s)} = \frac{\left(M_{\delta_e} + M_{\dot{\alpha}} Z_{\delta_e}/u_0\right)s + \left(M_\alpha Z_{\delta_e}/u_0 - M_{\delta_e} Z_\alpha/u_0\right)}{s^2 - \left(M_q + M_{\dot{\alpha}} + Z_\alpha/u_0\right)s + \left(Z_\alpha M_q/u_0 - M_\alpha\right)} \tag{14}$$

Substituting the numerical values, this transfer function is given by

$$\frac{\Delta q(s)}{\Delta \delta_e(s)} = \frac{-0.3047s - 0.6143}{s^2 + 5.182s + 25.56} \tag{15}$$

The long-period transfer function that relates the pitch angle to the elevator deflection is expressed as

$$\frac{\Delta \theta(s)}{\Delta \delta_e(s)} = \frac{-\left(Z_{\delta_e}/u_0\right)s + \left(X_u Z_{\delta_e}/u_0\right) - \left(Z_u X_{\delta_e/u_0}\right)}{s^2 - X_u s - \left(Z_u g/u_0\right)} \tag{16}$$

With the nominal parameters, this transfer function is

$$\frac{\Delta \theta(s)}{\Delta \delta_e(s)} = \frac{3.568 \times 10^{-5} s + 5.136 \times 10^{-7}}{s^2 + 0.01339s + 0.04364} \tag{17}$$

The elevator servo transfer function is given by

$$\frac{\delta_e}{v} = \frac{k_a}{\tau s + 1} \tag{18}$$

v denotes the input voltage, δ_e the elevator deflection, τ the time constant of the actuator, and k_a the actuator gain. In this study, the time constant is assumed to be $\tau = 0.1\ s$ and the elevator gain is chosen to be $k_a = 10$.

PID controller design

The standard PID controller can be expressed as

$$C(s) = K_p\left(1 + \frac{1}{T_i\, s} + T_d s\right) \tag{19}$$

K_p is the proportional gain; T_i and T_d denote the integral and derivative time constants respectively.
A flight control system is expected to achieve good reference tracking, disturbance rejection, and zero steady-state error. For certain problems, conventional PID controllers can be tuned to have a satisfactory performance given these requirements.
However, if the system is subjected to a change in step input, the pure derivative action will produce a spike in the control signal. This is because the time derivative of the step function is the Dirac delta function. As a result, the control signal will involve a sharp pulse (Ogata, 2010). This phenomenon known as *setpoint kick* can be detrimental to process components.
To avoid such undesirable effects, 2-DOF PID controllers can be used.
There exist multiple equivalent architectures of 2-DOF PID controllers (Araki and Taguchi, 2003).

The general structure of a 2-DOF PID controller is shown in the following figure:

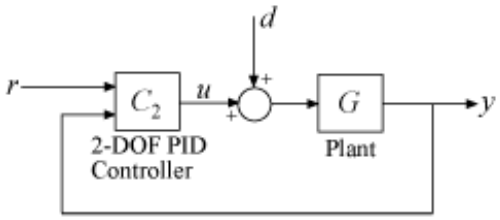

Figure 2. 2-DOF PID controller

In this work, the parallel form of the 2-DOF PID controller is considered. The control signal u can be expressed as

$$u = K_p(br - y) + \frac{K_i}{s}(r - y) + \frac{K_d\, s}{T_f\, s + 1}(cr - y) \tag{20}$$

K_p, K_i and K_d denote the proportional, integral and derivative gains respectively; u is the control signal; T_f denotes the derivative filter time; b and c are the setpoint weights on the proportional and derivative terms respectively; y represents the output signal and r is the reference input.

Flight controller architecture

The flight controller consists of two control loops: an inner loop with rate feedback provision and an outer loop for attitude control.

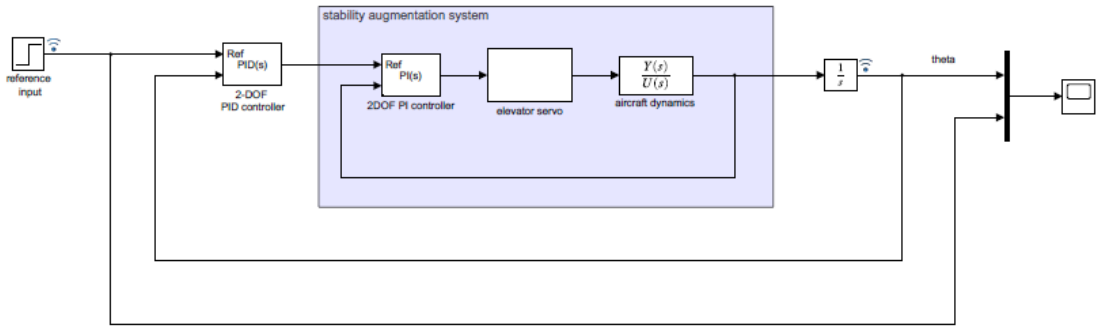

Figure 3. Pitch attitude controller architecture

RESULTS AND DISCUSSION

The system response is examined assuming a fixed throttle setting and a step elevator deflection of $\boldsymbol{\Delta\delta_e = 0.0873\ rad.}$

Open-loop response

Using the transfer function in Eq. (17), the open-loop response of the system to an elevator deflection is shown below:

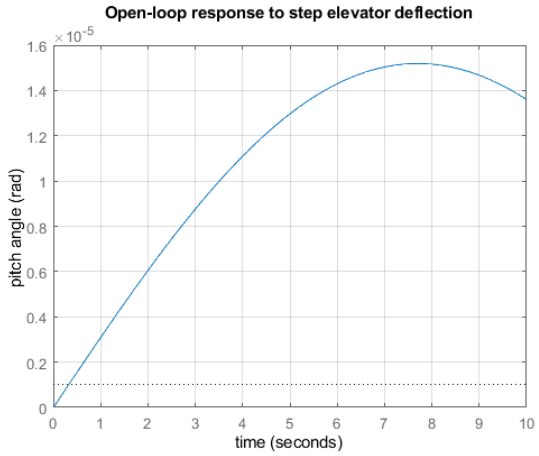

Figure 4. Open-loop response to step elevator deflection

It can be seen that the open-loop plant cannot adequately track the reference input. This poor performance warrants the aforementioned two-loop architecture; each loop comprising a controller and a feedback signal.

Closed-loop response

The tuning was carried out using Simulink® PID Tuner. The response of the system when subjected to a step elevator deflection of 0.0873 rad is shown below:

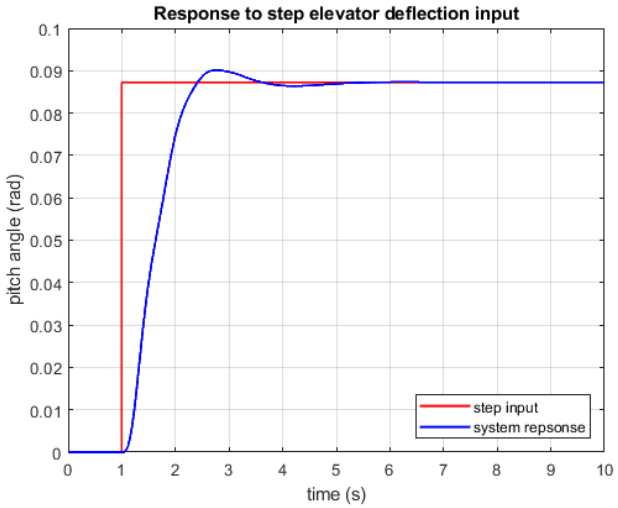

Figure 5. Nominal step response of the closed-loop system

The inner loop controller was found to be an integral-only controller with coefficient $K_i = 54.79$.

Furthermore, the outer loop is a 2-DOF PID controller with the following parameters:
$K_p = 6.47$, $K_i = 4.43$, $K_d = 0.625$, $T_f = 0.00113$, $b = 0.79$ and $c = 0.00809$.

The nominal response has the following time-domain characteristics:

- Settling time $T_s = 2.19\ s < 3\ s$,
- rise time $T_r = 0.862\ s < 1.5\ s$,
- % overshoot $3.25\% < 5\%$
- Steady-state error $e_{ss} = 0 < 1\%$

Thus, the specified design requirements are met.
It is worth noting that the steady-state error to a step input is zero. This is a property of a *Type 1 system*, which is characterized by the presence of one integrator.

Parametric uncertainties

The estimation of the stability and control derivatives lacks accuracy since the fuselage and propeller effects have been omitted. As a result, parametric uncertainties are present in the flight controller design. To design a robust pitch controller, it is assumed that there is 20% uncertainty in the values of $C_{m_{\delta_e}}$ and C_{m_α} and 10% uncertainty in C_{m_q}.

The tuning is carried out using a frequency-based approach: the target phase margins for the inner and outer loops are 60° and 45° respectively.

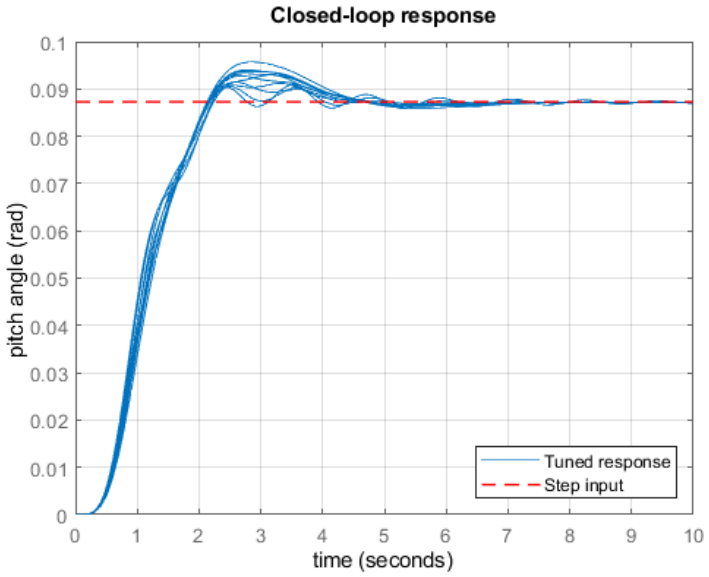

Figure 6. Closed-loop response under parametric uncertainty

The plotted responses are those of 10 cases. In all cases, the closed-loop responses are stable, although for certain parameter combinations, the transient response seems to be more oscillatory.

CONCLUSION

Oscillatory modes are inherent to the dynamics of a fixed-wing UAV. Stability augmentation systems (SAS) are crucial flight control systems to mitigate these effects. Flight control systems are required to be robust against model uncertainties as well as external disturbances. The current work discusses the design of a two-loop pitch attitude controller with SAS for a fixed-wing UAV given a set of design requirements. To improve the system response, 2-DOF PID controllers were used. The tuning of the PID parameters was carried out using MATLAB®'s built-in functionalities. It was determined that the nominal closed-loop response satisfies the time-domain specifications. In addition, the robustness properties were assessed by varying certain aerodynamic coefficients. A frequency-based approach was adopted for tuning the PID controllers. For the desired phase margins, both the inner and outer loops of the flight controller are closed-loop stable.

In future studies, further analyses will be carried out to investigate the effects of a higher number of uncertain parameters, external disturbances as well as sensor noise on the closed-loop response of the system. In addition, a custom algorithm will be developed for the tuning of robust controllers. The performance of said algorithm will then be assessed in terms of system response, stability margins, and computational cost.

Özet

Küresel Uydu Seyrüsefer Sistemleri (*GNSS*: Global Navigation Satellite Systems), gerek askeri gerekse sivil kapsamda pek çok alanda yaygın bir şekilde kullanılan ve uydulardan yayınlanan sinyallere dayalı olarak kullanıcılara yüksek doğrulukta konum, zaman, hız bilgilerini sağlayan en önemli seyrüsefer yardımcısı olarak görülmektedir. Uydulardan yayınlanan sinyaller oldukça yüksek doğrulukta olmasına rağmen uydulardan, yayınım ortamından ve alıcıdan kaynaklanan bir takım hata kaynakları nedeniyle hesaplanan konumsal bilgilerde bir miktar hata ortaya çıkmaktadır. Sistemin doğası gereği oluşabilecek bu hata kaynaklarının yanı sıra sinyal karıştırma (jamming) ve taklit sinyal (spoofing) yayınlama gibi bir takım kasıtlı uygulamalarla da alıcının elde ettiği konumsal bilgilerdeki hata miktarı ciddi oranda artırılabilir. Uydu sistemlerinin özellikle hava taşımacılığı açısından uçuşun tüm safhalarında yegâne seyrüsefer yardımcısı olarak kullanıldığı göz önünde bulundurulduğunda, bu tip kasıtlı bozucu etkiler önemli bir tehdit olarak görülebilir. Bu çerçevede uydu sistemlerinin modernizasyon programları ile birlikte gerek sinyal gücünü artırarak sinyal karıştırmayı önleme (anti-jamming), gerekse yanıltıcı yayınları engellemek üzere aldatmaya karşı koruma (anti-spoofing) teknikleri geliştirme konusunda yapılan araştırmaların arttığı görülmektedir. Bu çalışmada GNSS'de sivil kullanıcılar açısından sinyal güvenliğini tehlikeye sokabilecek taklit sinyal yaklaşımları ve bunları engellemek için uygulanan aldatmaya karşı koruma tekniklerinin incelenmesi amaçlanmıştır.

Anti-Spoofing Techniques in Global Navigatıon Satellite Systems

Abstract

Global Satellite Navigation Systems (GNSS: Global Navigation Satellite Systems) is seen as the most important navigation aid, which is widely used in many fields, both military and civilian, and provides users with high-accuracy location, time and speed information based on signals broadcast from satellites. Although the signals broadcast from the satellites are of very high accuracy, some error occurs in the calculated positional information due to some error sources originating from the satellites, the broadcasting environment and the receiver. In addition to these error sources that may occur due to the nature of the system, the amount of error in the positional information obtained by the receiver can be significantly increased by some deliberate practices such as jamming and spoofing. Considering that satellite systems are used as the only navigation aid in all phases of flight, especially in terms of air transport, such deliberate disruptive effects can be seen as a significant threat. In this context, with the modernization programs of satellite systems, it is seen that the researches on both preventing signal jamming by increasing the signal strength and developing anti-spoofing techniques to prevent misleading broadcasts have increased. In this study, it is aimed to examine the spoofed signal approaches that may endanger the signal security for civilian users in GNSS and the anti-deception techniques applied to prevent them.

1. Giriş

Günlük hayatın vazgeçilmez bir parçası olan uydu sistemlerinin tarihsel gelişimine bakıldığında uydu teknolojisi ile ilgili çalışmaların 1950'li yılların ortalarında başladığı görülmektedir. Sovyetler Birliği ve Amerika tarafından uzaya gönderilen ilk uydulardan elde edilen veriler ışığında uydu teknolojisinin

haberleşme, seyrüsefer, izleme, meteoroloji vb. gibi pek çok alanda kullanılabileceği kanıtlanmıştır. İlerleyen yıllarda Amerika'nın geliştirdiği Transit ile Sovyetler Birliği'nin Tsikada sistemleri sayesinde özellikle deniz taşımacılığında iki boyutlu konum belirleme işlemi yapılabilmiştir. Gelişen teknoloji ile birlikte uydulara eklenen atom saatleri, taşıyıcı frekansı modüle etmek için kullanılan Sahte Rastgele Gürültü (PRN: Pseudo Random Noise) olarak adlandırılan kodlar sayesinde de üç boyutlu konum belirleme işlemi kullanılabilir hale gelmiştir. Bu sayede mevcut uydu sistemlerinin gelişiminde hızlı bir ilerleme kaydedilmiştir. Günümüzde GNSS kapsamında yer alan Amerika'nın Küresel Konum Belirleme Sistemi-GPS (Global Navigation Satellite System), Rusya'nın GLONASS (Globalnaya Navigatsionnaya Sputnikovaya Sistema), Avrupa'nın GALILEO ve Çin'in BeiDou-3 sistemleri yer almaktadır [1]. Bu sistemlerin belirli taşıyıcı frekansları üzerinden yayınladıkları sivil ve askeri amaçlı tasarlanan PRN kodları ve seyrüsefer mesajları sayesinde kullanıcılar konumlarını teorik olarak ortalama 5-10 m'lik hata ile hesaplayabilmektedir. Kullanıcının konumsal doğruluğunu etkileyen faktörler genel olarak uydu yörünge hatası, uydu saat hatası, uydu geometri hatası, iyonosferik hata, troposferik hata, alıcı gürültüsü, yansıma hatası şeklinde sıralanabilir [2]. Gelişen teknoloji ve bir takım modernizasyon çalışmaları kapsamında hata miktarının 1 m'nin altına inmesi konusunda çalışmalar halen devam etmektedir.

Günümüzde özellikle sivil kullanıcılar için yayınlanan sinyallerin taşıyıcı frekanslarının, kullanılan modülasyon tekniklerinin ve seyrüsefer mesaj içeriklerinin açık kaynaklardan elde edilebilir olması uydu sistemlerinde sinyal güvenilirliği konusunu ön plana çıkarmaktadır. 20000-25000 km uzaklıktaki uydulardan iletilen sinyaller alıcıya ulaşana kadar zayıfladığı için sinyal girişime karşı oldukça hassastır. Bu da sinyali bozmak amacıyla yapılabilecek yayın karıştırma (jamming) işlemlerinin kullanılabilir olacağı anlamına gelmektedir. Uydu sistemleri için bir diğer önemli konu ise yine açık kaynaklardan elde edilen sinyal özellikleri ile sinyalin taklit edilebilecek (spoofing) olmasıdır [3]. Dolayısıyla yerdeki bir verici tarafından üretilen ve orijinal sinyalden ayırt edilmesi mümkün olmayan bir sinyal yayınlanması kullanıcının hesapladığı konumsal bilgiyi tamamen yanlış hale getirecektir. Bu tip bozucu bir etkiye maruz kalmak çok hassas konumsal doğruluk gerektiren uygulamalar ve özellikle de hava taşımacılığı açısından son derece kritik öneme sahiptir. Bu kapsamda yapılan literatür araştırması araştırmacıların son yıllarda GNSS ile sunulan hizmetlerin güvenilirliğini artırmak amacıyla çeşitli aldatmaya karşı koruma (antispoofing) teknikleri üzerinde çalıştıklarını ortaya koymaktadır. *Kim ve ark*. 2013 yılında yapmış oldukları çalışmalarında GNSS sinyal üreteci simülatör yazılımını kullanarak taklit sinyali ürettikten sonra mevcut GPS sinyalleri ile senkronize etmiş ve sinyal gücü izleme yöntemi kullanarak taklit sinyali engellemişlerdir [4]. *Yuan ve ark*. 2016 yılında yapmış oldukları çalışmalarında BeiDou için sivil seyrüsefer bilgilerinin güvenirliğini sağlamak üzere ECDSA (Elliptic Curve Digital Signature Algorithm) algoritmasını ile TESLA (Timed Efficient Stream Loss-Tolerant Authentication) protokolü kombinasyonunu kullanmışlardır. Bu sayede alıcının kimlik doğrulama verimliliğinin arttığını vurgulamışlardır [5]. *Kerns ve ark*. 2016 yılındaki çalışmalarında GPS'in CNAV mesajı için veri güvenliğini sağlamak üzere hibrit bir ECDSA-TESLA protokolü önermişlerdir [6]. *Motella ve ark*. (2021) araştırmalarında farklı uydu sistemlerinin birlikte kullanılabilirliğini dikkate alarak hem GPS hem de Galileo uydu sinyalleri için ortak bir Chimera ve OSNMA (Open Service Navigation Message Authentication) yöntemi önermişlerdir [7]. *Hernandez ve ark*. (2015) Galileo'da E6 üzerinden iletilecek ticari sinyalinin tüm yayınım kodunu şifrelemiş ve ayrıca TESLA protokolüne dayalı bir seyrüsefer kimlik doğrulaması tasarlamışlardır [8].

Bu çalışmada GNSS'de özellikle sivil kullanıcılar sinyal güvenliğini tehlikeye sokabilecek taklit sinyal yaklaşımları ve bunları engellemek için uygulanan aldatmaya karşı koruma (anti-spoofing) tekniklerinin incelenmesi amaçlanmıştır. Bu doğrultuda öngörülen tekniklerin maliyet, uygulanılabilirlik ve güvenilirlik açısından sağladığı üstünlükler ile geleceğe yönelik eğilimler ortaya konulmuştur.

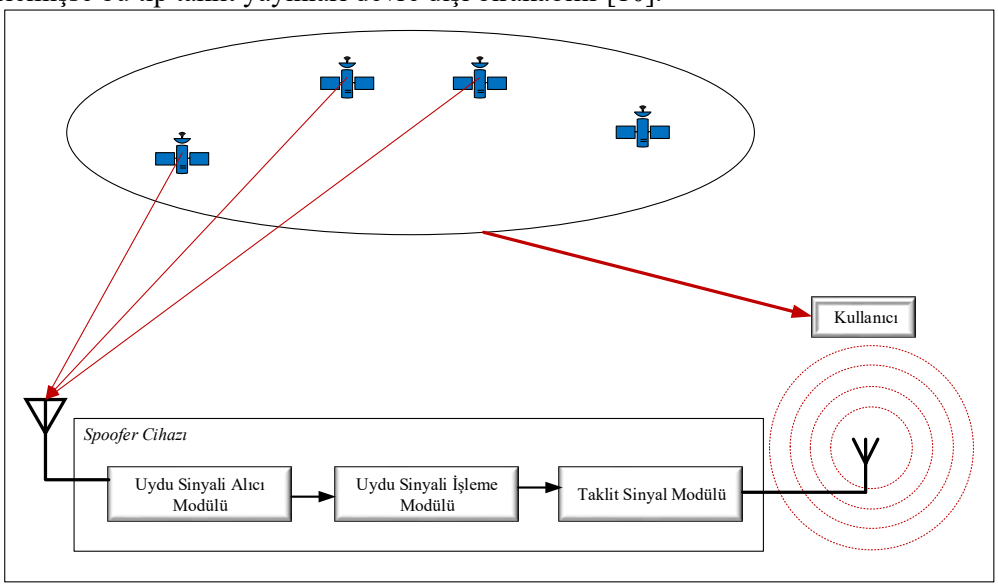
2. GNSS'de Taklit Sinyal (Spoofing)

Daha önce bahsedildiği üzere küresel uydu seyrüsefer sistemlerinde özellikle sivil kullanıcılara yayınlanan sinyal bileşenlerinin teknik özelliklerine erişebilir olması kötü amaçlı kullanıcılar açısından sinyal güvenilirliğini etkileyebilecek öneme sahiptir. Bu kapsamda uydulardan gönderilen sinyalin taklit edilmesinde Üretilen Taklit Yayın (*GSA*: Generating Spoofing Attack) ve İletilen Taklit Yayın (*FSA*: Forwarding Spoofing Attack) olarak tanımlanan iki tür teknik dikkati çekmektedir. GSA'da uydudan gönderilen yayının bir benzeri spoofer adı verilen bir cihaz tarafından üretilerek alıcıya gönderilir. FSA'da ise uydudan gönderilen sinyal yakalanarak alıcıya belirli bir gecikme ile gönderilir. Alıcıya gönderilen bu sinyal, iletim gecikmesi ve sinyal genliğindeki farklılık dışında gerçek sinyal ile tamamen aynıdır. Dolayısıyla kullanıcı açısından hatalı yayınım gecikmesi ile hesaplanan menzil ölçüm değeri ve konum bilgisindeki hata miktarı artacaktır [9].

Kullanıcı sinyalinde bozucu etki yaratmak amacıyla yukarıda genel olarak tanımlanan iki tür teknik özelinde uygulanabilecek üç tip taklit sinyal yaklaşımı bulunmaktadır. Bu yaklaşımlar Tekrarlı Taklit Sinyal

(*RSA*: Replay Spoofing Attack), Tahmini Taklit Sinyal (*ESA*: Estimation Spoofing Attack) ve Sahte Taklit Sinyal (*FSA*: Forgery Spoofing Attack) olarak adlandırılmaktadır.

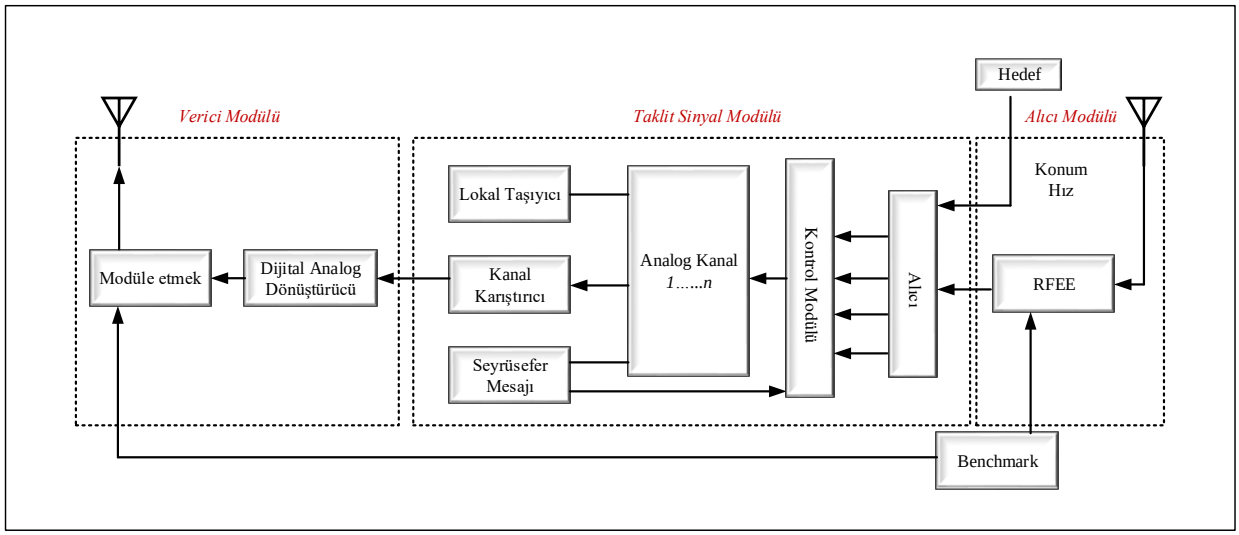
***Tekrarlı Taklit Sinyal (RSA)*:** Bu yaklaşımda çok antenli bir spoofer cihazı gerçek uydu sinyalini yakaladıktan sonra, bu sinyalin genliğini dolayısıyla gücünü de artırarak yapay bir gecikme ile alıcıya gönderir (Şekil 1). Bu şekilde taklit edilen sinyaller tek bir yönden geldiği için alıcı gerçek uydu yayınlarının geliş yönünü belirlemişse bu tip taklit yayınları devre dışı bırakabilir [10].



Şekil 1. Tekrarlı Taklit Sinyal (RSA) [10].

***Tahmini Taklit Sinyal (ESA)*:** Bu yaklaşım, kullanıcılara gönderilen seyrüsefer mesajı içindeki güvenlik kodunun çözülmesine (*FEA*: Forward Estimation Attack) veya tahmin yürütülerek (*SCER*: Security Code Estimation and Replay) sahte güvenlik kodu oluşturulmasına dayanan bir yöntemdir. Seyrüsefer mesajlarında sinyal güvenliğini garantilemek amacıyla genellikle özel algoritmalar kullanılarak şifrelenmiş güvenlik kodları bulunur ve bunların çözülmesi oldukça zordur. ESA yaklaşımında seyrüsefer mesajı içerisindeki bu güvenlik kodları spoofer cihazı tarafından başarılı bir şekilde tahmin edildikten sonra taklit sinyal oluşturmak için gerçek uydu sinyalinin parametreleri ve yayınım kodları kopyalanır. Taklit sinyalin oluşturulması iyi bir tahmin yapılmasını gerektirdiğinden gerek *SCER* gerekse ESA yaklaşımları uygulanması oldukça zor yöntemlerdir. Uydu sistemlerinde sinyal güvenilirliğini sağlamak adına olası bu tip tehditleri ortadan kaldırmak için günümüzde pek çok araştırma ve uygulama yapılmaktadır. Bu uygulamalara örnek olarak bir sonraki bölümde açıklanacak olan Seyrüsefer Mesaj Doğrulama (*NMA*: Navigation Message Authentication) tekniği verilebilir [11].

Sahte Taklit Sinyal (FSA): Bu yaklaşımda uygulanan yöntem Şekil 2'den de görüldüğü üzere genel olarak üç adımdan oluşmaktadır. İlk aşamada yakalanan uydu sinyali Radyo Frekansı Ön Ucu (*RFFE*: Radio Frequency Front End) vasıtasıyla modülün alıcısına iletilir. Bu alıcı aynı zamanda taklit sinyal gönderilecek hedefin yerini ve hızını belirlemek için gerçek zamanlı izleme yapar. İkinci aşamada yakalanan ve alıcı kısmına gönderilen gerçek uydu sinyali kontrol modülüne iletilir. Kontrol modülünde gerçek seyrüsefer mesaj içeriği taklit seyrüsefer mesaj içeriği $\{D_i\}^n$ ile değiştirildikten sonra taklit edilen sinyal analog kanallara bölünerek mikser vasıtasıyla verici modülüne gönderilir. Burada modüle edilen taklit sinyal hedeflenen kullanıcıya gönderilir [12].



Şekil 2. Sahte Taklit Sinyal (FSA) [12].

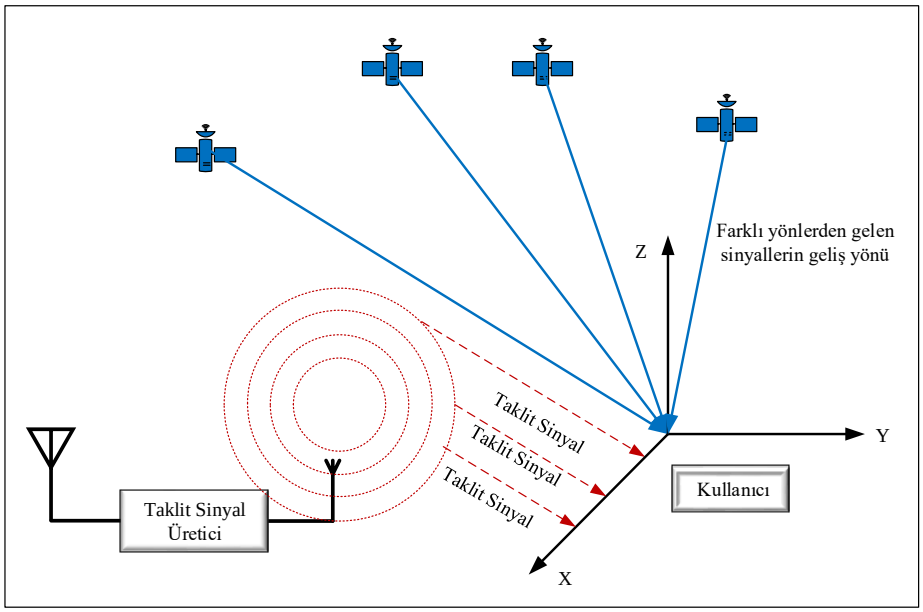
3. Aldatmaya Karşı Koruma (Antispoofing) Teknikleri

Günümüzde GNSS uydularından alınan sinyallerinin ikinci bölümde açıklandığı üzere çeşitli şekillerde taklit edilebilecek ya da yerdeki bir verici tarafından üretilebilecek olması araştırmacıları bu tip girişimleri önlemek amacıyla neler yapılabileceği konusundaki araştırmalara yönlendirmiştir. Bu kapsamda gelişen teknoloji ile birlikte geliştirilen ve halen üzerinde çalışmaların devam ettiği çeşitli aldatmaya karşı koruma (antispoofing) yöntemleri bulunmaktadır. Bu yöntemler sinyal ve veri düzeyinde olmak üzere iki şekilde sınıflandırılabilir. Çalışmanın bu bölümünde her iki yaklaşımda uygulanan teknikler halinde açıklanmıştır.

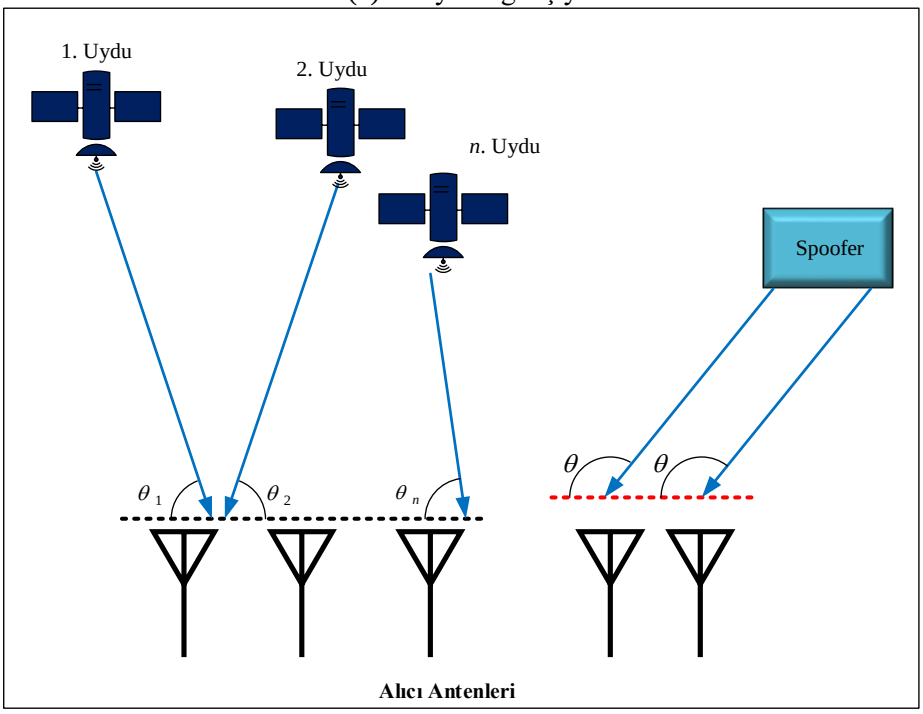
3.1 Sinyal Düzeyinde Aldatmaya Karşı Koruma Teknikleri

Mevcut uygulamalarda taklit sinyalleri sinyal düzeyinde engelleyebilmek amacıyla kullanılan dört teknik bulunmaktadır.

- *Sinyal Varış Zamanı Farkı*: Uydulardan gönderilen sinyaller spoofer alıcı cihazı vasıtasıyla yakalandıktan sonra çeşitli yöntemlere tabi tutularak gerçek kullanıcılara iletilebilir. Alıcı anteninin faz merkezine ulaşan uydu sinyalleri arasındaki zaman farkı belirli bir aralığın dışındaysa bu sinyalin taklit bir sinyal olduğu alıcı tarafından tespit edilerek devre dışı bırakılabilir.
- *Antene Dayalı Tespit*: Bu yöntemde alıcı anteni tarafından alınan bir sinyal için uzamsal filtreleme teknikleri kullanılır. Diğer bir ifadeyle antene gelen sinyallerin gerçek uydudan mı yoksa spoofer cihazından mı geldiğini tespit etmek amacıyla kullanılan bir yöntemdir. Uydular yörünge üzerinde sürekli hareket ettiği için iletilen sinyaller uzamsal özelliklere sahiptir ve farklı yönlerden iletilmektedir. Spoofer cihazı ile iletilen sinyaller ise sabit bir yerden ve sürekli aynı yönden iletilmektedir. Bu tespit yönteminin uygulanabilmesi için alıcıda sinyal yakalama ve izleme devreleri bulunmalı ve anten açısından bir takım düzeltmeler yapılmalıdır. Ek bir donanım gerektirmesi nedeniyle bu yöntem oldukça yüksek maliyetlidir [13-14].
- *Doppler Kaymasına Dayalı Tespit Yöntemi*: Uydunun alıcıya yaklaşma ve uzaklaşma durumuna bağlı olarak gönderilen sinyalin frekansında kaymalar meydana gelir. Alıcı izleme ünitesinde de Doppler Ofset Detektörü (*DOD*: Doppler Offset Detector) vasıtasıyla iletilen sinyalin Doppler kayması hesaplanır. Eğer Doppler kayma değeri önceden belirlenmiş bir eşik değerini aşıyorsa sinyalin uydudan iletilmediği anlaşılır [15].
- *Sinyal Geliş Yönü ve Açısına Dayalı Tespit Yöntemi:* Elektromanyetik dalganın yönü değişmez ve taklit edilmesi imkânsızdır. Şekil 3 (a)'da görüldüğü gibi spoofer cihazından iletilen sinyaller arasında uzamsal bir korelasyon vardır. Mevcut teknik koşullar nedeniyle uydulardan gönderilen sinyaller spoofer alıcısı tarafından yakalandıktan sonra sonra uzamsal bir korelasyon şeklinde kullanıcıya iletilir. Gerçek uydu sinyalleri ise yanıltıcı sinyaller gibi uzamsal korelasyonuna sahip değildir. Bu şekilde de iletilen sinyalin geliş yönüne bağlı olarak gerçek mi taklit mi olduğu tespit edilir [16]. Bununla birlikte uydulardan iletilen sinyaller değişken ve farklı açılardan (Şekil 3(b)) gönderilmektedir. Spoofer cihazından gönderilen sinyaller ise hep aynı açıdan gönderilir. Bu nedenle alıcıda gerçek uydu sinyali ile taklit sinyal arasındaki açısal fark tespit edilerek alınan sinyalin taklit bir sinyal olduğu tespit edilebilir [17].



(a) Sinyalin geliş yönü



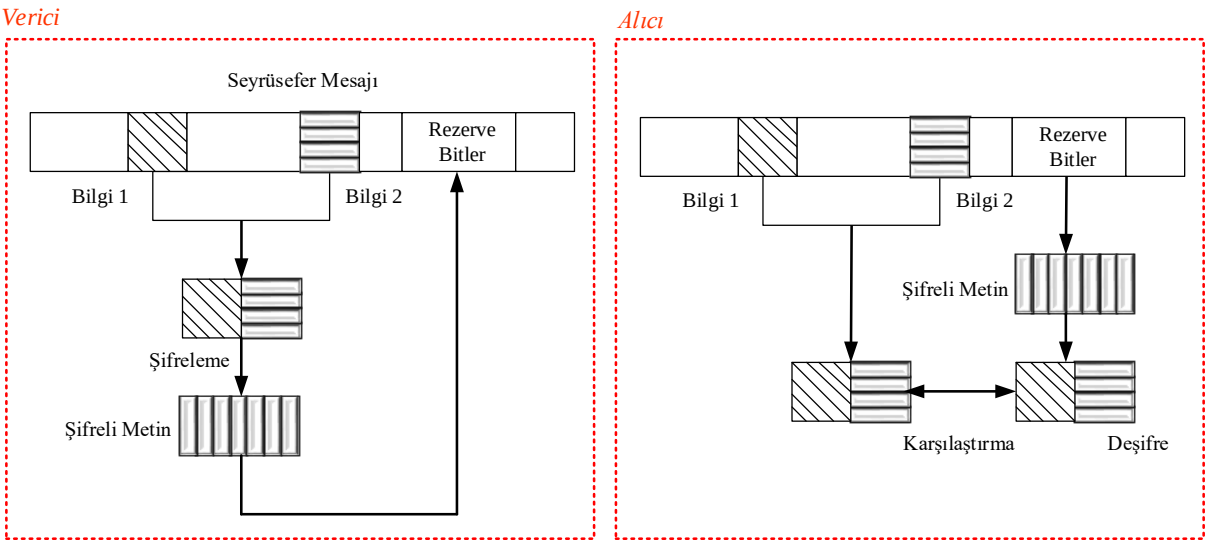
(b) Sinyalin geliş açısı

Şekil 3. Sinyal Geliş Yönü ve Açısına Dayalı Tespit Yöntemi [16-17].

3.2 Veri Düzeyinde Aldatmaya Karşı Koruma Teknikleri

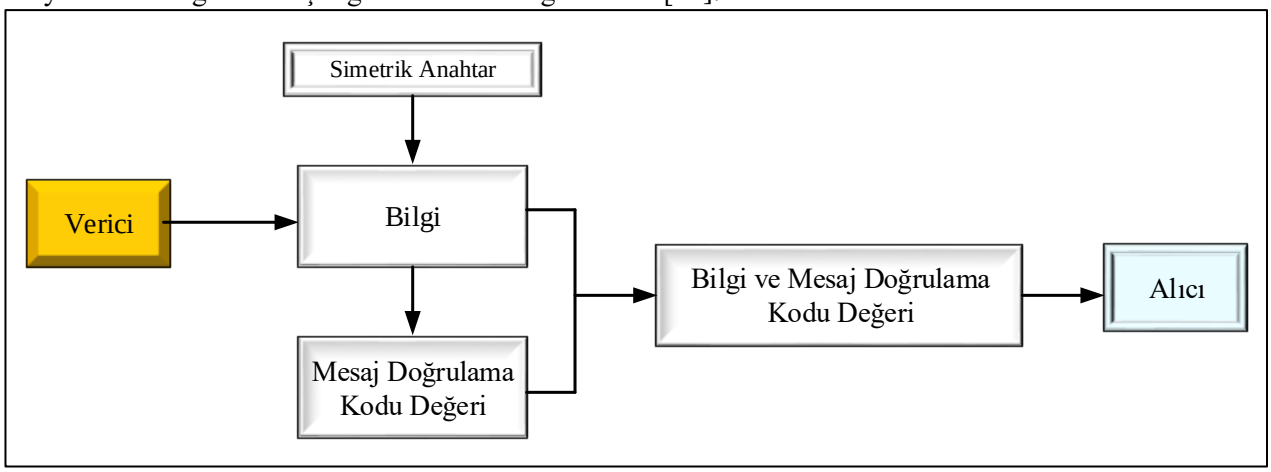
Mevcut uygulamalarda taklit sinyalleri veri düzeyinde tespit edebilmek ve engelleyebilmek amacıyla kullanılan beş farklı teknik bulunmaktadır.

- *Seyrüsefer Mesajı Kimlik Doğrulaması (NMA:Navigation Message Authentication*): Bu yöntemde simetrik ve asimetrik şifreleme algoritmaları kullanılmaktadır. NMA tekniğinin genel çalışma mantığı Şekil 4'te verilmiştir. Seyrüsefer mesajı uydudan gönderilmeden önce kimlik doğrulama bilgileri örneğin ECDSA (Elliptic Curve Digital Signature Algorithm), DSA (Digital Signature Algorithm), RSA (Rivest Shamir Adleman) gibi özel algoritmalarla şifrelenir [18, 19, 20, 21]. Daha sonra şifrelenmiş metin seyrüsefer mesajında rezerve bit alanına eklenir. Alıcı kısmında da seyrüsefer mesajında rezerve bit bölümüne eklenmiş şifreli metin özel anahtarlarla çözülür ve seyrüsefer mesajı bilgileriyle karşılaştırılır. Karşılaştırma sonucunda mesaj doğruluğu onaylanmazsa alıcı bu bilginin sahte olduğunu kabul eder ve alınan sahte bilgiyi siler [19].



Şekil 4. Seyrüsefer Mesajı Kimlik Doğrulaması [22]

- *Protokol Kimlik Doğrulaması:* NMA yönteminde alıcı kimlik doğrulama işlemi uygulamak için asimetrik anahtarı kullanır veya simetrik anahtar aracılığıyla şifreli metinin şifresini çözer. Bu yöntemde kimlik doğrulama için kullanılan asimetrik şifreleme algoritması büyük bir kimlik doğrulama ek yüküne neden olmaktadır [23]. Simetrik şifreleme algoritması da düşük güvenliğe sahiptir. Bu nedenle seyrüsefer mesajı kimlik doğrulama hızını ve sinyal güvenliğini iyileştirmek için TESLA (Timed Efficient Steam Loss Tolerant Authentication) protokolü kullanılmaktadır. TESLA simetrik şifreleme algoritması ve asimetrik şifrelemeyi uygulamak için anahtar bırakma gecikmesi teknolojisini kullanan bir protokol tipi kimlik doğrulama tekniğidir. Şekil 5'te görüldüğü gibi TESLA protokol modeli kullanan bir verici, bir simetrik anahtar vasıtasıyla kısmi veya tüm seyrüsefer mesajına karşılık gelen bir mesaj doğrulama kodu (*MAC*: Message Authentication Code) üretir. Simetrik anahtar, tek yönlü bir fonksiyon zincirine aittir. Verici bilgiyi sadece kendisinin bildiği bir anahtar kullanarak belirli bir süre içinde şifreler ve daha sonra bu süre içindeki bilgiye karşılık gelen bir MAC değeri üretir. Daha sonra bilgi ve MAC değeri alıcıya iletilir. Alıcının bir şifre çözme anahtarı olmadığından gelen bilgileri arabelleğe alır ve ilk etapta bilgilerin kimliğini doğrulayamaz. Bir süre sonra da verici tarafından alıcıya kimlik doğrulama için gereken anahtar gönderilir [24].



Şekil 5. TESLA Protokolü Model Diyagramı [24].

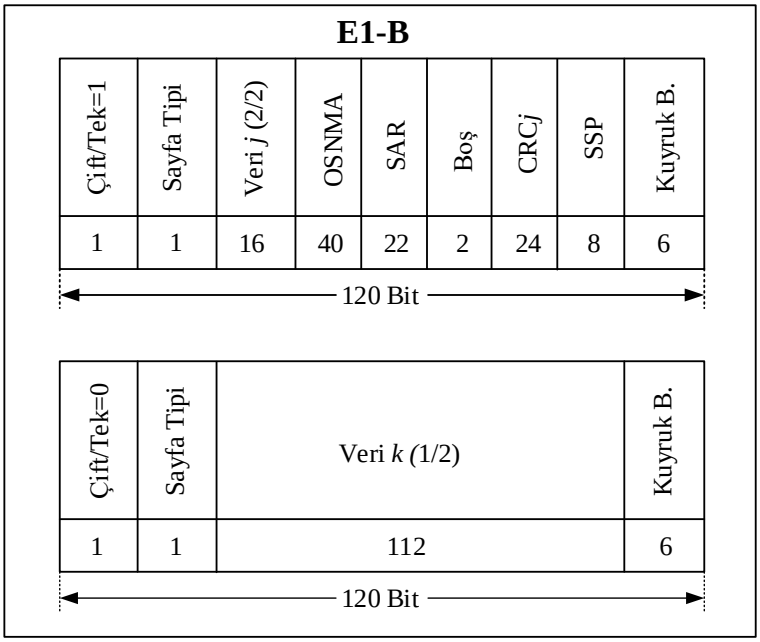
Son zamanlarda yapılan araştırmalarda NMA tekniği ile TESLA protokolünün bir araya getirilerek birden fazla taklit sinyale karşı sinyal güvenirliliğin artırılabileceği yönünde uygulamalar olduğu görülmektedir.

- *Yayımlanan kod şifrelemesi* (*SCE*: *Spreading Code Encryption)*: Yayımlanan sivil bir kodun tamamının veya bir kısmının şifrelenerek gönderilmesi yöntemidir [25].
- *Yayımlanan Kod Kimlik Doğrulaması* (*SCA*: *Spreading Code Authentication)*: Mesaj şifreleme teknolojilerinden biridir. Bu yöntemde yayımlanan koda öngörülemeyen bazı çipler (şifrelenmiş çipler veya filigran dizileri vb) eklenerek şifrelenmemiş ve genel olarak yayımlanan kod bilgilerinin korunması sağlanır [26].
- *Filigran Teknikleri:* Yayımlanan kodun bir bölümünü şifreleme tekniğidir. Diğer bir deyişle, yayımlanan kodu korumak için etiketleme tekniği olarak adlandırılır [12].

- *Seyrüsefer Dışı Mesaj Şifreleme Teknolojisi (NON-NMET: Non-Navigation Message Encrption Technology)*: Bu yöntemde iletilen seyrüsefer mesajında herhangi bir şifreleme işlemi yapılmaz. Yüksek hassasiyetli alıcılarda birden çok uydudan gelen seyrüsefer mesajı bilgileri birleştirilir ve analiz edilir. Bu kapsamda bazı algoritmalar kullanılarak yayınlanan bilgilerde hata olması halinde taklit bilgi olduğu çıkarımı yapılabilir [27].

4. Tartışma ve Sonuç

Günümüzde gelişen teknoloji ile birlikte uydu yayınlarına yapılabilecek çeşitli taklit sinyal girişimleri özellikle emniyetin ön planda olduğu hava taşımacılığı gibi uygulama alanları açısından önemli güvenlik tehditlerinden biri olarak görülmektedir. Bu kapsamda gerek sinyal özelinde gerekse veri düzeyinde bir takım aldatmaya karşı koruma tekniklerinin ön plana çıktığı görülmektedir. Sinyal düzeyinde uygulanabilecek aldatmaya karşı koruma yöntemleri incelendiğinde genellikle alıcıda ekstra donanım ihtiyacı olduğu ortaya çıkmaktadır. Bu da kullanıcılar açısından maliyeti artırıcı bir faktördür. Bunun yanısıra kurulum işleminin karmaşıklığı, uygulama adımları ve işlem süreci açısından da bazı dezavantajları ortaya çıkabilmektedir. Dolayısıyla bu tip yöntemler teorik olarak verimli olsa da ekstra donanıma sahip olmayan kullanıcılar açısından sinyal güvenilirliği sağlanamamış olacaktır. Buna karşılık özellikle seyrüsefer mesajı kimlik doğrulama ve protokol kimlik doğrulama olarak adlandırılan veri düzeyinde uygulanabilecek aldatmaya karşı koruma yöntemlerinin gerek tasarım kolaylığı ve maliyet, gerekse sinyal güvenliği açısından çok daha verimli olabileceği ortaya çıkmaktadır. Bu kapsamda son yıllarda yapılan araştırmalarda genellikle bu iki tekniğin bir arada kullanılabileceği kombine yöntemler üzerine odaklanıldığı görülmektedir. Bu yaklaşıma örnek olarak Avrupa'nın uydu seyrüsefer sistemi GALILEO'nun I/NAV (Integrity Navigation Message) seyrüsefer mesajı verilebilir. Açık Hizmet Seyrüsefer Mesajı Kimlik Doğrulaması (*OSNMA*: Open Service Navigation Message Authentication) olarak tanımlanan bu yöntemde SHA-256 algoritması ve TESLA protokolü kullanılmaktadır. I/NAV mesajı 720 sn uzunluğunda çerçevelerden oluşmaktadır. Her çerçeve 30 saniye uzunluğunda 24 alt çerçeveden oluşur. Alt çerçevelerin her biri 2 sn süreli 15 sayfadan oluşmaktadır. Şekil 6'da da görüldüğü üzere E1-B (1575.42 MHz) üzerinden yayınlanacak olan I/NAV seyrüsefer mesajında önceden rezerve olarak bırakılan 40 bitlik alanının tümü yakın zamanda aldatmaya karşı koruma amacıyla kullanıcıların hizmetine sunulacaktır [29].



Şekil 6. GALILEO I/NAV mesajı nominal sayfa içeriği [28]

Günümüz uydu seyrüsefer sistemlerinde verimli, düşük maliyetli ve güvenli olmaları nedeniyle veri düzeyinde uygulanabilecek aldatmaya karşı koruma teknikleri her ne kadar yeterli olsa da şüphesiz uzun vadede hızla gelişen teknoloji karşısında yetersiz kalacaklardır. Bu nedenle alternatif aldatmaya karşı koruma yöntemlerinin ve bu kapsamda daha etkili şifreleme tekniklerinin geliştirilmesi araştırmacılar açısından uzun vadede araştırma konusu olmaya devam edecektir.

Özet
Zatürre (pnömoni) bakteriyel veya viral enfeksiyonun neden olduğu yaşamı tehdit eden bir akciğer hastalığıdır. Bu nedenle, hastalığın erken teşhisi ölüm oranını önemli derecede azaltmaktadır. Göğüs radyografileri pnömoni hastalığının teşhisinde büyük öneme sahiptir. Pnömoni teşhisinde sağlık alanındaki çalışmalar dışında, mühendislik alanında da birçok çalışma yapılmakta ve teşhis sürecini hızlandırma konusunda kolaylıklar sağlamaktadır. Bu uygulamalardan biri de Derin Öğrenme yöntemleri ile hastalığı teşhis etmektir. Bu çalışmada genel erişime açık 1-5 yaş arası çocuklara ait 5856 adet akciğer görüntüsünün bulunduğu bir veri seti (veri set – 1) ile bu veri setinden 2686 adet görüntünün seçildiği ve bunlara ait işaretlemelerin bulunduğu ikinci bir veri seti (veri set – 2) kullanılmıştır. Bu çalışmada pnömoni sınıflandırma başarısını önerilen yöntemlerle %98,55 olarak elde edilmiştir.

Detection of the rib cage region from chest radiographs and classification of deep learning-based pneumonia disease

Abstract
Pneumonia is a life-threatening lung disease caused by bacterial or viral infection. Therefore, early diagnosis of the disease significantly reduces the mortality rate. Chest radiographs are of great importance in the diagnosis of pneumonia disease. In the diagnosis of pneumonia, besides the studies in the field of health, many studies are carried out in the field of engineering and it provides convenience in accelerating the diagnosis process. One of these applications is the diagnosis of the disease with Deep Learning methods. In this study, a publicly available dataset (dataset – 1) containing 5856 lung images of children aged 1-5 years and a second dataset (dataset – 2) containing 2686 images selected from this dataset and their markers were used. . We achieved 98.55% pneumonia classification success with the methods developed in this study.

Keywords: Convolutional Neural Network, Segmentation, Deep learning, U-Net, Pneumonia Detection

GİRİŞ

Pnömoni; bakteri, virüs veya mantar gibi farklı bulaşıcıların akciğerdeki gaz değişiminin gerçekleştiği alana nüfuz etmesiyle oluşan bir hastalıktır. Pnömoni hastalığında enfekte olan akciğerler sıvıyla dolar ve bu hastalığın en sık görülen belirtileri kaşıntılı öksürük, yüksek ateş, titreme ve nefes alma sırasında havasızlık veya göğüs ağrısıdır (Tursyngaliyeva, A. 2019).

Dünya Sağlık Örgütü'ne (DSÖ) göre, pnömoni çocuk ölümlerinin önde gelen nedeni biridir ve her yıl 5 yaşın altındaki yaklaşık 2 milyon çocuğu ölümüne sebep olduğu tahmin edilmektedir (Rudan ve ark. 2008).

Tıbbi görüntüleme, çeşitli tıbbi durumların erken tespiti, izlenmesi, teşhisi ve tedavi değerlendirmesi için kullanılan tıbbi prosedürler gibi farklı klinik uygulamalarda önemli bir rol oynar (Puttagunta ve ark. 2021). Pnömoni için de röntgen görüntüleri ile teşhis etkili bir yöntem olarak kabul edilmektedir. Fakat, deneyimli bir doktorun bile bir hastanın akciğer grafisini görsel olarak analiz etmesi yaklaşık 5 ila 15 dakika arasında sürebilmektedir. Vakalar yoğunlaştığında, doktorun klinik teşhisi üzerinde ciddi bir baskı oluşabilmektedir. Bu nedenle, pnömoninin klinik görüntü teşhisi için yapay zekâ tabanlı yaklaşımların kullanımı

yaygınlaşmaktadır. Bununla beraber yapay zekâ tanı koymada çok hızlıdır ve Evrişimli Sinir Ağları (ESA)'nın insanlardan daha iyi performans elde edilebildiği raporlanmıştır (Yue ve ark. 2020).

Bu çalışmada da özgün ESA tabanlı bir sınıflandırıcı oluşturularak çocuk akciğer grafilerinden pnomani tespit edilmeye çalışılmıştır. Daha önce bu konuda yapılan çalışmalardan farklı olarak, sınıflandırıcıya orijinal akciğer röntgen görüntüleri yerine bölütlenmiş görüntüler verilmiştir. Böylece hastalık ile ilgili doğrudan akciğer üzerinden öznitelikler çıkarılması amaçlanmıştır. Bölütlenmiş görüntülerde her zaman ideal sonuçlar elde edilememektedir. Bu nedenle bölütlenmiş görüntüler üzerinde çeşitli morfolojik işlemler yardımıyla göğüs kafesi (thorax) seçilecek maskeler üretilmiş ve ESA'ya giriş olarak maskelenmiş görüntüler kullanılmıştır.

Çalışmada (Kermany ve ark. 2018)'nın oluşturduğu ve Pham (2021) tarafından etiketlenen çocuk akciğer grafileri veriseti kullanılmıştır. Aynı veriseti ile Kermany ve ark. (2018) yapmış oldukları çalışmada normal ile pnömonili göğüs röntgenlerinin sınıflandırmasında %92,8 hassasiyet, %93,2 duyarlılık ve %90,1 özgüllük ile %92,8 doğruluk elde etmişlerdir. Bu çalışmada herhangi bir bölütleme süreci kullanılmamıştır. Benzeri şekilde Rajaraman ve ark. (2018) %96.2, Ayan ve Ünver (2019) %84.25, Demir ve Bingöl (2022) %96.3, Hashmi ve ark. (2021) %98.3 doğruluk değerlerine ulaşmışlardır. Aydın ve Bingöl (2022) ise çalışmalarında iki aşamalı bir ağ önerisinde bulunarak %96.81'lik bir doğrulama elde etmişlerdir.

Göğüs kafesini daha yüksek başarımla elde edilmesine odaklanılan bu çalışma Aydın ve Bingöl (2022)'nin bir devam çalışması niteliğinde olup, sınıflandırıcı ağ yapısı benzeri mimaride kurulmuştur.

MATERYAL VE METOD

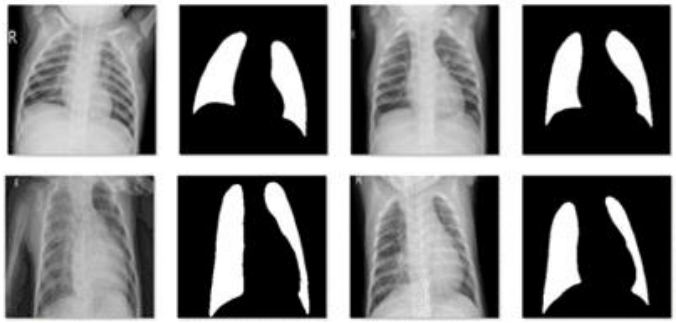
Veri Seti

Çalışmada kullanılan veri seti, Kermany ve ark. (2018)'in oluşturduğu 5856 adet görüntü içeren veriseti içinden 2686 adet görüntü seçilerek Pham (2021) tarafından akciğer bölgelerini gösteren maskeler hazırlanarak oluşturulmuştur. Tablo 1'de bu veri setindeki normal ve pnömoni olan görüntülerin sayıları ve boyutları verilmiştir.

Tablo 1. Veri seti

Normal		**Pnömoni**	
Resim	**Maske**	**Resim**	**Maske**
1341	1341	1345	1345
299×299	256×256	299×299	256×256

Şekil 1'de veri setine ait normal (ilk satır) ve pnömoni (ikinci satır) görüntü örnekleri verilmiştir. Ayrıca her bir görüntünün yanında bunlar için oluşturulan maske görüntüler de bulunmaktadır.



Şekil 1. Normal Görüntüler (ilk satır) ve Bu Görüntülere Ait Maske Görüntüleri (ikinci satır)

Sınıflandırıcı Ağ Yapısı

Tablo 2'de sınıflandırma işlemlerinde kullanılmak üzere, en iyi sonuca ulaşma amacı güderek tasarlanan ESA ağı için, parametreler üzerinde birçok değişiklik ve denemeler yapıldıktan sonra elde edilen en iyi değerler için yeni bir sınıflandırma ağ yapısı tasarlandı. Tablodaki katman olarak verilen her bir yapı sırasıyla 1 adet Evrişim, 1 adet Normalizasyon, 1 adet Evrişim, 1 adet Normalizasyon ve 1 adet Havuzlama bloğu içermektedir. Sınıflandırıcının normal ve pnömoni tespitini gerçekleştiren tam bağlantılı katman yapısı 5 adet alt katman içermektedir ve ağın ezberden kurtulması için bu katmanlar arasında unutma (Dropout) blokları kullanılmıştır (Aydın İ. ve Bingöl Ö. 2022).

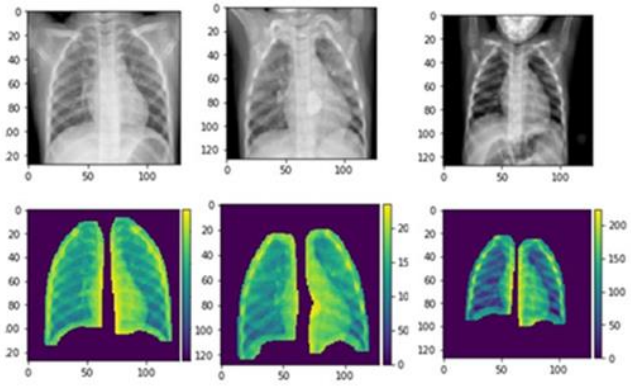
Tablo 2. Sınıflandırma Ağ Yapısı

Katman		Giriş	Çıkış
1	Giriş	256,256,1	256,256,1
2	Katman – 1	256,256,1	128,128,32
3	Katman – 2	128,128,32	128,128,64
4	Katman – 3	64,64,64	32,32,128
5	Katman – 4	32,32,128	32,32,16
6	Katman – 5	16,16,128	8,8,256
7	Düzleştirme (Flatten)	8,8,256	16384
8	Tam Bağlantı Katmanları 256x128x64x32x16	16384	2

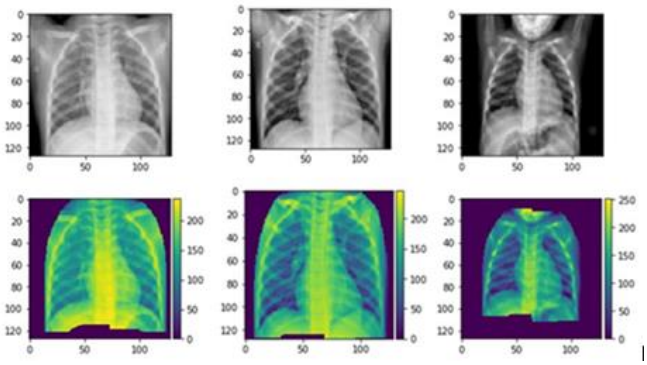
Morfolojik İşlemler

Bu çalışmada, bölütleme için Aydın ve Bingöl (2022) tarafından geliştirilen U-Net mimarisi ve parametreleri kullanılmıştır. İlk önce bölütlenmiş görüntüler üzerinde sınıflandırma işlemi yapılmıştır. Daha sonra sınıflandırma başarısını artırmak adına görüntüler ayrıntılı olarak incelenmiş ve bazı görüntülerin akciğer bölgelerinin düzgün şekilde bölütlenmediği tespit edilmiştir. Bu görüntüleri düzgün bölütlenenler arasına katmak ve sınıflandırma başarısını artırmak adına yayma (dilation) morfolojik işlemi gerçekleştirilmiştir.

Sorunlu bölütlenen akciğer loblarını da içine alacak şekilde tüm görüntüler için farklı pencere boyutlarında yayma işlemleri yapılmıştır. Bunlarla ilgili Şekil 2'de 10×10, Şekil 3'te ise 22×15 boyutlarındaki pencerelerin uygulandığı yayma işlemlerinin görüntüler üzerindeki etkileri gösterilmiştir.



Şekil 2. Yayma İşlemi (10×10)



Şekil 3. Yayma İşlemi (25×12)

Çalışma sırasında, görüntülerde göğüs kafesi (Thorax), bölgesi veya bu bölgeye yakın bölge seçildiğinde, sınıflandırma başarısının arttığı tespit edilmiştir. Yukarıdaki şekillerde verilen yayma işlemlerine ait başarım oranları Tablo 3'te sunulmuştur.

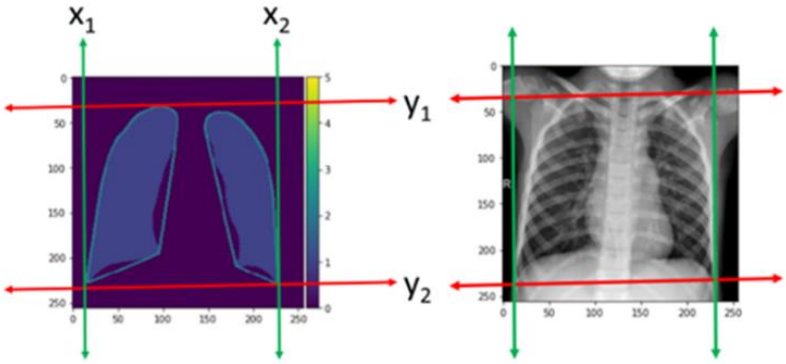
Tablo 3. Yayma başarı değerleri

Boyutlar	Doğruluk (Accuracy)	Kesinlik (Precision)	Duyarlılık (Recall)	F1-Skor
10x10	0.9709	0.9799	0.9809	0.9804
25x12	0.9740	0.9804	0.9845	0.9443

Elde edilen sonuçlar göğüs kafesine en yakın bölgelerin seçilmesinin önemli olduğu göstermiştir.

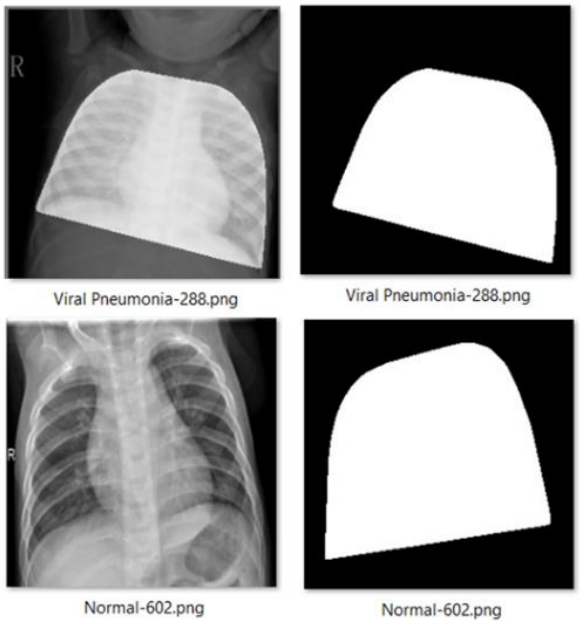
Göğüs Kafesi Bölgesinin Seçimi

Akciğer göğüs kafesinin tespiti genişletme işlemleri bölütlenmiş akciğer lobları baz alınarak yapılmıştır. Verisetindeki tüm akciğer görüntülerine ait bölütlenmiş lobların kenarlara en yakın ve en uzak noktalarının toplamlarının ortalaması alınarak elde edilen piksel değeri kadar genişleme yapılıp, genişlemenin yapıldığı kenarlardan (X veya Y) uzun kenar kadar, kare oluşturacak şekilde diğer kenar (kısa kenar) bu kenara eşitlenerek karesel alan elde edilmiştir. X ve Y doğruları Şekil 4'de gösterilmiştir.



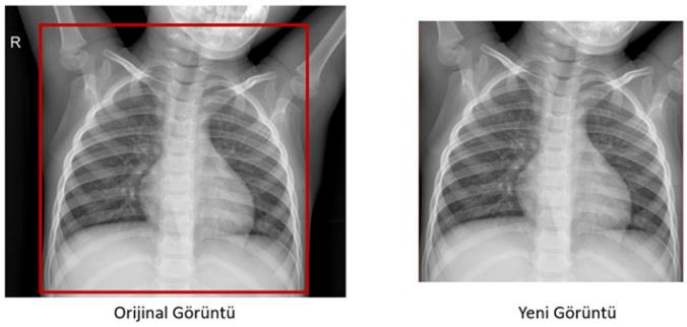
Şekil 4. X ve Y Değerlerinin görsel olarak gösterimi

X ve Y bilgileri kullanılarak lobların uç noktaları bulunmuş ve bu uç noktalar, birleştirilerek şekil 5'te gösterilen siyah-beyaz alanlar elde edilmiştir.



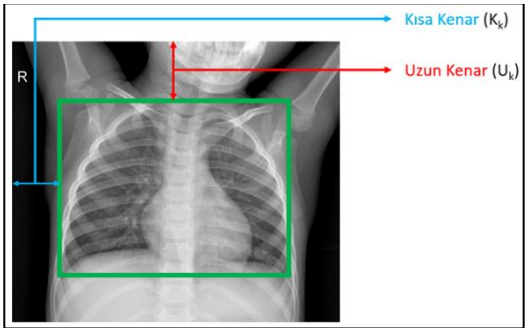
Şekil 5. Lobların birleştirilmesi

Elde edilen karesel alanlar 255×255 boyutuna ölçeklenerek yeni akciğer görüntüleri olarak kaydedilmiştir. Şekil 6'da orijinal görüntü ve bu görüntüden hesaplamalar sonucunda elde edilen yeni görüntü gösterilmektedir.



Şekil 6. Orijinal görüntü – Yeni görüntü

Veri setindeki görüntüler için Göğüs kafesine (thorax) yaklaşık 32 piksellik yayma-genişletme yapıldığında pnömoni sınıflandırma başarısının arttığı görülmüştür. 32 değeri şekil 7'de gösterilen uzun ve kısa kenar bilgileri kullanılarak aşağıdaki denklem yardımıyla elde edilmiştir.



Şekil 7. Uzun ve kısa kenar

$$OKD = \frac{1}{n_n}\sum_{i=0}^{n_n} K_{k(i)} + \frac{1}{n_p}\sum_{i=0}^{n_p} U_{k(i)} \quad (1)$$

Denklemdeki (1); OKD Ortalama Kenar Değerini, n_p Dizideki Pnömoni Görüntü Sayısını, n_n Dizideki Normal Görüntü Sayısını, Kk ve Uk sırasıyla Kısa ve Uzun Kenarı temsil etmektedir.

Tüm görüntülere bu yaklaşım uygulandıktan sonra göğüs kafesi bölgesi tespit edilmiş ve uygun maskeler yardımıyla sınıflandırma işlemi gerçekleştirilmiştir.

TARTIŞMA VE SONUÇLAR

Bu çalışmada, Aydın ve Bingöl (2022)'ün Kermany ve ark. (2018)'na ait veriseti üzerinde yapmış oldukları çalışmadan esinlenerek, bölütleme işleminin sınıflandırma başarısını artırıp artırmayacağını gösterilmeye çalışılmıştır. Bu amaçla yapılan birçok denemeden sonra göğüs bölgesi (thorax)'ni içine alacak şekilde bir yayma işlemi yapıldığında sınıflandırma başarısının arttığı görülmüştür.

Başarımın en sağlıklı şekilde ifade edile bilinmesi adına veriseti-2'de yer alan 2686 maske ve bunlara ait görüntüler kullanılarak, geliştirilen yöntemle maskelere ait uç noktalardan algoritmik şartlar sağlandığında 32 piksellik yayma ve kareye tamamlamanın ardından 255×255 boyutuna genişletme işlemi yapılmış ve ardından sınıflandırma işlemine tabi tutulmuştur.

Tablo 4'te geliştirilen bu yönteme ait K-Fold k=5 için başarı değerleri verilmiştir.

Tablo 4. Geliştirilen yönteme ait başarı değerleri

K Doğ.	Doğruluk (Accuracy)	Kesinlik (Precision)	Duyarlılık (Recall)	F1 Skor
1	0.9833	0.9927	0.9749	0.9837
2	0.9851	0.9781	0.9926	0.9853
3	0.9907	0.9927	0.9891	0.9909
4	0.9833	0.9854	0.9818	0.9836
5	0.9851	0.9854	0.9854	0.9854
Ort.	**0.9855**	**0.9869**	**0.9848**	**0.9864**

Tablo 4'teki değerler ve giriş bölümünde verilen literatürdeki çalışmalar göz önüne alındığında, akciğer grafilerinin doğrudan ESA'ya giriş olarak verilmesi yerine doğru şekilde seçilmiş göğüs kafesinin verilmesi durumunda daha başarılı sonuçlar elde edilebileceğini göstermektedir.

Abstract

Nowadays, due to the increasing energy costs, energy efficiency studies have gained great importance. In this study, it is aimed to increase the energy efficiency as well as to increase the battery performance by decreasing the kaizen tunnel plate curing temperature value. When the microstructure of the cured plate is examined by decreasing 15% of the plate curing temperatures approximately; it is seen that the 3BS (3PbO.PbSO4.H2O) microstructure is formed instead of 4BS (4PbO.PbSO4). Only when the temperature value of the high temperature chamber is reduced by 15%, the resulting microstructure contains 3BS and 4BS microstructures. It is observed that the number of battery cycles increased by optimizing the 3BS/4BS ratio. By reducing both the high temperature chamber and the low temperature chamber by 15%, the microstructure formed in the cured positive plate is almost completely 3BS. By reducing both the high temperature chamber and the low temperature chamber by 15%, the microstructure formed in the cured positive plate was almost completely 3BS, which increased the OCV (V), CCA (A-EN) and charge acceptance values. With the decreasing curing temperature, approximately 42 TL/h savings were achieved in energy costs.
Keywords: Lead-Acid Battery, Curing Temperature of plate, 3BS, 4BS

1. INTRODUCTION

Lead-acid battery does not store electricity but rather it stores a series of chemical, through a chemical process electricity is produced. The primary task in vehicles is to run the starter that gives the engine the first movement. Besides, in state of problems with the charger, the air conditioner, heater, radio, a headlight is needed to operate such systems (Boden, 1998). Lead-acid batteries form the basis of rechargeable battery systems. Lead-acid batteries' reliability, low-cost and life span for many years despite the developing technology of new battery systems, lead-acid batteries are still the most preferred battery in the world as the most widely used system (Sirin, 2020).

Lead–acid battery consisted of positive electrode, negative electrode, separator and electrolyte (Figure 1). Lead acid battery: oxide manufacturing, strip and grid manufacturing, paste mixing process, pasting process, curing process, assembly, formation, laboratory and test processes, including different manufacturing methods and processes are produced as a result of the merger (Eydemir, 2019).

During the process of curing, paste particles are interconnected to form an uninterrupted strong porous mass (skeleton) which, in its turn, is tightly bound to the grid in Figure 2. During plate curing, the following basic processes take place (Pavlov, 2017). The skeleton (hard porous mass) of the cured paste is built. Small crystals in the paste dissolve and big ones grow in size. Water contained in the thin liquid films between the particles evaporates as a result of which 3BS or 4BS crystals and PbO particles interconnect into a strong skeleton. When curing is conducted at temperatures higher than 80 ˚C, 3BS paste is converted into 4BS cured paste. Residual free lead in the paste is oxidized. This is the lead in the leady oxide that has remained un-oxidized during the process of paste preparation. The grid alloy is oxidized and a corrosion layer (CL) forms on the grid surface, which is tightly bound to the cured paste. Two parameters effect the plate curing processes, which are internal (phase composition, density, and moisture content of the paste) and external (air temperature, relative humidity (RH), and air flow rate).

In this study, it is aimed to reduce costs by providing energy efficiency by optimizing and reducing the temperature value of the plate curing kaizen tunnel. In this context, it is also aimed to increase the performance of the lead-acid battery by increasing the 3BS/4BS ratio in the plate active material that occurs during curing by lowering the temperature, ensuring a homogeneous distribution of crystal grain sizes in the desired sizes and shapes.

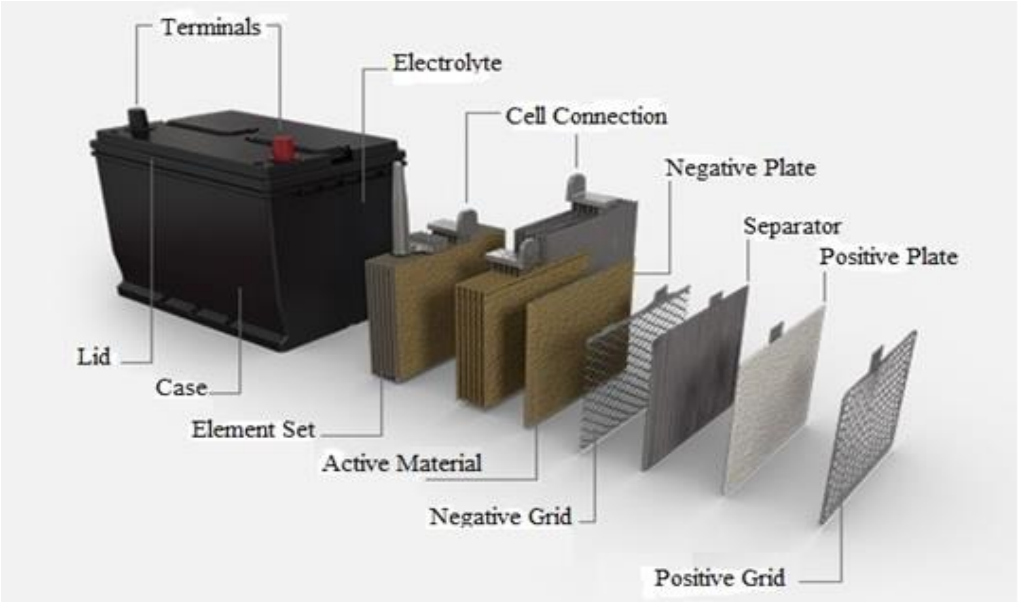

Figure 1. Standard lead acid battery and components

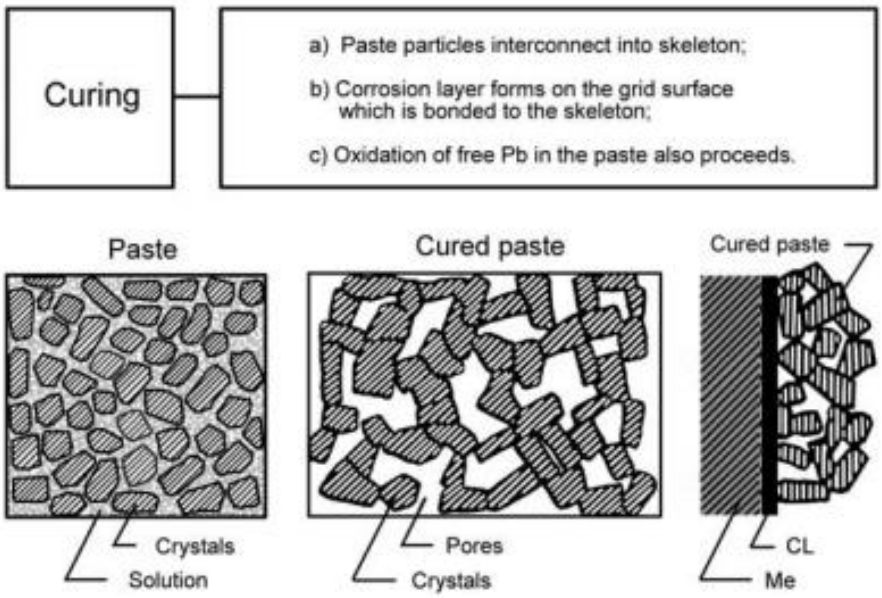

Figure 2. Basic processes during plate curing. (Pavlov, 2017)

2. MATERIALS AND METHODS

2.1. Sample Preparation

Plate production is carried out by reducing the temperature in the Kaizen plate curing tunnel. (Table 1).

Table 1. Control and Test Groups

T0	Control Sample
T2	15% reduction in curing temperature in the low temperature chamber
T3	15% reduction in curing temperature in the low and high temperature chambers.

2.2. Test and Characterization

Cold-cranking ampere (CCA) (A-EN) and open-circuit voltage (OCV) (V) values of batteries were measured by midtronics device. The OCV (V) value means the total voltage of the 6 cells of the battery and should be a minimum of 12.72 V. CCA (EN-A) means that cold cranking ampere value of battery.

In order to check capacity of batteries, capacity test was implemented with respect to EN 50342-1 test standard (EN: European Norm). The capacity (Cn) is 20 h capacity (C20-Ah) defined for the temperature of 25°C ± 2°C. The battery must be discharged with the current, which is kept constant at ± 1% of the rated value, until the voltage between the terminals drops to 10,50 V ± 0,05 V. This discharge time, t (h), should be recorded. The beginning of the discharge should be within the period of 1 hour to 5 hours from the end of the charge. The nominal 20 h capacity Cn is the electric charge (in Ah) that a battery can supply with a current: (1) In = Cn /20 h (2) Ce = t x In (Ah)

In accordance with EN 50342-1 test standard, cold-cranking performance test applied to the batteries. The battery temperature should be adjusted to -18˚C ± 1ºC. The battery must be discharged with Icc current. After 10 s discharge, the voltage Uf between the terminals should be recorded, and the current cut off. The Uf voltage should not be less than 7.50 V.

A charge acceptance test (EN 50342-1) was applied battery in order to examine the effect of curing conditions on charge acceptance. The battery should be discharged at a temperature of 25 ºC ± 2 ºC at a current I0 (A) for 5 h where: (3) I0= Ce/10h. Ce value should be taken as the maximum value Ce of the previous discharges. Within 10 min after the discharge, the battery should be placed in a cooling chamber with (forced) air circulation at a temperature of 0 ºC ± 1 ºC until the temperature of the middle cells is 0 °C ± 1 °C. It is generally accepted that the required temperature will be achieved after a minimum period of 15 h in the cooling chamber. At this temperature, the battery should be charged at a constant voltage of 14,40 V ± 0,05 V and Imax = 50 A for batteries having sizes defined in EN 50342-2 and Imax = 100 A for batteries having sizes defined in EN 50342-4. After 10 min, the charging current Ica should be recorded. Requirements: (4) Ica ≥ 2 I0.

Batteries should be placed in a water bath and stored at +40 ± ˚C ± 2˚C. The charge voltage U 15,6 V and charge rate CR of the battery to be tested will be used as 1,08. Batteries will be connected to series of cycles. Each cycle consists of the following; the battery will be discharged with a constant current at I = 5 ln for 2 hours. If it drops below 10.5 V, the test will be terminated. In the first step, the battery will be charged for a maximum of 5 hours under constant voltage and with a current limitation at 5 ln. The above steps are applied until the voltage during discharge is above the limit or until the number of 360 cycles is reached.

SEM analysis was performed on the plates cured at different temperatures to examine the microstructure.

3. RESULTS and DISCUSSION

3.1. OCV (V) and CCA (A-EN) Measurements

The OCV and CCA (EN-A) values of the batteries were measured by midtronics device. The OCV (V) values of test groups and control groups are given in Figure 3. The results show that OCV (V) values of T2 and T3 test groups are approximately 0,5 % and 1 % and higher than control sample – T0, respectively. The control group -T0 OCV (V) value was found to be lower than the desired 12.72 V value. When it comes to CCA (A-EN) values (Figure 4), CCA values of test groups (T2 and T3) are higher than the CCA values of control groups (T0). The CCA values of the T2 and T3 test groups were approximately 17 and 12 units higher than the control group T0, respectively. The results demonstrate that since the 3BS microstructure was formed with the decrease of the curing temperature, the charge acceptance and electrical conductivity of the plate increased.

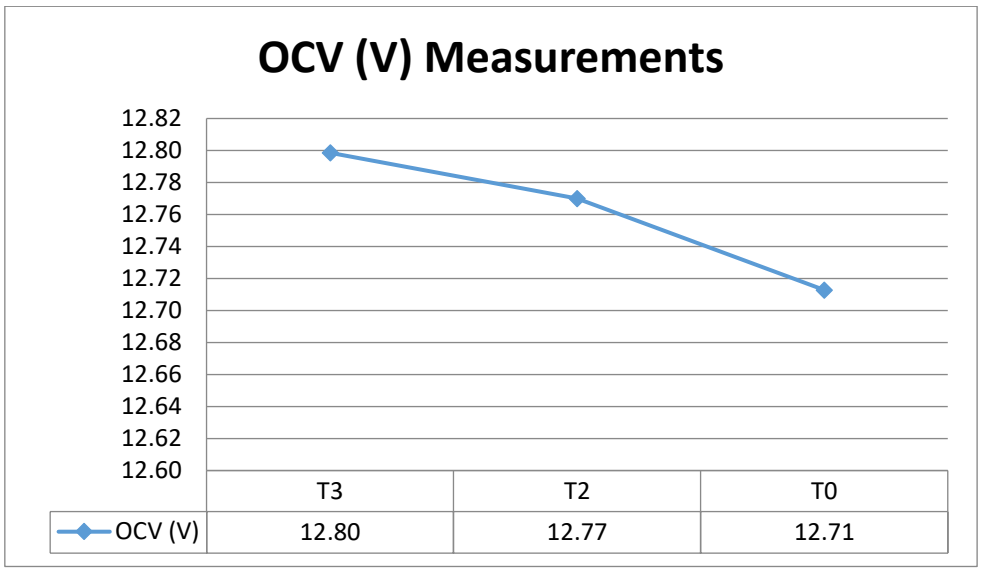

Figure 3. Open-Circuit Voltage (OCV) Values of Batteries

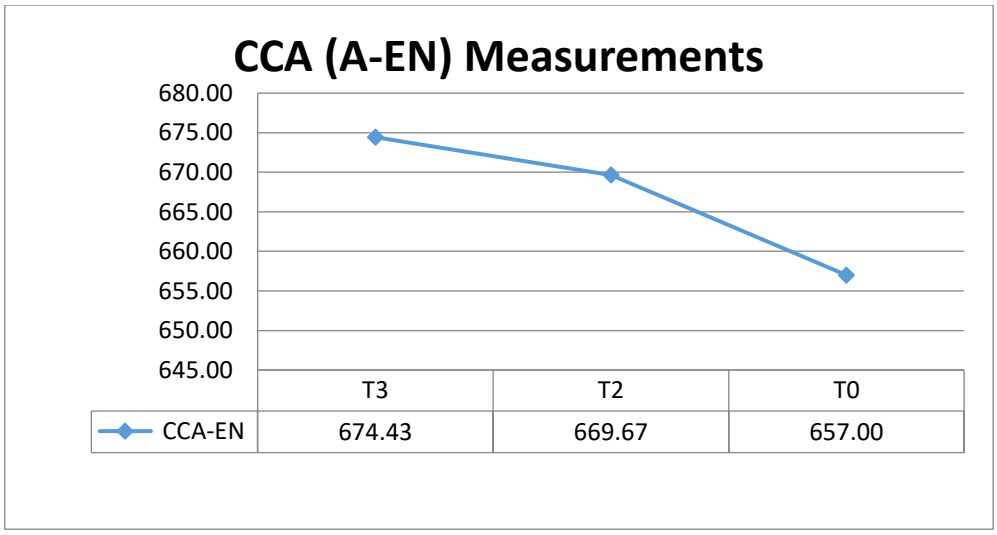

Figure 4. Cold cranking Ampere (CCA) Values of Batteries

3.2. Capacity (C_{20}, Ah) Test Measurements

The effect of curing temperature on the battery capacity was investigated. The capacity test results of control sample and tests groups are given in Figure 5. There was no noticeable change in capacity with decreasing plate curing temperatures and increasing the 3BS/4BS ratio.

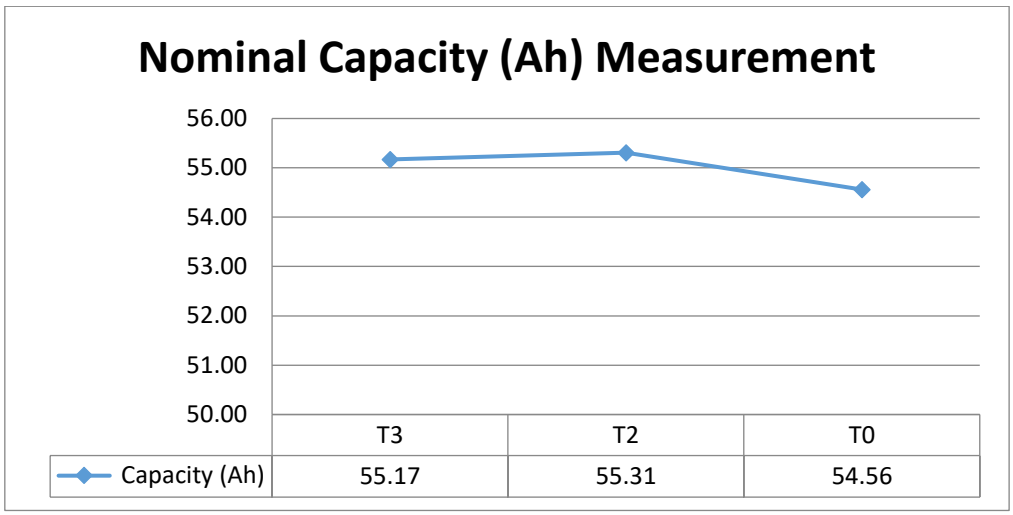

Figure 5. Capacity (Ah) Values of Batteries

3.3. Cold Cranking Performance Test Measurements

In order to examine the effect of decreasing curing temperature of plate on the battery performance, the cold-cranking performance test was performed. Test results are given in Figure 6. According to the test procedure, 590 A current was drawn for 10 seconds from the batteries at -18 ºC. After 10 s discharge, Terminal voltage, U_f , should not be less than 7, 5 V. The test results show that the U_f value of all batteries is above 7, 5 V. The Uf , terminal voltage, values of the T2 and T3 test groups are higher than the control group (T0).

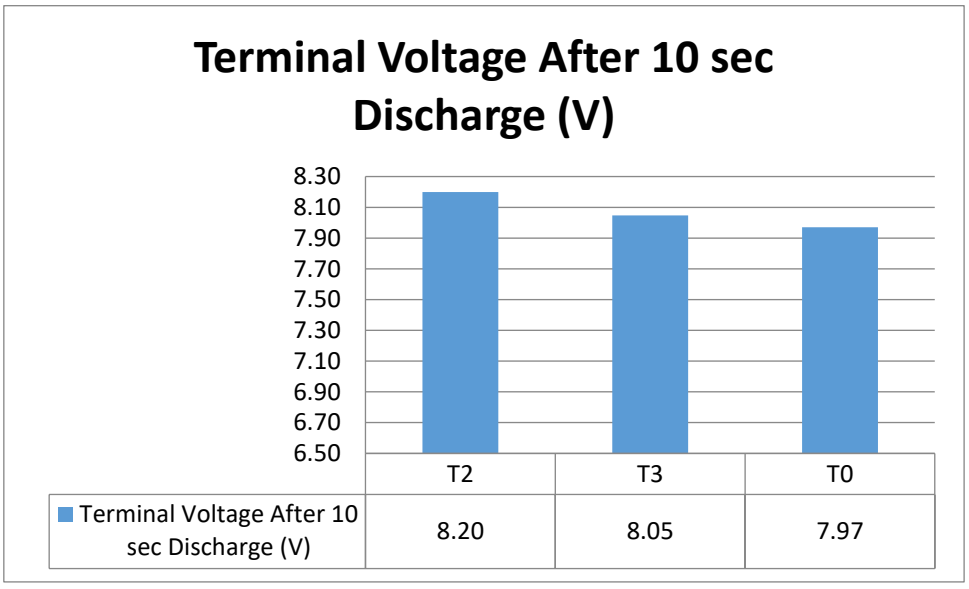

Figure 6. Cold-cranking performance test results of batteries

3.4. Charge Acceptance Test Measurements

A test was carried out to examine the effect of curing temperature on charge acceptance. According to Figure 7, the charge acceptance value of the T3 test group is approximately 10% higher than that of the T0 control group. As the temperature values of both the high temperature chamber and the low temperature chamber were decreased by about 15%, the 3BS/4BS ratio increased, so an increment in the charge acceptance value is observed.

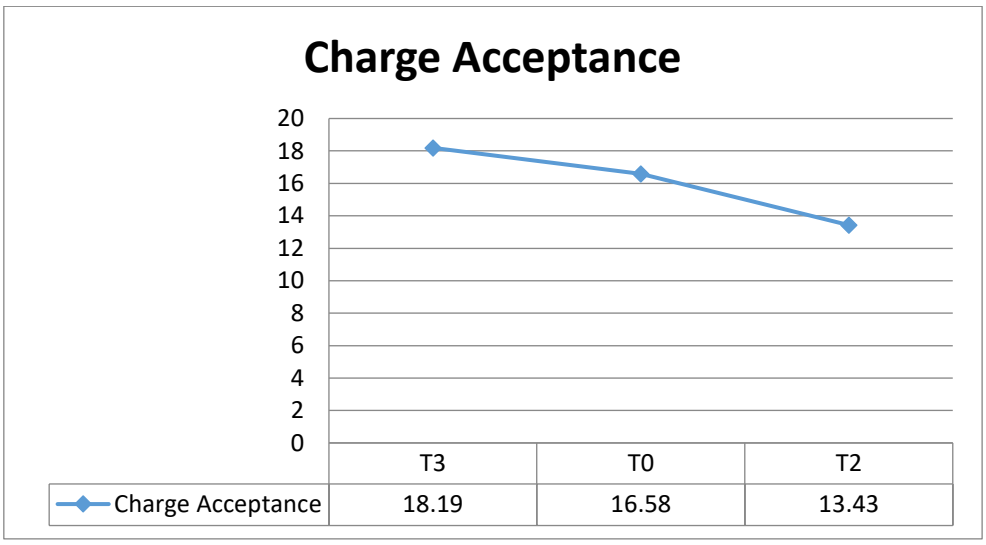

Figure 7. Charge Acceptance test results of batteries

3.5. Endurance Cycle Test

In order to examine the lead acid battery cycle life of the decrement in curing temperature, an endurance cycle test was performed. Test results are given in Figure 8. Compared to T0, the cycle numbers of T2 and T3 are approximately 28% and 19% higher, respectively. It is seen that the optimum 3BS/4BS ratio increases the battery cycle life.

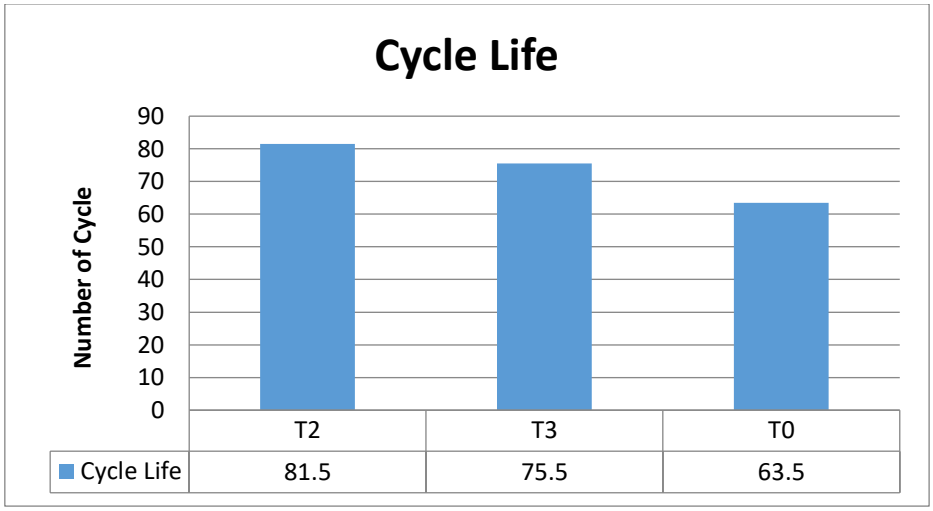

Figure 8. Cycle Life test results of batteries

3.6. Microstructure of Cured PAM

In order to examine microstructure of cured PAM, SEM analysis was carried out. Microstructure of cured PAM is given in Figure 9. It is observed that with the reduction of the temperature values of both high and low temperature chambers by about 15% (T3), 4BS microstructures decreased and 3BS microstructures were formed. Although increasing the 3BS structure increases charge acceptance, it may result in reduced battery cycle life.

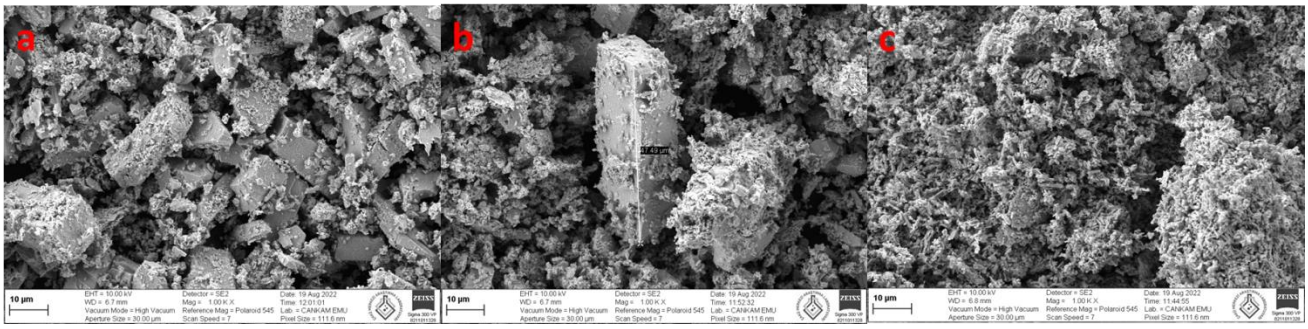

Figure 9. Cured Plates; (a):T0, (b): T2, (c): T3

CONCLUSION

In this study, the effect of curing temperature is investigated on SLI (Starting Lighting Ignition) lead-acid battery. When the SEM analysis is examined, it is observed that the 3BS/4BS microstructure ratio increased with the decrease of the curing temperature value. By reducing the temperature value of both high and low temperature chambers by 15% (T3), OCV (V) and CCA (A-EN) values were found to be 0.09 and 17 units higher than the control group, respectively, which can be associated with an increase in the 3BS ratio. Increasing the 3BS/4BS ratio does not significantly raise the battery capacity. The increment in the 3BS/4BS ratio also caused an increase in the Uf, terminal voltage, value. When the Uf value of T2 and T3 test groups are compared with T0, an increase of 3 % and 1 % are observed, respectively. When it comes to charge acceptance of batteries, The charge acceptance value of T3 is about 10% higher than the charge acceptance value of T0. It is observed that the charge acceptance value increased with the increase in the formation of the 3BS microstructure. The number of cycles of the T2 test group is found to be approximately 28% higher than the number of cycles of the T0 group, indicating that the 3BS/4BS ratio is optimum.

Abstract

Recently, the use of carbon addition in lead acid batteries, such as carbon black, activated carbon, graphene and carbon nanotube, has become widespread. The most important feature of carbon derivatives is that they increase electrical conductivity and enhance active material utilization. Nowadays, due to its unique properties, such as high electrical conductivity and multi-layer, the use of multi-walled carbon nanotube (MWCNT) lead acid batteries has gained importance. In this study, the effects of MWCNT addition on both positive active material (PAM) and negative active material (NAM) on lead acid battery performance were investigated. Although there was no visible microstructural change in NAM containing MWCNT, it had a positive effect on battery performance, including, cold-cranking performance and charge acceptance, compared to others. On the other hand, when MWCNT is added to PAM, it has been observed that there is a significant increase in battery cycle life.

1. INTRODUCTION

Lead-acid battery does not store electricity but rather it stores a series of chemical, through a chemical process electricity is produced. The primary task in vehicles is to run the starter that gives the engine the first movement. Besides, in state of problems with the charger, the air conditioner, heater, radio, a headlight is needed to operate such systems (Boden, 1998). Lead-acid batteries form the basis of rechargeable battery systems. Lead-acid batteries' reliability, low-cost and life span for many years despite the developing technology of new battery systems, lead-acid batteries are still the most preferred battery in the world as the most widely used system (Sirin, 2020).

Lead–acid battery consisted of positive electrode, negative electrode, separator and electrolyte (Figure 1). Lead acid battery: oxide manufacturing, strip and grid manufacturing, paste mixing process, pasting process, curing process, assembly, formation, laboratory and test processes, including different manufacturing methods and processes are produced as a result of the merger (Eydemir, 2019).

Recently, the use of carbon addition in lead acid batteries, such as carbon black, activated carbon, graphene and carbon nanotube has become widespread. The most important feature of carbon derivatives is that they increase electrical conductivity and enhance active material utilization. Nowadays, due to its unique properties, such as high electrical conductivity and multi-layer, the use of MWCNT lead acid batteries has gained importance.

M. Saravanan, et al. carried out study which adding of Multi-Walled Carbon Nanotubes (MWCNT) in the negative active material (NAM) as an alternate conductive. The adding of optimum ratio of MWCNT in the NAM, lead-acid battery performance was increased, including, high capacity, excellent cycling performance and high-rate partial state of charge (HRPSoC). In addition, irreversible lead sulfate on the NAM were considerably decreased, which are increased active material utilization and enhanced electrode performance (Saravanan, 2013).

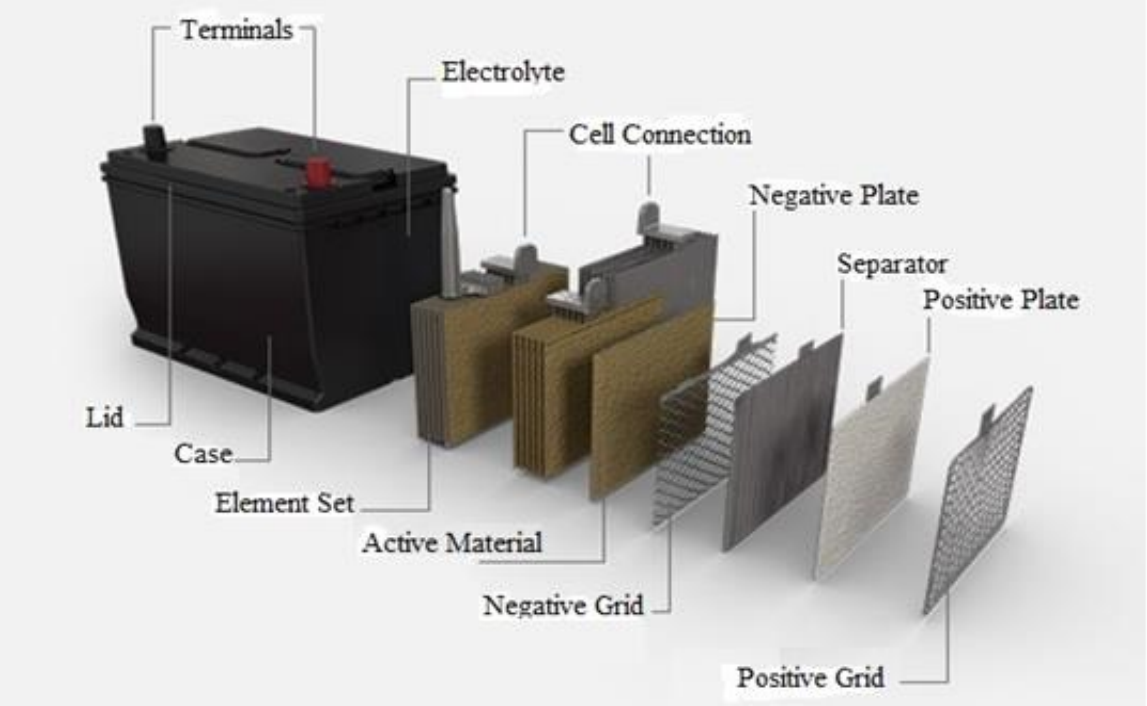

Figure 1. Standard lead acid battery and components

S. Mithin Kumar, et al. investigated the effect of different diameter ranges of MWCNT adding to the NAM on the lead acid battery. MWCNT diameter ranges between 50-100 nm shows that high specific capacity and cyclability in the lead acid battery (Kumar, 2019).

Steven W. Swogger, et al. researched that effect of MWCNT additive which is discrete carbon nanotubes (dCNT) in NAM for lead acid battery (LAB). With the adding of dCNT in the NAM, lead acid battery performances were enhanced. Batteries including dCNT in NAM showed that no change paste properties, improved charge acceptance, reserve capacity, and cold-cranking performance (Swogger, 2014).

Nanjan Sugumaran, et al. studied that effect of MWCNT (dCNT) in both positive active material (PAM) and NAM for lead acid battery. dCNT was added to PAM and NAM 0.16% w.r.t. Using of dCNT both PAM and NAM, lead acid batteries properties were improved, which are cycle life, charge acceptance and cold cranking performance (Sugumaran, 2015).

R. Marom, et.al. investigated different type MWCNT additives, which are un-modified and modified with carboxylic group, in the PAM and NAM electrodes for lead acid battery. These additives were added to PAM and NAM with the different ratio (between 0,008 % to 0,02 %). Batteries containing MWCNT additive that is modified with carboxylic group showed that enhancement electrical conductivity and prolonged cycle life (Marom, 2015).

In this study, the effects on the SLI lead acid battery were investigated by using MWCNT both positive active material (PAM) and negative active material (NAM).

2. MATERIALS AND METHODS

2.1. Sample Preparation

Positive and negative electrodes were produced by adding MWCNT to PAM and/or NAM. Both positive and negative control samples without MWCNT were produced for comparison (Table 1).

Table 1. Experiment Groups

Experiment Groups	PAM	NAM
Control Groups (CS)	STANDARD	STANDARD
C1 Test Groups	MWCNT	MWCNT
C2 Test Groups	STANDARD	MWCNT
C3 Test Groups	MWCNT	STANDARD

2.2. Test and Characterization

Cold-cranking ampere (CCA) (A-EN) and open-circuit voltage (OCV) (V) values of batteries were measured by midtronics device. The OCV (V) value means the total voltage of the 6 cells of the battery and should be a minimum of 12.72 V. CCA (A-EN) means that cold cranking ampere value of battery.

In order to check capacity of batteries, capacity test was implemented with respect to EN 50342-1 test standard (EN: European Norm). The capacity (Cn) is 20 h capacity (C20-Ah) defined for the temperature of 25°C ± 2°C. The battery must be discharged with the current, which is kept constant at ± 1% of the rated value, until the voltage between the terminals drops to 10,50 V ± 0,05 V. This discharge time, t (h), should be recorded. The beginning of the discharge should be within the period of 1 hour to 5 hours from the end of the charge. The nominal 20 h capacity Cn is the electric charge (in Ah) that a battery can supply with a current: (1) In = Cn /20 h (2) Ce = t x In (Ah)

In accordance with EN 50342-1 test standard, cold-cranking performance test applied to the batteries. The battery temperature should be adjusted to -18˚C ± 1ºC. The battery must be discharged with Icc current. After 10 s discharge, the voltage Uf between the terminals should be recorded, and the current cut off. The Uf voltage should not be less than 7.50 V.

A charge acceptance test (EN 50342-1) was applied battery in order to examine the effect of curing conditions on charge acceptance. The battery should be discharged at a temperature of 25 ºC ± 2 ºC at a current I0 (A) for 5 h where: (3) I0= Ce/10h. Ce value should be taken as the maximum value Ce of the previous discharges. Within 10 min after the discharge, the battery should be placed in a cooling chamber with (forced) air circulation at a temperature of 0 ºC ± 1 ºC until the temperature of the middle cells is 0 °C ± 1 °C. It is generally accepted that the required temperature will be achieved after a minimum period of 15 h in the cooling chamber. At this temperature, the battery should be charged at a constant voltage of 14,40 V ± 0,05 V and Imax = 50 A for batteries having sizes defined in EN 50342-2 and Imax = 100 A for batteries having sizes defined in EN 50342-4. After 10 min, the charging current Ica should be recorded. Requirements: (4) Ica ≥ 2 I0.

Batteries should be placed in a water bath and stored at +40 ± ˚C ± 2˚C. The charge voltage U 15,6 V and charge rate CR of the battery to be tested will be used as 1,08. Batteries will be connected to series of cycles. Each cycle consists of the following; the battery will be discharged with a constant current at I = 5 ln for 2 hours. If it drops below 10.5 V, the test will be terminated. In the first step, the battery will be charged for a maximum of 5 hours under constant voltage and with a current limitation at 5 ln. The above steps are applied until the voltage during discharge is above the limit or until the number of 360 cycles is reached.

SEM analysis was performed on the cured positive and negative plates to examine the microstructure.

3. RESULTS and DISCUSSION

3.1. OCV (V) and CCA (A-EN) Measurements

The OCV (V) and CCA (A-EN) values of the batteries were measured by midtronics device. The OCV (V) values of test groups and control groups are given in Figure 1. The results show that OCV (V) values are similar in all batteries. No significant differences are observed. When it comes to CCA (A-EN) values (Figure 2), CCA (A-EN) values of control group is higher than the CCA values of test groups. With adding of MWCNT to NAM and/or PAM, increment in CCA values would be expected. On the contrary, a decrease in CCA values

was observed in lead acid batteries containing MWCNT. The lowest CCA value was seen when the MWCNT was added to both PAM and NAM – C1.

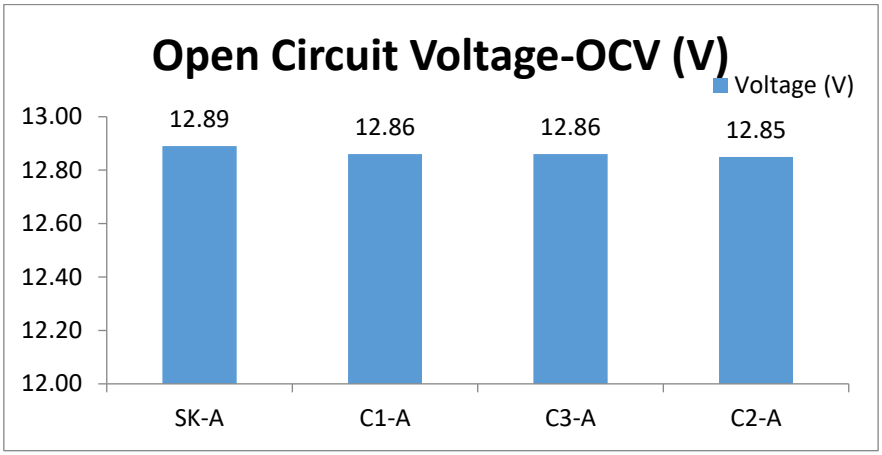

Figure 2. Open-Circuit Voltage (OCV) (V) Values of Batteries

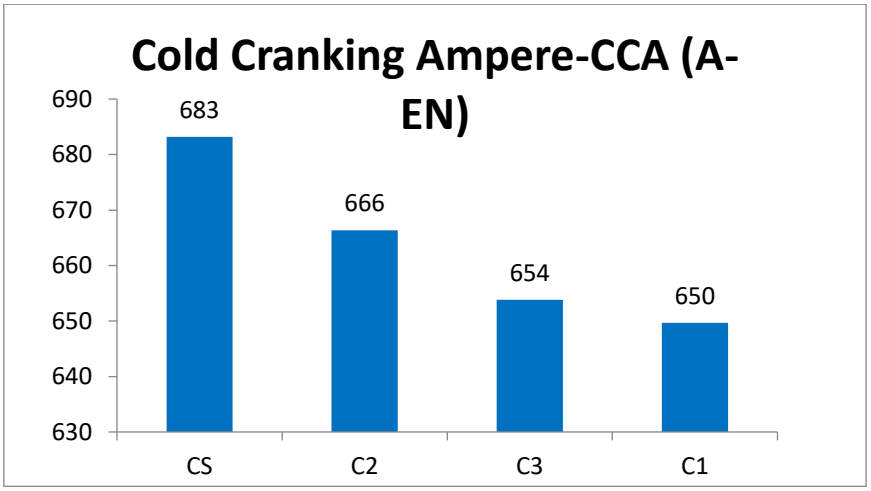

Figure 3. Cold cranking Ampere (CCA) Values of Batteries

3.2. Capacity (C_{20}, Ah) Test Measurements

The effect of PAM and/or NAM containing MWCNT on the battery capacity was investigated. The capacity test results of control sample and tests groups are given in Figure 4. An increment in capacity was observed with the addition of MWCNT to both PAM and NAM – C1. Its capacity is 8% higher than the control sample (CS). In addition, with the addition of MWCNT only to NAM – C2, an increase of 6% was observed compared to the CS. This shows that the addition of MWCNT has a positive effect on capacity efficiency.

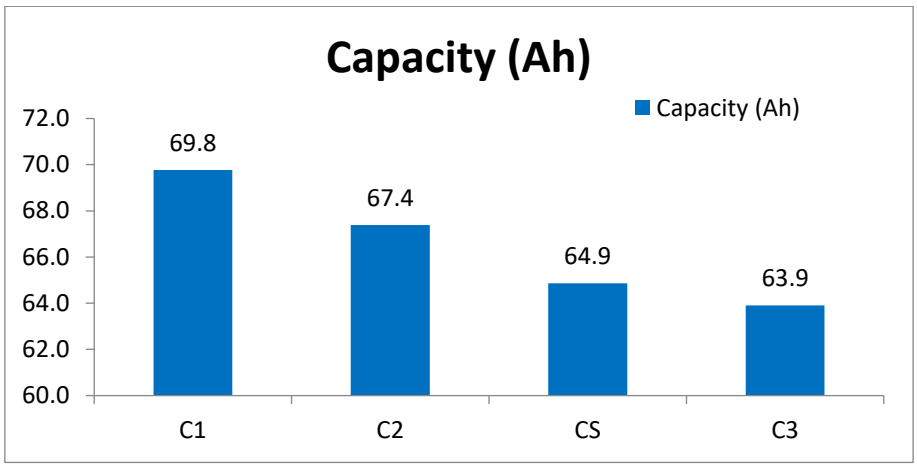

Figure 4. Capacity (Ah) Values of Batteries

3.3. Cold Cranking Performance Test Measurements

In order to examine the effect of MWCNT additives were added to NAM and/or PAM on the battery performance, the cold-cranking performance test was performed. Test results are given in Figure 5. According to the test procedure, 610 A current was drawn for 10 seconds from the batteries at -18 ºC. After 10 s discharge, Terminal voltage, U_f, should not be less than 7, 5 V. The test results show that the U_f value of all batteries is above 7, 5 V. The battery that is included MWCNT additive in NAM – C2 has the highest U_f value, which corresponds to 7, 95 V. Terminal voltage value of C2 is approximately 1% higher than CS.

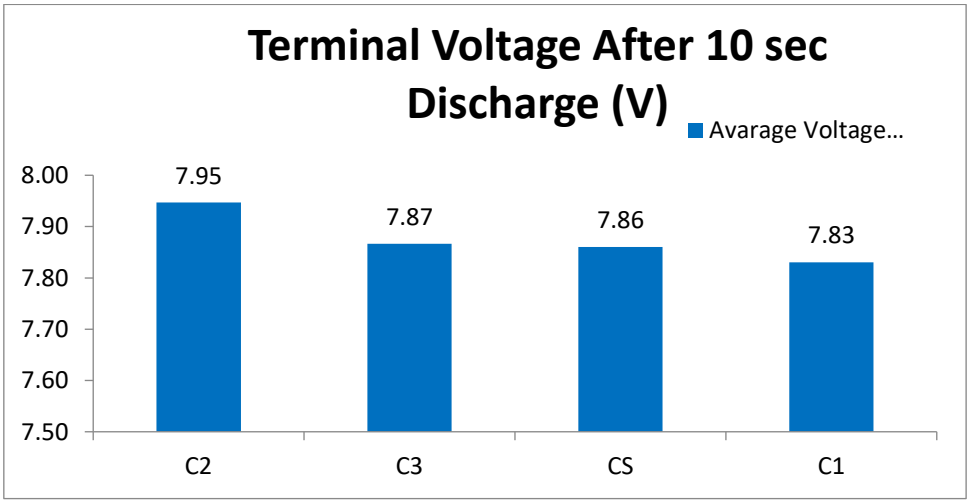

Figure 5. Cold-cranking performance test results of batteries

3.4. Charge Acceptance Test Measurements

A test was carried out to examine the effect of PAM and/or NAM including MWCNT on charge acceptance. According to Figure 6, the addition of MWCNT to NAM – C2 increased 7% charge acceptance with respect to CS.

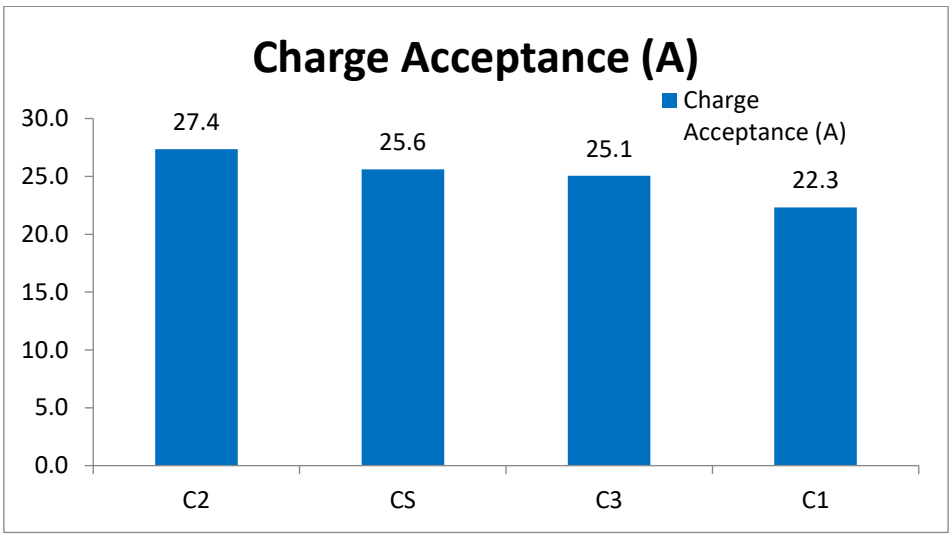

Figure 6. Charge Acceptance test results of batteries

3.5. Endurance Cycle Test

In order to examine the lead acid battery cycle life of the MWCNT addition, an endurance cycle test was performed. Test results are given in Figure 7. The results show that the addition of MWCNT to PAM significantly increases the battery cycle life. The addition of MWCNT to the PAM increased the battery cycle life by approximately 34 % compared to the control sample.

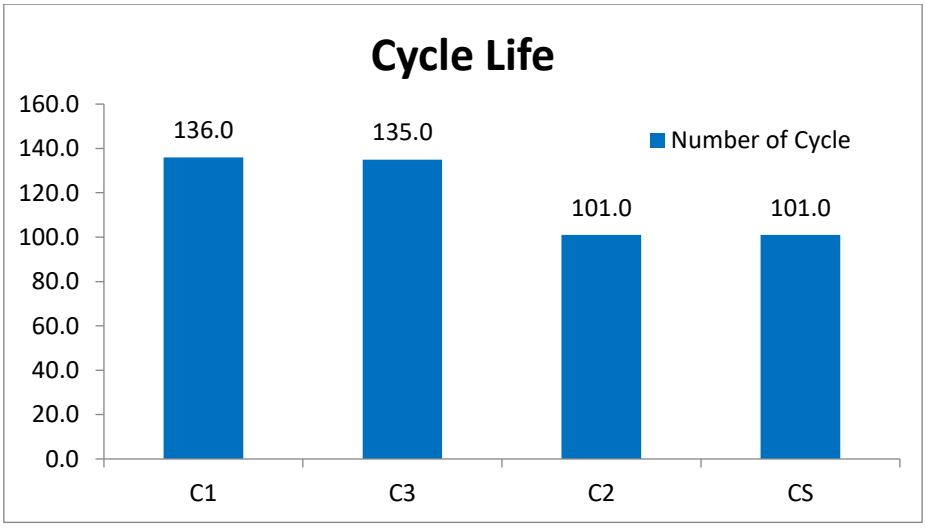

Figure 7. Cycle Life test results of batteries

3.6. Microstructure of Cured PAM and NAM

In order to examine microstructure of cured PAM and NAM w/o MWCNT, SEM analysis was carried out. Microstructure of cured PAM and NAM are given in Figure 8. When PAM containing MWCNT was examined, it was observed that smaller crystals were formed instead of large crystals, which is one of the factors that increase the charge acceptance ability, capacity and cycle life. As for the cured NAM containing MWCNT, there is no significant difference in micrographs compared to the control sample.

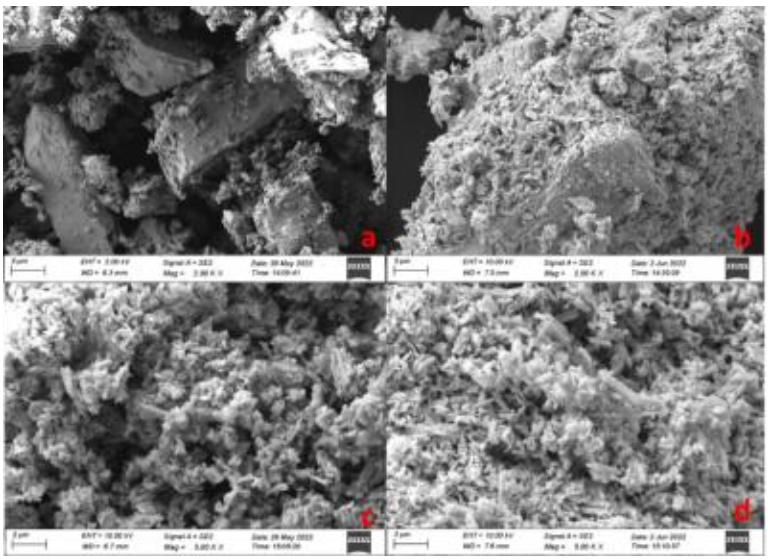

Figure 8. Cured Plates; (a): PAM without MWCNT, (b): PAM with MWCNT, (c): NAM without MWCNT, (d): NAM with MWCNT

CONCLUSION

In this study, the effect of MWCNT addition to PAM and/or NAM was investigated on SLI (Starting Lighting Ignition) lead-acid battery. In the OCV (V) values, there are no significant differences. However, the addition of MWCNT had an unexpected negative effect on CCA values. In particular, the addition of the MWCNT additive to PAM and NAM significantly reduced the CCA value, which corresponds to 33 units. While there was no change in capacity when MWCNT was added to PAM only, it was observed that when added to PAM and/or NAM that has higher capacity compared to the control sample. The capacity value of C1 (PAM and NAM including MWCNT) is approximately 8% higher than the capacitance value of CS (MWCNT-free). The addition of MWCNT had no noticeable effect on cold cranking performance. The charge acceptance value increased with the addition of MWCNT to NAM, which is about 7%. When the cycle life is examined, it is seen that the addition of MWCNT to both PAM and NAM significantly increase the battery cycle life, which is approximately 35%. Just by adding MWCNT to PAM, the battery cycle life is increased, which is about 34%. Addition of MWCNT to NAM did not increase the battery cycle life. When the microstructures of cured PAM and NAM were examined, it was observed that the crystalline size of PAM decreased with the addition of MWCNT. However, there is no visible difference in the microstructure of MWCNT added NAM. As a result, the addition of MWCNT addition to NAM increased lead battery performance compared to others. In future studies, the effect of MWCNT addition on the performance of both AGM and EFB batteries will be examined.

Abstract

Smart gas meters (SGM) are designed to meet the necessity of remote monitoring of end-user consumption data, precise measurement, steady communication, cyber security and software requirements. Smart gas meters (SGM); have to meet all technical requirements in the end-to-end process until their transfer to the IoT platform. Additionally, smart gas meters have met technical specifications such as operating range, battery life, data recording and sending, alarm generation and regular communication. Smart gas meters must work in compliance with the Measurement Instrument Directive (MID), Electromagnetic Compatibility (EMC) and Atmospheric Explosion (ATEX) directive within the framework of the European Union conformity criteria. The measurement of gas volume in smart gas meters is realized based on the principle of measuring gas velocity with a flow sensor or thermal sensor. Smart gas meters consist of some components (flow sensor, temperature sensor, pressure sensor, gyro sensor, etc.) depending on the manufacturer's preference. Mentioned standards above have provided a baseline within the scope of this study to satisfy the requirements of smart gas meters.
In this study, the evaluation process has been investigated for the technological features that have been considered in smart meter procurement. This study aims to perform a systematic ranking and selection of the best smart meter alternatives meeting the necessities of distribution system operators (DSO) as per the determined criteria mentioned above. The aim of this paper is to determine the criteria for a special smart gas meter by using Quality Function Deployment (QFD) technique for the natural gas sector in Turkey. QFD technique was selected for the product enhancement operation at Istanbul Gas Distribution Industry And Trade Joint Stock Company (IGDAS), one of the largest natural gas distribution firms in Europe. The three specialists provided their evaluations of the criteria. The implementation of QFD in a smart gas meter is defined systematically. To the best of my knowledge, there is no study intended to address the quality evaluation of smart gas meters privately in the literature. This study will guide DSO in selecting the right smart gas meter alternatives.

Keywords: Quality Function Deployment (QFD), Smart Natural Gas Meter, Natural Gas Distributor, Supplier Selection.

INTRODUCTION

Quality Function Deployment (QFD), which is designed for determining customers` needs and transforming these needs into technical information by improving and developing, is one of the best techniques from a quality perspective. QFD is designed by Yoji Akao in Japan (Akao, 1990). QFD analysis is preferred as a convenient tool not only for new product development (NPD) but also for the improvement of a product with different targets and approaches in various areas. It is observed clearly that, customers` necessities as the most important factor that one should identify, while compounding the quality approach and NPD. QFD is utilized with Analytical Hierarchy Process (AHP) to design a better sports earphone (Tu et al. 2011). Some authors have determined the optimum set of design requirements for indoor air quality problems using the house of quality (Park and Kim, 1998).

Some authors mentioned that Pipe Strangling Equipment is designed as per customer expectations (Camgoz-Akdag et al. 2012). Others have suggested that for the setting of the energy security management model (Shin et al. 2013). Yet, others have used that in developing of chartering services for shipping companies (Fatahillah et al. 2019). This is then utilized to enhance product quality and the negotiation process, hence increase to

market success (Fonseca et al. 2020). Some others used QFD in the examination of quantitative models of sustainability liquefied natural gas supply chain management (Al-Haidous and Al-Ansari 2020).
The limited number of studies in the field of especially energy and other areas is presented in table 1.

Table 1. Studies using QFD method

	Author (year)	Title	Methodology	Focus
1	Fonseca et al. (2020)	QFD as a Tool to Improve Negotiation Process, Product Quality, and Market Success, in an Automotive Industry Battery Components Supplier	QFD	Battery Suppliers
2	Al-Haidous and Al-Ansari (2020)	Sustainable Liquefied Natural Gas Supply Chain Management: A Review of Quantitative Models	QFD	Liquefied Natural Gas

6	Park and Kim (1998)	Determination of an Optimal Set of Design Requirements Using House of Quality	QFD	Indoor Air Quality Improvement

Especially in the last decade, QFD has been used in combination with different methods. Some researchers have established a decision support system by combining QFD and Failure Mode and Effects Analysis (FMEA) for the selection of production automation technologies (Almannai et al. 2008). Some authors used a hybrid fuzzy decision model combining The Decision Making Trial and Evaluation Laboratory (DEMATEL) with QFD to evaluate and understand financial innovation perviousness in renewable energy investment (Li et al. 2022). Some authors proposed the Fuzzy Quality Function Deployment (FQFD) framework in order to carry out sustainable operations efficiently by saving energy and using energy resources efficiently in wastewater treatment plants (WWTPs). The framework presents multi-criteria decision-making (MCDM) models which use Technique for Order Preference by Similarity to Ideal Solution (TOPSIS) in determining the selection algorithm for order preferences (Akbaş and Bilgen 2017).
The limited number of studies which combined QFD with other methods in the field of especially energy and other areas is presented in table 2.

MATERIALS AND METHODS

Within the scope of the project carried out in İGDAŞ, the QFD methodology was chosen to determine the product features to be preferred. Experts were selected to improve the smart gas meter thanks to QFD. Smart gas meters are used in households to measure gas flow and to manage some operations.
The implementation of the QFD to the smart gas meter is explained step by step as follows:
Step1: User prospects were specified by questionnaires by quality control, R&D and field personnel. User expectations and weights were rated out of 9 as presented in Table 3.
Step 2: At this stage, technical requirements relevant to user expectations are specified and stated. Technical requirements for QFD analysis are significant as experts take these requirements into account to meet user expectations. To specify the requirements, specialists from Quality, R&D and other departments need to collaborate together. Technical requirements described in this work: Measurement Accuracy, Abnormality Detection Rate Lifetime, Assembly and Preparation Time, Cost, Failure Rate Per Batch, Lifetime, MID, CE, EMC, Compliance IP 65, IP 66, IP 67, %30 hydrogen blending.

Step 3: Within the scope of the study, after specifying the technical requirements, the Experts at İGDAŞ establish the relationships between user expectations and technical requirements. Significance and direction of improvement are other important issues in QFD analysis. Experts interpret this information. In addition, it was determined by the experts that user expectations are relevant to technical requirements. All relationships are classified as strong, medium or weak. According to the interrelation between customer expectations and technical requirements, 9, 3 and 1 points indicate a strong, moderate and weak relationship, respectively. These relationships, improvement direction and significance levels are shown in Table 3.

Step 4: At this stage, the significance value of each technical requirement is figured out using the equation 1.

$$IVTR_i = \sum_{j=1}^{k} (IDCS_{ij} \times WCE_j) \quad (1)$$

where,
IVTR: The Significance value of technical requirement
IDCS: Significance degree of customer satisfaction between TR i and CE j.
WCE: Weight of j'th customer prospect

Technical importance degree clarifies the most significant requirements. Experts reveal as per the relations mentioned that: Measurement Accuracy, Abnormality Detection, Lifetime, Failure Rate Per Batch, MID, CE, EMC Compliance most significant features for this area. The normalization rate of each technical necessity is calculated with equation 2, by dividing the theoretical importance rating by the sum of all theoretical significance ratings and written into the QFD matrix.

$NTID_i = (TID_i \,/\, \sum_{j=1}^{n}(TID_i)$ (2)

where,
NTID: Normalization of i'th technical significance degree
TID: i'th technical significance degree

The degree of difficulty represents the level of applicability of each technical requirement. These ratings are calculated on a five-point measure. A score of 1 means that the applicability is very easy, and a score of 5 stands that the applicability is very difficult. Normalized values of technical requirements and difficulties are presented in Table 3. Relationships among user expectations and technical necessities are presented in Table 3.

Step 5: In this stage, correlations among technical relevancies are defined. The symbols defined above are put into the correlation matrix. "+" demonstrates a positive relation, "++" demonstrates a powerful positive relation, "-" demonstrates a negative relation, and "––" demonstrates a powerful negative relation. These correlations are presented in the relation matrix in Table 4.
Step 6: In the final stage, the quality improvement plan is made by prioritizing and considering the weight of technical requirements. These are presented in results section.

RESULTS

In this study, the measurement accuracy has the highest weight with 126 points as expected. For this reason, it has been determined that the elimination of any measurement errors is the most important technical requirement and it remains at the forefront for the following processes. One of the most important results of this study is related to the Failure Rate Per Batch and it has 114 points in weight importance. It is revealed that the failure rate per batch is the second important issue according to experts. In the quality improvement plan, it was determined that the most important issue was the failure rate per batch.

Table 3 – Technical evaluation for expectations and requirements

	TECHNICAL REQUIREMENTS										
CUSTOMER IMPORTANCE RATING	CUSTOMER EXPECTATIONS	Lifetime	Abnormality Detection Rate	Measurement Accuracy	Assembly and Preparation Time	Cost	IP 65, IP 66, IP 67	Lifetime	MID, CE, EMC Compliance	Failure Rate Per Batch	%30 Blending
9	Battery Life	9		1						1	
9	Generating Alarm in case of interference		9	3						1	
3	Accurate Measurement			9	3	3			3	3	3
3	Plug in Play				9					1	
9	Cost Effective			3		9	3	3			3
3	Adaptation to the Environment			1			9				
3	Longevity	9		1				9		1	
9	Regulatory Compliance			3					9		
9	After Sales Reponsibilities									9	
3	Hydrogen Measurement Capability			1							9
	Technical Difficulties	3	3	3	3	3	2	2	4	4	4
	Technical Priorities	108	81	126	36	90	54	54	90	114	63
	Normalization Value	13,2	9,93	15,4	4,4	11	6,62	6,6	11	14	7,7

"MID, CE, EMC compliance" and "cost" criteria are the other significant features found as significant technical requirements. The score of these two features is 90, after the measurement accuracy and failure rate per batch. Therefore, the cost of each technical requirement should be considered. In other words, the cost is another competitive area for the product. “Abnormality Detection Rate” must be considered at the determine the next improvement area because of 81 points in importance weight. Thus, the alarms generated by smart gas meters are another important issue for gas distribution companies. However, the least important quality requirement is found as “assembly and preparation time”.

Table 4 – Correlation for each expectations and requirements

	Lifetime	Abnormality Detection Rate	Measurement Accuracy	Assembly and Preparation Time	Cost	IP 65, IP 66, IP 67	Lifetime	MID, CE, EMC Compliance	Failure Rate Per Batch	%30 Blending

30%	Measure capability for Hydrogen blended gas	10

CONCLUSION

It has been determined that fuzzy QFD can be done in order to bring further levels of studies. The results of the study have been a guide to gas distribution companies about what should be considered in the determination of technical requirements before procurement. These results also can be used for supplier selection. Especially, meter failures that may occur in the field can lead to measurement errors and unexpected costs such as meter removal activities afterwards. It is possible to conduct surveys with more participants to identify areas where smart gas meters can improve. Additionally, the determined requirements can be concerned with lifecycle management in smart gas meter usage processes.

Özet
Elektronik fatura uygulaması kapsamı dışında kalan e-arşiv ve kağıt faturalar dijital olarak teslim edilmemektedir. Bu faturalar dijital ortamda teslim edilmediği için fiziksel fatura olarak adlandırılmaktadır. Fiziksel faturaların finansal akışın incelenmesi ve muhasebe işlemlerinin kolaylaştırılması amacıyla dijital hale getirilmesi gerekmektedir. Yüksek fatura trafiğine sahip firmalar, faturaların sisteme aktarılmasında çok yoğun insan gücüne ihtiyaç duymaktadır. Bu çalışmada insan gücü ihtiyacının azaltılması amacıyla metin sınıflandırma ve Adlandırılmış Varlık Tespiti (AVT) *(Named Entity Recognition (NER))* araçları kullanılarak faturaların sınıflandırılması ve hedef varlıklarının tespiti sağlanmıştır. Fatura görüntülerinden metin elde etme aşamasında Google Vision Optik Karakter Tanıma (OKT) *(Optical Character Recognition (OCR))* aracı kullanılmıştır. Kullanılan OKT aracının çıktılarında bulunan blok ve kelime sıralamasında oluşan hatalar düzeltilmiştir. Uygulanan düzeltme işlemlerinin kullanılan araçlar üzerindeki etkisinin arttığı gözlemlenmiştir. Fatura türü sınıflandırma ve AVT modellerinin eğitimi için kullanılacak veri kümesinde veri dağılımını düzenlemeye yönelik çalışmalar yapılmıştır. Fatura türü sınıflandırma araçlarının eğitimi için dengeli veri kümesi oluşturmak üzere her sınıftan eşit miktarda veri alınmıştır. Ayrıca veri kümesindeki her varlık sınıfı, AVT modelinin eğitimi için eğitim ve test ortamına dahil edilmiştir. Eğitim için kullanılacak veri kümesi 80% eğitim, 10% test ve 10% validasyon verisi olmak üzere üçe bölünmüştür. Hiper parametre optimizasyonları gerçekleştirilerek optimum katsayılar bulunmaya çalışılmıştır. Fatura türünün sınıflandırılması ve AVT modellerinin eğitilmesinde spaCy ve CRF araçları kullanılmıştır. AVT araçlarının eğitiminde spaCy için en yüksek doğruluk değeri 98,75%, CRF (Conditional Random Fields) için ise en yüksek doğruluk değeri 97,68% olarak elde edilmiştir. Fatura türünün sınıflandırılması amacıyla eğitimi gerçekleştirilen spaCy modeli için en yüksek doğruluk değerine 98,3% olarak ulaşılmıştır.
Anahtar Kelimeler: Adlandırılmış Varlık Tespiti, CRF, Metin Sınıflandırma, spaCy, Türkçe Fatura

Machine learning and named entity recognition applications on Turkish invoice dataset

Abstract
E-archive and paper invoices which are outside the scope of electronic invoice application are not delivered digitally. Since these invoices are not delivered digitally, they are called physical invoices. Physical invoices need to be digitized in order to facilitate accounting transactions and examine financial flow. Companies with high invoice traffic need a lot of manpower in transferring invoices to the system. In this study, classification of invoices and determination of target entities were provided by using text classification and NER (Named Entity Recognition) tools to reduce the need for manpower. Google Vision OCR tool was used in the process of obtaining text from invoice images. Errors in block and word order in the outputs of the OCR (Optical Character Recognition) tool used have been corrected. It has been observed that the effect of the applied corrections on the tools used has increased. Data distribution in the dataset was adjusted to be used for invoice type classification and training of NER models. An equal amount of data was taken from each class to create a balanced dataset to train invoice type classification tools. Also, each entity class in the dataset is included in the training and testing environment for training the NER model. The dataset to be used for training is divided into three parts as 80% training, 10% testing and 10% validation data. Optimum coefficients were tried to be found by performing hyper parameter optimizations. SpaCy and CRF (Conditional Random Fields) tools were used to classify invoice type and train NER models. In the training part of NER tools, the highest accuracy value for spaCy was 98.75%, and the highest accuracy value for CRF was 97.68%. The highest accuracy value for the spaCy model, which was trained to classify the invoice type, was 98.3%.
Keywords: CRF, Named Entity Recognition, spaCy, Text Classification, Turkish Invoice

GİRİŞ

Muhasebe sisteminde verilerin kayıt altına alınması, raporlanması ve işlenmesi teknolojide yaşanan gelişmelere bağlı olarak dijital ortamda gerçekleştirilmeye başlanmıştır. (Dursun vd., 2019). Fiziksel ortamda teslim edilen faturaların finansal akışın incelenmesi ve muhasebe işlemlerinin kolaylaştırılması amacıyla dijital hale getirilmesi gerekmektedir. Yüksek fatura trafiğine sahip firmalar, fiziksel faturaların sisteme aktarılmasında çok yoğun insan gücüne ihtiyaç duymaktadır. Faturaların insan gücü kullanılarak dijital ortama aktarılması zaman, işgücü, nakit akışı, maliyet sorunlarını da beraberinde getirmektedir. Faturaların dijital ortama aktarılması için birçok doğal dil işleme ve yapay zeka çalışmaları gerçekleştirilmiştir (Ha ve Horák, 2022). Bu çalışmalarda fatura türlerini belirlemek amacıyla sınıflandırma, fatura üzerindeki bilgilerin elde edilmesi amacıyla ise AVT yöntemleri kullanılmaktadır(Srivastava vd., 2022).

Fatura, satılan hizmet veya ürünü alan kurum/kişi için düzenlenen ve gerçekleştirilen işlem hakkında tüm bilgileri içeren belgedir. Faturanın e-Fatura, e-Arşiv, basılı fatura vb. gibi bir çok türü bulunmaktadır. Fatura türleri işlem amacı, gönderi yöntemi ve vergilendirmeye göre değişmektedir. E-fatura, faturaların internet ortamında düzenlenmesini, paylaşılmasını ve izlenmesini sağlayan sistemdir. Kağıt veya baskı araçları kullanılmadan sunucular arasında firmadan firmaya iletilmektedir. e-Arşiv fatura, e-Fatura uygulaması dışında kalan kişiler veya kurumlar arasındaki kağıt fatura işlemlerinin gerçekleştirilmesini ve saklanmasını sağlayan fatura türüdür. e-Arşiv faturalar genellikle hazır dosya formatlarında e-posta ya da çıktı olarak gönderilmektedir (Gökçen ve Özdemir, 2016). Basılı fatura ise ticari firmaların fatura işlemlerini gerçekleştirebilmek için yetkili matbaalardan temin edip kullandığı fatura türüdür. Ayrıca fatura türü fark etmeksizin faturayı düzenleyen ve müşteriye ait ticari detaylar, malın cinsi ve birimiyle beraber toplam fiyat bilgisi, vergi tutarları, fatura tarihi ve seri numarası her faturada bulunması gereken bilgilerdir.

Fatura türlerinden e-Fatura sunucular arasında oluşturulup teslim edilmektedir. Fakat e-Fatura uygulamasının dışında kalan e-Arşiv ve basılı faturaların kağıt ortamında teslim edilmesi gereklidir. Basılı faturalar yetkili matbaalardan gerekli kurallara göre şablonu hazırlanmış ve basılı hale getirilmiş faturalardır. Kağıt olarak hazır alınan bu şablon üzerine gerekli fatura bilgileri el yazısı ya da yazıcı gibi araçlar kullanılarak doldurulmaktadır. Bu fatura türleri hazırlandıktan sonra çeşitli dosya formatlarında ya da kağıt üzerine yazdırılmış şekilde alıcıya iletilmektedir. Bu tür faturalar ile işlem gerçekleştiren kurum yada kişilerin e-Fatura mükellefi olmaması sebebiyle yoğun fatura trafiğine maruz kaldıklarında faturaların dijital ortama aktarılması için yoğun insan gücü gerekmektedir.

Bu çalışmada faturaların dijital ortama aktarılmasındaki insan gücü ihtiyacının azaltılması amacıyla metin sınıflandırma ve Adlandırılmış Varlık Tespiti (AVT) (Named Entity Recognition (NER)) araçları kullanılarak faturaların sınıflandırılması ve hedef varlıklarının tespiti sağlanmıştır. Faturaların sınıflandırma yöntemi ile fatura görüntüsünün e-Fatura, e-Arşiv ve basılı fatura türünden hangisine ait olduğu bulunmaktadır. Fatura türü belirlendikten sonra dijital olarak teslimi gerçekleştirilmeyen e-Arşiv ve basılı faturaların AVT modelleri kullanılarak bilgilerinin çıkarılması sağlanmıştır. Bu yöntemler kullanılarak faturaların insan gücüne gerek kalmadan dijitalleştirilmesi gerçekleştirilmektedir.

Bu çalışmanın geri kalanı şu şekilde düzenlenmiştir: İkinci bölümde, fatura sınıflandırma, metin sınıflandırma ve yapılandırılmamış metinlerden bilgi çıkarımı ile ilgili yapılan çalışmalar incelenmiştir. Üçüncü bölümde deneylerde kullanılan yöntemler, veri kümesi ve algoritmalar anlatılmıştır. Dördüncü bölümde deneylerin sonuçları açıklanmış ve sonuçlar yorumlanmıştır. Son olarak, beşinci bölümde deneylerin sonuçları özetlenmiş ve çalışma hakkında genel çıkarımlar verilmiştir.

LİTERATÜR TARAMASI

Bu kısımda fatura sınıflandırma, metin sınıflandırma ve yapılandırılmamış metinlerden bilgi çıkarımı ile ilgili daha önce yapılmış çalışmalara yer verilmektedir.

Pudasaini vd. (2022) yaptıkları çalışmada geniş çeşitliliğe sahip metin belgeleri üzerindeki yapılandırılmış bilgilerin elde edilmesi için bir NLP boru hattı uygulamaktadır. Önerdikleri boru hattı, belge sınıflandırma, belgeyi bölümlerine ayırma ve belgeden metin çıkarma gibi NLP tekniklerinden meydana gelmektedir. Sürecin başında metin belgeleri sınıflandırılırken Destek Vektör Makineleri (DVM) *(Support Vector Machine) (SVM)* ve XGBoost algoritmaları kullanılmaktadır. Sınıflandırma işleminin ardından belgelerin farklı bölümleri, parçalama, regex eşleştirme ve POS (Part Of Speech) etiketleme gibi NLP teknikleriyle kategorize edilmektedir. Son aşamada ise Adlandırılmış Varlık Tanıma (AVT) *(Named Entity Recognition(NER))*, regex eşleştirme ve havuz ayrıştırma teknikleri yardımıyla her bölümden ayrıca bilgi çıkarımı yapılmaktadır. AVT modelinin eğitimi spaCy ile yapıldığında daha iyi sonuçlar verdiği belirtilmektedir.

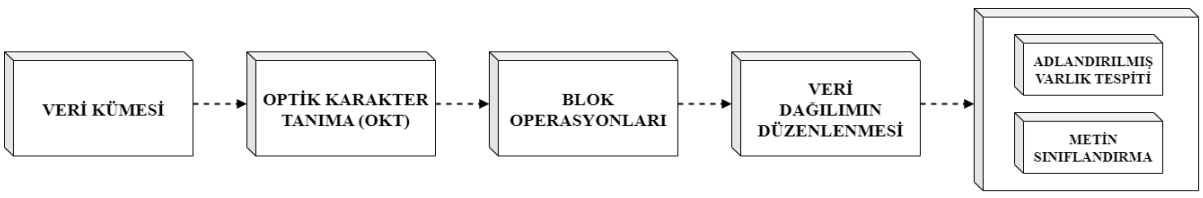
Guggilla vd. (2018) yaptığı çalışmanın amacı finansal alanda manuel olarak yapılmakta olan heterojen verilerden varlık çıkarımı işini otomatikleştirmeye çalışmaktır. Varlıkları etiketlemek için denetimli öğrenme algoritmaları olan Koşullu Rastgele Alan (KRA) *(Conditional Random Field (CRF))* ve Destek Vektör Makineleri (DVM) *(Support Vector Machine (SVM))* ile deneyler yapılmıştır. İş sürecinde dış kaynak kullanımı organizasyonlarından elde ettikleri gerçek dünya verileri üzerinde deneylerinin detaylarını paylaşmışlardır. Lojistik iş sürecinde KRA kullanılarak 0,81, DVM kullanılarak 0,73 F1 skoruna ulaşılmıştır. Borç hesabı süreçlerinde ise KRA kullanılarak 0,80, DVM kullanılarak 0,56 F1 skoruna ulaşılmıştır. İki süreçte de görüldüğü üzere KRA daha iyi sonuçlar vermektedir.

Dwivedi vd. (2020) yaptığı çalışmada faturaların yüksek işleve sahip olduğu finans departmanları için bir tür bilişsel bot sunmaktadır. Bahsedilen botun amacı faturalardaki 'miktar' bilgisini tespit ve teyit etmektir. Bununla birlikte kuruluş adı, konum, fatura tarihi gibi bilgilerin de faturadan çıkarımını sağlamaktadır. Basılı ve el yazısı olmak üzere 3000 adet fatura üzerinde çalışılmıştır. Bunlardan 2500'ü PNG, JPG ve JPEG formatlarında, 500'ü ise PDF formatındadır. Faturaların üzerindeki metinlerin çıkarılması için Tesseract OCR ve PDFMiner kullanılmıştır. Son aşamada spaCy üzerinde eğitilen AVT modeli kullanılarak bir önceki aşamada elde edilen yapılandırılmamış metinlerin içinden miktar, tarih, kuruluş adı ve konumu gibi bilgilerin çıkarılması sağlanmaktadır.

Nasiboğlu ve Akdoğan'ın (2021) yaptığı çalışmanın amacı fatura görüntüleri üzerinden faturanın numarası, tarihi, kdv tutarı gibi çeşitli bilgilerin çıkarılması için en başarılı makine öğrenmesi modelini tespit etmektir. Çalışmada, Tesseract Optik Karakter Tanıma aracı ile fatura görüntülerindeki bilgiler düzenlenebilir metne çevrilmiştir. Bu adım sonrasında elde edilen metinler n-gram formatına dönüştürülmüştür. Kontrol anahtar kelimeler listesindeki anahtar kelimeler ve aday n-gramlar arasındaki Levenshtein mesafesi kullanıldığında yüksek tahmin oranlarına ulaşıldığı gözlemlenmiştir. Çeşitli faturalardan oluşan 9910 fatura üzerinde 6 farklı tahmin modeli denenmiştir. Bu modeller Gradyan Yükseltme Makinesi *(Gradient Boosting Machine)*, Rassal Orman *(Random Forest)*, Aşırı Gradyan Yükseltme *(Extreme Gradient Boosting)*, AdaBoost, Karar Ağacı *(Decision Tree)* ve K-En Yakın Komşu *(K-Nearest Neighbors)* algoritmalarından oluşmaktadır. Veri kümesi 80% eğitim, 20% test için kullanılacak şekilde ayarlanmıştır. En iyi sonuca 0,9137 F1 puanıyla Rassal Orman modeli kullanılarak ulaşılmıştır.

YÖNTEM

Literatürde metin sınıflandırma ve AVT model eğitimleri için çeşitli algoritmalar kullanılmaktadır. Bu çalışmada kullanılan yöntemler ve algoritmalar bu bölümde daha ayrıntılı olarak ele alınmaktadır. 145.000 fatura görüntüsünden elde edilen ve etiketlenen metin veri kümesi ile fatura türü için sınıflandırma ve adlandırılmış varlık tespiti modellerinin eğitilmesi sağlanmıştır. Faturaların sınıflandırma yöntemi ile e-Fatura, e-Arşiv ve basılı fatura türünden hangisine ait olduğu bulunmaktadır. Fatura türü belirlendikten sonra dijital olarak teslimi gerçekleştirilmeyen e-Arşiv ve basılı faturaların AVT modelleri kullanılarak bilgilerinin çıkarılması sağlanmıştır. Fatura görüntülerinden metin elde etmek amacıyla Google Vision OKT aracı kullanılmış olup fatura şablonları nedeniyle oluşabilecek blok ve kelime sıralaması hatalarının giderilmesi sağlanmıştır. Elde edilen eğitim veri kümesi üzerinde veri dağılımı için çeşitli düzenlemeler uygulanıp sınıflandırma ve AVT modellerinin doğruluk oranı artırılmıştır. Sınıflandırma veri kümesinde veri dağılımının dengelenmesi amacıyla skorlama yapacak ön model eğitimi gerçekleştirilmiştir. Gerçekleştirilen model kullanılarak her fatura kümesinden belirli skor aralıklarında belirlenen değerler kadar veri toplanmıştır. AVT veri kümesi içinde varlıkların sayıları küçükten büyüğe sıralanarak en az olan varlıktan başlayarak veri kümesi oluşturulmuştur. Elde edilen veri kümesi kullanılarak metin sınıflandırma için spaCy, adlandırılmış varlık tespiti için ise spaCy ve CRF modelleri kullanılmıştır. Bu çalışmada kullanılacak olan ana yöntemler Şema 1.'deki akış diyagramında gösterilmektedir. Bu içeriklerin detaylı anlatımları aşağıdaki bölümde verilmiştir.



Şema 1. Çalışma Kapsamında Uygulanan Akış Diyagramı

Veri Kümesi

Derin öğrenme ve makine öğrenmesi algoritmalarının eğitilmesi için büyük veri kümelerine ihtiyaç duyulmaktadır. Fakat Türkçe fatura görüntü kümelerinde yeterli büyüklükte veri kümesi bulunmamaktadır. Bu nedenle veri toplama aşamasında yalnızca Türkçe fatura görüntüleri kullanılmıştır. Bu veri kümesinde 145.000 fatura görüntüsünün çeşitli görüntü işleme yöntemleri kullanarak OKT başarı sonuçlarının arttırılması sağlanmıştır. Fatura görüntülerinden elde edilen metinler etiketlenerek eğitime hazır hale getirilmiştir. Veri kümesinde 40 farklı etiket birimi kullanılarak 112.672 adet dijital ve 32.328 adet kağıt fatura olmak üzere toplamda 145.000 fatura görüntüsü etiketleme işlemi gerçekleştirilmiştir (Yıldız vd., 2022).

Blok Operasyonları

Fatura görüntülerinden metinlerin elde edilmesinde Google Vision OKT aracı kullanılmıştır. Google Vision OKT, taranmış fatura görüntülerini düzenlenebilir ve aranabilir verilere dönüştürülmesini sağlayan bir araçtır (Awel ve Abidi, 2019). OKT, görüntü üzerinde bulunan harfleri algılayarak kelimeleri, kelimelerden de cümleleri oluşturmaktadır. OKT araçları bir görüntü üzerinde bulunan metinler için blok, paragraf, satır ve kelime numarası ve koordinat özelliklerini oluşturmaktadır. Fatura görüntülerinde bulunan tablo ya da metin yerleşim sorunlarından dolayı OKT sonuçlarında blok yapıları ve kelime sıralamaları için hatalar gözlemlenmektedir. Bu durum eğitilecek olan AVT ve sınıflandırma modellerinin doğruluk oranını yüksek oranda etkilemektedir. Bu nedenle iki blok arasındaki ortalama kelime ve blok yükseklikleri, iki blok arasında başka bloğun olmaması gibi durumlar incelenerek blok ve kelime sırası yeniden düzenlenmiştir.

Veri Dağılımının Düzenlenmesi

Derin öğrenme ve makine öğrenmesi algoritmalarının eğitimi için eğitim veri kümesi kullanılmaktadır. Veri kümelerinin dağılımı ve büyüklük oranları eğitilen model başarı oranını doğrudan etkilemektedir. Bu nedenle veri kümesinde eğitim verisi oluşturulurken veri dağılımı için düzenleme çalışmaları gerçekleştirilmiştir. Sınıflandırma ve AVT modellerinde eğitim için kullanılacak veri kümesinin dağılımının düzenlenmesi ile model başarı oranlarında artış görülmektedir. Sınıflandırma yapılacak veri kümesi üzerinde her sınıftan eşit miktarda veri bulunması gerekir. Sınıflardan birisinin az sayıda örneğe sahip olması o sınıfın öğrenimini düşürecektir. AVT modelinin eğitiminde kullanılan veri kümesinde her varlıktan belirli miktarda bulunması, varlık tahmin sonuçlarının doğruluk oranını yükseltmektedir. Varlık sayılarının dengesiz olması varlık tahmininde az olan varlık için doğruluk oranını düşürmektedir. Bu nedenle varlık sayısının dağılımında veri kümesi oluşturulurken düşük sayıda olan varlıkların seçiminde öncelik tanınması gerekmektedir. Bu sayede her varlık tahmini için yeterli öğrenme seviyesi gerçekleştirilebilmektedir.

Adlandırılmış Varlık Tespiti(AVT) ve Metin Sınıflandırma

Adlandırılmış varlık tespiti (AVT), bir metin içerisinde belirtilen varlıkları arayan ve kategorilere göre ayıran bir bilgi çıkarma yöntemidir. AVT aynı zamanda varlık tanıma, varlık parçalama ve varlık çıkartma olarak da bilinmektedir (Bagiya vd., 2015). AVT doğal dil işleme ve makine öğrenmesi olmak üzere yapay zekanın bir çok alanında kullanılmaktadır.

Spacy, Python'da gelişmiş doğal dil işleme yöntemleri için kullanılan açık kaynaklı bir kütüphanedir (Shelar vd.,2020). Varlık çıkartma veya doğal dil işleme sistemlerini oluşturmak veya derin öğrenme yöntemleri için metin ön inceleme aşamaları için kullanılabilmektedir. SpaCy belirteçleme, konuşma metinlerinin etiketlenmesi, metin sınıflandırma ve AVT için özel geliştirilmiş araçları bulundurmaktadır.

CRF, sekans verilerini bölümlere ayırmak ve etiketlemek için olasılıksal modeller oluşturan bir sistemdir (Lafferty vd., 2001). CRF bir makine öğrenme algoritmasıdır ve AVT modellerinin eğitiminde kullanılır. SpaCy den farklı olarak modele ek özellik girişlerinin sağlanması durumunda eğitimin doğruluk oranının artırılması sağlanabilmektedir.

CRFsuite, sıralı verileri etiketlemeye yarayan bir CRF uygulamasıdır. CRF'lerin çeşitli uygulamaları arasında bu yazılım, hızlı öğrenme ve etiketleme, eğitim ve etiketleme için basit veri formatı, eğitimde performans değerlendirmesi gibi birçok özellikle öne çıkmaktadır (Okazaki, 2007).

DENEY ORTAMI VE DENEY SONUÇLARI

Deney Ortamı

Bu çalışma HP Z4-G4 iş istasyonu üzerinde gerçekleştirilmiştir. İş istasyonunda NVIDIA Quadro RTX 6000 ekran kartı , Intel(R) Xeon(R) W-2155 CPU işlemcisi, 32 GB DDR4 2933 Mhz RAM , 4 TB SSD depolama alanı bulunmaktadır. Çalışma ortamı olarak Ubuntu 20.04 kullanılmıştır. Programlama dili olarak Python programlama dili, Sklearn, SpaCy kütüphaneleri kullanılmıştır.

Deney Sonuçları

Bu çalışmada metinler üzerinde fatura türü için sınıflandırma ve AVT eğitimi gerçekleştirilmiştir. Model eğitimi gerçekleştirilmeden önce OKT sonuçları için iyileştirme çalışması yapılmıştır. Uygulanan yöntem, test kümesi oluşturularak spaCy aracında eğitilen model üzerinde test edilmiştir. Yapılan blok ve kelime sırası düzeltme işlemleri sonrasında model başarısının arttığı görülmüş ve tüm veri kümesi için uygulanmıştır. Elde edilen veri kümesi için veri dağılımını düzenleyen yöntemler uygulanmıştır. Sınıflandırma yönteminde tüm fatura türlerinin veri kümesine eşit bir şekilde alınması sağlanmıştır. Eğitimi gerçekleştirilecek olan AVT yöntemi için de kullanılacak varlıkların tamamının veri kümesine dahil edilmesi sağlanmıştır. Veri dağılımı düzenlendikten sonra oluşturulan veri kümesi ile spaCy ve CRF modellerinin eğitimi gerçekleştirilmiştir.

OKT tarafından üretilen veri içerisinde metin ile ilgili olarak koordinat, paragraf, blok ve satır bilgileri bulunmaktadır. Fatura görüntülerinin yapısından dolayı metin algılama ve tanıma işlemi gerçekleştirilirken OKT sonuçlarında blok yapıları ve kelime sıralamaları için hatalar gözlemlenmiştir. Bu durum eğitilecek olan AVT modelinin doğruluk oranını etkilemektedir. Bu nedenle iki blok arasındaki ortalama kelime ve blok yükseklikleri, iki blok arasında başka bloğun olmaması gibi durumlar incelenerek blok ve kelime sırası yeniden düzenlenmiştir.Uygulanan işlemin test edilmesi için düzeltme öncesi ve sonrasında aynı veri kümesi kullanılarak spaCy sınıflandırma model eğitimi gerçekleştirilmiştir. Model eğitimi için ana veri kümesi içerisinden rastgele 5000 fatura seçilmiştir. Bu veri kümesinin %80'i eğitim, %20'si test için kullanılmıştır. İki model eğitimi de gerçekleştirilirken aynı parametre değerleri kullanılmıştır (epoch=50, optimizer=adam, dropout=0,1, learning_rate=0,001). Yapılan düzenleme işlemi öncesinde eğitilen Model-1 sonuçları için doğruluk oranı *(accuracy)* 86,7%, kesinlik oranı *(precision)* 89,2%, duyarlılık oranı *(recall)* 87,0% ve F1 Skoru *(F1 Score)* 84,9% olarak ölçülmüştür. Yapılan düzenleme işlemi sonrası eğitilen Model-2 sonuçları için doğruluk oranı 97,1%, kesinlik oranı 98,1%, duyarlılık oranı 97,1% ve F1 skoru 96,1% olarak ölçülmüştür. Model-2'de blok operasyonlarının kullanılmasından ötürü Model-1'e kıyasla daha yüksek başarı oranları alındığı gözlemlenmiştir. OKT sonuçlarında blok operasyonları kullanılarak doğruluk oranında 10,4%'lük bir artış elde edilmiştir. Eğitilen model sonuçları Tablo 1.'de gösterilmektedir.

Tablo 1. Blok Operasyonları İçin Model Eğitim Sonuçları

Model	Doğruluk (%)	Kesinlik(%)	Duyarlılık(%)	F1 Skoru(%)
Model-1	86,7	89,2	87,0	84,9
Model-2	97,1	98,1	97,1	96,1

Eğitim verisi hazırlanırken veri dağılımı için düzenleme çalışmaları gerçekleştirilmiştir.Metin sınıflandırma için dengeli veri kümesi oluşturmak üzere her sınıftan eşit miktarda veri alınmıştır. Faturaların veri seçiminde sınıflandırma yöntemi için ön model eğitimi gerçekleştirilmiştir. Her sınıftan veri seçimi gerçekleştirilirken düşük, orta ve yüksek skorlu verilerden belirli oranda seçim işlemi gerçekleştirilmiştir. Ayrıca bir faturanın birden fazla sınıfta olmamasına dikkat edilmiştir. Örnek vermek gerekirse, e-Arşiv fatura türünden veri kümesi içerisinde 30.000 adet fatura bulunmaktadır. Bu faturaların skorlanması için ön model eğitim çalışması gerçekleştirilmiştir. Bu skorlama sonucunda 1.734 adet fatura düşük (0-33%), 3.584 adet fatura orta (34-66%) ve 24.682 adet fatura yüksek (67-100%) skor aralığında olduğu tespit edilmiştir. Eğitime girecek veri kümesinin e-arşiv sınıfının dağılımı için 10.000 adet fatura gerektiği belirlenmiştir. Eğitim için gereken verinin %15'i düşük, %25'i orta ve %60'ı yüksek puanlamaya sahip gruptan seçilmiştir. Bu nedenle 24.682 adet yüksek skorlanmış fatura içerisinden en yüksek skora sahip 6000 adet fatura, orta skora sahip 3584 fatura içerisinden en yüksek skorlamaya sahip 2500 fatura ve düşük skora sahip 1734 fatura içerisinden en yüksek skorlamaya sahip 1500 adet fatura seçilmiştir. Her bir fatura türü için gerçekleştirilen veri dağılımı ile ilgili veriler Tablo 2'de gösterilmiştir.

Tablo 2. Veri Dağılımlarının Gösterimi

Fatura Türü	Toplam Örnek Sayısı	Örnek Sayısı			Veri Dağılımı (Her Sınıf için 10.000 adet)			Doğruluk Oranı (%)
		Düşük (0-33%)	Orta (34-66%)	Yüksek (67-100%)	%15 (Düşük)	%25 (Orta)	%60 (Yüksek)	
E-Arşiv	30.000	1734	3584	24682	1500	2500	6000	93.5%
Kağıt Fatura	30.000	1715	3422	24863	1500	2500	6000	92.7%
E-Fatura	30.000	1075	2959	25966	1500	2500	6000	92.1%

AVT modelinin eğitimi gerçekleştirilirken yüksek başarı oranlarına ulaşabilmek için veri seçim işlemi uygulanmıştır. Bu amaçla her varlık örneğinin eğitim ve test ortamına dahil edilebilmesi için örnek sayılarına göre küçükten büyüğe sıralama işlemi gerçekleştirilmiştir. Sıralanan bu örnek sayısına göre varlıklar, en az örnekten başlayacak şekilde veri seçimi gerçekleştirilmiştir.

Adlandırılmış varlık tespiti modelinin eğitimi için CRF ve spaCy araçları kullanılmıştır. İki model için de giriş verisi metinlerden oluşmaktadır. Eğitim için kullanılacak veri üzerinde veri dağılımı gerçekleştirildikten sonra hazır hale getirilen veri kümesi 80% eğitim, 10% validasyon ve 10% test verisi olarak ayrıştırılmıştır.

Fatura türlerinin belirlenmesi için ilk olarak spaCy sınıflandırma model eğitimi gerçekleştirilmiştir. Fatura türünün belirlenmesinden sonra e-Arşiv ve basılı faturalar için spaCy ve CRF Adlandırılmış Varlık Tespiti modellerinin eğitimi gerçekleştirilmiştir. Kullanılacak eğitim verisi belirlendikten sonra performans metriği oluşturulması amacıyla beş katlı çapraz doğrulama uygulanmıştır. Sınıflandırma için gerçekleştirilen eğitim sonrasında spaCy aracı kullanılmış, (epoch=75, optimizer=adam, dropout=0,1, learning_rate=0,001) parametreleri ile en yüksek başarı oranı 98,75%, kesinlik oranı 97,60%, duyarlılık oranı 98,76% ve F1 Skoru 98,92% olarak ölçülmüştür. Fatura türünün belirlenmesi için sınıflandırma modeli gerçekleştirildikten sonra e-Arşiv ve basılı faturalar için adlandırılmış varlık tespiti modelinin eğitimi gerçekleştirilmiştir. Gerçekleştirilen eğitim sonrasında spaCy için (epoch=75, optimizer=adam, dropout=0,1, learning_rate=0,001) parametreleri ile en yüksek başarı oranı 97,68%, kesinlik oranı 96,44% duyarlılık oranı 97,65% ve F1 Skoru 98,89% olarak ölçülmüştür. CRF modeli için (epoch=75, optimizer=adam, dropout=0,1, learning_rate=0,001) parametreleri kullanılarak en yüksek başarı oranı 98,36%, kesinlik oranı 97,80%, duyarlılık oranı 98,35% ve F1 Skoru 98,91% olarak ölçülmüştür.

Tablo 3. Varlıkların Sayılarına Göre Dağılımlarının Gösterimi

Yöntem	Model	Accuracy (%)	Precision(%)	Recall(%)	F1 Score(%)
Sınıflandırma	spaCy	98,75	97,60	98,76	98,92
Adlandırılmış Varlık Tespiti (AVT)	spaCy	97,68	96,44	97,65	98,89
	CRF	98,36	97,80	98,35	98,91

SONUÇLAR VE GELECEK ÇALIŞMA

Bu çalışmanın amacı dijital ortamda teslim edilmeyen faturaların sınıflandırma ile tespit edilmesi ve dijital ortama aktarılması için gerekli doğal dil işleme modellerinin eğitilmesidir. E-fatura, e-Fatura mükellefi iki kurum veya kişi arasında sunucular üzerinde oluşturulmakta ve dijital olarak teslim edilmektedir. e-Arşiv ve kağıt faturalar ise e-posta ya da kağıt olarak fiziksel şekilde teslim edilmektedir. Bu faturaların dijital ortama aktarılmasında kullanılan insan gücünün ve oluşabilecek hataların azaltılması amaçlanmıştır. Fatura metinlerinin OKT araçları kullanılarak oluşturulduğu ve 40 farklı varlık etiketlemesi gerçekleştirilmiş 145.000 faturadan oluşan veri kümesi kullanılmıştır. OKT araçları bir görüntü üzerinde bulunan metinler için blok, paragraf, satır ve kelime numarası ve koordinat özelliklerini oluşturmaktadır. Fatura görüntülerinin yapısından dolayı metin algılama ve tanıma işlemi gerçekleştirilirken OKT sonuçlarında blok yapıları ve kelime sıralamaları için hatalar gözlemlenmiştir. Bu hatalar için geliştirilen çeşitli kurallar yardımıyla düzeltilmesi sağlanmıştır. Düzeltme işlemi öncesi ve sonrasında oluşturulan veri kümesi spaCy aracı ile eğiterek blok ve kelime sırası için uygulanan düzeltme işlemlerinin doğruluk oranını arttırdığı anlaşılmıştır. Doğal dil işleme ve derin öğrenme algoritmalarında büyük veri kümelerine ihtiyaç duyulmaktadır. Büyük veri kümelerinde verinin dağılımı da model başarı oranını doğrudan etkilemektedir. Bu nedenle eğitim için veri kümesi oluşturulurken sınıflandırma ve AVT model eğitimi için veri dağılımı düzenleme işlemleri uygulanmıştır.

Oluşturulan metin veri kümesi test, eğitim ve validasyon alt veri kümelerine bölünmüştür. Bu veri kümeleri kullanılarak Adlandırılmış Varlık Tespiti için spaCy ve CRF modelleri eğitilmiştir. Fatura türünün belirlenmesi için sınıflandırma uygulanmış ve spaCy aracı kullanılmıştır. Model eğitimleri gerçekleştirilirken model doğruluk oranlarının optimize edilmesi amacıyla hiper parametre optimizasyonları uygulanmıştır.

TEŞEKKÜR

Özet

Uçak yapılarındaki kullanım oranı gün geçtikçe artan kompozit malzemeler, havacılık endüstrisi için büyük avantaj sağlayan hafiflik ve dayanıklılık gibi birçok özelliğe sahiptir. Fiber katkılı polimer kompozitler de sahip olduğu yüksek mukavemet, hafiflik ve korozyona dayanıklılık özellikleri nedeniyle uçak yapısında sıkça kullanılan kompozitlerdir. Bu çalışmada %1, %2, %3, %4 oranlarda Grafen ve DWCNT nanoparçacık katkılı boya ile boyanmış FRP (Fiber Reinforced Polymer) numunelerin elektriksel iletkenlikteki değişimleri incelendi. Numunelerin yüzey morfolojisindeki değişimlerine göre temas açılarındaki farklılıkları belirlemek amacıyla temas açısı ölçümleri alınmıştır.

Anahtar Kelimeler: Fiber Takviyeli Polimer Kompozit, Temas Açısı, Karbon Nanotüp, Grafen, Kompozit, Elektriksel İletkenlik

The Effect of Nanoparticle Doping on Contact Angle in Fiber Reinforced Polymer Composites

Abstract

Composite materials, the usage rate of which is increasing day by day in aircraft structures, has many features such as lightness and durability, which provide great advantages for the aviation industry. Fiber reinforced polymer composites are also frequently used in aircraft construction due to their high strength, lightness and corrosion resistance properties. In this study, the changes in electrical conductivity of FRP (Fiber Reinforced Polymer) samples dyed with Graphene and DWCNT nanoparticle doped paint at 1%, 2%, 3%, 4% ratios were investigated. Contact angle measurements were taken to determine the differences in contact angles according to the changes in the surface morphology of the samples.

Keywords: Fiber Reinforced Polymer Composite, Contact Angle, Carbon Nanotube, Graphene, Composite, Electrical Conductivity

GİRİŞ

Uçak yüzeyinde herhangi bir nedenle oluşan statik elektriğin veya uçuş esnasında yıldırım düşmesiyle oluşan elektriğin uçağa zarar vermeden uçak gövdesinden atılması önemli bir konudur (Berkay, 2015).

Uçak üzerinde elektrik farklı şekillerde oluşabilir. Bunu genelleştirirsek;

- Uçuş esnasında yıldırım düşmesi sonucu oluşan elektrik,
- Uçak kar, buz, sulu kar, dolu veya toz bulutu içinden geçerken sürtünme etkisi ile oluşan statik elektrik
- Elektronik cihazların oluşturduğu statik elektrik

Uçak malzemesi olarak alüminyum kullanıldığında alüminyumun iyi bir iletken olması sebebiyle elektriksel iletkenliğin sağlanması açısından sorun yaşanmamaktaydı. Ancak son yıllarda metallere göre daha hafif buna karşılık daha dayanıklı olduğu için iletkenliği düşük kompozit malzemelerin kullanımı artmaktadır.

Tablo 1. Uçak Malzemelerinin Elektrik Direnç Değerlerinin Karşılaştırması (Özel ve Töre, 2007)

Temas Eden Malzeme Yüzeyleri	Maksimum Direnç Değeri (Ohms)
Alüminyum	0.0005
Çelik	0.0007
Titanyum	0.001
Kompozit	1

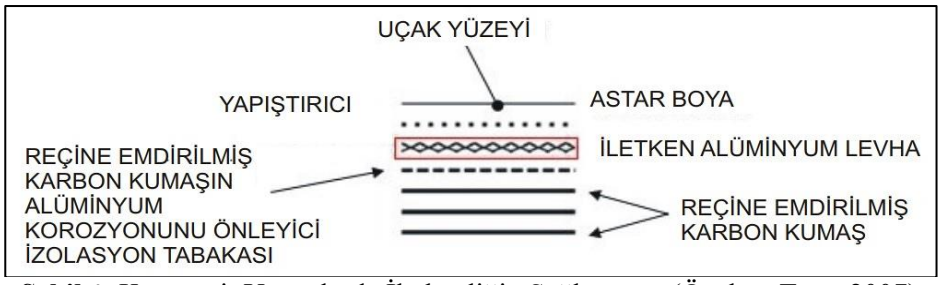
Kompozit gövdeyi iletken bir yapıya dönüştürmek için Şekil 1'deki gibi astar boya öncesinde uçak yüzeyine aşağıdakilerden birinin uygulanması gerekmektedir:

1) iletken alüminyum folyo yapıştırmak

2) alüminyum ya da bakır tel örgü (mesh) yerleştirmek

3) kompozit yüzeyi anti-statik iletken bir malzeme ile kaplamak.

Kompozit parçaların iletkenliğini sağlayacak kaplamalar yıldırım çarpması sonucunda oluşan akımın iletilmesini sağlayanlar (1 ve 2 nolu maddeler) ve statik elektrik akışını sağlayanlar (3 nolu madde) olarak iki grupta incelenebilir. Bu iki grup arasındaki temel fark elektrik akışına karşı gösterdikleri direnç farkından kaynaklanmaktadır (Özel ve Töre, 2007).



Şekil 1. Kompozit Yüzeylerde İletkenliğin Sağlanması (Özel ve Töre, 2007)

Literatürde temas açısı ile ilgili çalışmalara bakıldığında, Mpukuta (2018), farklı oranlarda Grafen katkılama ile oluşturduğu kompozit nano fiberlere 15 kV gerilim uygulayarak elektriksel iletkenliklerini incelediğinde en iyi iletkenliğin $8.85x10^{-3}$ S/cm değeri ile %1 Grafen katkılı kompozit nano fiberde olduğunu görmüşler ve bu numunenin temas açısı ölçümünü yaptığında hidrofobik bir yapıya sahip olduğunu belirtmiştir. Hameed ve ark. (2007), yaptıkları çalışmada topaklanma arttığında yapının daha hidrofobik olacağını belirtmiştir. Açıkbaş ve ark. (2021), yaptıkları çalışmada kaba partikül boyutunun hidrofobik bir yüzey elde etmede uygun morfolojiyi sağlamadığı belirtilmiştir. Çalışmada mikro boyutta çinko oksit tozunun hidrofobikliği iyileştirmediği fakat nano çinko oksit katkısının hidrofobikliğe olumlu yönde etki sağladığı belirtilmiştir.

MATERYAL VE METOD

Bu çalışmada, uçak yapısı üzerinde kullanılan bir kompozit çeşidi olan FRP kompozitlerden QFRP kompozit kullanılmıştır. QFRP kompozit malzemesi bir Airbus 320 uçağının kullanım dışı olmuş radome bölümünden elde edilmiştir.

Bu çalışmada katkı malzemesi olarak kullanılan Grafen ve Çift Duvarlı Karbon Nanotüp (Double Walled Carbone Nanotube - DWCNT) malzemelerinin özellikleri aşağıdaki Tablo 2 ve Tablo 3' te verilmiştir.

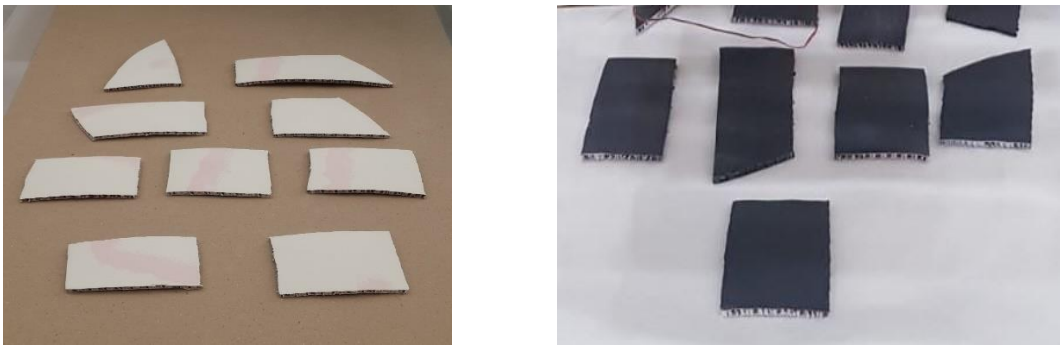
Tablo 2. Grafen Nano Toz Malzeme Özellikleri

Malzeme	Saflık (%)	Kalınlık (nm)	Çap (µm)	Belirli Yüzey Alanı (m^2/g)	İletkenlik (S/m)
Grafen Nanotoz	99.9	3	1.5	800	1500/1980

Tablo 3. Çift Duvarlı Karbon Nanotüp Malzeme Özellikleri

Malzeme	Saflık (%)	Dış Çap (nm)	İç Çap (nm)	Uzunluk (µm)	İletkenlik (S/m)
Çift Duvarlı Karbon Nanotüp	> 65	2-4	1-3	48	9800

Yüzeyi boyanacak olan FRP kompozit bir A320 uçağının artık kullanılmayan radome parçasından alınmıştır. Airbus A320 uçaklarının radome bölgesinde kullanılan FRP malzeme çeşidi QFRP kompozit malzemedir. Radome parçasından, elektriksel direnç ölçümleri için kullanılacak, kontak çapı 4 mm ve iki kontak arası 50 mm olan prob ile üç farklı noktadan ölçüm alabilecek büyüklükte 9 adet numune elde edilmiştir.



(a) (b)

Şekil 2. Radome parçasından elde edilen QFRP malzemeler (a), Katkılı boyalar ile boyanmış numuneler(b).

Kompozit üzerine Airbus boyama prosedürüne göre uygulanacak boya katmanları sırasıyla astar boya olarak kullanılan 5014 PU Surfacer ve anti-statik boya olarak kullanılan 0986/2620 Anti-statik boyadır (Airbus, 2020). Ayrıca Antistatik boyayı uygulamak için hazırlarken 0709/9000-aktivatör ve 0491/9000-inceltici kullanılmıştır.

Katkılı boyaları hazırlarken ilk olarak 0986/2620 Anti-Static Type II Kit prosedüründe verilen 3:1:1 oranına uygun olarak sırasıyla 0986/2620 Anti-statik boya, 0709/9000 aktivatör ve 0491/9000 – inceltici karıştırılmıştır. Sonrasında her bir numuneye uygulamak için 37,5 gr olarak ayrılan bu karışımlara malzeme özellikleri Tablo 2 ve Tablo 3'te verilen Grafen ve DWCNT malzemelerinden %1, %2, %3, %4 oranında eklenmiş ve yeni karışımlar elde edilmiştir. Grafen ve DWCNT malzemelerinden %1, %2, %3, %4 oranında katkılanmış boya ile yüzeyi boyanan QFRP kompozit numuneler Tablo 4'teki gibi adlandırılmıştır.

Tablo 4. Numunelerin katkı oranlarına göre adlandırılması

Numune No	Katkı Malzemesi	Katkı Oranı
N0	KATKISIZ	0%
N1	Grafen	1%
N2	Grafen	2%
N3	Grafen	3%
N4	Grafen	4%
N5	DWCNT	1%
N6	DWCNT	2%
N7	DWCNT	3%
N8	DWCNT	4%

Farklı ve değişik oranda nanoparçacık katkılı boya boyanmış numunelerin yüzey morfolojisi ve iletkenlik değişimlerine bağlı olarak temas (kontak) açısı değişimlerini belirlemek için Kocaeli Üniversitesi Havacılık ve Uzay Bilimleri Fakültesi, Havacılık Malzemeleri Araştırma ve Geliştirme (HAMAG) laboratuvarında

tasarlanıp montajlanan ±2° sapma ile çalışan temas açısı ölçüm cihazı ile yüzey temas (kontak) açısı ölçümleri alınmıştır (Günerhan, 2021).

Elde edilen katkılı boyalar ile QFRP kompozit numunelerin boyanması sonrasında ilk olarak Airbus elektriksel yüzey direnç ölçme prosedürüne göre C.A. 6525 Megohmmeter kullanılarak direnç ölçümleri yapılmıştır (Airbus, 2018). Numunelerin yüzey direnç değerleri ile iletkenliklerinin hesaplanması için denklem (1)'deki formül kullanılmıştır.

$$\sigma = \frac{l}{R \times A} \quad (1)$$

burada ;

σ = Elektriksel iletkenlik (S/m)

R = Direnç (Ω)

A = Yüzey alanı (m^2)

l = Elektrotlar arası uzunluk (m)

Nanoparçacık katkısı olmayan boya ile boyanmış N0 numunesi referans alınarak, nanoparçacık katkı oranına göre numunelerdeki iletkenlik artış oranları karşılaştırıldığında (Tablo 5 ve Tablo 6) DWCNT etkisinin Grafen'e göre en az %31.29, en fazla %17617.59 daha iyi sonuç verdiği görülmüştür. Bu durumun hem DWCNT'nin iletkenliğinin Grafen'den daha yüksek olduğu hem de nanoparçacık boyutlarının Grafen'den daha uzun olduğu için gerçekleştiği düşünülmektedir.

Tablo 5. Referans numunenin (N0) elektriksel iletkenlik değerine göre, %1, %2, %3, %4 Grafen katkılı boya ile boyanmış numunelerdeki elektriksel iletkenlik artış oranı

Grafen			
Numune Numarası	Katkı Oranı	İletkenlik Değeri [S/m]	İletkenlik Artış Oranı [%]
N1	1%	1.01E-04	109.71%
N2	2%	1.68E-04	247.06%
N3	3%	4.37E-04	804.24%
N4	4%	9.26E-04	1817.02%
N0 (Katkısız)	0%	4.83E-05	

Tablo 6. Referans numunenin (N0) elektriksel iletkenlik değerine göre, %1, %2, %3, %4 DWCNT katkılı boya ile boyanmış numunelerdeki elektriksel iletkenlik artış oranı

DWCNT			
Numune Numarası	Katkı Oranı	İletkenlik Değeri [S/m]	İletkenlik Artış Oranı [%]
N5	1%	1.33E-04	175.32%

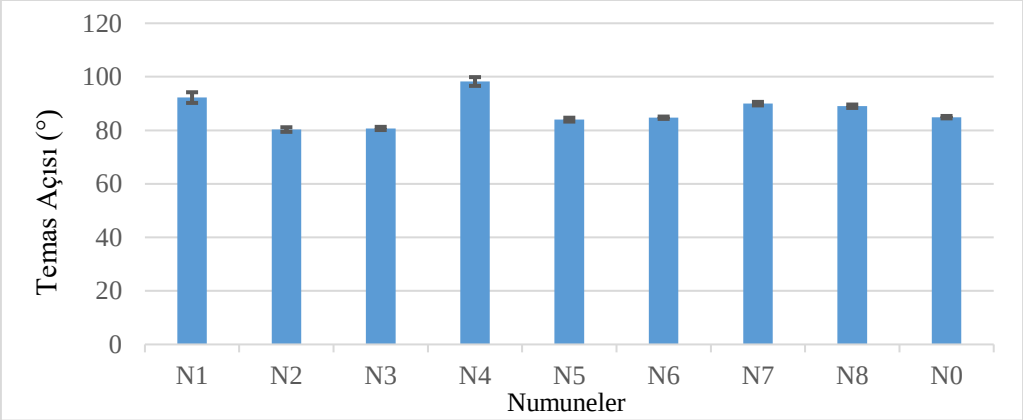
N7	3%	2.85E-02	58906.21%
N8	4%	4.34E-03	8885.92%
N0 (NP-Katkısız)	0%	4.83E-05	

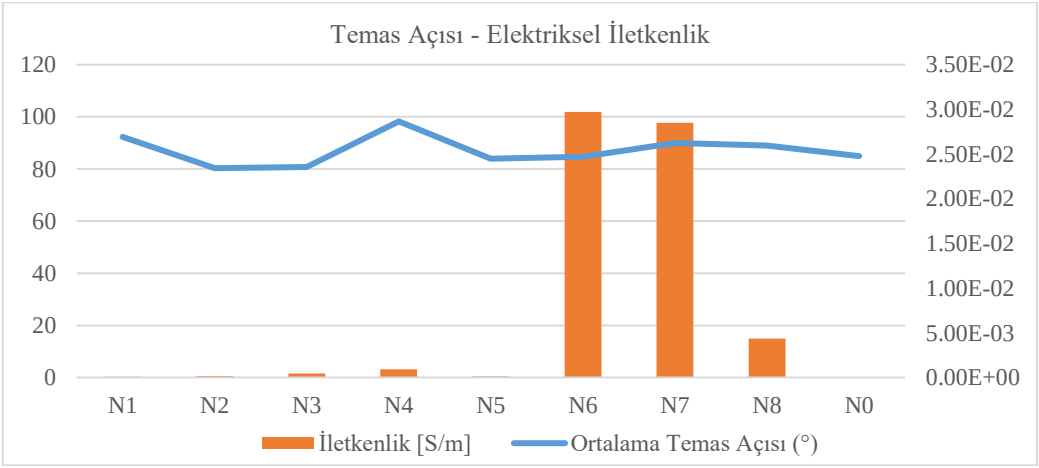
BULGULAR ve TARTIŞMA

Farklı ve değişik oranda nanoparçacık katkılı boya ile boyanmış numunelerin yüzey morfolojisine bağlı olarak temas (kontak) açısı değişimlerini belirlemek için temas açısı ölçümleri 3 farklı ölçümün ortalaması ile hesaplanmıştır. Ölçüm sonuçlarına ait grafik Şekil 3'te görülmektedir.



Şekil 3. Numunelerin temas açısı ölçümleri

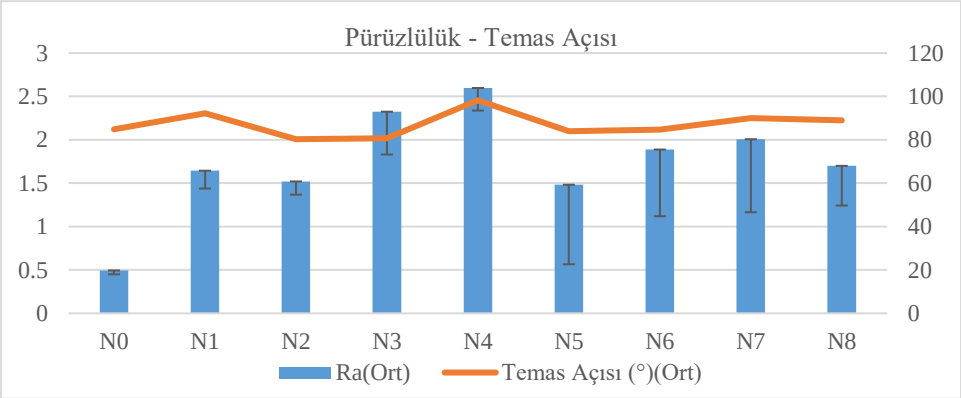
Şekil 3'teki verilere göre farklı oranlarda Grafen ve DWCNT ile katkılanmış uçak boyasının numunelerin Temas Açısı (TA) üzerindeki etkisi incelendiğinde N0 referans numunesine göre su temas açısının en fazla artış gösterdiği %4 Grafen katkılı uçak boyası ile boyanmış N4 numunesidir. Mpukuta (2018), farklı oranlarda Grafen katkılama ile oluşturduğu kompozit nano fiberlere 15 kV gerilim uygulayarak elektriksel iletkenliklerini incelediğinde en iyi iletkenliğin $8.85x10^{-3}$ S/cm değeri ile %1 Grafen katkılı kompozit nano fiberde olduğunu görmüşler ve bu numunenin temas açısı ölçümünü yaptığında hidrofobik bir yapıya sahip olduğunu belirtmiştir. Bu çalışmada %1, %2, %3 ve %4 Grafen katkı oranı ile oluşturduğumuz uçak boyaları ile boyanan sırasıyla N1, N2, N3 ve N4 numuneleri içerisinde en yüksek iletkenliğe sahip olan numune $1.01x10^{-4}$ S/m değeri ile N4 numunesidir ve aynı zamanda hidrofobik bir yapıya sahip olduğu Şekil 4'te görülmektedir. %1, %2, %3 ve %4 DWCNT katkılama sonucu elde edilen uçak boyaları ile boyanmış sırasıyla N5, N6, N7, N8 numuneleri incelendiğinde N0 referans numunesine göre su temas açısının en fazla artış gösterdiği %3 DWCNT katkılı uçak boyası ile boyanmış N7 numunesinin en iyi hidrofobikliğe sahip olduğu görülmektedir. Yani N7 numunesi farklı oranlarda DWCNT katkılama sonucu elde edilen uçak boyaları ile boyanmış numunelerin içinde en iyi iletkenlik değerine sahip ikinci numune olurken aynı zamanda üzerine gelen suyun yayılmasını en iyi önleyen numune olduğu görülmektedir.



Şekil 4 Numunelerin temas açısı ve elektriksel iletkenliklerinin karşılaştırması

Hameed ve ark. (2007), yaptıkları çalışmada topaklanma arttığında yapının daha hidrofobik olacağını belirtilmiştir. DWCNT katkılı uçak boyası ile boyanmış numuneler içinde yüzeyinde topaklanma olan N6 ve N7 numuneleri incelendiğinde topaklanmanın artmasıyla numunelerin daha hidrofobik bir yapıya sahip olduğu görülmektedir.

Şekil 5 incelendiğinde Grafen katkılı uçak boyası ile boyanmış numuneler içinde en yüksek pürüzlülük değerine sahip N4 numunesinin aynı zamanda daha hidrofobik bir yapıya sahip olduğu görülmektedir. DWCNT katkılı uçak boyası ile boyanmış numuneler içinde N7 ve N8 numuneleri incelendiğinde pürüzlülüğün artmasıyla numunelerin daha hidrofobik bir yapıya sahip olduğu görülmektedir.



Şekil 5. Numunelerin temas açısı ve pürüzlülük değerlerinin karşılaştırılması

Tüm numuneler karşılaştırıldığında en iyi hidrofobik yapıya sahip olan numunenin N4 numunesi olduğu görülmektedir. Açıkbaş ve ark. (2021), yaptıkları çalışmada kaba partikül boyutunun hidrofobik bir yüzey elde etmede uygun morfolojiyi sağlamadığı belirtilmiştir. Çalışmada mikro boyutta çinko oksit tozunun hidrofobikliği iyileştirmediği fakat nano çinko oksit katkısının hidrofobikliğe olumlu yönde etki sağladığı belirtilmiştir. Bu bilgi doğrultusunda Grafen nanoparçacık katkılı uçak boyası ile boyanan numunelerin hidrofobikliği referans numunesi N0'a göre incelendiğinde %1 ve %4 Grafen nanoparçacık katkı oranıyla oluşturulan boyalar ile boyanmış N1 ve N4 numunelerinde nanoparçacık katkısının hidrofobikliğe olumlu yönde etki ettiği görülmüştür. DWCNT nanoparçacık katkılı uçak boyası ile boyanan numunelerin hidrofobikliği referans numunesi N0'a göre incelendiğinde %3 ve %4 DWCNT nanoparçacık katkı oranıyla oluşturulan boyalar ile boyanmış N7 ve N8 numunelerinde nanoparçacık katkısının hidrofobikliğe daha az etki ettiği ve hata barlarından da görüldüğü gibi pürüzlülük değişimlerinin daha fazla olduğu görülmüştür. Bu numunelerin yüzeyi incelendiğinde, yüzeydeki yüksek pürüzlülük değişimlerine nanoparçacıkların birleşiminden kaynaklanan topaklanmalar neden olmuştur.

SONUÇ

QFRP kompozit numunelerinin Grafen ve DWCNT nanoparçacıklar ile katkılanmış boyalarla yüzeylerinin boyanması sonucu yüzey morfolojisindeki değişimin yüzey pürüzlülüklerini, temas açılarını ve iletkenliklerini nasıl etkilediğini açıklamak için ölçümleri gerçekleştirildi. Numunelerin katkılı boyalar ile boyanması sonucu hem yüzey morfolojisinde hem de yüzey kimyasında farklılaşmalar oluşmuş, dolayısı ile yüzey enerjileri değişerek temas açılarında değişimler meydana gelmiştir. Numunelerin temas açısı değerleri hem elektriksel iletkenlik hem de pürüzlülük ölçümleri ile karşılaştırılmıştır. Grafen nanoparçacık katkılı uçak boyası ile boyanmış numunelerde hem en yüksek elektriksel iletkenlik hem de en yüksek pürüzlülük değerine sahip N4 numunesinin aynı zamanda en yüksek temas açısına yani en iyi hidrofobik davranışa sahip olduğu görülmektedir. DWCNT nanoparçacık katkılı uçak boyası ile boyanmış numunelerde N7 ve N8 numunelerinde elektriksel iletkenlik ve pürüzlülük değerleri N0'a göre yüksek olmakla birlikte temas açıları da daha yüksektir dolayısıyla daha hidrofobik bir yapıya sahiplerdir.

TEŞEKKÜR

Abstract

A new era has begun for Steel Moment frames after the Northridge--California earthquake happened. Since then, steel moment frames have gone through different studies and investigations where plenty of research are undertaken. Steel moment frames are those frames that develop their seismic resistance through bending of steel beams and columns and moment-resisting beam-column connections. A beam-to-column moment-resistant connection is one that is designed to develop moment resistance between the beam and the column at the joint and to develop shear resistance at the column panel area. In this research paper, which 'Seismic performance evaluation of mid-rise steel special moment frames with various span lengths.' will be discussed a six-story building with 40 meters height. e is a 6-story building which is 45m in height. Then, 4-cases of analysis will be applied and compare their results, and each case has its span lengths. Span arrangements will be in these four cases which, 1: 5x9m, 2: 6x7.5m, 3: 6m-9m-7.5m-7.5m-9m-6m and 7.5m-10m-10m-10m-7.5m. The building was designed for a site in downtown Los Angeles where SS is 200%g and S1 is 100%g. The moment connections are formed with reduced beam sections. 44 pairs of ground motions compatible with site class D in Los Angeles area are used in this study. Design spectrum parameters are SDS=1.333(g), SD1=1.000(g) and TL=12.0 s. Ground motions were selected using the PEER Ground motion database. The results indicate that the structural response is sensitive to the span length and variable span length within the frame might significantly increase the seismic demand on column splices.

Keywords: Various Span Lengths, Special Steel Moment Frame, Seismic Performance.

INTRODUCTION

Since the existence of the universe, an earthquake is one of the most well-known natural disasters, it has many features that should be considered in terms of its effects. Earthquakes cause loss of life by causing landslides, damage, and collapses in structures. On the other hand, to be less affected by these earthquakes that occur day by day, human beings have tended to design the structures in a way that will show non-linear behavior, will take damage in a controlled manner, and survive without collapse. Steel moment frames are those frames that develop their seismic resistance through bending of steel beams and columns and moment-resisting beam-column connections. Steel moment frames are those frames that develop their seismic resistance through bending of steel beams and columns and moment-resisting beam-column connections [1]. A beam-to-column moment-resistant connection is one that is designed to develop moment resistance between the beam and the column at the joint and to develop shear resistance at the column panel area. In line with this purpose lateral load-bearing systems such as Special Moment Resisting Frame (SMRF) to absorb the energies of incoming severe ground motions. In moment frames, beams are one of the most important members that contribute the load carrying process of the structure. The length of the beam is just the overall length of the member, and the span is the distance between the two supports measured from center to center. The span of the beams defines how the structure response the ground motions. Therefore, in this study, four different span lengths with SMFs are used to specify the effect of span length difference in seismic performance of the frames, which each of them will be 6-story building with steel perimeter frames is designed with different span lengths. Cases 1 and 2 have same span lengths in each of their bays while, case 3, 4 span lengths different in the frame. Differently are the frames are subjected to a suite of earthquake ground motions. An ensemble of ground motions is selected so that the seismic response of each of the four frames would range from moderate to severe and the

seismic energy demand would be evaluated based on the response of the frames. A 44 pairs of ground motions compatible with site class D in Los Angeles area are used in this study. Design spectrum parameters are SDS=1.333(g), SD1=1.000(g) and TL=12.0 s. Ground motions were selected using PEER Ground motion database. Each pair of ground motion is composed of two components, which are fault normal (FN) and fault parallel (FP). Non-linear dynamic time history analyses results are evaluated.

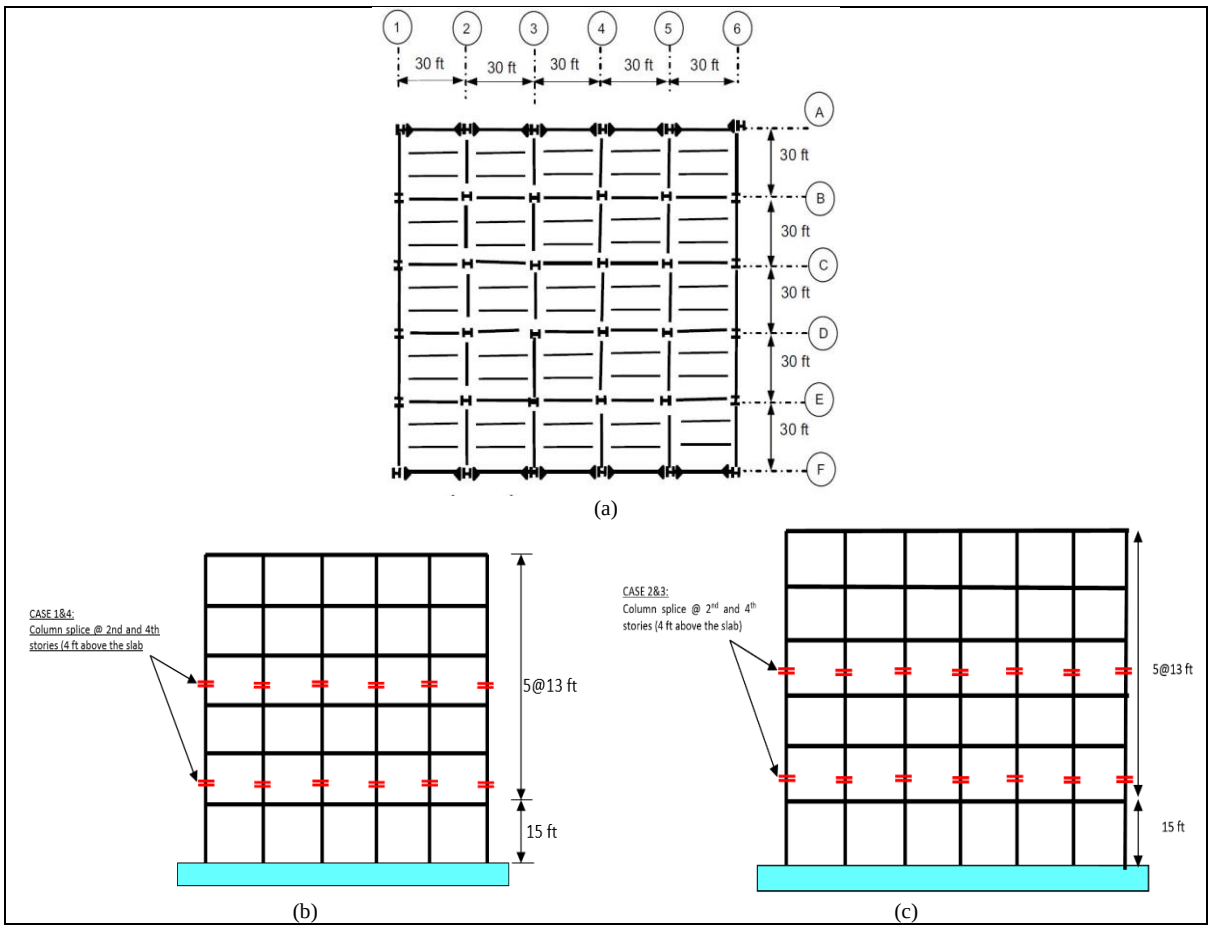
Objectives

The purpose of this research is to investigate the contribution of the various span lengths to the moment frame's seismic demands. It also explores the amplified seismic loads in steel special moment frames (SMF) under strong ground motions. This study, it is aimed to examine the non-linear structural behavior that may occur in buildings under earthquake effects. To this end, plastic hinge rotations, P-M interactions for side columns, and pushover curves for all frames will be evaluated. Moreover, the increase in axial loads on columns and braces for the maximum lateral load level and the corresponding lateral displacement will be investigated. For this reason, in this study; Four steel frames with six-story floors are designed. The selected buildings are designed for vertical loads and earthquake loads for experimental purposes. Column attachments have been placed in steel structures and it is aimed to find the demand/capacity ratios formed in these column attachments. For this, In this study, it was investigated to what extent the cyclic behavior of the model can be determined with the help of non-linear time history analysis by affecting a total of 44 ground motion steel moments with 2% and 10% grafting probability on the frames. nonlinear dynamic time history analysis and load combinations specified in regulations (ANSI/AISC 341) were used.

BUİLDİNG DESCRİPTİON

Based on the seismic design specifications for special moment frames in ASCE 7 [7] and AISC 341 [1,2], typical steel moment frames of six stories were designed. The structures' dead and live loads for the floors and roof are 50 psf and 20 psf, respectively, and they are designed to withstand gravity and seismic loads. Moment connections are established by using reduced beam sections (RBS). The building's floor systems are composed of beams that work compositely with the floor slab. The buildings' floor systems are expected to produce a diaphragm and to be rigid in the horizontal plane. This study examines the influence of span length on four instances.

This study discusses a six-story steel moment frame divided into four cases of a steel moment frame with a constant column dimension, but each case will be having a different span length. The building has an area of 150x150 ft2 with plan dimensions as shown in Figure 1.a), and the first story is 15 ft tall, while the next five floors are 13 ft tall, as shown in Figure 1.b). The moment frames along the A and F axes of (Figure 1.a) are comprised of five spans, each measuring 9.15 m in width. In short, the building consists of a total area of approximately 22500 ft2 and a height of 80 ft.



(a) Building plan, (b) & (c) Elevation of the moment frames on Line A and F (Case 1.2,3&4: Spliced at 2nd and 4th stories),

Figure 1. Plan and elevation of 6-story building.

Horizontal load-bearing systems are moment frames located around the structure. The beams in the frames in the interior openings carry only vertical loads since their ends are hinged, and there is no horizontal load-bearing system in the interior openings. The columns of the structure are assumed to be fixed and connected to the foundation. In addition, the gravity loads on P-Delta columns will be pinned. As a result, the behavior of the moment frames in the A and F axes has been considered in the design.

This study used 22 pairs of earthquake records included in the far area earthquake set, compatible with the D soil class defined in ATC 63 (2009). That is, a total of 44 earthquake ground motions were applied to the structure [7]. The details of the ground motions will be mentioned in the following sections.

(Case I): Five bays and each span length are constant at 30ft. In (Case II): a constant span length of 25 ft six equal span lengths. In (Case III): various span lengths of 20 ft at two edge spans and two 30 ft spans following the two edge spans and 25 ft in the two mid spans (a total of six different spans). In (Case IV): various span lengths of 25 ft at two edge spans and three 33.3 ft span in the mid bays of the frame (a total of five different span length). Figure 1, Table 1.

Table 1. Floor plan dimensions for the 4-story building.

Case	Dimensions	Span Length
Case 1	36.60 m X 54.90 m	36.60 m X 54.90 m
Case 2	36.60 m X 54.90 m	36.60 m X 54.90 m
Case 3	36.60 m X 54.90 m	36.60 m X 54.90 m
Case 4	36.60 m X 54.90 m	36.60 m X 54.90 m

The period of oscillation was not expected to change dramatically for frames with varied span lengths. As a result, the dynamic behavior would be identical. These structures are comparable to those designed as an aspect of FEMA supported steel frame research facility launched in the aftermath of the 1994 Northridge-California earthquake [3]. This structure was planned for a central Los Angeles site where Ss is 2.0g and S_1 is 1.0g. Design spectrum parameters are S_{DS}=1.333(g), S_{D1}=1.000(g), and T_L=12.0 s. The unique moment frames for the structure were developed with a response modification factor of R = 8. The 4-story frame's ASCE 7 [4] design base shear was determined to be 5938 kN (16.7% of total weight) (Table 2). Tables 2 show the member sizes for all frames.

Table 2. Member sizes for the 4-story frames.

FINDINGS

Nonlinear static response

Following numerical validation, the inelastic responses of the six-story buildings were evaluated under increasing lateral static loads employing inverted triangle-like load patterns (i.e., seismic design forces). Figure 2 shows the non-linear static responses in terms of base shear and roof drift ratio (i.e., lateral roof displacement divided by building height) for the six-story buildings. The design base shears for the system (i.e., one-fourth of the overall design base shear) were similarly indicated by the horizontal dash-dotted lines in Figure 2. In addition, in order to evaluate the changes in the over-strength factors and the SMF contribution to the overall lateral strength was resistant throughout the pushover analyses.

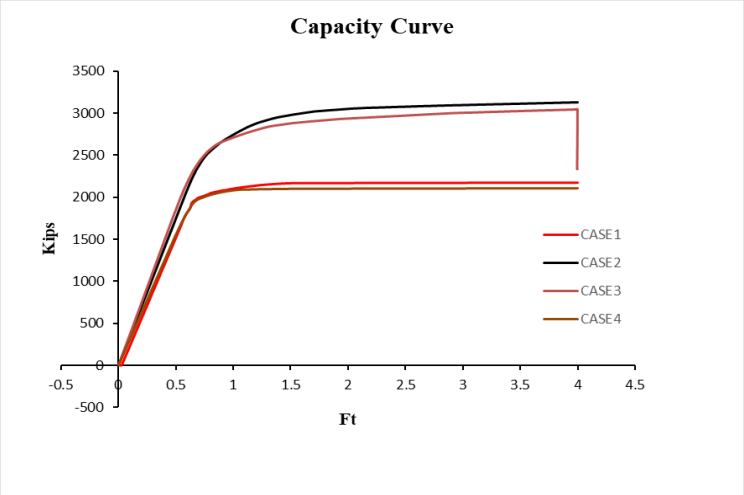

Figure 2. Nonlinear static response of the 4-story dual structures under monotonically increasing lateral loads:

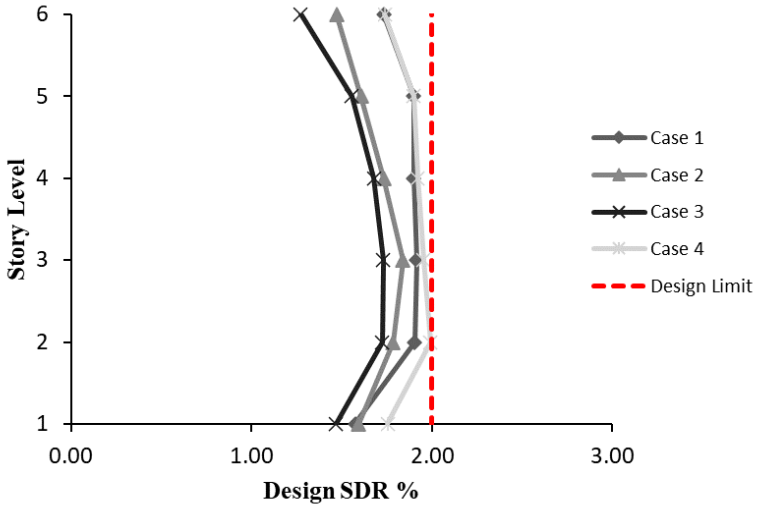

Figure 3. SMF contribution to the total base shear resisted by dual structures during nonlinear static analyses at various demand levels 4-story structures.

Figure 3 depicts the over-strength factors and percentage of base shear resistance withstood by the SMF during benchmark deformations. Based on findings of the nonlinear analysis under monotonically rising static loads shown in Figures 2 through 3, the following can be emphasized:

1. Comparing the pushover curves in Figure 2 reveals that, regardless of building height, the initial stiffnesses of Case 2 structures were the highest, whereas the Case 1,4 structures had the lowest elastic stiffnesses in the 6-story structures, which agrees with the fundamental periods listed in Table 3.
2. Overall, the static responses suggested that the arrangement might have a detrimental role on the initial stiffness, base shear distributions, and potential overstrength in the structures. It indicates the configuration-to-configuration variability in lateral stiffness and strength seems to be due to design concerns such strength design of highly ductile members, strong-column weak-beam need, and particularly, capacity design of girders and columns. Furthermore, the fundamental force deformation interaction tendency of the primary and backup frames due to the differing schemes found to play an essential influence in base shear distributions inside each structure. However, the scheme effect appears to be more relevant in the base shear distribution across the primary and backup frames in the 6-story buildings, where the force deformation interaction becomes quite complicated as the degree of in-elasticity created in the components in interaction grows.

Nonlinear dynamic response

Following the assessment under static loads, the inelastic responses of the structures are carefully evaluated in terms of global and member responses under a suite of ground motions. First, the seismic event responses were summarized using global demand parameters, which included peak and permanent drift demands as well as inelastic energy dissipated in individual frames. Then, the seismic demands' height-wise distribution was elaborated. The drift demands and floor acceleration distributions along the structure height were examined to determine the influence of the configuration on the height wise variation in demand.

Earthquake ground motions; In the current study. The FEMA P-695 [5] far-field record set is used for the evaluation. The far-field record set [5] contains 22 pairs of ground motions with magnitudes ranging from 6.5 to 7.6. Table 4 highlights the fundamentals of each pair of ground motions. It is worth noting that each record is made up of two parts: normal and parallel to the fault. Therefore, a total of 44 different components were used. Therefore, a total of 44 different components were used. The ground movements were chosen from the PEER-NGA2 database [5] using the criteria described in [5], where more information on the ground motion characteristics may be found using the RSN mentioned in Table 4. The ground motion scaling procedure reported in [6] included normalizing and scaling stages. During the normalizing of the data, the previously normalized far-field records were factored in accordance with the guidelines in [1], to acquire a variety of scale factors. The scaled ground motions are shown in Figure 4, together with the mean and target spectra that were used to scale them.

Normalization and scaling steps were involved in the ground motion scaling technique detailed in [4]. After the records were normalized, the recommendations in [1] were followed by multiplying the previously normalized far-field records by 2.59 to get scale factors that ranged from 1.06 to 5.43. In Figure 4, the 5% damped spectra of the scaled ground motions are shown along with the mean and target spectra that were used to scale the motions. As shown in Figure 4, the ground motions were scaled so that the spectral accelerations of the mean and targeted maximum considered earthquake (MCE) level spectrum (where SS = 2.0 g and S1 = 1.0 g) were the same at 1 s [4]. The details of the above scaling criteria can be found in [4].

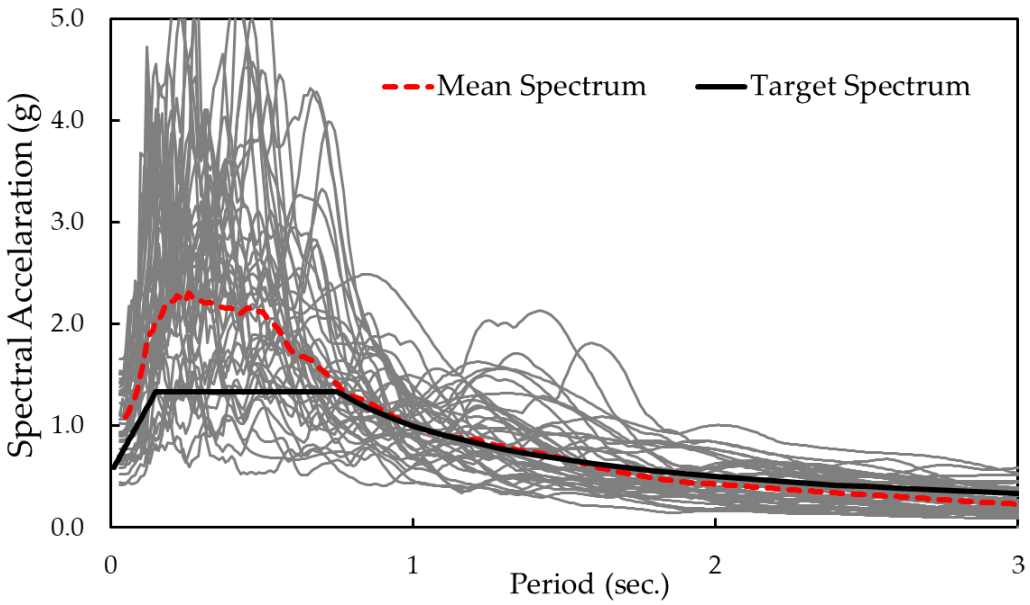

Figure 4. Spectra of the 22 pairs of ground motion records used in the study.

The acceleration time histories of the ground motions were taken from historical recordings or physical simulations and adjusted such that their mean response spectrum meets the 1997 National Earthquake Hazard Reduction Program (NEHRP) designing spectrum, modified from soil type SB-SC to soil type SD, and with a hazard described by the 1997 USGS maps [7]. Figure 5 depicts the time histories of the ground motions[8].

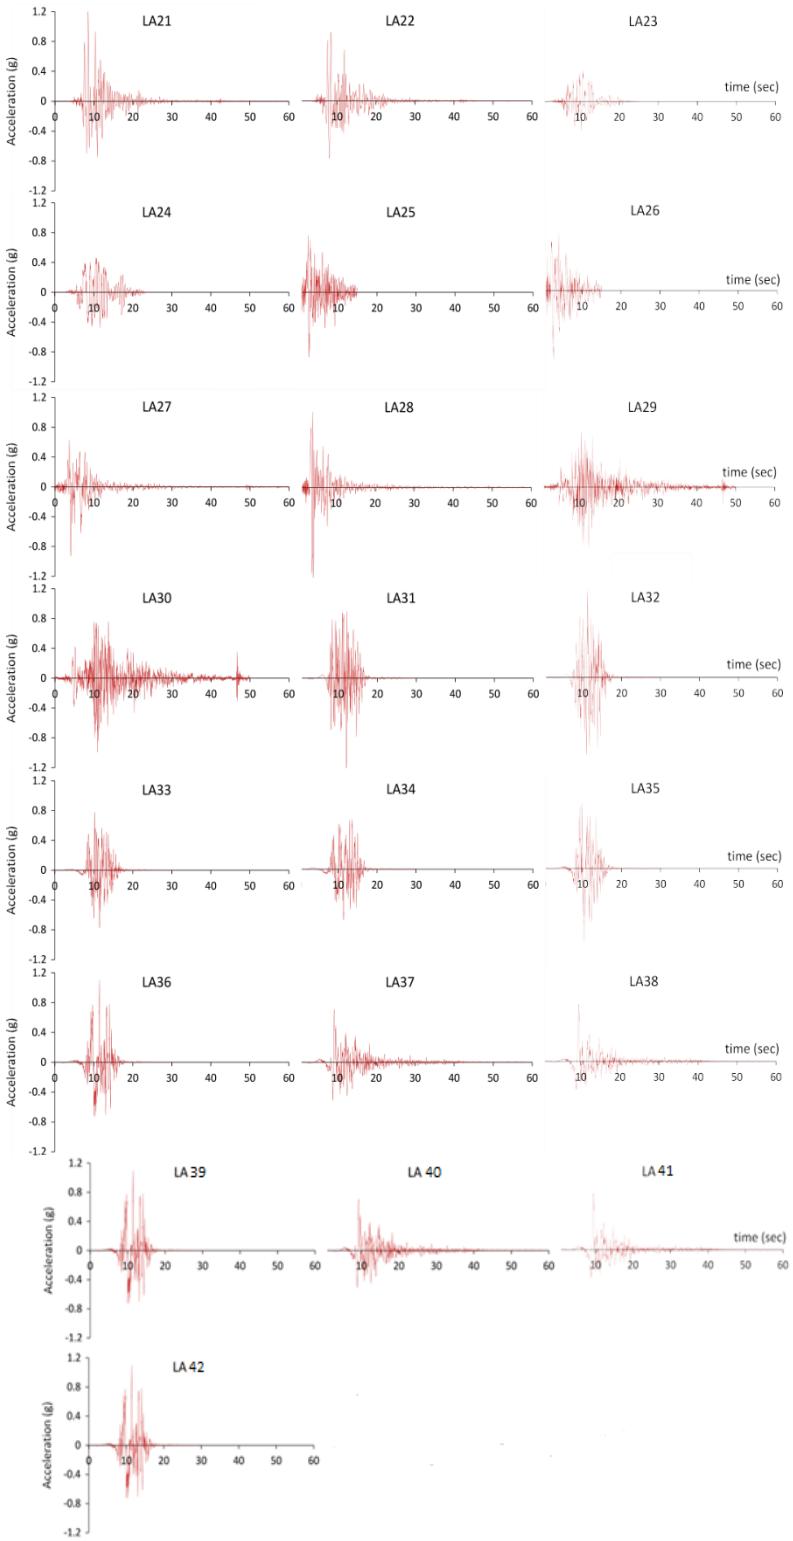

Figure 5. Time histories of the selected ground motions

CONCLUSIONS

This research focuses on the seismic demand for column splices in steel moment-resistant frames with varying span lengths. Since the peak story drift ratio and plastic hinge rotation are sensitive to the structure's dynamic properties, it is assumed that all frames have the identical total floor area but slightly different lateral stiffness depending on the length of the span. For one exceptional case (Case 4), the structure is believed to be almost identical, with just the span lengths within the frame varying. For the 6-story steel moment frames examined in this study, column splice demand depends on a structural model assuming the column splice is placed 1.22 m above the finished floor elevation and with various span lengths, the following findings and recommendations might be reached:

1. Peak story drift ratio is demonstrated to be sensitive to span length for the Case 1 frame. Peak plastic hinge rotation becomes considerable for the structure when span lengths vary within the identical frame when subjected to moderate ground motions.
2. In storey steel frames, axial in floors with column joints, the force demand/capacity ratios are doubled in outer columns compared to inner columns. close values were found
3. Considering the axial force demand/capacity ratios according to earthquake intensities, although an increase is observed depending on the earthquake intensities, this increase is very small seen.
4. The axial force demand/capacity ratios under the effect of the most severe earthquake LA34 (0.68 g) and the least severe earthquake LA06 (0.23 g) are examined, there is a 10% difference.
5. The axial force demand/capacity ratios in the columns above and below the floors where the column attachments are located, it is seen that there is an increase from the upper column to lower column.

Özet

Bu çalışmada genetik moleküler analiz yöntemiyle Nörofibromatozis tip 1(NF1) tanısı alan hastalarda hemogram parametreleri ve özellikle trombosit indekslerinin rolünü araştırmayı planladık.

Çalışmamıza NF1 tanısı olan 33 hasta ve sağlıklı 32 birey olmak üzere toplam 65 kişi dahil edildi. Genetik polikliniğine gelen hastaların kayıtlarından retrospektif olarak hemogram verileri incelendi. Tam kan sayımı Abbott Alinity hq (Abbott, Santa Clara, ABD) sisteminde çalışıldı.

Çalışma ve kontrol grubundaki olgular yaş açısından benzer olmak üzere ($p>0.05$), NF1 pozitif olan hastaların ve kontrol grubunun PLT(trombosit) değerleri arasında istatistiksel olarak anlamlı bir farklılık vardı ($p=0,026$). Diğer tüm parametreler arasında ise istatistiksel bir fark izlenmedi ($p>0,05$).

Çalışmamızda PLT düzeyi normal referans aralıkta olmasına rağmen hasta grubunda kontrol grubuna göre anlamlı düşüklük tespit edildi.

Anahtar kelimeler: Nörofibromatozis tip 1, PLT, Tam kan sayımı

Giriş

Nörofibromatozis tip 1, otozomal dominant kalıtılan nörokutanöz genetik bir hastalıktır (1). Hastaların yaklaşık %42'sinde NF-1 geninde mutasyon de novo olarak görülmektedir (2). Hastalığın insidansı ülkelere göre farklılık göstermekle birlikte dünya genelinde yaklaşık 1/3000'dir (3). Kadın ve erkeklerde görülme oranı birbirine eşit olup etnik kökenlere farklılık gözlenmemektedir (2). Hastalık, tümör süpresör protein olan nörofibromini kodlayan NF1 genindeki mutasyonlardan kaynaklanır (4). NF1'in penetrasyonu %100 olup NF1 gen mutasyonu olan bireylerde NF1 klinik bulguları görülmektedir (5). Nörofibromatozis tip 1'de, çoklu sistem tutulumu nedeniyle farklı klinik bulgular gözlenir. Hastalığın tanısı daha çok erken yaşlarda ortaya çıkan belirgin deri bulguları ile konulur (6). 1988 yılında NIH (Ulusal Sağlık Enstitüsü) tarafından belirlenen tanı kriterleri arasında; en az altı veya daha fazla cafe au lait makülü, aksiller veya inguinal çillenme, optik gliom, en az iki veya daha fazla Lisch nodülü, en az iki veya daha fazla nörofibrom veya bir pleksiform nörofibrom, farklı bir kemik lezyonu ve NF1 tanısı bulunan 1.derece akrabanın olması yer almaktadır. Tanı için NF1 tanı kriterlerinden en az ikisinin olması önerilmiştir (7). NF1 birçok organ tutulumunun görüldüğü multisistemik bir hastalıktır. Genellikle dermatolojik bulgularla başlayan hastalık ilerleyen dönemlerde hastalarda farklı klinik bulgulara yol açabilir. Hastalarda başta nörofibrom olmak üzere farklı organ ve dokularda kanser gelişimi, kardiyovasküler anormallikler, iskelet displazileri, hormonal bozukluklar, konuşma ve öğrenme güçlüğü riski bulunmaktadır (8).

Bu çalışmada genetik moleküler analiz yöntemiyle NF1 tanısı alan hastalarda hemogram parametreleri ve özellikle trombosit indekslerinin rolünün araştırılması planlandı. Elde edilen veriler ışığında hastalığın prognozunda rutinde sıklıkla kullanılan hemogram parametrelerinin rolü araştırılacaktır.

Materyal metod

Retrospektif olan çalışmamız, Harran Üniversite Hastanesi Genetik polikliniğine, Ocak 2016- Eylül 2021 tarihleri arasında Nörofibromatozis tip-1 tanı kriterleri olan Lisch nodülü, nörofibrom, café-au-lait lekeleri, optik gliom, iskelet displazileri, aksiller veya inguinal çillenme ve aile öyküsü kriterlerinden en az 2 tanesini taşıyan, NF-1 geni mutasyon analizi yapılmış olan Nörofibromatozis Tip-1 tanılı hastalar dahil edildi. Hastalardan rutin muayene esnasında istenen hemogram parametreleri araştırılacak, öz ve soygeçmişinde NF1

hastalığı veya nörokutanöz hastalık öyküsü bulunmayan sağlıklı kontrol grubunun hemogram parametreleri ile karşılaştırıldı.

Bu hastaların tam kan örnekleri 3 mL'lik K3-etilendiamintetraasetik asit (EDTA) içeren bir tüpe alındı. CBC sayımı Abbott Alinity hq (Abbott, Santa Clara, ABD) sisteminde çalışıldı. Analiz edilen hematolojik parametreler aşağıdaki gibidir: beyaz kan hücresi sayısı (WBC), nötrofil (neu), lenfosit (lym), monosit (mono), eozinofil (eos), kırmızı kan hücresi (RBC), hemoglobin (Hb), hematokrit (HCT), ortalama alyuvar hacmi (MCV), ortalama alyuvar hemoglobini (MCH), ortalama alyuvar hemoglobin konsantrasyonu (MCHC), alyuvar dağılım genişliği (RDW), trombosit (PLT) ve ortalama trombosit hacmi (MPV).

Verilerin değerlendirilmesinde SPSS 20 istatistik programı kullanıldı. Sürekli değişkenlerin dağılımının normal olup olmadığı Kolmogorov-Smirnov testiyle araştırıldı. Parametrik veriler ortalama ± standart sapma, parametrik olmayan veriler ortanca (min-max) olarak verildi. Gruplar arasında anlamlı farklılığı non parametrik testler için, Mann Whitney U testi, parametrik testler için ise Student-t testi kullanıldı. $p<0.05$ istatistiksel olarak anlamlı kabul edildi.

Bulgular

Çalışmaya NF-1 genetik testi pozitif olan (n=33) hastalar ile ve kontrol grubunun (n=32) karşılaştırmalı laboratuvar parametreleri Tablo 1'de verilmiştir.

Tablo 1:

Parametre	NF1 (n=33)	Kontrol (n=32)	p

Tartışma

NF1 hastalarında özellikle nörofibromların rezeksiyonu sırasında kanama eğilimi olduğu uzun zamandır bilinmektedir. NF1'de kanama, hastalık mortalitesinden büyük ölçüde sorumludur (9) Kanama hem artan vasküler kırılganlıktan hem de primer hemostaz bozukluklarından kaynaklanır (10). NF1 hastalarında gelişen tümörler oldukça vasküler olduğundan kan kaybının hematolojik nedenleri histolojik faktörlerden net olarak ayırt edilememiştir (11). Birkaç rapor dışında, NF-1'li hastalarda tam kan sayımı parametrelerinin tam olarak değerlendirildiği bir çalışma bulunmamaktadır. Bu çalışmalardan birinde trombosit sayıları da dahil olmak üzere tam kan sayımının standart parametrelerinin incelenmiş ve NF-1'li hastalarda trombosit değerlerinin normal aralıkta olduğu bildirilmiştir (12). Çalışmamızda ise NF1 hastalarında kontrol grubu ile karşılaştırıldığında platelet sayısının daha az olduğu tespit edildi. Bu durum hastalarda nörofibrom rezeksiyonu esnasında daha fazla kanama eğiliminin nedenini açıklayabilir. Ayrıca bugüne kadar sadece bir çalışmada NF1 hastalarında trombosit fonksiyon bozukluğu değerlendirildi. Rasko ve ark. tarafından NF1 tanılı 30 hastadan alınan trombositlerde ADP, araşidonik asit, trombin ve kollajene yanıt olarak ATP salınımı ve

agregasyon durumları incelendi. Çalışmada trombositleri NF1 hastalarından ve kontrollerden ayıran durumun, normal bir agregasyon yanıtı elde etmek için daha yüksek kolajen konsantrasyonlarının gerekli olmasıydı. Rasko tarafından açıklanan trombosit defektinin biyokimyasal temeli tam olarak aydınlatılamamıştır; ancak cerrahi planlanan NF1 hastalarının kanama diyatezi açısından araştırılması gerektiği öne sürülmüştür (13). Lösemi özellikle jüvenil kronik miyeloid lösemi ve miyelodisplastik sendromlar NF1'li çocuklarda nadir görülmekle birlikte hastalarda normal sağlıklı çocuklara göre çok daha yaygındır. (14). NF1'li küçük çocuklarda, özellikle JMML ve miyelodisplazinin bir çocukluk varyantı olan monozomi 7 sendromu gibi malign miyeloid bozuklukların riski normal popülasyondan 200-500 kat kadar yüksek sıklıkta görülür (15). Özellikle NF1'li çocuklar beyin tümörleri, rabdomiyosarkomlar, JCMML ve akut miyelojenöz lösemi dahil olmak üzere malign bozukluklar geliştirme açısından belirgin şekilde yüksek risk altındadır (16,17). 1978'de Brader ve Miller (18) MPS' lerin NF1'li çocuklar arasında orantısız bir şekilde yaygın olduğunu gözlemledi. Monozomi 7 ile ilişkili MPS, klinik ve patolojik olarak JMML' ye benzerdir ancak çocuklarda ayrı bir kronik MPS olarak kabul edilmektedir (19). p21ras (Ras) sinyal proteinleri ailesinin üyelerine bağlanan nörofibromin adı verilen bir proteini kodlayan NF1 geni 1990 yılında klonlanmıştır. NF1 geni, Ras-guanin nükleotid trifosfatın (ras-TP) Ras-guanin nükleotid difosfata (Ras-GDP) hidrolizini hızlandırarak biyokimyasal aktivitelerini düzenler (16). Çok sayıda deneysel kanıt, normal ve anormal hematopoietik hücre büyümesinde Ras proteinlerini içerir. Özellikle, birçok hematopoietik büyüme faktörüne verilen proliferatif tepkiler, artan hücre içi Ras-GTP seviyeleri ile ilişkilidir; aktive edici RAS mutasyonları prelösemi ve AML'de yaygındır; ve mutant RAS alelleri, miyeloid hücre dizilerini verimli bir şekilde dönüştürür (20-22).

NF1'li hastalardan alınan lösemik kemik iliği hücrelerinin ve murin NF1 geninin homozigot inaktivasyonu ile embriyolardan toplanan hematopoietik hücrelerin biyokimyasal ve hücre kültürü çalışmaları, Ras-GTP düzeylerinin yükseldiğini, Ras üzerinde GTP hidrolizini hızlandırma yeteneğinde bir azalma olduğunu, mitojenle aktive olan protein (MAP) kinazın aktivasyonu (Ras'ın aşağı akış efektörü) ve granülosit-makrofaj koloni uyarıcı faktöre (GM-CSF) karşı in vitro aşırı duyarlılık göstermiştir (16).

Ras aktivasyonu, IL3, GM-CSF, CSF-1 ve kök hücre faktörü (SCF) dahil olmak üzere çeşitli büyüme faktörleri tarafından reseptör bağlanmasından sonra indüklenen proliferatif tepkilerin temel bir bileşenidir (17). NF1 ve MPS'ler arasındaki patogenetik ilişki hakkında çok sayıda vaka raporu ve çalışma bulunmaktadır. Bu nedenle, NF1 ve çocukluk çağı MPS'nin bir arada bulunması iyi bilinen bir durumdur.

Sonuç

Çalışmamızda PLT düzeyi normal referans aralıkta olmasına rağmen hasta grubunda kontrol grubuna göre anlamlı düşüklük tespit edildi. Sonuç olarak NF1 tanılı hastalarda hemogram değerlerinin ve özellikle platelet değerlerinin hastalığın takibinde önemli olduğu görülmektedir.

Özet
Son yıllarda tekstil üretiminde daha çok çevreci üretimler tercih edilmektedir. Tekstilde baskı ve boyama işlemlerinde dijital baskı en çevreci baskı metotlarından biridir. Tekstil baskı teknolojisinde pigment baskı en eski baskı yöntemidir. Pigment baskıcılığın seçilme neden proses adım sayısının az olması, üretim hızının yüksek olması, her türlü lif karışımında kullanılabilir olması bu yöntemin en büyük tercih nedenidir. Diğer baskı yöntemleriyle kıyaslandığında atık su miktarının çok düşük olması çevreci baskıların arttığı bir ortamda bu yöntemin önemini artırmaktadır. Bu çalışmada reaktif dijital baskı ve pigment dijital baskı hakkında bilgi verilmiştir. Dijital baskı makinelerin üretim prensibi olarak baskı kafaları tek tip boyarmadde kullanımına uygundur. (reaktif dijital baskı ya da pigment dijital baskı). Çalışmamızda baskı kafası değiştirilmeden açık-orta ve koyu renk yoğunluklarına sahip 3 farklı desen çalışmasının 3 farklı kumaş türünde reaktif dijital baskı ile pigment dijital baskı numuneleri hazırlanmıştır. Reaktif dijital baskı ve pigment dijital baskının proses adımları, üretiminde harcadıkları su, elektrik ve kimyasal miktarları ayrıca haslık sonuçları kıyaslanmıştır. Çalışmamızın amacı çevreci bir üretim sağlayan dijital baskı makinelerinde baskı kafalarını değiştirilmeden kullanılan kimyasal ve doğal kaynakların miktarlarını azaltarak dahada çevreci baskı yöntemiyle üretim sağlamak.
Anahtar Kelimeler: Dijital baskı, Reaktif baskı, Pigment baskı, Haslık test sonuçları

Performing Desired Color Studies with Less Water,Chemical and Energy Consumption with Both Reactive and Pigment Printing in the Same Print Heads in Digital Printing Machines

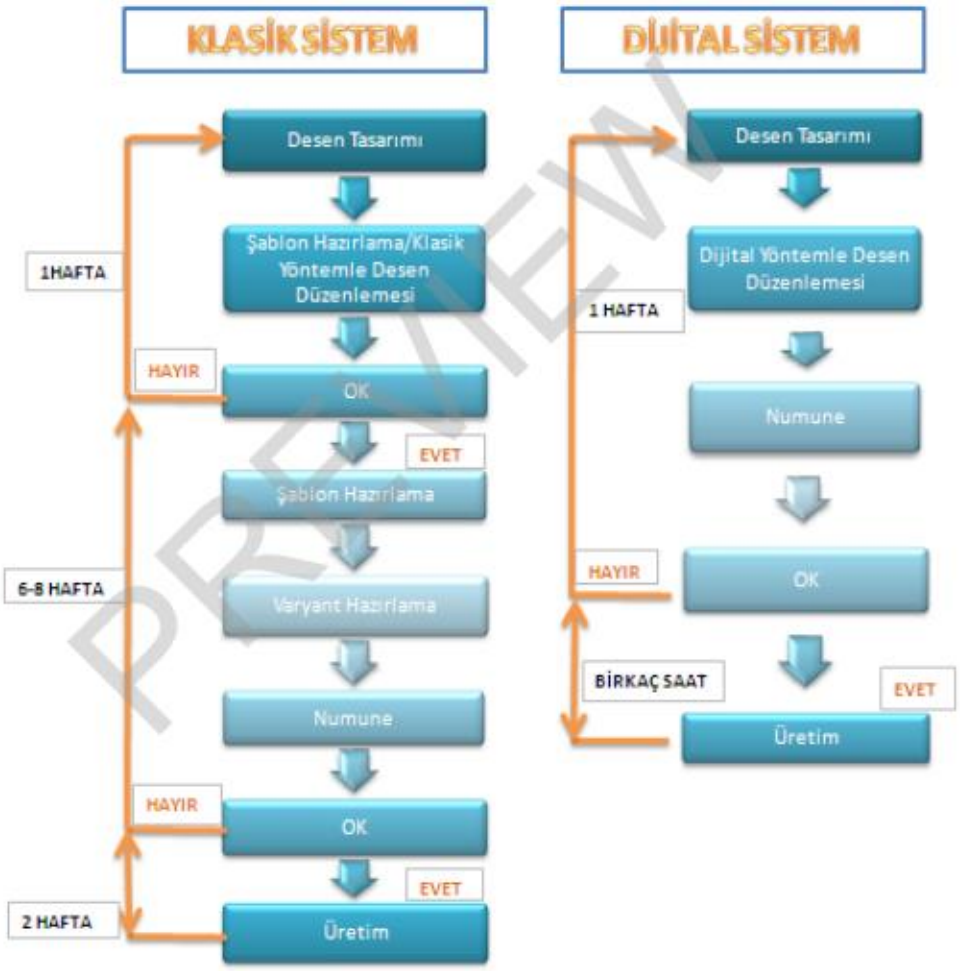
Abstract
In recent years, more environmentally friendly productions are preferred in textile production. Digital printing is one of the most environmentally friendly printing methods in textile printing and dyeing processes. Pigment printing is the oldest printing method in textile printing technology. The reason for choosing pigment printing is that the number of process steps is low, the production speed is high, and it can be used in all kinds of fiber mixtures. The fact that the amount of waste water is very low compared to other printing methods increases the importance of this method in an environment where environmental pressures are increasing. In this study, information is given about reactive digital printing and pigment digital printing. As the production principle of digital printing machines, the print heads are suitable for the use of one type of dyestuff. (reactive digital printing or pigment digital printing). In our study, pigment digital printing samples were prepared with reactive digital printing on 3 different fabric types of 3 different pattern studies with light-medium and dark color densities without changing the print head. The process steps of reactive digital printing and pigment digital printing, the amount of water, electricity and chemicals they consume in their production, as well as the fastness results were compared. The aim of our work is to reduce the amount of chemical and natural resources used in digital printing machines, which provide an environmentally friendly production, without changing the print heads, and to provide production with a more environmentally friendly printing method.
Keywords: Digital printing, Reactive printing, Pigment printing, Fastness test results

GİRİŞ

Tekstil endüstrisinde çevresel kirliliğine neden olan üretim hatlarında boyama ve bitim işlemleri gelmektedir. Bu sebepten dolayı çevre kirliliğini daha aza indirmek için üretim proseslerinin gözden geçirilmesi ve proseslerin kısaltılması, kullanılan kimyasal yerine çevre ve insan sağlığı açısından sorun teşkil etmeyecek kimyasallarla değiştirilmesi gerekmektedir.

Tekstilde baskı metotlarından klasik tekstil baskı teknolojisi ile dijital baskı teknolojisi (ink-jet baskı) karşılaştırıldığında, dijital baskı teknolojisinde adım sayısının azlığından, daha az kimyasal, su ve enerji tüketimi sayesinde daha çevreci bir baskı metodudur.

Ink jet baskı bir dijital baskı yöntemi olup, bilgisayar dosyasından direkt olarak alınan verilerden, baskılı materyal üretilebilmesini sağlayan bir baskı teknolojisidir. Bu teknoloji, konvansiyonel baskı metodundaki mekanik adımları elimine eder ve film, ara makine, şablon hazırlama gibi ara aşamaları gerektirmez (Selçuk, 2009). Daha yeni bir baskı metod tekniği olduğundan gelişimlere açık yönleri bulunmaktadır.



Şekil 1. Klasik tekstil baskıcılığı ile ink jet tekstil baskıcılığının karşılaştırılması (http://eng.taeil.com/solution/digital.asp)

Klasik tekstil baskıcılığında baskı işleminden önce basılacak desen çizerek şablona aktarılması gerekmektedir ve klasik tekstil baskıcılığında renk sınırlaması bulunmaktadır. Fakat dijital renk baskıcılığında herhangi bir renk sınırlaması bulunmamaktadır ve şablon hazırlama işlemi olmadığından ne zaman ne de kayıp sudan dolayı çevre kirliliği olmamaktadır (Tippet, 2003).

Dijital baskı avantajlarını sıralayacak olursak;

- Anında desene müdahale edilebilmektedir.
- Şablon hazırlama adımı olmadığından dolayı zaman ve maliyet tasarrufu elde edilir.
- Müşteriye "Hızlı Yanıt Verme" ve "Anında Üretim"e imkan sağlar.
- Klasik tekstil baskıcılığına göre daha az riski üretim sağlanmaktadır.
- Piyasaya sürülmeden önce desenin çalınma riskini ortadan kaldırır.
- Moda sezonlarında çeşitliliğe olanak sağlar.
- Film, şablon, desen v.b. için gerekli yer ihtiyacını elimine eder.
- Klasik baskı sistemlerine göre deneme ve kısa metraj üretimlerde daha karlı olabilir.
- Deneme çalışmaları süresini haftadan saatlere düşürür; bu durum, desen ve ürün geliştirmesini hızlandırır.
- Basılan desenin o anda değiştirilmesi, toplam maliyeti etkilemez.
- Uygulanacak düzeltme ve modifikasyonların herhangi bir zamanda termini etkilemeden, maliyeti arttırmadan yapılabilmesine izin verir.
- Klasik baskıya göre; daha temiz, güvenli ve genellikle daha az israflı ve çevreye daha az zarar veren bir sistemdir.
- Numune prosesinde verimliliği arttırarak, ekstra maliyetleri düşürmesi sebebiyle ink jet sisteminin maliyetini kısa sürede amorti eder (Masselink 1993).

(http://www.first2print.com/digital_textile_printing/printing-benefits.php).

Dijital baskıda kullanılan mürekkepler lif tipine göre değişiklik göstermektedir. Pamuk, ipek, suni ipek, pamuk/polyester karışmalarında pigment boyarmaddeler kullanılmaktadır. Pamuklu ve selülozik liflerde reaktif, polyester mamulde dispers mürekkep kullanılmaktadır. Naylon, yün, ipek ve naylon/likra karışımlarında asit boyarmaddeler kullanılmaktadır. Tekstil de baskı işlemlerinde kullanılan reaktif ve pigment boyarmaddeleri incelendiğinde pigment baskı en eski ve en basit yöntemidir.

Reaktif baskı işlemi, kullanılacak boyarmadde ve kimyasallar baskı patı içerisine konulur. Hazırlanan reaktif boyar maddenin kumaşa bağlanması için bazik ve tuzlu bir ortam olması gerekmektedir. Daha sonra baskı işlemi yapılır baskı işleminin ardından fiksaj işlemine geçirilir. Fiksaj işlemi buharlama doymuş buharda 100-110 ℃' de ve kurutma 120-150 ℃ arasında yapılır. Fikse işleminden sonra kumaşa bağlanamayan boyarmaddeleri uzaklaştırmak için kumaşa redüktif yıkama işlemi yapılır.

Pigment baskı işlemi, reaktif baskı işlemi ile aynı şekilde baskı patın için pigment boyar maddenin ihtiyaç duyduğu tüm kimyasal ve yardımcı maddeler vardır. Pigment baskı işleminde binderler bağlayıcı görev yaparlar. Tüm kimyasallar eklendikten sonra pat baskıya hazır demektir. Hazırlanan pat kumaş üzerine sürülür. Pigment boyarmaddeler bağ yapmadıkları için kapatıcılıkları diğer tüm boyarmaddelere oranla daha yüksektir. Pigment baskı patında viskozite en önemli etkenlerdir biridir. Baskı yapıldıktan sonra en önemli etkenlerden biride kurutma işlemidir. Kumaş basıldıktan sonra bekletme işlemi yapılmadan kumaş kurutma işlemine alınmalıdır. Bu işlem, her ne kadar pat kıvamlı ve akması, yayılması zor olsa da fikseye gitmeden önce bir kurutma işleminden geçmelidir. İşletme içerisindeki iş akışına bağlı olarak kumaş baskıdan hemen sonra beklemek zorunda kalabilir ve fikseye giremeyebilir. Bu esnada renklerin karışmaması, birbiri üzerine sarılan ya da yığılan kumaşın kendini kirletmemesi için bir ara kurutmaya ihtiyaç duyulur. Bu işlem 100-120 °C sıcaklıklar civarında ve sadece kumaş üzerindeki patı kurutmak amaçlı yapılır. Islaklığın yoğunluğuna göre 5-10 dakika arasında değişir.

Üzerinde elektrolit bulunan kumaşın pigment baskısında, yetersiz baskı, keskin olmayan kontürler, renk sapmaları, düşük haslıklar gibi problemler ortaya çıkar. Belirli bir elektrolit konsantrasyonunun üstünde ise baskı akmaya başlar, baskı deseni net olarak elde edilemez. İnce pamuklularda yayılma eğilimi olur, pat kumaşın içine dağılmaz. Kalın pamuklularda ise pat iyice emildiğinden yüzeyde renk daha açıktır. Kumaş üzerinde alkali artıkları varsa, beyaz zeminde sararmalar gözlenir. Kumaşta hidrofilite kötü ise, baskı yüzeyde kalır ve istenilenden daha koyu görünür (Doğan, 2010).

Bu nedenle iyi bir pigment baskı için:

- Kumaş üzerinde elektrolit bulunmaması,
- İyi bir hidrofiliteye sahip olması,
- Alkali olmaması önem taşır

MATERYAL VE METOD

Yapılan literatür araştırmalarında dijital baskı makinelerinde kafa yapılarına göre ya reaktif ya da pigment baskı üretimi sağlamaktadır

Pigment dijital baskıda, pigment boyarmadde parçacıklarının pürüzsüz akışı için nozullar değiştirilmelidir, aksi takdirde nozullar tıkanır. Aynı zamanda pigment boyarmadde parçacıkların boyutu nozuldan geçebilecek mikron seviyesine gelmesi de düşünülebilir. Fakat burada karşılaşılacak problem ise mikron seviyesi düşürülen kimyasalın etkin istenilen baskı kalitesini de sağlayabilmesidir. Baskı kafaları dijital tekstil baskı makinesinin en önemli parçası olarak kabul edilir. Yazıcı kafasının ömrü, makinede kullanılan mürekkebin kalitesi etkilidir.

Menderes Tekstil Sanayi ve Ticaret A.Ş firmasında 6 adet dijital baskı makinesi bulunmaktadır ve bu makinelerin baskı kafaları sadece reaktif baskı yapabilmektedir. Bunlar; MS JP-6, MS JP-7, JPK EVO 1, JPK EVO 2, Minilario (MS), Reggiani dijital baskı makineleridir. Makinelerimiz Multipas prensibine göre çalışmaktadır. Makinelerin enleri; MS JP-6, MS JP-7: 180 en, Reggiani : 280 en, JPK EVO 1, JPK EVO 2, Minilario (MS) : 320 en dir. İşletmemizde dijital baskı makinelerinde reaktif baskı yapılabilmektedir. Çalışmamızın asıl amacı; dijital baskı makinelerinde baskı kafaların değişimi yapılmadan sadece mürekkep ve nozul değişimi yapılarak, hem reaktif baskı hem de pigment baskı işlemi yapılması sağlamak. Öncelikli hedefimiz nozul değişikliği yapılmadan kimyasallar ile çözebilmek ikinci aşama ise nozul büyüklüğünde değişikliğe gitmek. Çalışmamızda süper ranforce, lyocell saten ve %100 cotton olmak üzere 3 farklı kumaş tipi kullanılmıştır. Ayrıca 2,3 ve5 renkli desen çalışmaları yapılarak açık, orta ve koyu tüm renk yoğunluklarında görüntü, haslık değerleri incelenmiştir.

Tablo 1. Reaktif baskı proses adımları

Reaktif Baskı İşlem Adımları		Su (m^3/kg)	Enerji (kWh/kg)
1.	Yakma Haşıl Sökme	0,00312639	0,02344791

9.	Apre	0,00085720	0,15429559
10.	Kalandır	-	0,05774806
11.	Sanfor	0,01469616	0,01469616
Toplam		0,26024284	1,55335005

Tablo 2. Pigment baskı proses adımları

Pigment Baskı İşlem Adımları		Su (m^3/kg)	Enerji (kWh/kg)
1.	Yakma Haşıl Sökme	0,00312639	0,02344791
2.	Kasar	0,02770213	0,03196400
3.	Egalize	0,00085763	0,15437393
4.	Baskı	0,01606477	0,64259093
5.	Fixe	0,00085720	0,15429559
6.	Kalandır	-	0,05774806
7.	Sanfor	0,01469616	0,01469616
Toplam		0,06330428	1,079117

Tablo 1'de reaktif baskı proses adımları Tablo 2'de pigment baskı proseslerini karşılaştırdığımız da pigment baskı proses adım sayısının 8 reaktif pigment baskı proses adım sayısının 12 olduğu gözlemlenmiştir. Pigment baskı prosesin daha az olduğundan birim metrajda daha çok üretim miktarı sağlanmıştır.

Ayrıca 0,13 kg/m^3 kumaş miktarı baz alınarak Tablo 1'de reaktif baskı proses adımlarında Tablo 2'de pigment baskı proses adımlarında harcanan su ve elektrik miktarları belirtilmiştir. 0,13 kg/m^3 kumaşın reaktif baskı işleminde harcanan toplam su miktarı 0,26 m^3/ kg ve enerji miktarı 1,55 kWh/kg' dır. 0,13 kg/m^3 kumaşın pigment baskı işleminde harcanan toplam su miktarı 0,06 m^3/kg ve enerji miktarı 1,08 kWh/kg' dır. Yani 0,13 kg/m^3 kumaşı reaktif dijital baskı yerine pigment dijital baskı ile üretimi sağlandığında %0,77 su ve %0,30 enerji tasarrufu sağlanmıştır. Aynı zaman da proses adımları incelendiğinde pigment dijital baskı işlemine alınacak kumaşların ön işlem adımında merserize adımının olmamasından. 0,13 kg/m^3 kumaşın merserize işleminde kullanılan 0,049600 kg/m^3 Kostik ve 0,000248 kg/m^3 Asetik Asit kullanılmamıştır. Böylece pigment dijital baskı üretiminde daha az kimyasal kullanılmıştır. Böylece daha az doğal kaynak tüketimi ve daha az kimyasal kullanılarak çevreci bir üretime geçiş yapılmıştır.

Çalışmamızda 2 renkli super ranforce, 5 renkli lycoll saten ve 8 renkli %100 cotton kumaşlarda hem reaktif baskı hem de pigment baskı yapılmıştır. Baskı yapılan kumaşlara sürtünme haslığı, yıkama haslığı ve ışık haslık testleri yapılmıştır. Yapılan test sonuçlarını aşağıdaki Şekil 1,2 ve 3' te görebileceğiniz gibi renk yoğunluğu farketmeksizin pigment baskı yapılan kumaşların haslık değer sonuçları daha iyi olduğu görülmektedir.Bu durumda müşteri memnuniyetindeki atışı sağlamaktadır.

Şekil 4. 8 renkli desen çalışmasında kullanılan % 100 cotton kumaşın test sonuçları

BULGULAR ve TARTIŞMA

- Pigment dijital baskı çalışmalarında kullanılan pigment boyarmadde parçacıkların nozullardan geçebilecek mikron seviyesinde olmaması. Nozulların pigment boyarmadde parçacıkların geçebileceği şekilde ayarlanması.
- Kullanılan pigment boyarmadde parçacıkların nozulları tıkama riski test edilmiştir. Değiştirilen nozulların reaktif boyarmadde parçacığı ile aynı sürede tıkanmaya başladığı gözlemlenmiştir.
- Pigment dijital baskı işlemi sonrası kumaşta istenilen tuşenin elde edilememesi kullanılan kimyasalın değiştirilmesi ile elde edilmiştir.
- Koyu renkli pigment dijital baskılarda istenilen sürtünme haslık sonuçların elde edilmemesi. Açık-orta ve koyu renk yoğunlukların olduğu desen çalışmaları seçilerek test denemeleri yapılmış ve koyu renklerde sürtünme haslık sonuçlarında herhangi bir sorunla karşılaşılmamıştır. (bkz. Şekil 2,3 ve 4)

SONUÇ

- İşletmemizde reaktif dijital baskı üretimleri yapılmakta fakat günümüz koşullarında sürdürülebilirlik kapsamında daha az su, daha az kimyasal ve daha az enerji tüketimi benimsenmektedir. Sektörümüzde su tüketimi bir hayli yoğun olması sebebiyle proseslerde yapılan ve yapılacak olan iyileştirmeler Ar-Ge olarak bizim için önemli olmaktadır. Bu sebeple pigment baskıda reaktif baskıya göre daha az su,

kimyasal ve enerji kullanımı olmaktadır. Dijital baskı makinelerinde aynı baskı kafaları ile hem reaktif baskı hem de pigment baskı işlemi yapılabilmektedir.

- Dijital baskı makinelerinde pigment baskı yapılarak daha az doğal kaynak tüketimi sağlanmış ve daha az kimyasal tüketilerek çevreci bir üretime geçiş yapılmıştır.

- Pigment dijital baskı proses adımı reaktif dijital baskı prosesine göre daha kısa olduğundan birim metrajda gerçekleşen üretim miktarı fazladır.

- Reaktif dijital baskı işlemi sadece pamuklu kumaş türlerine uygulanabilmektedir. Pigment baskı uygulamasında farklı elyaf içerikli kumaşlara da baskı işlemi yapılabilmektedir. Böylece müşteri portfoyun genişlemesi sağlanmıştır.

- Reaktif dijital baskı işleminden sonra kumaşın buharlama işlemine girmesi ile bazı kumaşlarda neps oluşumuna sebep olmaktadır. Pigment dijital baskı işleminde ise baskı sonrası buharlama adımın olmaması bu duruma rastlanması engellenmiş olmaktadır.

- Reaktif dijital baskı işlemi sonrası kumaşın haslık testlerinde ter ve tükürük haslıkları özellikle koyu renklerde 2,2-3 çıkmaktadır. İstenilen değerler 4,4-5 olması gerekmektedir Pigment dijital baskı işleminden sonra kumaşın ter ve tükürük haslık değer sonuçları koyu renklerde istenilen 4,4-5 değer sağlanmıştır.

TEŞEKKÜR

Abstract

As the early and precise detection of diseases has a great impact on life science applications, researchers have focused on the gap between the medicine and tissue engineering applications to accelerate the development of new treatment strategies. Therefore, optical imaging of cancer cells and related biomarkers have gained much attention, recently. Hence, herein this study, it was aimed to use one of the most novel molecular probes, BODIPY- gold nanoparticles (AuNPs), which exhibits a high selectivity as well as sensitivity towards cysteine, homocysteine and glutathione biothiols over other relevant species. The system was based on the modulation of BODIPY-gold nanoparticles (AuNPs) and the fluorescent quenching mechanism, which mainly associated with the fluorescent resonance energy transfer (FRET) effect. In the presence of thiols, principally, the BODIPY was released from the surface of AuNP and subsequently displaced with the thiols, providing about 20-fold florescence enhancement.

Keywords: BODIPY, gold nanoparticles, biothiols.

INTRODUCTION

One of the bottlenecks in the development of tissue engineering applications is the limited availability of metabolite-specific sensors for continuous sampling and monitoring implemented by conventional methods. On the other hand, only a limited number of approaches exist for connecting existing measurement systems to macro scale instruments. Sensor development is seen as an effective strategy to meet the need for rapid, cost-effective and high-throughput screening, especially in drug development, disease diagnosis and treatment (Fernandes et al., 2018). Multi-usability platforms, on the other hand, can be easily connected to laboratory-scale analyzers and analytical equipment such as HPLC using standardized connectors. Many protocols available for biochemical analyzes in medical applications are based on intermittent sample extraction from a blood gas machine and external analysis. Advanced sensor-systems, on the other hand, make this process possible for real-time measurement of the biologically relevant biomarkers in small sample volumes and detection limits (Ramamoorthy et al., 2003).

Having a pivotal role on homeostasis, biothiols, which are cysteine, homocysteine and glutathione has a great potential in cell imaging applications. Although they are essential antioxidant (Towndsend et. al., 2003) and protein synthesis (Paulsen et al.,2013) the abnormal levels of these reactive sulphur species (RSS) are commonly linked with critical diseases such as cancer and cardiovascular disorders. Hence, the detection of RSS in biological samples is quite critical for diagnostics. Providing a clear cell imaging through microscopy, fluorometric methods based on the changes in fluorescence signals are commonly used for visualization of biological biomarkers. Moreover, due to the diversity and specificity of the florescent probes, multiple structures/molecules in cells and biological samples can be identified simultaneously. Having its exceptional properties (e.g., high fluorescence quantum yield & extinction coefficient), BODIPY has been utilized and designed to detect biothiols among many fluorophores including Rhodamine and coumarin (Ucuncu, 2022). As such, recent studies showed that the gold nanoparticle (AuNP)-BODIPY based fluorescent probes are one of the most promising candidates for biothiols detection. Providing apparent advantages like high sensitivity&selectivity along with the operational simplicity, AuNP-BODIPY presents an efficient fluorescent resonance energy transfer effect. Hence, herein this study, BODIPY-2-aminopyridine skeleton was used together with AuNPs to detect biothiols.

MATERIALS AND METHODS

Synthesis of BODIPY

The synthesis of BODIPY was performed as previously descripted (Ucuncu, 2022). Briefly, 2-aminopyridine and potassium carbonate were added to the tetrahydrofuran (THF) solution of meso-BOD-Cl. The well-mixed solution was placed into oil bath and stirred under nitrogen atmosphere at reflux temperature. The progress of reaction monitored by thin layer chromatography and quenched by removing THF under reduced pressure. The residue was dissolved in dichloromethane (DCM) and extracted with water. Aqueous phase was further extracted with DCM and dried over Na2SO4. Then solvent was removed and the crude was purified by silica gel column chromatography (Hexane:DCM).

Preparation of AuNPs

AuNPs were synthesized by strictly following the citrate reduction method in the literature (Karakus et al., 2021). Briefly, the solution of chloroauric acid was added to ultrapure water under vigorous stirring. After boiling, sodium citrate solution was rapidly added to the solution, and boiled for additional 10 min under vigorous stirring. Meanwhile the colour of solution changed to bright red. After cooling naturally, solution was filtered through a 0.45-mm membrane. The resulting AuNP solution was kept in the dark at 4 °C.

Preparation of BODIPY-AuNPs

To prepare BODIPY-AuNPs module, BODIPY (2µL, 1 mM in dimethyl sulfoxide (DMSO)) was added to 1 mL of AuNPs solution. Following the stirring for 10 min at 37 °C, the absorbance and fluorescence intensity measurements were performed at 300-800 nm and λ_{exc} 460 nm, respectively.

The procedure for biothiol measurements

The BODIPY (2 µM)-AuNP solution was diluted with ultrapure (UP) water (pH: 7.4) at the ratio of 50:50 (v/v). Following, the corresponding molar ratio of biothiols were added to the BODIPY-AuNPs mixture, and the fluorescence intensities were measured at time point:1 min.

RESULTS AND DISCUSSION

The effects of different solvent types on the optimum sensing conditions of synthesized BODIPY-AuNPs were measured via UV-VIS spectrums and fluorescence intensities. Overall, AuNPs were obtained through the citrate reduction method, and the UV-VIS spectrum of AuNPs solution, which was diluted with UP water, phosphate (PB) and HEPES buffers, revealed the characteristic peaks at 520 nm (**Figure 1**). According to the results, BODIPY-AuNPs mixture remained stable in only UP water.

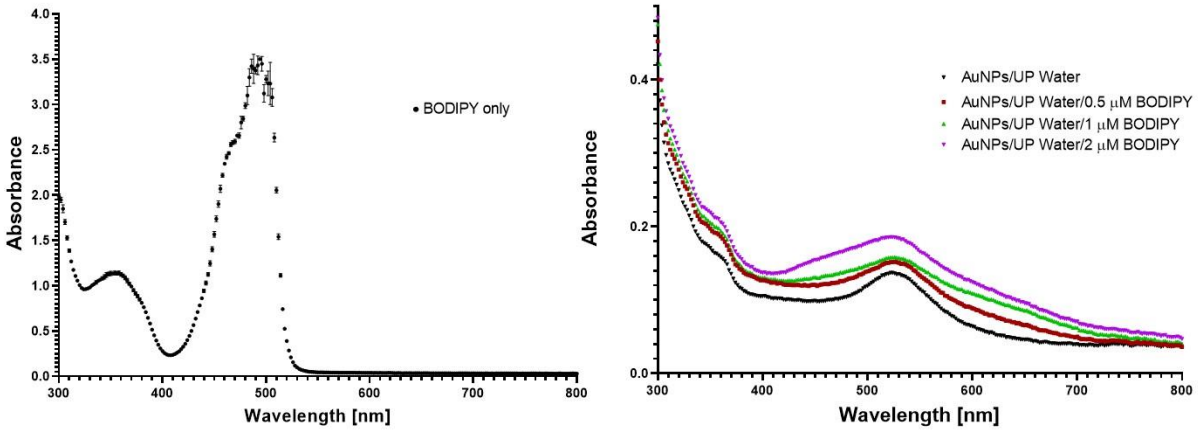

Figure 1. UV-VIS spectrums of BODIPY (left) and AuNPs solution along with different concentrations of BODIPY-AuNPs (right).

Due to the hydrophobic nature of BODIPY, the requirement of an organic cosolvent was also tested to prevent any possible aggregation. Hence, different percentages of AuNPs-UP Water-Organic Solvent mixture were tested (**Figure 2**). Although the addition of organic solvent (DMSO) prevented the aggregation, it decreased the quenching effect of BODIPY. Hence, the 50:50 (v:v) of AuNPs: UP Water was selected as optimum condition for the rest of study.

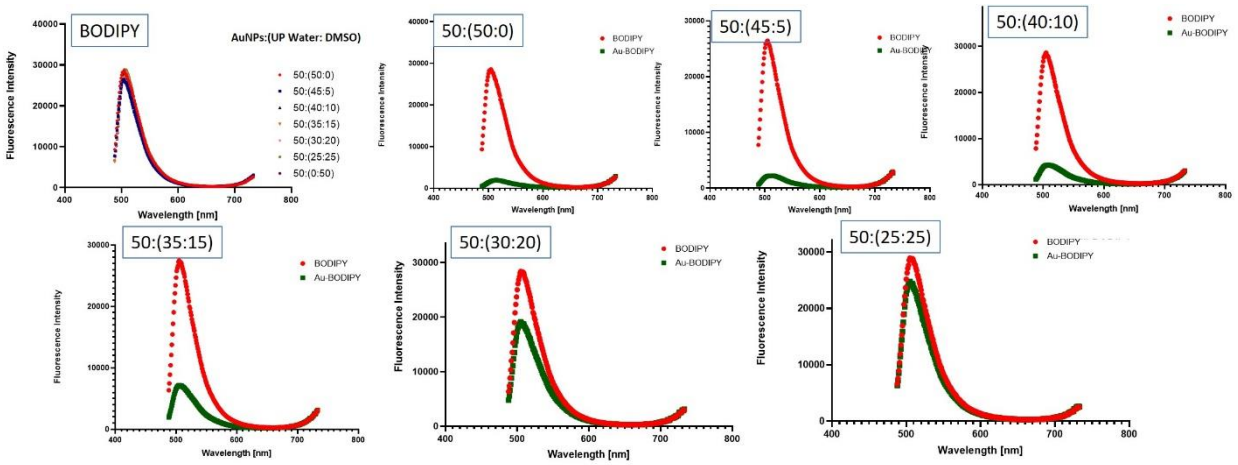

Figure 2. Fluorescence intensities of BODIPY only and BODIPY-AuNPs combination within the various percentages of DMSO (from 0 to 25%), UP Water (from 25 to 50%) and AnNPs (constant at 50% of total volume).

It was also observed that the increased concentration of organic solvent decreased the tendency of AuNPs to thiols (**Figure 3**). Following the careful investigation of all parameters, the optimal sensing conditions were established as 2 µM BODIPY in 50:50 (v:v) AuNPs Soluition: UP Water (pH:7.4).

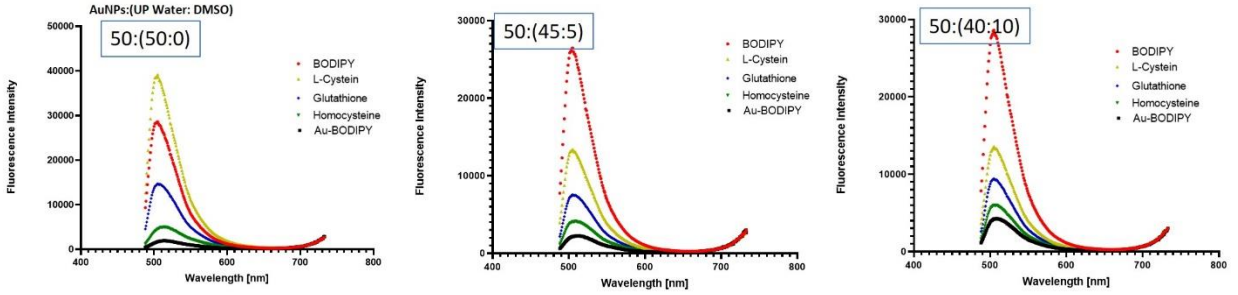

Figure 3. Decreased fluorescence intensities representing the decreased cysteine sensing of BODIPY due to the increased concentration of DMSO within the AuNPs:UP Water: DMSO solution.

To evaluate the selectivity of BODIPY, the florescence intensities in the presence of biothiols and metal ions were recorded. Although no significant response was achieved towards the metal cations, glutathione or homocysteine, a rapid turn-on response towards cysteine was achieved. Therefore, different mole equivalents (equivs.) of cysteine were tested (**Figure 4**).

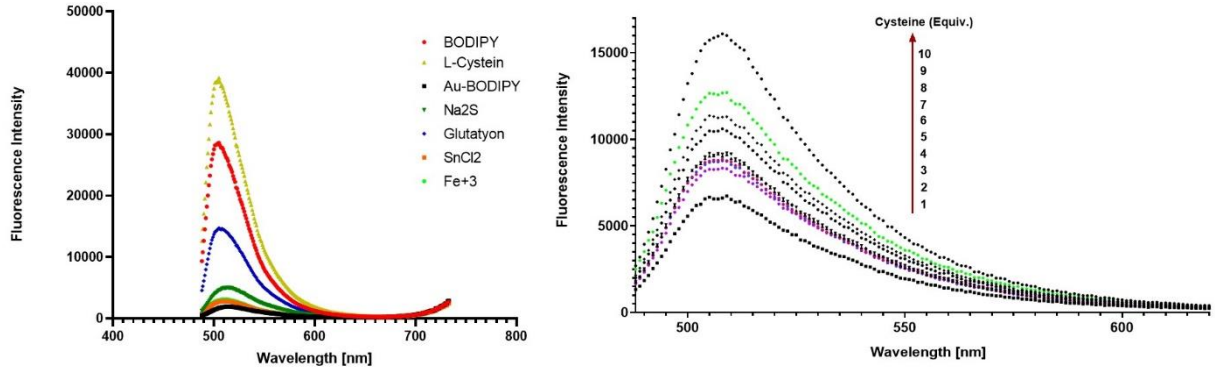

Figure 3. The fluorescence response of BODIPY towards metal cations and biothiols (left). The fluorescence titration through the addition of varying amounts of cysteine. (BODIPY: 2 µM, and 1 equiv. is 2 µM)

CONCLUSION

In this study, the spectral behaviours of BODIPY fluorescent probe in the present of biothiols were reported. Overall, an optimization study was performed for BODIPY-AuNPs in various aqueous solvent system. A rapid (<1 min) "turn on" response towards cysteine with high selectivity was observed. Moreover, the potential of this system has been showed for imaging of cellular cysteine.

Abstract

Removal of nutrients rich as nitrogen and phosphorus in water and wastewater by biological treatment using algae cultures instead of conventional methods is increasing day by day. The utilization of algal cultures has numerous benefits, including the use of the biomass produced during the treatment as a raw material in many industries and the lack of a significant energy and chemical requirement. In this study; nitrogen and phosphorus removal natural waters gas bubbled immobilized *Chlorella vulgaris* algae culture was investigated. The study, Porsuk stream, which is rich in nitrogen and phosphorus, was determined as a polluted natural water body in the vicinity of Eskişehir province in Turkiye and samples were collected to be used for the experimental processes. *Chlorella vulgaris* algae culture was immobilized in a gas flow condition and experimental studies were conducted in the constructed reactor, considering different parameter values and nitrogen and phosphorus removal studies from natural waters. *Chlorella vulgaris* used for the purification process was obtained as pure culture and for suitable environmental conditions, 24:0, 16:8 and 12:12 hours light exposure time and pH 7, 8, 9. The experiments were performed air flow rate 0.3, 0.4 and 0.5 L/min respectively. According to the preliminary research findings, the PO_4^{-3} 99.1%, NO_3^- 63.2% and NH_4^+ 86% removal rate were calculated, considering the experimental results at the 45th hour depending on different environmental conditions. The production of fish bait using the gas bubbled immobilized algae culture that was collected from the treated natural water body will be examined.

Keywords: Algal biomass, *Chlorella vulgaris*, Immobilization, Biological treatment, Water treatment

INTRODUCTION

Nowadays, there are high concentrations of nitrogen, phosphorus and toxic metals in the water and wastewater treatment plants, and the treatment of these components is carried out by traditional techniques such as coagulation, flocculation, adsorption, dissolved air flotation and gravity separation. In the application of these methods, a significant amount of chemical substances are used for the removal of elements such as nitrogen and phosphorus. The energy consumption and the cost of operation and maintenance of the plants are quite high (Jasmine et al., 2016).

Heavy metals, inorganic and organic pollution parameters such as nitrate, phosphorus and carbon in the water bodies lead to deterioration of water resources quality (Wollmann et al., 2019). On a global scale, there are two major pollutions that pose a great threat. These are organic pollution and eutrophication of aquatic ecosystems. The presence of inorganic nutrients such as nitrogen and phosphorus in high concentrations in wastewater leads to eutrophication of water bodies (Mujtaba et al., 2018). For this reason, wastewater must undergo appropriate and functional treatment before being discharged directly into the receiving environment (Ruiz-Marin, 2010). To prevent eutrophication and prevent algae formation in wastewater and lakes, it is necessary to remove nitrogen and phosphorus from the existing water body (Mujtaba et al., 2018). To minimize such problems, scientific studies on the removal of nitrogen and phosphorus in water treatment, the use of algal cultures and biological removal methods instead of conventional methods are accelerated day by day.

Algal cultures of *Tetradesmus obliquus*, *Chlorella vulgaris*, and *Spirulina palatesis* are commonly used in water and wastewater treatment (Prescott, 1973). *Chlorella vulgaris* algal cultures are spherical microscopic cells with a diameter of 2-10 μm and contain many plant like structural elements (Safi et al., 2014).

Immobilization of microalgae is a common approach in a variety of bioremediation applications. Immobilization in various substances offers microorganisms several important advantages over free-living suspensions (Moreno-Garrido, 2008). The advantages of immobilization methods are cheap, easy to use in

biotechnological processes, resistant to environmental conditions (Ozdemir P, 2012), easy reuse of cells, high cell density of cultures compared to free cells, lower recovery and recycling costs (Lebeau and Robert 2006), better adaptation of cells to substrate and easy cleaning during the process (Travieso et al., 1996).

Immobilization with natural polymers like alginate was nontoxic and the algal cells did not suffer from drastic environmental changes and intense chemical reactions, so the immobilized algal cells exhibited higher viability. It has been extensively reported that the carboxyl groups and calcium ions of the alginate gel can increase the removal of ammonium and phosphate from wastewater by physical adsorption and chemical precipitation (Hu et al., 2021). Calcium alginate is often used to immobilize microalgae to maintain cell stability over long periods of time. However, the matrix is susceptible to chelating agents such as phosphate and citrate present in wastewater, which affect the strength of the gel matrix and eventually dissolve it. But this problem can be solved by re-calcification the alginate particles (Ruiz-Marin, 2010).

In the framework of this study; with the experimental studies to be carried out, the possibilities of bioremediation with using the gas bubbled immobilized *Chlorella vulgaris* microalgae culture in the polluted natural waters that have problems regarding nitrogen and phosphorus pollution were investigated. Preparation of microalgae culture in the form of gas bubbles during the immobilization phase has advantages, such as maintaining the floating form after addition to natural waters and harvesting after treatment. The density of gas bubbled immobilized algal culture is lower than that of water, it ensures that the algae are in a floating form in the water. Even if the water body has high turbidity, the algae can easily absorb the light they need for the photosynthesis process from the surface. Thus, the harvesting process of the immobilized algal biomass is facilitated by the treatment and no additional treatment (filtration, coagulation-flocculation, etc.) is required. Moreover, the harvested algal biomass can be used as an alternative for fish bait industry.

MATERIALS AND METHODS

Characteristics of raw natural water

The natural water source used for the experimental studies is from the location 39°46'55.66"N 30°36'53.29"E, which is the connection point of the Eskişehir Wastewater Treatment Plant in the Alpu district of Eskişehir, to the Porsuk Stream. According to the preliminary on-site evaluations, this point was found to have high level nitrogen and phosphorus pollution. The results of the on-site raw water quality measurements for ammonium (NH_4^+-N) 24.2±10.8 mg-N/L, nitrate (NO_3^--N) 1.43±1.68 mg-N/L and phosphate (PO_4^{-3}) 2.14±0.8 mg-PO_4/L. In order to avoid possible contamination of the natural water body and possible changes in its chemical composition, water samples were regularly collected from the field every week before the start of experimental study. The water samples are stored in the refrigerator at +4 °C before being used for the experiments.

Microorganisms culture supply and cultivation

Within the scope of the study, the algae culture *Chlorella vulgaris* was used for nitrogen and phosphorus removal from polluted natural water. The pure algal culture was obtained from Eskişehir Technical University, Department of Environmental Engineering and observed and examined for contaminants under an optical microscope at regular intervals. Cultivation of microalgae is carried out in the ESCO AC2-4E8 Class II Biological Safety Cabinet in the laboratory. *Chlorella vulgaris* was cultivated in autoclaved bottles by diluting with BBM medium at a 1:10 algae:BBM ratio. A Pol-Eko KK 240 INOX brand climatic chamber and an Infors/HT brand orbital shaker system were used in this study. Algae are grown in a Pol-Eko brand climatic chamber under the ideal environmental conditions necessary for their growth. These conditions include 28°C temperature and 45% humidity, 18/6 light/dark lighting, blue and red LED lamps with 470 nm and 660 nm wavelengths. The light intensity of LED plate is 165 umol/m^2s under 50 cm. BBM (Bold's Basal Medium) was used to ensure continuity of algal culture. The stock solutions required for BBM medium are prepared in 250 mL flasks and sterilized at 121°C for 20 minutes in a Hirayama HG-80 autoclave unit. Stock solutions and BBM are stored in the refrigerator at +4 °C.

Gas bubbled immobilization of algae culture

Various chemical materials such as alginate, k-carrageenan, polyvinyl and polyurethane are used for immobilization of algal cultures (Göksungur and Güvenç, 2002). These chemicals are provided during experimental studies, and the immobilization process is performed on the based on previous studies in the literature. The concentrations of the compounds required to perform the immobilization process and the amounts that need to be mixed with the algal culture are determined in accordance with the procedure of the immobilization process procedure based on the literature. Given the literature and preliminary studies for the *Chlorella vulgaris* microalgae culture to be used in the project, it was deemed appropriate to prepare 3%

sodium alginate and 20% calcium chloride solutions for immobilization. After dissolving the sodium alginate solution to be prepared in the magnetic stirrer for 12 hours, the mixture is prepared as algae/sodium alginate at a ratio of 1:1 v/v, magnetic stirrer used for homogenization at 125 rpm during 15 min. After the mixture is homogeneous, gas bubbled immobilized algal spheres are formed using a 9 rpm peristaltic pump with a 2-pole Y- tube connection (Figure 1). While one of the hoses supplies air with the help of an air pump, the other is fed into 20% calcium chloride, prepared simultaneously with the homogenized algae mixture, and gas bubbled algae balls are formed (Göncü et al., 2021). Thanks to this structure, the mixing of the algae biomass with the water body is prevented. Immobilized gas bubbled algae balls provide simultaneous removal of nitrogen and phosphorus, which are nutrients found in polluted natural water. After immobilization is complete, 1 g of the immobilized algae is dissolved with 5 ml of 8% sodium citrate to determine the amount of in-vivo chlorophyll-a present in the algal biomass measured by Turner Design Aquafluor fluorometer.

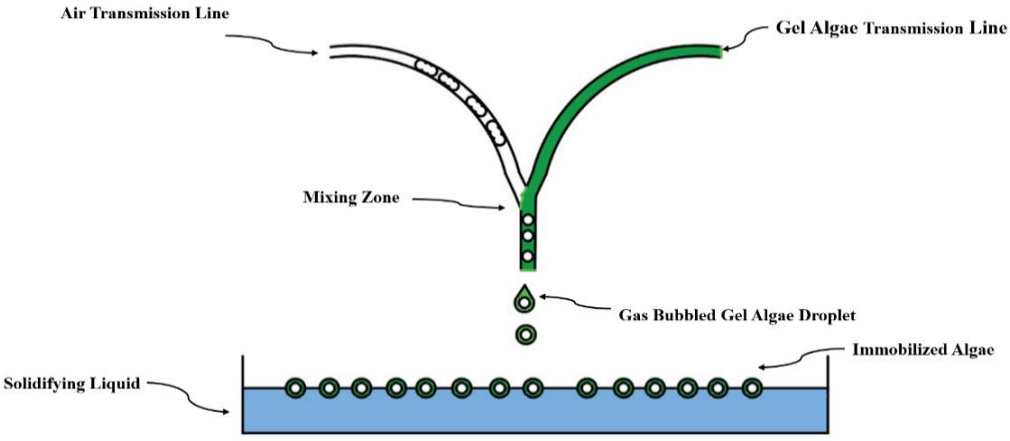

Figure 1. Immobilized algae

Experimental design

The experimental studies were performed in a batch reactor. The experimental setup dimensions are 520*320*60 mm. The bottom of the setup is covered with air diffuser tubes and air flow rate was set to 0.3, 0.4 and 0.5 L/min. The experimental setup was covered with a plexiglass pane and 5 cooling fans and led lights were placed to the upper part of the setup. In the design reactor, 50W COB type power LED lights with blue (470 nm) and red (660 nm) wavelengths suitable for the growth of algal cultures were used. In the experimental studies, the pH was set to 7, 8 and 9. For the experiments, 400 g of gas bubbled immobilized algae and 4 L of polluted natural water are added to the vessel to be treated (Figure 3). The experimental setup is shown in Figure 2. Samples for phosphate measurements were taken according to Standard Method 8048 Phosphorus, Reactive (Orthophosphate) Ascorbic Acid. HACH PhosVer3 reagent was added to 10 mL of sample and mixed for 2 minutes. At this time, the cuvette containing 10 mL of blank sample was read in the HACH DR/2400 spectrophotometer, then the PhosVer3 reagent was added and the readings of the mixed sample were read in PO_4-P mg/L and recorded along with the day and time information. Samples taken for nitrate measurements were analysed using Standard Method 8171 Nitrate, Cadmium Reduction Method. HACH NitraVer5 reagent was added to 10 mL of the sample and mixed for 1 minute, with an expected reaction time of 5 minutes. During the completion of the reaction, the cuvette containing 10 mL of blank solution was read in the HACH DR/2400 spectrophotometer instrument and the measurement results were recorded in the form of NO_3-N mg/L with the day and time indicated. The pH of the setup is automatically controlled by the INFORS HT Labfors 5 photobioreactor. To adjust the pH, 0.2 M HCl and 0.2 M NaOH were used and the device was calibrated with pH 4, pH 7 and pH 10 buffer solutions before each setup. For in vivo chlorophyll-a measurements were performed using the Turner Design Aquafloor Fluorometer device. An ammonium probe connected to the HACH HQ40d multimeter was used for ammonium measurements. Calibration solutions of 0.1, 1, 10, and 100 mg/L NH_4^+-N were used for daily calibration of the instrument.

RESULTS and DISCUSSION

The study investigated the effects of different pH values, air flows and lighting periods on the removal of nitrate, phosphate and ammonium from polluted natural waters by gas bubbled immobilized *Chlorella vulgaris* microalgae culture. The following graphic shows the experimental results of an example study in 0.5 L/min air flow, 24:0 light period, pH 7 conditions. As a result of the experimental study, the removal efficiencies were calculated under different conditions as phosphate 96.2%, nitrate 16.4% and ammonium removal rate were calculated as 81.2%.

The graph of the time-dependent chlorophyll-a concentration change is shown in Figure 4. The initial immobilized chlorophyll-a value of 0.004 mg/L is used all of the experimental setup. When algae growth phases are examined, lag phase between 0-21 hours, logarithmic phase between 21-43 hours, stationary phase between 43-63 hours and 73th hours completed the death phase.

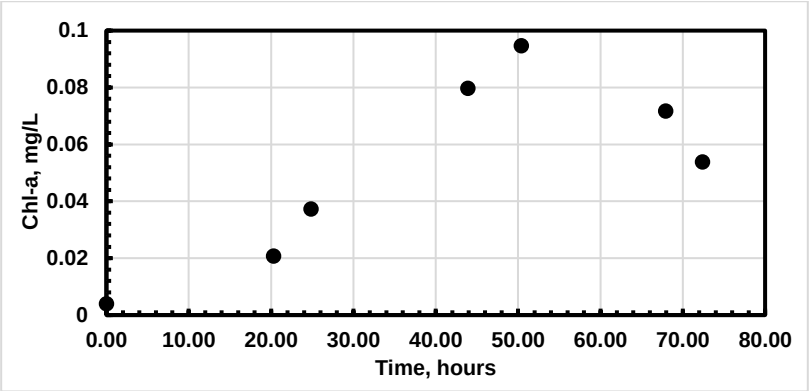

Figure 4. Graph of the time-dependent chlorophyll-a concentration changes

The ammonium change measured over time in an exemplary experimental study is shown in Figure 5. The initial ammonium concentration was measured as 18.2 mg/L and after treatment process it was measured as 2.39 mg/L at the time of 73. hours. Examining the data reveals that the ammonium concentration dropped by 85% in roughly 45 hours.

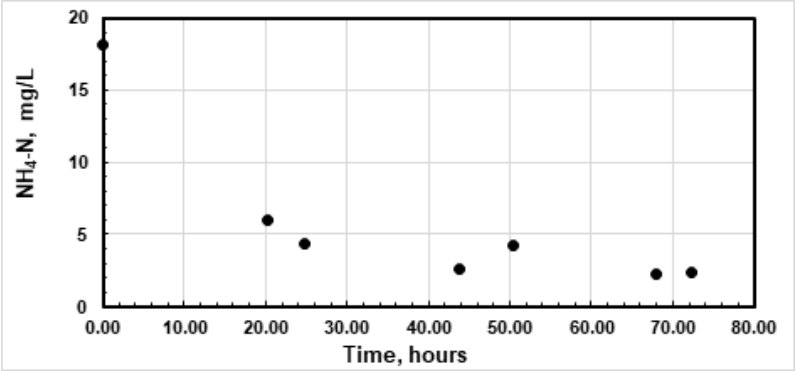

Figure 5. Graph of the time-dependent ammonium concentration changes

The phosphate change measured over time in an exemplary experimental study is shown in Figure 6. The initial phosphate concentration was measured as 1.61 mg/L and at the end of the experiment it measured as 0.17 mg/L. The efficiency of the treatment at the 45th hour was calculated as 98.7 %.

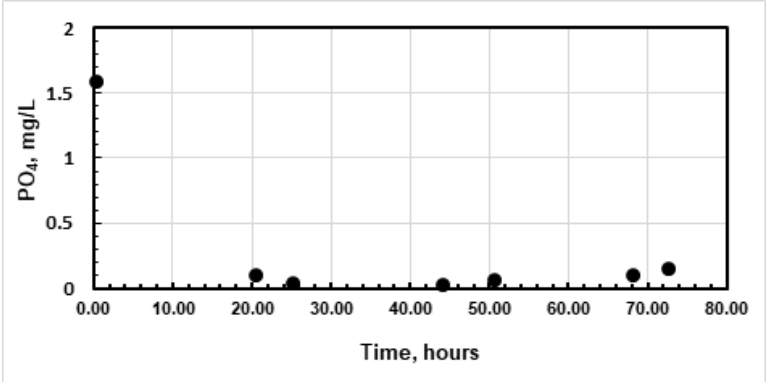

Figure 6. Graph of the time-dependent ammonium concentration changes

The nitrate change measured over time in an exemplary experimental study is shown in Figure 7. The initial nitrate concentration was measured as 1.4 mg/L and at the end of the experiment it measured as 0.4 mg/L. The efficiency of the treatment at the 45th hour was calculated as 12.8% According to the test results, the most important reason for the low nitrate removal efficiency is that the algae prefer to use the ammonium ion primarily as a nutrient in the water body. In addition, due to the existing bacterial activities in the natural water body, an increase in nitrate concentration can be observed due to the nitrification process of ammonium.

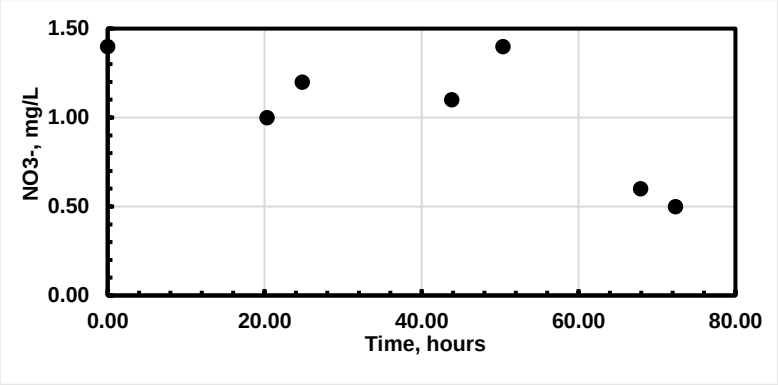

Figure 7. Graph of the time-dependent nitrate concentration changes

In the exemplary experimental study, the pH was stabilized at 7. The pH change measured over time shown as Figure 8.

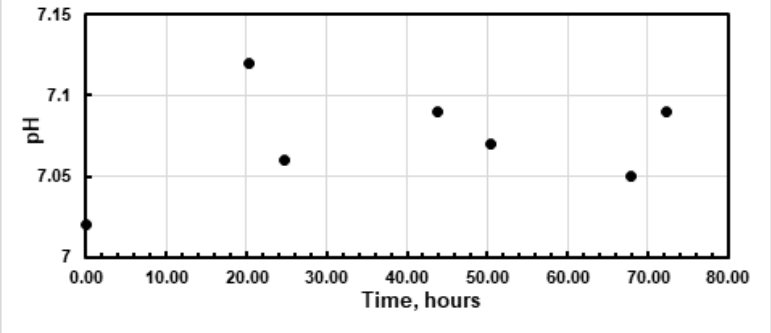

Figure 8. Graph of the time-dependent pH concentration changes

The usage of immobilized algae in fish bait industry

Due to the high amount of protein (45%) of dry weight in the composition of algae, it can be an alternative to fish feed. Gas bubbled immobilized algae will be investigated as an alternative additive to fish feed in the fish bait production industry after using polluted natural water treatment process.

Yields of different experimental sets

During the experimental studies, the effects of algae on polluted natural water bioremediation were investigated at pH 7, 8 and 9, air flow rates are 0.3, 0.4, and 0.5 L/min, and light intervals are 24:0, 12:12, 16:8 h/h. Based on the 45th hour, the ammonium, nitrate, and phosphate removal efficiencies of algae from polluted natural water as shown in Table 2.

Table 2. The removal efficiency of parameters in different experimental conditions and algae biomass growth rate

Experimental Conditions			Nitrate, % (NO_3-)	Ammonium, % (NH_4+)	Phosphate, % (PO_4^{-3})	Chlorophyl-a, mg/m^3 /h
pH	**Air condition, L/min**	**Lightning, h/h**				
9	0.3	24:0	53.3	71.9	99.1	0.0017
7	0.5	24:0	16.4	81.2	96.2	0.0246
7	0.4	24:0	-17.6	85.5	48.3	0.0043
7	0.3	24:0	38.3	86	77.6	0.0028
8	0.3	16:8	63.2	75.2	90	0.0018

CONCLUSION

In this study, the removal efficiency of NH_4^+-N, PO_4^{3-} and NO_3^- from natural water was investigated using a gas bubbled immobilized *Chlorella vulgaris* pure algal culture under different pH, air flow and light conditions.

Considering the removal efficiency, a nitrate removal of 63.2 % was achieved in the series of experiments with

a pH of 8, an air flow rate of 3 m^3/s and an lightning condition of 16:8, ammonium removal was calculated to be 86% and this condition was achieved in the series of experiments with a pH of 7, an air flow rate of 3 m^3/s, and an lightning condition of 24:0, the phosphate removal was calculated to be 99.1% and this condition was achieved in the series of experiments with a pH of 9, an air flow rate of 0.3 L/min and an lightning condition of 24:0. The air flow rate of 0.5 L/min was found to have the highest algal growth rate, as shown in Table 2. When considering the treatment efficiency, it was found that the effect of algae in on water treatment is quite high and it has a suitable treatment capacity compared to conventional treatment methods. The experimental processes are still ongoing, and once the experimental process is completed, the effectiveness of the treatment will be further investigated based on Taugichi analysis at the most effective pH, airflow, and lightning periods.

ACKNOWLEDGEMENTS

This study has been funded by Scientific Research Commission of Eskisehir Technical University under project no. 22GAP240

The authors would like to express his gratitude to Professor Erdem Ahmet Albek for his suggestions. The necessary analyzes for the usability of immobilized algae harvested as a result of treatment for fish feed production are carried out by ÖZPEKLER Fish Feed Production Facility.

Abstract

Environmental pollution increases significantly as a result of increasing population and industrial activities. Water resources, which are of vital importance for humans and the environment, are also affected by this pollution. The amount of water consumed by living things turns into wastewater and pollutes the receiving environments. Wastewater, which contains many pollutants such as detergents, heavy metals, pesticides, and which is formed by human activities, needs to be treated appropriately. Biological treatment methods, which are frequently used for wastewater treatment, are the process of using and decomposing organic matter in wastewater by various microorganisms such as fungi, protozoa and algae as nutrients. Microalgae, which has been used in many researches in recent years, provides the sustainability of wastewater treatment by converting nutrients such as nitrogen-phosphorus in wastewater into biomass. In this study, it was aimed to investigate the removal of nitrogen and phosphorus from domestic wastewater by using *Chlorella vulgaris* algae culture. Experimental studies were carried out in a batch reactor under conditions of constant temperature and pH, light source and aeration rate. Nitrate nitrogen, ammonium nitrogen and phosphate phosphorus removal efficiencies were investigated by measurements made twice in a day. The results showed that microalgae are able to remove nitrogen and phosphorus efficiently and the use of microalgae is successful. Wastewater sample parameter removal efficiencies, respectively; 99.1% for ammonium nitrogen, 64.3% for nitrate nitrogen and 94.2% for phosphate. For the pollution parameters in the surface water source, the removal efficiencies 98,7% for ammonium nitrogen and 100% for phosphate.

Keywords: *Chlorella vulgaris*, Wastewater treatment, Microalgae.

INTRODUCTION

Excessive use of fertilizers and pesticides in urban and agricultural areas creates serious nitrate and phosphate pollution problems in surface and ground waters. Municipal wastewater discharge, sewage effluent, animal farms, processed food factories and decomposition of rotten organic matter release nitrogen into aquatic environments. For these reasons, studies on nitrogen and phosphorus pollution and the treatment of this pollution are important (Taziki, et al., 2015).

Biological treatment of nitrogen and phosphorus-containing wastewater has been investigated and studied with organisms such as bacteria, fungi, protozoa and microalgae. Among these organisms, microalgae have been the focus of attention in wastewater treatment in recent years. Microalgae, which can grow rapidly due to their unicellular or simple multicellular structure, are photosynthetic microorganisms that can live in harsh conditions. It is a good way to remove pollutants such as nitrogen, phosphorus and carbon from wastewater. They can also reduce the harmful effects of pollutants in the sewer (Delgadillo-Mirquez, ve diğerleri 2016). In addition, microalgae technology is based on natural ecosystems and is environmentally friendly.

In previous studies, the behavior of different types of microalgae in wastewater was investigated in order to observe nutrient removal. Among species such as *Chlorella vulgaris*, *Scenedesmus obliques*, *Spirulina maxima*, *Botrycoccus braunii* and *Chlamydomonas reinhardtii*; *Chlorella v*. is recognized as one of the fastest growing microalgae (Gutwinski and Cema 2016).

Su et al (2012) stated that the performance of some algae species such as Phormidiaceae, Chlorella and Scenedesmus stand out in water treatment, and among these species, Chlorella exhibits the best nitrogen and phosphorus removal ability (Xe, ve diğerleri 2021). In addition, *Chlorella vulgaris* has been identified as one of two microalgae capable of removing 55% of phosphate in pig farms wastewater in Colombia (Sayadi et al., 2016).

Chlorella vulgaris is a genus of unicellular, round-shaped, 2-12 μm green algae belonging to the phylum *Chlorophyta*, which can serve as a potential source of food and energy. They live in fresh water or soil and are easy to grow. For this reason, it is frequently used in scientific studies and engineering.

In this study, it was aimed to remove nitrogen and phosphorus from domestic wastewater by using *Chlorella vulgaris* algae culture and the details of the treatment process were examined under laboratory conditions.

MATERIAL AND METHOD

The aim of this study is to determine the biological treatment capacities of *Chlorella vulgaris* algae culture in water and the removal efficiency of nitrogen and phosphorus ions from water sources. Within the scope of the experiments carried out in the Water Quality Laboratory of the Department of Environmental Engineering of Eskişehir Technical University, it was studied with domestic wastewater samples and with Porsuk Stream water samples.
Measurements were made approximately every 10 hours. All tests were performed at a constant temperature (room temperature) of 25°C, pH values were recorded daily. Necessary corrections were made in each measurement to keep the pH value at a constant value of 8.

1. Study Area

The wastewater sample was taken from the outlet of the primary sedimentation at the Eskişehir Municipal Wastewater Treatment Plant. The surface water sample was obtained from the discharge point of the facility outlet of the Porsuk Stream. Sampling locations are shown in the Figure 1.

Figure 1 Sampling locations

2. The Experimental Setup

The experiment solution was 810 mL of sample (wastewater or surface water), 90 mL of algae culture (in a total volume of 900 mL). The algae strain used was *Chlorella v.* as mentioned above. Algae culture fed with BBM was obtained from Eskişehir Technical University Environmental Engineering Department Water Quality Laboratory. The algae culture to be used in the experiment, examined under the microscope, is shown in Figure 2.

Figure 2 Microscope view of *Chlorella v.* algae

Batch reactor was used to set up the experiment with an imhoff cone. The reason for this preference is that when air is supplied from the lower part of the funnel, this air can easily reach everywhere in the assembly in a homogeneous manner. Air was fed from the lower part of the funnel via the diffuser, and the system was illuminated with blue-red light using a power LED light source. A parabolic reflective surface covered with aluminum foil is placed around the cone for better efficiency from the light source. Within the scope of the experiment, in addition to NO_3-N, NH_4-N, PO_4^{3-}, pH and temperature values, chlorophyll-a was measured to see the growth stages of algae. During the experimental studies, pH fixation was done manually. The image of the system before the light source is turned on is given in Figure 3.

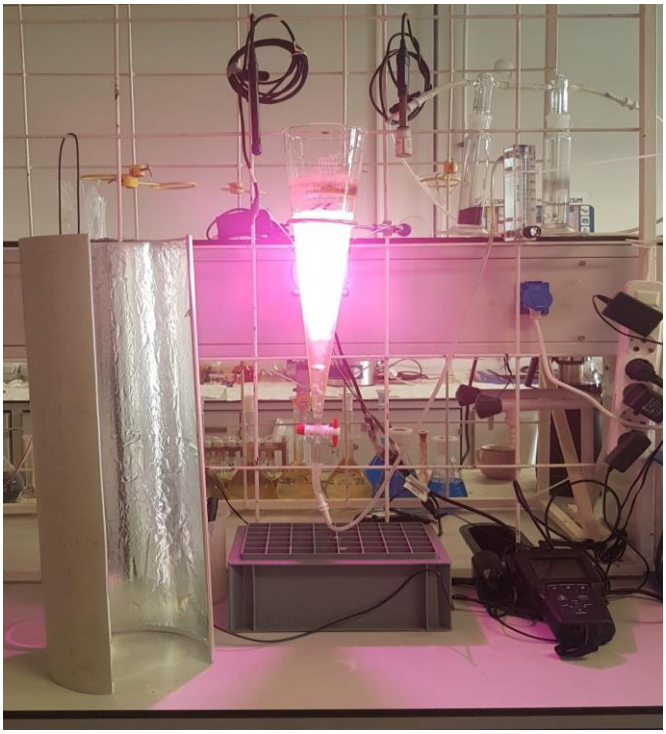

Figure 3 The batch reactor

3. Measurement of Parameters

The following parameters were measured in the water samples taken from both locations: Nitrate (NO_3-N) nitrogen, Ammonium (NH^{4+}-N) nitrogen, Phosphate (PO_4^{3-}), pH, Chlorophyll-a.

At the beginning, the sample, which was taken from the cone, mixed homogeneously and reached room temperature, was filtered using glass fiber filter paper (diameter 47 mm). Then, the filtered sample was subjected to nitrogen and phosphorus analysis. Phosphate was measured by the Phosphate Standard Method 8048 Phosphorus, Reactive (Orthophosphate) Ascorbic Acid Method. Nitrate measurement was made with the Standard Method 8171 Nitrate, Cadmium Reduction Method. The measurement of ammonium nitrate was carried out by the Nessler method. Values were read using the Hach DR2400 VIS spectrophotometer. Chlorophyll-a measurements were made with the Turner Design Aqua Fluor Fluorometer/Turbidimeter device as in vivo Chl-a values. Spectrophotometer and fluorometer are given in Figures 4.

Figure 4 Spectroscopy and fluorometer used in the experiment

RESULTS AND DISCUSSION

Ammonium nitrogen and phosphate concentrations in experiments with *Chlorella vulgaris* in wastewater are shown in the graphs below. Both parameters were determined with high efficiency values reaching respectively 99.1% and 94.2%. Subsequently, the removal rate was greatly reduced in proportion to the reduction in algae concentrations. Exponential graphs of the removals are shown in Figures 5.

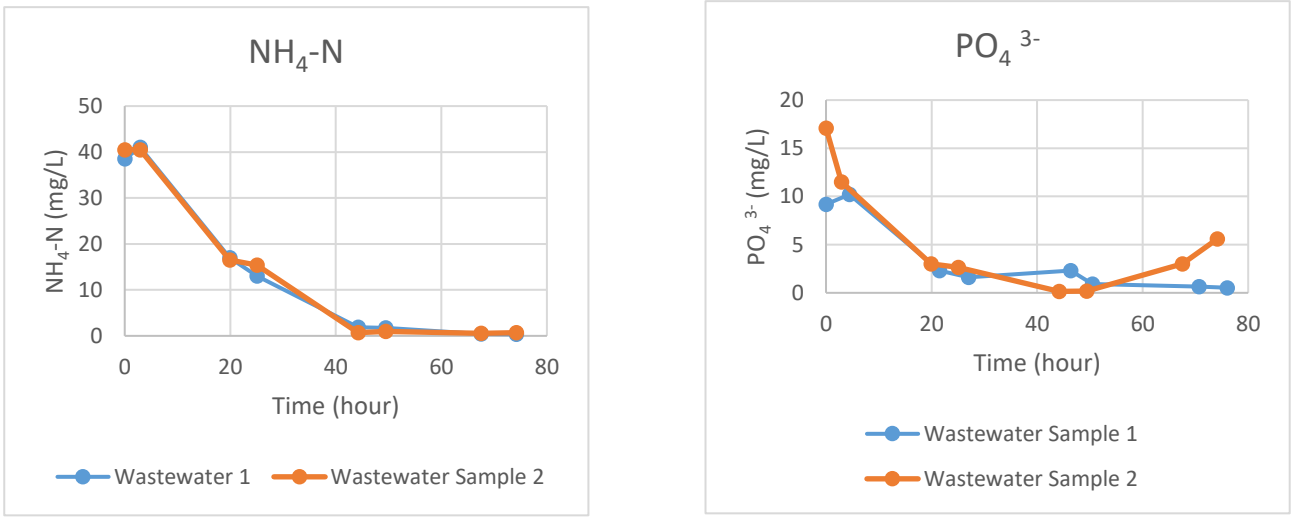

Figure 5 Time-dependent change of phosphate and ammonnium concentration in wastewater

The graph below shows the concentration changes of NO_3-N concentrations in wastewater (Figure 6). At the beginning, nitrate nitrogen removal was observed, but after the twentieth hour, an increase was observed. Nitrification processes as a result of bacterial activity in the system can be shown as the reason for the risings. For this reason, the risings were observed in some periods. However, this rising was replaced by the depletion of nitrate nitrogen with the depletion of ammonium ion. The total removal efficiency is 64.2%.

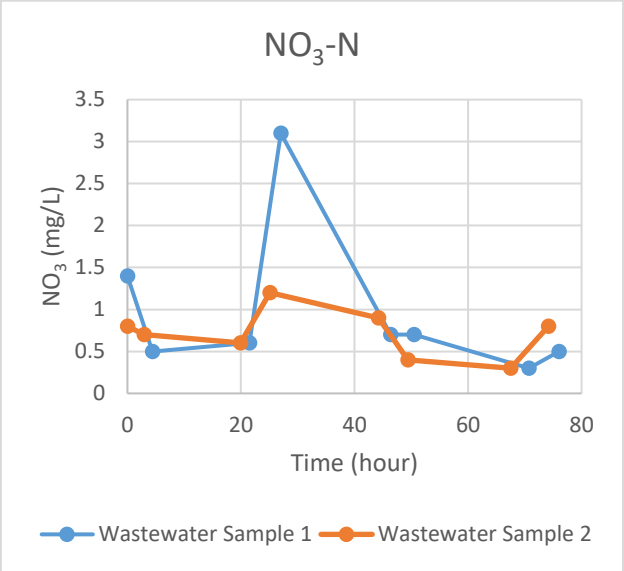

Figure 6 Time-dependent change of nitrate-N concentration in wastewater

The graph below shows chlorophyll-a changes in the wastewater sample. It can be seen that the algae concentrations increase continuously during the first 45 hours due to the presence of abundant phosphorus and nitrogen at the beginning. In the following hours, the system enters the stationary phase because there is small amount of nutrients left in the system. Figure 7 shows the time depended change of algae biomass amount.

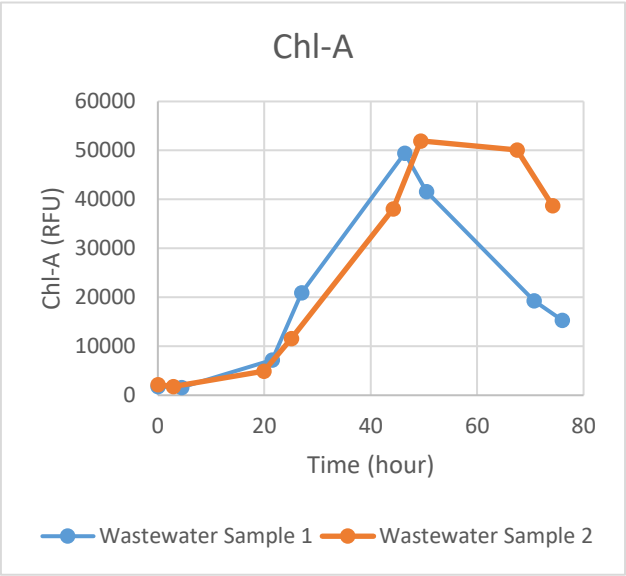

Figure 7 Time-dependent change of Chlorophyll-a (RFU) in wastewater

The concentrations of ammonium nitrogen and phosphate can be seen from the graphs below in experiments performed with the same algae species in Porsuk Stream water. For these parameters, it was observed that the removal efficiency reached up to 98.7% and 100%, respectively. Most of the pollutant removal occurred in the first twenty hours of high algae growth. Afterwards, the removal rate was greatly reduced in proportion to the decrease in algae concentrations. Graphs are shown in Figure 8.

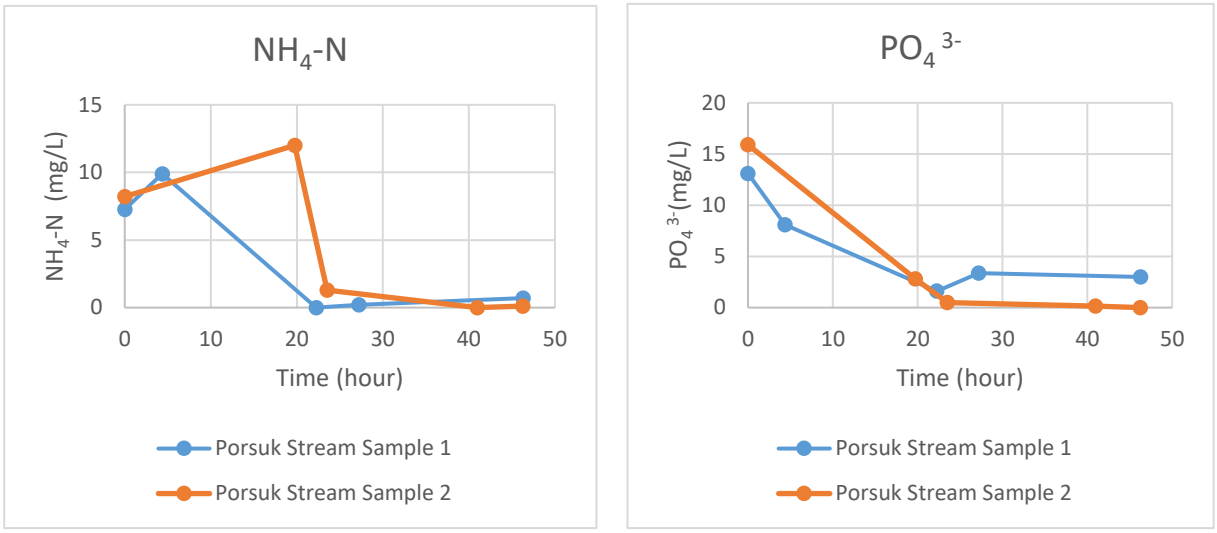

Figure 8 Time-dependent change of phosphate and ammonium concentration in Porsuk Stream

The concentration of NO_3-N values in surface water is very low and the algaes are growing slowly. As a result, the removal of NO_3-N has not been efficient.

The graph below shows chlorophyll-a changes in the Porsuk Stream water sample. In the beginning, there is plenty of phosphorus and nitrogen in the system and the algae concentrations increase continuously during the first 20 hours. After 20 hours, it reaches the maximum value, the rising stops and the algae starts to die. Figure 9 shows algal culture concentration changes in surface water.

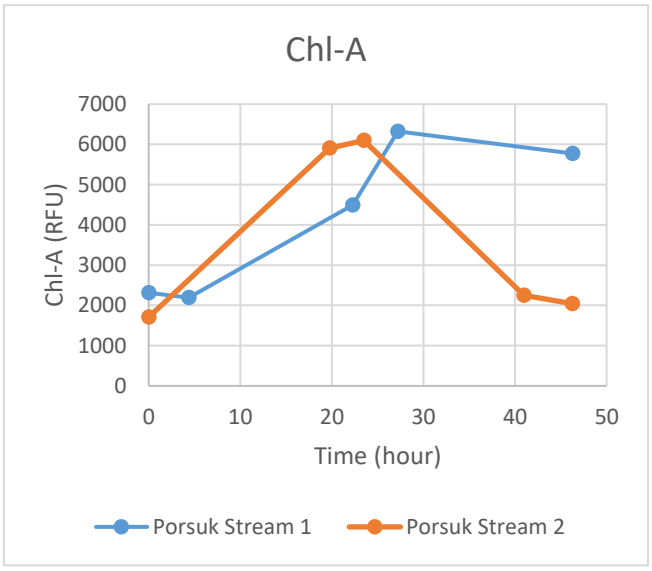

Figure 9 Time-dependent change of Chlorophyll-a (RFU) in Porsuk Stream water sample

As shown in the graphs, it can be said that working with *Chlorella vulgaris* algae is efficient for the removal of ammonium nitrogen (NH_4-N), nitrate nitrogen (NO_3-N) and phosphate (PO_4^{3-}), including for wastewater or surface water. Compared to surface water with wastewater, due to the presence of lower concentrations of phosphorus and nitrogen, nutrients for algae at the beginning, it took a shorter time for the algae to enter the

stationary phase and the system efficiency ended earlier. While the transition to the stationary phase in the wastewater sample took 45 hours, this value decreased to 20 hours for the surface water samples.

CONCLUSION

As a result, it can be concluded that the use of microalgae in nitrogen and phosphorus removal from domestic wastewater gives successful results. It has been observed that algae play an active role in the rehabilitation of wastewater and natural waters, and they can be used in the treatment process more quickly and efficiently due to the excess of the initial nutrient in the wastewater. Microalgae can be indicated as a significant role-player while used in wastewater, being an affordable process with multiple benefits.

This experiment confirms that *Chlorella v.* can be considered as efficient nutrient removers from wastewater and surface waters. It is capable of completely depleting N and P correspondingly from especially wastewaters containing high concentrations of nitrate and phosphate.

Özet
Alp-Himalaya Deprem Kuşağı'nda bulunan Türkiye, büyük levhaların sıkıştırıcı etkisi altında olup aktif bir deprem kuşağındadır. Her geçen gün büyük magnitüdlü depremler ile sarsılmakta ve bu bağlamda deprem kaçınılmaz bir gerçeklik olarak ortaya çıkmaktadır. Can ve mal kaybını minimuma indirgemek için saha çalışmaları önem teşkil etmektedir. Yapıların inşa edileceği alanların zemin formasyonları iyi irdelenmeli ve özellikle yumuşak zeminlerde karşılaşılan zemin büyütme faktörü üzerinde durulmalıdır. Bu çalışmada Ankara ilinin ve çevresinin fay özellikleri irdelenmiş ve zemin formasyonları hakkında bilgi verilerek zemin büyütmesi durumuna değinilmiştir.
Anahtar sözcükler: Deprem, Ankara, Zemin Büyütmesi

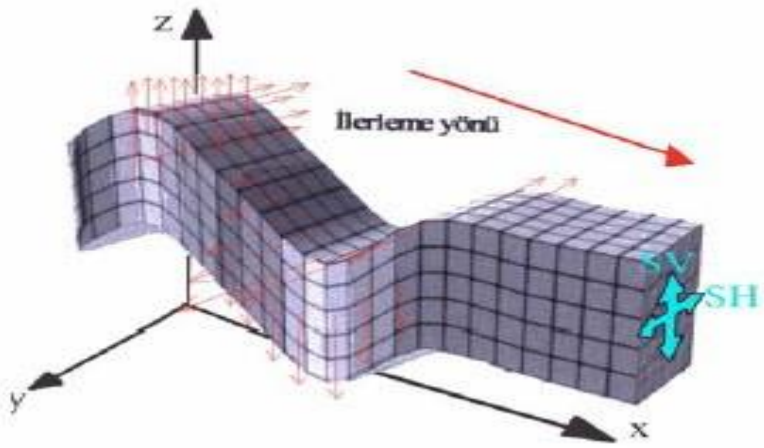
Abstract
Located in the Alpine-Himalayan Seismic Belt, Turkey is under the compressive effect of large plates and is in an active seismic belt. It is being shaken by earthquakes of great magnitude day by day, and in this context, earthquakes emerge as an inevitable reality. Field studies are important to minimize the loss of life and property. Soil formations of the areas where the structures will be built should be well examined and the soil amplification factor encountered especially in soft soils should be emphasized. In this study, the fault characteristics of Ankara province and its surroundings were examined and the soil amplification was mentioned by giving information about the soil formations.
Keywords: Earthquake, Ankara, Soil Amplification

GİRİŞ

Türkiye gibi deprem kuşağında yer alan ülkeler büyük magnitüdlü depremler ile sarsılmakta ve bunun sonucunda ciddi can ve mal kayıpları meydana gelmektedir. Bir deprem meydana geldiğinde, farklı sismik dalgalar odak noktasından itibaren yer içinde farklı hızlarda yayılmaya başlarlar. Bu dalgalar yer yüzeyinde süresi saniyeden dakikalara varacak kadar titreşimler oluştururlar. Belirli bir yerdeki titreşimin süresi ve şiddeti; depremin büyüklüğüne, kaynaktan uzaklığına, dalgaların yol aldığı ortamın fiziksel özelliklerine ve o yerin zemin özelliklerine bağlıdır. Sismik dalgalar, kaynaktan yer yüzeyine ulaşıncaya kadar yayılımının büyük bir kısmını yer kabuğunu oluşturan sert ana kayadan geçirirken, son kısmını ana kayaya göre oldukça farklı olan gevşek zemin tabakaları içinden geçirirler. Taban kayaya ulaşan deprem dalgaları, tabakalı bir zemin ortamında yukarıya doğru yayılırken, bu zemin tabakalarının fiziksel özellikleri yüzünden titreşimin frekans muhtevası (hakim periyodu) ve titreşimin genlikleri önemli ölçüde değişikliğe uğrayabilmektedir. Zemin tabakaları, sismik dalgalar için bir süzgeç görevi görmektedir. Bazı frekanslardaki sismik dalgalar sönüme uğrarken bazıları ise büyütülmektedir. Sismik dalgaların zemin tabakaları içinde geçirdiği değişimlerin tümüne zemin etkisi adı verilir. Genellikle bu değişim genliklerin artması şeklinde gözlendiğinden, zemin etkisi terimi zemin büyütmesi olarak da adlandırılır. Yumuşak zeminlerde zemin büyütmesi durumuna sık rastlanmaktadır.

Yumuşak kilden oluşan kalın zeminler yer hareketini sönümlemezler aksine onları büyütürler. Bu zeminler pik yer ivmesini ve periyodu büyütme eğilimindedirler. Yumuşak zemin üzerine inşa edilen yapılar ana kayadakilere göre daha fazla zarar görür. Sismik dalgaların kayada 0,3 s civarındaki baskın periyodu yumuşak zeminlerde 1~4 saniyeye kadar çıkabilir. Bu durum da yapılarda çok yıkıcı sonuçlar doğurabilmektedir. Deprem odak noktasında ciddi kayıplar, hasarlar meydana gelmezken deprem odak noktasına kilometrelerce uzakta bulunan, yumuşak zeminden oluşan bölgelerde zemin etkisinden kaynaklı olarak hasarlar ve can kayıpları meydana gelebilir. İnşaat mühendisliği alanında yapı periyodundan kasıt herhangi bir kuvvet altında

yapının harekete başlama zamanı ile yapının tekrar eski haline gelmesi arasındaki süredir. Yapıların salınım periyotları kabaca N/10 saniyedir (N: kat adedi). Pik yer ivmesi ise bir yerde deprem anından meydana gelen en büyük yer ivmesidir.
Zemin büyütmesini; malzemenin empedans oranı, havza altı topografyası, havza kenar etkisi, yer yüzü topografyası ve zemin yapısı-dokusu gibi özellikler etkilemektedir.
Deprem etkisi ile zararlarının azaltılması veya önüne geçilebilmesi için yerleşim yerlerinin, deprem tehlikesinin ve zeminlerin geoteknik özelliklerinin belirlenmesi ve bunlara göre yapının projelendirilmesi oldukça önemlidir. Yapı-zemin etkileşiminin projeye yansıtılması bağlamında zeminde deprem esnasında oluşacak zemin büyütmesinin belirlenmesi hususundaki incelemeler, araştırmalar gün geçtikçe önemli bir hale gelmektedir.
Zemin büyütmesi birçok farklı yöntemle irdelenebilmektedir ancak bu çalışmada kayma dalgası hızından (V_s) yola çıkılarak zemin büyütmesi durumu hakkında fikir yürütülmüştür. Kayma dalgası hızı Vs, inşaat mühendisliğinde zeminlerin dinamik davranış özelliklerini belirlemede önemli parametrelerden biri olarak kabul edilmektedir. Deprem sırasında meydana gelen enerjinin bir kısmı elastik dalgalar şeklinde yayılır. Kayma dalgaları elastik bir ortamda bükülerek, parçacık hareketine dik yönde yayılırlar. Hacim değişmesine neden olmazlar ancak ortamda şekil değişikliği meydana getirirler. Kayma dalgaları “S-dalgası”, “ikincil dalga” veya ”transvers dalga” ifadelerle anılırlar.



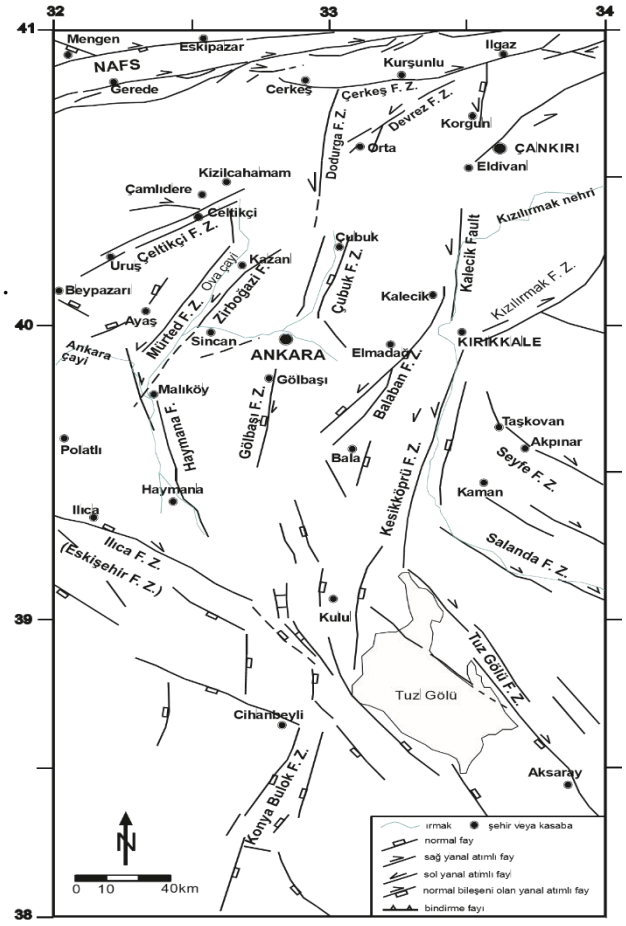
Şekil 1.1: S dalgasının yayıldığı ortamda meydana getireceği deformasyon

Bu çalışmada Ankara ilinde yapılmış olan zemin inceleme çalışmalarından yararlanılarak elde edilen verilerden zemininin deprem etkisi altında büyümesi irdelenmiştir.

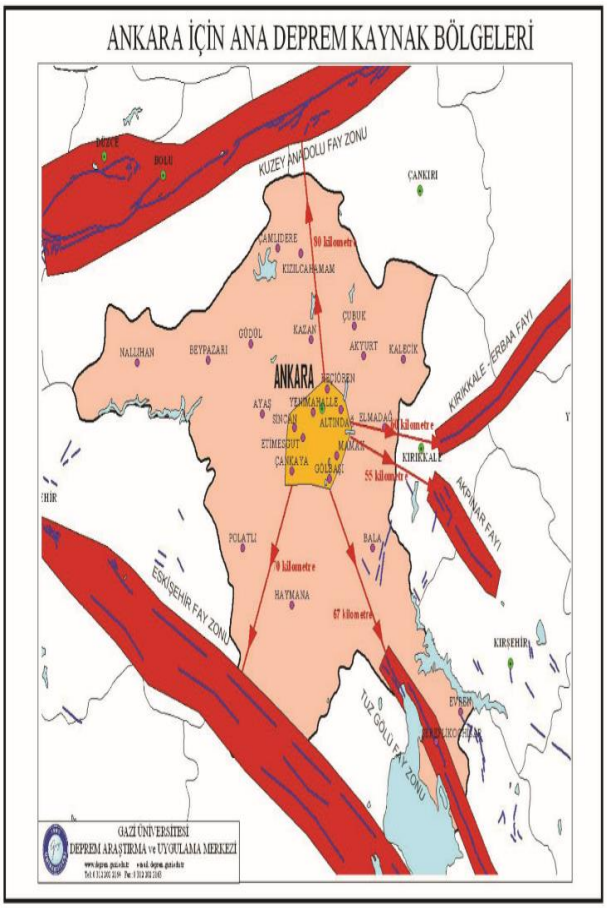
ANKARA İLİ VE ÇEVRESİNİN DEPREMSELLİK ÖZELLİKLERİ

Kuzey Anadolu Fay Hattı, Van Gölü’nden Yunanistan’a kadar uzanan yaklaşık 1700 kilometre uzunluğunda bir hattır. Bu hattın Ankara’ya uzaklığı 110 kilometredir. Bu hat 300 yılda bir büyük ve yıkıcı bir deprem üretme potansiyeline sahiptir. En son Çankırı’nın Orta ilçesinin hemen batısında 2000 yılında 6.0 büyüklüğünde olan bir deprem bu faydaki hareketlenme ile meydana geldi. Bu hat Çerkeş’ten Çubuk Esenboğa’ya kadar uzanmaktadır ve bu hat üzerinde kısa aralıklarla depremler devam etmektedir. Bir başka Ankara’yı etkileyen aktif deprem hattı Ankara’nın yaklaşık olarak 70 kilometre kuzeybatısından geçen Çeltikçi Fay Hattı’dır. Bu fay hattı Ankara-İstanbul otoyolunun geçtiği mevkiye ve Çamlıdere Barajı’nın bulunduğu mevkiye çok yakın geçmektedir. Çeltikçi fay hattı ise Kızılcahamam’dan Beypazarı’na kadar uzanan yaklaşık 70 kilometre uzunluğunda bir fay hattıdır. Bu fay hattı da 2000 yılında 4,4 büyüklüğünde Güdül depremini üretmiştir.
Daha güney tarafta ise Ankara’nın yaklaşık olarak 50 kilometre kuzeybatısından geçen ve aktif durumda olan Ayaş Fay Hattı bulunmaktadır. Aynı şekilde Ankara’ya 75-80 kilometre mesafede bulunan Ankara’nın güneybatı tarafında yer alan Haymana Fay Hattı bulunmaktadır. Aşağıda bulunan haritalar incelendiğinde Ankara birçok fay hattı ile çevrelenmiş görünmektedir. Yine Ankara’ya yaklaşık 25-30 kilometre uzaklıkta bulunan Elmadağ Fay Hattı, üzerinde çok sayıda depremin gerçekleştiği aktif bir fay hattıdır. Bir diğer fay hattı ise balaban çayı ve vadisini oluşturan Ankara’nın 60-65 kilometre doğusunda yer alan ve 2005 yılında 5,2 büyüklüğünde deprem üreten ve 2007 ile 2008 yıllarında da depremler üreten bir fay hattıdır. Güneyde Kesikköprü Fay Hattı bulunmakta ve bu fay hattının hemen doğusunda da Kırıkkale Fay Hattı bulunmaktadır.

Batıda Bursa'dan doğuda Sultan Karapınar'a kadar uzanan yaklaşık 470 kilometre uzunluğunda ve 30 kilometre genişliğinde bir aktif fay kuşağı bulunmaktadır. Bu fay kuşağı 1956 yılında 6,4 büyüklüğünde Eskişehir depremini üretmiştir. Eskişehir fay sistemi de Ankara'yı dolaylı olarak etkileyen bir hattır. Bir başkası ise Bolluk gölünün bulunduğu alandır. Burası çok fazla deprem üreten bir bölgedir ve aktif bir faydır. Çevre illerden olan Kırşehir Fay Hattı 4 tane aktif fay kuşağından oluşmaktadır ve 7 büyüklüğünde deprem üretme potansiyeline sahiptir. Kapadokya bölgesinde Avanos'tan Kırıkkale'ye kadar 175 kilometre uzunluğunda ve 25 kilometre genişliğinde çok önemli bir deformasyon kuşağı bulunmaktadır.



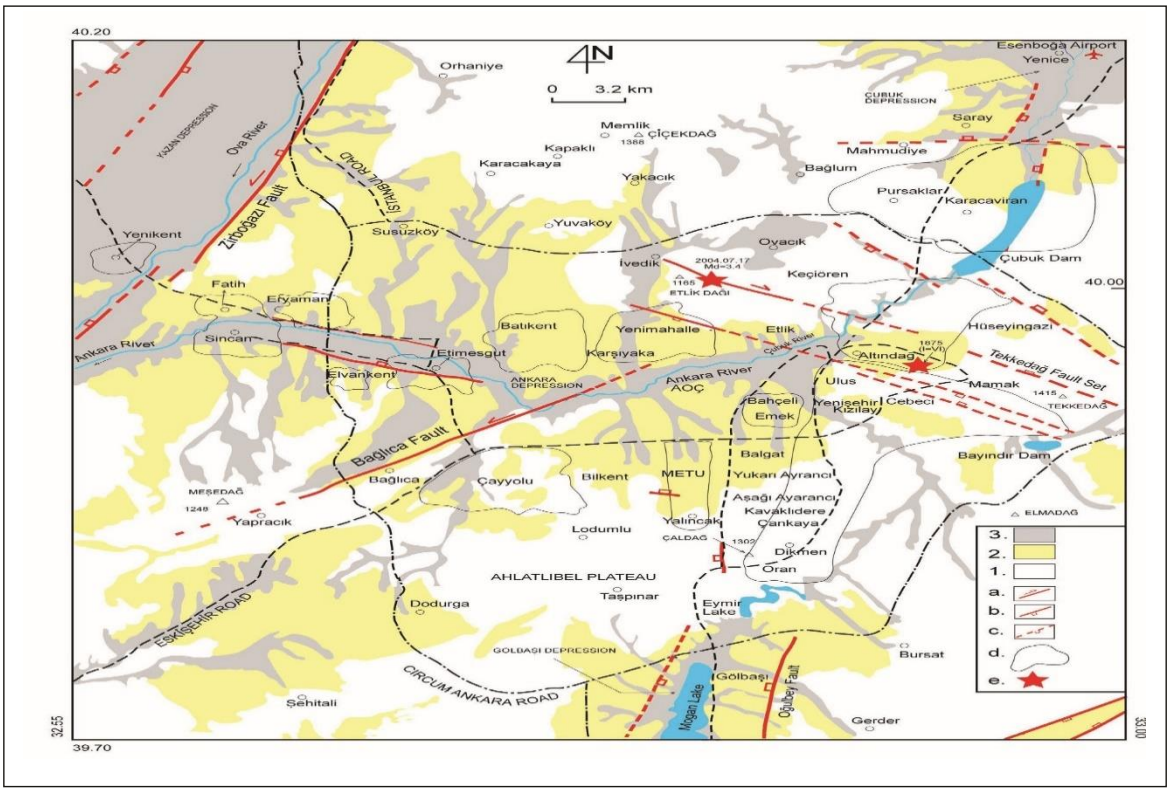
Şekil 1.2: Ankara çevresi fay haritası



Şekil 1.3: Ankara için ana deprem kaynak bölgeleri

ANKARA İLİ JEOLOJİK FORMASYONLAR

Ankara zemininin jeolojik formasyonlarından kısaca bahsetmek gerekirse aşağıda bulunan harita üzerinden bu formasyonları ifade edelim. Beyaz ile gösterilen zeminler kaya zeminler olmakla birlikte bu tür zeminler oldukça sağlam zeminlerdir ve deprem esnasında kuvvetli yer hareketini büyütmeyeceğini bildiğimiz zeminlerdir. Sarı ile gösterilen zeminler deprem etkisini kısmen de olsa büyütebilecek zeminlerdir. Gri ile gösterilen alanlar ise alüvyon veya pekişmemiş aynı zamanda bazı mevsimlerde suya doygun hale gelebilen zeminler olduğu için kuvvetli yer hareketini büyütebilecek zeminlerdir. Kırmızı çizgiler aktif fayları göstermektedir. Özetlemek gerekirse Ankara ili ve çevresinde yaklaşık olarak 200 kilometre çaplı dairesel alan içerisinde deprem büyüklüğü 6-6,5 arasında ya da bu değerlerin üzerinde deprem üretecek aktif faylar bulunmaktadır. Ankara'nın dolaylı etki altında görünüyor olması durumun önemsiz olduğu yanılgısına neden olabilir. Ancak Ankara zemini kuvvetli yer hareketini büyütecek bir zemin olduğu için bu durum tehlike arz etmektedir. Ankara zeminini yaklaşık olarak %50 si bu tür formasyonlar üzerine kuruludur.



Şekil 1.4: Ankara zemininin jeolojik formasyon haritası

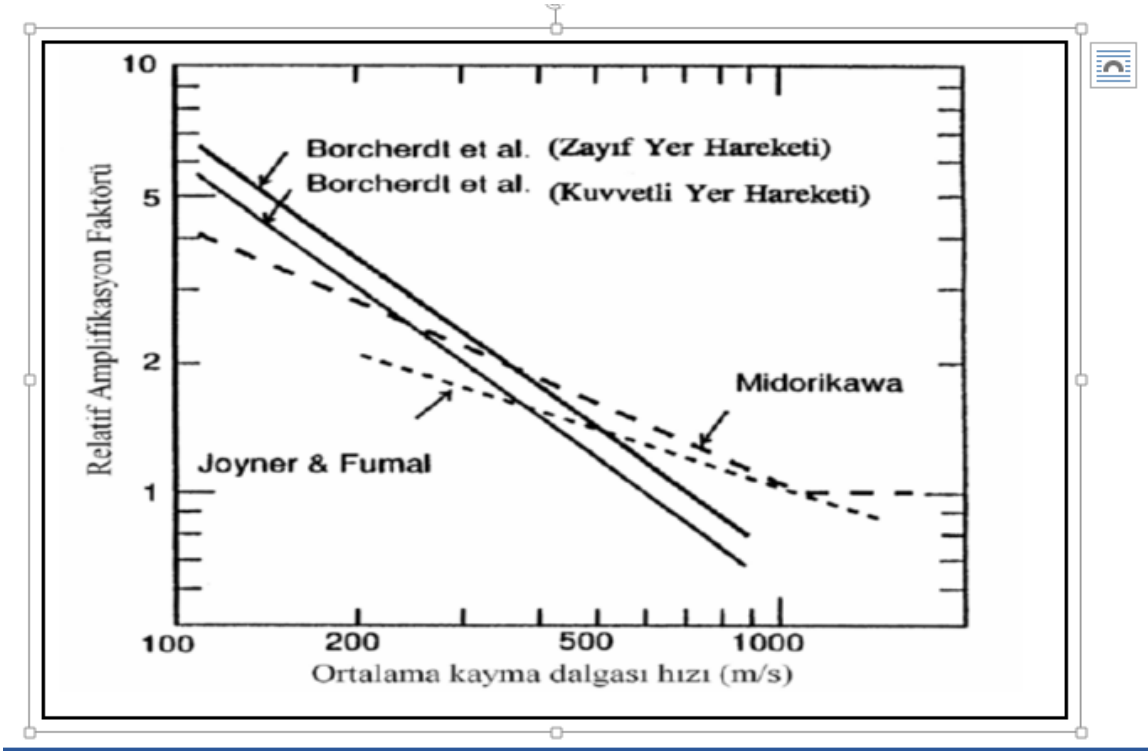
ÖRNEK SAHA ÇALIŞMASI

Yüzeye yakın tabakaların kayma dalgası hızları bir arazinin sismik büyütmesi için yararlı bir indeks olarak kabul edilmektedir. Ankara zemininde yapılan bir saha çalışması raporuna göre kayma dalgası hızı ve zemin parametreleri aşağıdaki tabloda verilmiştir ve farklı araştırmacılar tarafından önerilen, bağıl büyütme ile yüzeye yakın tabakaların ortalama kayma dalgası hızı arasındaki korelasyonlar gösterilmiştir. Bu ilişkiler baz alınarak kayma dalgası hızı göz önünde bulundurularak zemin büyütmesi hakkında yorumlar yapılmıştır.

Tablo 1.1: Büyütme oranları ile ortalama kayma dalgası hızı arasındaki korelasyonlar

Araştırmacılar	Eşitlikler
Midorikawa (1987)	$A = 68V_1^{-0.6}$ ($V_1 < 1100$ m/sn) $= 1.0$ ($V_1 > 1100$ m/sn)
Joyner&Fumal (1984)	$A = 23V_2^{-0.45}$
Borcherdt vd.(1991)	$AHSA = 700/V_1$ (zayıf hareket için) $= 600/V_1$ (kuvvetli hareket için)

A: Zemindeki en büyük hız için bağıl büyütme faktörü
AHSA: 0.4 ~ 2.0 s periyod aralığında ortalama yatay spektral büyütme
V_1: 30 m derinlik içersindeki ortalama kayma dalgası hızı (m/sn)
V_2: Bir saniye periyodlu dalga için ¼ dalga boyu derinliğe kadar ortalama kayma dalgası hızı (m/s)

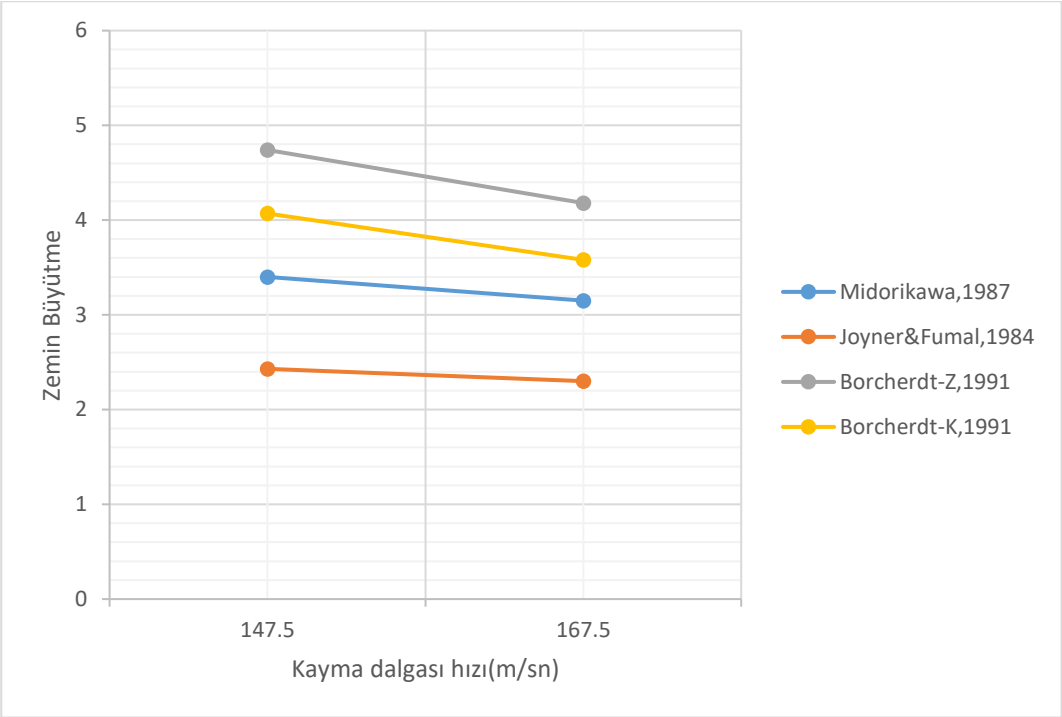


Şekil 1.5: Bağıl büyütme faktörlerinin karşılaştırılması

Tablo 1.2 de özellikleri verilen saha örneği Ankara ilinde Sıhhiye semti ve Bilkent semtinde ölçülen kayma dalgası hızı değerleri göz önünde bulundurularak hazırlanmıştır. Sıhhiye semtinde ölçülen kayma dalgası hızı değeri (V_s) 147,5 m/sn iken Bilkent semtinde semtinde ölçülen kayma dalgası hızı değeri (V_s) 167,5 m/sn bulunmuştur. Bunun sonucunda elde edilen değerler ve oluşturulan grafik aşağıda verilmiştir.

Tablo 1.2: Kayma dalgası hızına göre zemin büyütme değerleri

Kayma dalgası hızı(m/sn)	Midorikawa, 1987	Joyner&Fumal, 1984	Borcherdt-Z, 1991	Borcherdt-K, 1991
147,5	3,4	2,43	4,74	4,07
167,5	3,15	2,3	4,18	3,58



Şekil 1.6: Zemin büyütme ve kayma dalgası hızı değerlerinin karşılaştırılması

Bu çalışma kapsamında hesaplanan kayma dalgası hızı-zemin büyütme bağıntılarının, Midorikawa, Joyner&Fumal , Borcherdt tarafından önerilen bağıntılarla karşılaştırılması grafikte görülmektedir. Büyütme değerlerinin hesaplanmasında 30 m derinlikteki ortalama kayma dalgası değeri dikkate alınmıştır. Borcherdt (1991) yöntemiyle analiz sonucu elde edilen büyütme değeri, diğer araştırmacıların bağıntıları kullanılarak bulunan değerlere göre daha yüksek sonuç vermektedir. Joyner&Fumal tarafından geliştirilen bağıntılarla bulunan sonuçlar ise en düşük değerleri vermektedir. Ansal ve diğ. (2003) büyütme değerine göre tehlike düzeyi ölçütü oluşturmuş ve 2.5 değerine kadar olan büyütmeleri düşük tehlike düzeyi, 2.5-4 arası büyütmeleri orta tehlike düzeyi ve 4.0'den büyük büyütme değerlerini yüksek tehlike düzeyi olarak tanımlamışlardır. Bu ifadeler sonucunda Borcherdt'in bağıntısına göre her iki semt de yüksek risk taşıyan bölgeye girmektedir.

BULGULAR ve TARTIŞMA

Ankara 6,5 ve üzerinde deprem üretme potansiyeline sahip faylarla çevrilmiştir ancak doğrudan kaynağın üzerinde bulunmamaktadır. Ankara her ne kadar doğrudan aktif deprem üretecek kaynağın üzerinde bulunmasa da çevresindeki faylarda meydana gelecek yıkıcı depremlerden etkilenecektir. Buradan yayılacak olan enerji Ankara'nın altındaki zeminde kuvvetli yer hareketini büyüteceğinden bu zemin büyütmesine maruz kalacak zemin üzerine inşa edilmiş olan yapılar deprem tehlikesine açık bulunmaktadır. Ancak tehlikenin boyutu, önlem alınmalı mı hususu bir tartışma konusudur.

SONUÇLAR VE ÖNERİLER

Verilen özet bilgilerden sonra anlaşılmaktadır ki Ankara il merkezinin yaklaşık %50 si kuvvetli yer hareketini büyütme özelliğine sahip zemin üzerine kuruludur. Kent alanının önemli bir kısmı Genç Pliyosen-Erken Kuvaterner yaşlı göl çökelleri ile Kuvaterner yaşlı alüvyon ve yaşlı nehir terasları gibi zayıf zeminden meydana gelmektedir. Ankara il merkezi altında bulunan zeminin oldukça büyük bir kısmı su aldığında şişme, kuruduğunda ise çekme-daralma özelliğine sahiptir. Bu yüzden yıkıcı bir depremde ($M_w \geq 6,5$) ciddi bir hasar ortaya çıkaracaktır.

Bunun için deprem yönetmelikleri bu hassasiyet ile hazırlanmalı, bu yönetmeliklere kesinlikle uyumalıdır. Ankara ili ve çevresini kapsayacak bir şekilde Deprem Risk Haritaları oluşturulmalı ve gerekli analizler yapılmalıdır. Ayrıntılı bir şekilde mikro bölgeleme çalışmaları yapılmalı ve problemli alanlar belirlenerek gerekli önlemler alınmalıdır.

TEŞEKKÜR

Çalışmamın tamamlanmasında yol gösterici olan tüm hocalarıma, arkadaşlarıma özellikle yüksek lisans arkadaşım sevgili Yusuf Yaşar'a teşekkür ediyorum.

Abstract
In this study, deep cryogenic heat treatment (-145 °C) was applied to the Ti-5553 alloy in order to increase the surface hardness due to the high effect of hardness on the wear resistance of the material. Before the wear tests, metallurgical characterization and surface hardness measurements were made. The cryogenic heat treatment was carried out for 24 hours and then bring back to room temperature for a period of 6 hours followed by the tempering at 200 °C for 2 hours. Wear studies were performed in dry conditions at two different loads (5 and 10N) and constant shear rates (20 mm/s). Abrasion tests were performed by using 6 mm diameter WC balls in a ball-on-disc type wear device and reciprocating dry sliding process. We have concluded that the deep cryogenic heat treatment parameters significantly affect the mechanical properties of the Ti-5553 alloy. According to the wear test results, the friction coefficient was highest in the sample that was not cryogenic heat treated under 10N load (CPUnapplied) and the lowest in the sample that applied deep cryogenic heat treatment (-145 °C) under 5N load.
Keywords: Cryogenic heat treatment, Ti-5553 alloy, Dry sliding wear, Hardness, Friction coefficient of.

1. INTRODUCTION

Titanium alloys are widely used in many industrial, aerospace, and biomedical fields as they have excellent mechanical properties, higher specific strength than stainless steel, and better corrosion resistance than stainless steel. Ti-5553 alloy materials are used in aircraft landing gears in the aviation industry, especially in Boeing 787 and Airbus A380 aircraft (Nouari and Makich 2013). The percentage usage rates of these materials in Boeing aircraft, aircraft engines, and fuselage parts are 18 and 36%, respectively (Peters, Kumpfert et al. 2003). The usage rate of Ti alloy materials has increased in Boeing 787, one of Boeing's new serial aircraft. The main reason for this is some important properties of Ti alloy materials such as maintaining their strength under high temperatures, being light, having high resistance to corrosion, and fatigue resistance. The mentioned properties enable these materials to be used in aviation and aircraft, in the most critical places such as aircraft engines and landing gear. In addition to these superior properties, titanium alloys also have some negative features such as limited wear resistance, difficulty in forming, and high cost. It is thought that the cryogenic heat treatment of the titanium alloy may contribute to the resolution of some of the above-mentioned negative aspects (Germain, Morel et al. 2013, Braham-Bouchnak, Germain et al. 2015).

Although Ti-5553 alloy shows high performance in a corrosion environment, it shows low performance in environments subject to wear due to its mechanical properties. Conventional heat treatment methods, mechanical surface treatments, and cryogenic heat treatment can be applied to impart high wear resistance to the Ti-5553 alloy material. In all methods, it is expected that the wear resistance will increase depending on the increase in the hardness of the material. Cryogenic heat treatment attracts attention as an effective method to increase the hardness, wear resistance, and service life of materials (Weng, Gu et al. 2020, Altas, Altin Karatas et al. 2021). Compared to conventional heat treatment and cryogenic heat treatment, cryogenic heat treatment affects the entire structure of the material (Kumar, Nagaraj et al. 2018). Cryogenic heat treatment especially affects unstable and metastable materials in the internal structure, contributing to the structure becoming more stable and regular. With this method, the conversion of residual austenite into martensite, the formation of fine carbide precipitates, and homogeneous Fe-C distribution in the conventional heat treated material. Thus, serious improvements are achieved in the mechanical properties of materials such as hardness and wear resistance. In this way, not only surface hardening can be achieved, but also a homogeneous hardness in the entire internal structure (Kumar, Nagaraj et al. 2018). In addition, the problem of increased surface roughness seen in mechanical surface treatments (such as ball forging) is not seen in cryogenic processing. To

minimize this situation caused by wear and corrosion, especially in systems that are in direct contact, the hardness of the material surfaces should be increased (Morón, Hernández-Onofre et al. 2020). The high corrosion resistance of the Ti-5553 material makes it an important alternative. However, it is difficult to prevent material loss due to low wear resistance. For this reason, it is necessary to investigate the increase in hardness and wear resistance of Ti-5553 alloy material.

In the literature, there are different studies on improving the surface properties of titanium alloys with different methods, examining many different properties such as manufacturability, properties, corrosion resistance, biocompatibility, and characterizing the changes in their structures. Heat treatments are applied to titanium alloys and the effects of these heat treatments on material properties are widely known. However, studies on the cryogenic heat treatment of titanium alloys and the effect of cryogenic heat treatment on the properties of titanium alloys have been found to be quite limited. Although the effects of cryogenic heat treatment on tool steels are widely researched, studies on non-ferrous materials seem to be more limited. (Senthilkumar and Rajendran 2011, Senthilkumar and Rajendran 2012, Çiçek, Kara et al. 2015, Katoch, Sehgal et al. 2016).

When the original value of this study was examined in the literature, it was determined that there was no study examining the change of surface hardness and friction coefficient as a result of dry sliding wear of Ti-5553 alloy, which applied deep cryogenic treatment. In order to fill this gap in the literature, in this study, the effects of surface hardness and friction coefficient as a result of dry sliding wear were investigated by applying deep cryogenic heat treatment to Ti-5553 alloy.

2. EXPERIMENTAL MATERIAL AND METHOD

2.1 Material used in the experiments

Ti-5553 alloy was used as a workpiece in experimental studies. The chemical composition of the sample used as a workpiece in the experiment is given in Table 1.

Table 1. Chemical composition of Ti-5553 alloy (% by weight).

Al	V	Mo	Cr	Fe
5.532	4.96	5.09	2.96	0.34

2.2 Application of Cryogenic Heat Treatment

Deep cryogenic heat treatment (at 145 °C) was applied to increase the surface hardness of the Ti-5553 alloy, as the hardness has a high effect on the wear resistance of the material together with the corrosion resistance. A sample of 20x20x5 mm was used as a workpiece in the experiments. The deep cryogenic heat treatment applied to the Ti-5553 sample was carried out in a specially designed computer-controlled cryogenic processing unit. In order to prevent thermal shocks that may occur during heat treatment and micro-cracks that may occur in the microstructure, gradual cooling and heating, and cryogenic treatment were performed. The samples were cooled to -145°C for 6 hours. The samples, which reached -145 °C temperature values, were kept at this temperature for 24 hours. After processing, the samples gradually reached room temperature over 6 hours. After cryogenic heat treatment, the samples were subjected to tempering. With the applied tempering process, the formation of homogeneous carbide structure in the samples and thus minimization of the internal stresses were aimed. The tempering process was applied for 2 hours at 200 °C, taking the literature studies as an example (Altas, Altin Karatas et al. 2021, Altas, Erkan et al. 2022).

2.3 Hardness Measurements

Surface hardness values of Ti-5553 samples after cryogenic heat treatment were measured in micro dimension by the Vickers method. It was made by taking the average of 5 different measurements from the outermost surface to the center for each sample with the QNESS Q10 A microhardness measuring device. Measurements were made for 10 seconds and under a load of 100 grf.

2.3 Wear Tests

Wear tests were carried out in dry conditions at two different loads (5 and 10N) and constant shear rates (20 mm/s). Abrasion tests were performed using a reciprocating dry sliding process using 6 mm diameter WC balls in a ball-on-disc type wear device (Turkyus). The friction coefficient values were recorded simultaneously during the test by means of the software of the device. Thus, the changes in the friction coefficients of the samples depending on the load and the cryogenic heat treatment temperature were investigated. Wear test parameters are given in Table 2.

Table 2. Wear tests test parameters

Sample	Load (N)	Cryogenic heat treatment	Sliding speed (mm/s)	Test duration (min)
Ti-5553	5 10	CPUnapplied -145 ºC	20	30

3. EXPERIMENT RESULTS AND DISCUSSION

3.1 Hardness Measurements

It is expected that the wear resistance of the materials will increase with the increase of the surface hardness values. (Kondul and Cetin 2022). At the same time, high hardness values increase the fatigue life of the materials. According to Figure 1, the hardness values of the deep cryogenic heat treated samples increased. The lowest surface hardness value (374 HV) was obtained in the non-cryogenic heat treated (CPUnapplied) sample, while the highest surface hardness value (442 HV) was obtained in the materials that underwent deep cryogenic heat treatment. An 18% increase in the hardness value of the deep cryogenic heat treated sample was observed compared to the sample without cryogenic heat treatment. The results are consistent with the literature. This improvement can be attributed to the conversion of residual austenite to martensite (Akincioğlu, Gökkaya et al. 2015, Altas, Altin Karatas et al. 2021). Akhbarizadeh et al., in their study, stated that the high hardness of shallow cryogenically processed samples was due to the decrease in the amount of residual austenite. In addition, in deep cryogenically treated samples, residual austenite elimination, high chromium carbide percentage, and homogenized chromium carbide distribution caused a further increase in hardness (Akhbarizadeh, Shafyei et al. 2009). Another reason for the increase in hardness is the increase in the number of grain boundaries as the grain size decreases. Having many grain boundaries prevents the planes (dislocations) in the grain structure of the material from slipping over each other. This situation increases the mechanical properties of the materials and thus the hardness values (Katoch, Sehgal et al. 2016, Kumar, Nagaraj et al. 2018).

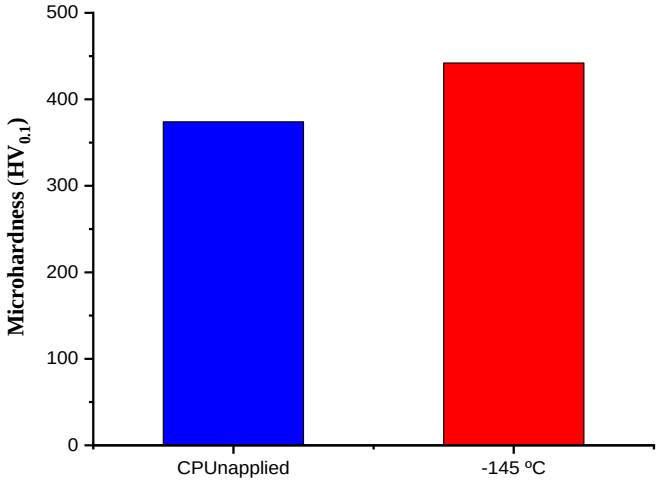

Figure 1. Microhardness values of samples with different heat treatment

3.2 Effect of Cryogenic Heat Treatment on Coefficient of Friction

Friction energy occurs between two surfaces in contact with each other, due to the sliding speed and load effect. The friction energy generated at the surface roughness points that are in contact with each other causes plastic deformations on the material's surface (Gu, Wang et al. 2014). The effect of cryogenic heat treated Ti-5553 alloy on wear resistance was evaluated in terms of friction coefficient. The friction coefficient values were measured in the wear tests performed under two different load and dry sliding conditions, and the friction coefficients and average values recorded during the test are given in Figure 2. The friction coefficient of the non-cryogenic heat treated sample was higher than the cryogenically treated samples. The relationship between cryogenic heat treatment and the coefficient of friction can be explained by the surface hardness and roughness of the cryogenic heat treated samples. Examining the effect of cryogenic heat treatment on the tribological properties of the sample, Podgornik et al. (Podgornik, Leskovšek et al. 2009) and Senthilkumar et al. (Senthilkumar and Rajendran 2011) stated in their studies that a low coefficient of friction was obtained thanks to the high surface hardness obtained by the cryogenic process. During the wear tests, the friction coefficient between the abrasive ball and the samples shows an increase in the first place. It then goes through a transitional phase and gradually turns into a steady state. In this transitional phase, a decrease in the coefficient of friction is observed. It can be said that the decrease in the friction coefficient is that the surfaces in contact with each other make the surfaces smoother during sliding. After this situation, an increase in the coefficient of friction is observed again as the wear particles enter between the sliding surfaces. The phenomenon described above is described in detail by Grairia et al. It has been discussed by (Grairia, Beliardouh et al. 2018).

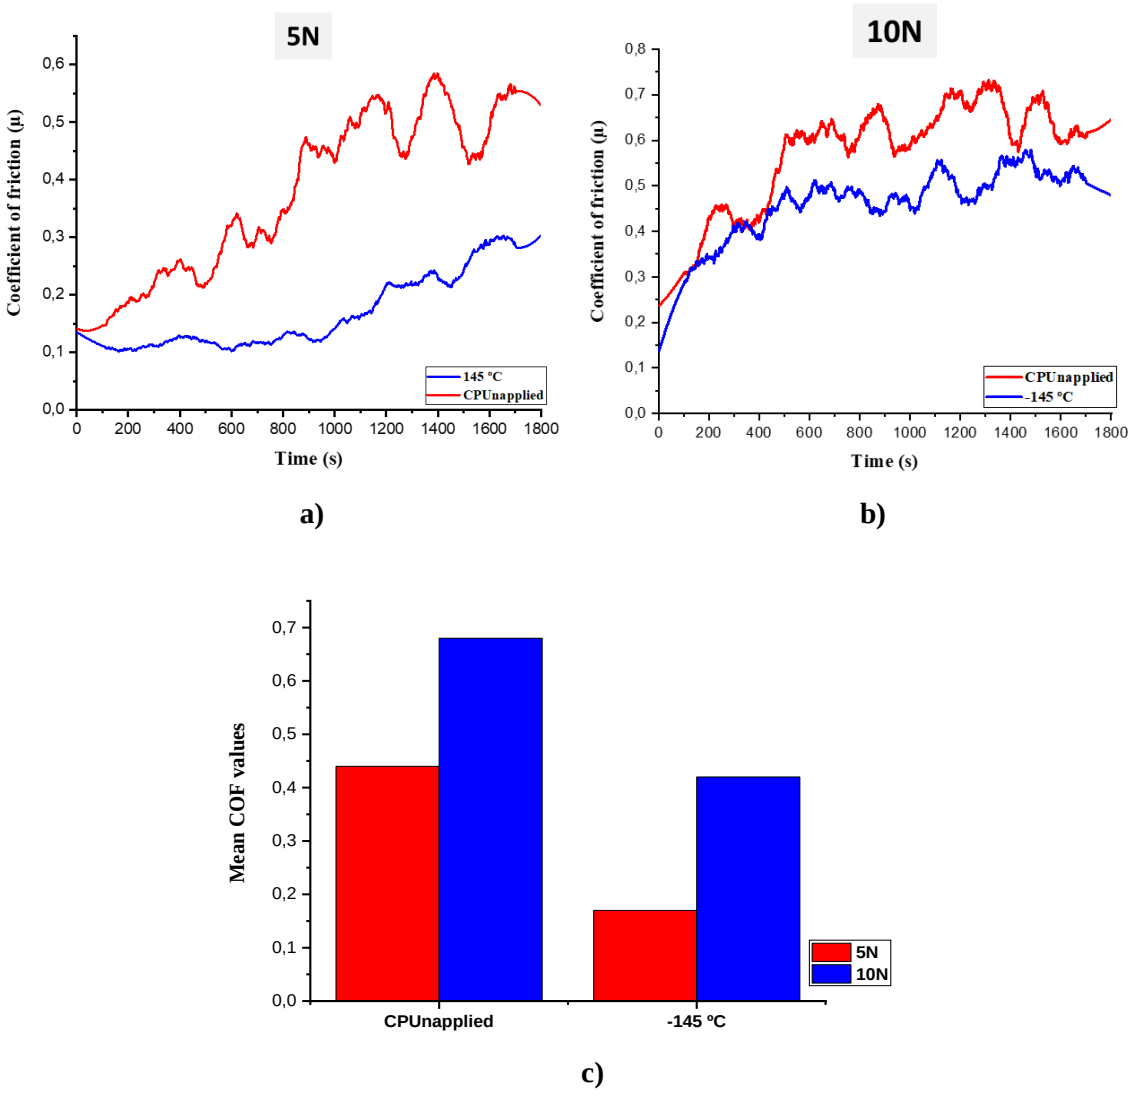

Figure 2. COF graphs of Ti-5553 samples obtained under different loads before and after cryogenic heat treatment.

4. CONCLUSIONS

Although the Ti-5553 alloy with high corrosion resistance shows high performance in a corrosion environment, it shows low performance in environments subject to abrasion due to its mechanical properties. Within the scope of the study, the effects of cryogenic heat treatment applied to the Ti-5553 alloy material on the hardness and friction coefficient of the material were investigated, and the results of the experimental studies are given below:

- The hardness of the Ti-5553 alloy (374 HV) increased by 18% (442 HV) as a result of deep cryogenic heat treatment.
- A low friction coefficient has been obtained thanks to the high surface hardness obtained as a result of deep cryogenic heat treatment.
- In the wear test, the friction coefficient was highest in the sample that did not undergo cryogenic heat treatment under 10N load, and the lowest in the sample that underwent deep cryogenic heat treatment under 5N load.

Abstract

Ductal carcinoma is a neoplasm that differentiates in the interlobular ducts.The neoplastic cell population has numerous anisokaryosis, anisocytosis, and mitotic figures and is arranged into cords and tubules that surround the slit-like lumen and are usually covered by a double membrane.
In this case report, the owner of the animal detected a mass the size of a hazelnut in the third left mammary lobe of a 9-year-old Tabby cat. A mass the size of an apple was removed from the left mammary lobe of the cat, which was brought to the Animal Care Home 1 month later, using the mastectomy method. The mass was brought to the Pathology laboratory in a 10% formaldehyde solution. Then, routine tissue follow-up was performed and paraffin was blocked. 5 µm thick sections were taken from paraffin blocks in a microtome device and stained according to the hematoxylin-eosin staining method. Microscopically, multiple anisocytosis, anisokaryosis, and mitotic figures were found in ductal epithelial cells, and hyperchromatic nuclei, increased nucleoli, and giant nuclei formations were observed. Additionally, foci of necrosis were determined.
As a result; Atypical cell formations were detected in feline mammary gland ductus epithelial cells and evaluated as ductal carcinoma. It is thought that tumor biomarkers should be investigated by molecular methods in feline breast cancers.

Keywords: Ductal Carcinoma, Mammary, Tabby Cat.

INTRODUCTION

Mammary neoplasms are very common in dogs, cats and humans and are known to be rare in most other species. Mammary tumors in dogs and cats are directly related to ovariectomy and the age at which it is performed, mammary neoplasms are less common in cats, and the incidence of mammary tumors overall is low compared to dogs (Goldschmidt et al., 2016). Feline mammary carcinomas (FMCs) are the third most common type of neoplasm in cats and the majority (90%) are malignant (MacEwen 1990; Thomas 2015). FMCs are usually quite aggressive, infiltrative and metastatic (Hughes and Dobson 2012). The etiology of FMCs is unknown, but reported risk factors include sex, breed, age, hormone exposure, and reproductive status (Hayes Jr et al., 1981; Misdorp et al., 1991). The World Health Organization's histological classification of feline mammary tumors scores for tubule formation, nuclear pleomorphism, and mitotic count (Castagnaro et al., 1998). In addition, new morphological categories such as ductal and intraductal papillary tumors and carcinoma and malignant myoepithelioma have been added(Zappulli et al., 2013).

The ductal system starts from the collecting (papillary) ducts of the nipple and ends with the secretory alveoli when the gland is completely differentiated. Increased progesterone level during diestrus and pregnancy induces further development of ducts, formation of lobules and alveoli (lobuloalveolar unit). (Goldschmidt et al., 2016). In ductal adenoma, the neoplastic mass is usually found in the lumen (or lumens) of an ectatic duct (or ducts). Ductal carcinomas, on the other hand, are the malignant character of ductal adenoma that differentiate into interlobular channels (Goldschmidt et al., 2011).

MATERIALS AND METHODS

The owner of the animal detected a mass the size of a hazelnut in the third left mammary lobe of a 9-year-old Tabby cat. A mass the size of an apple was removed from the left mammary lobe of the cat, which was brought to the Animal Care Home 1 month later, using the mastectomy method. The mass was brought to the Pathology laboratory in a 10% formaldehyde solution. Then, after the tissues were trimmed, the alcohols (70%, 80%, 90%, 96%, and 100%) in the tissue tracking device were passed through the xylol series, and the tissues were blocked with paraffin. Tissue samples cut with a thickness of 5 µm from these blocks with a microtome were opened in a hot water bath (37^0 C) and placed on slides. The sections were deparifinized in Xylene series, kept in a decreasing grade alcohol series (100%, 96%, 80%, 70%) and then washed in tap water. Then it was stained in hematoxylin solution for 3 minutes. It was washed in tap water for 2 minutes, dipped once in 1% acid alcohol solution, and then washed and kept in alcoholic eosin solution for 1 minute.
After washing in tap water, they were dehydrated from graded alcohols (96%, 96%, 100%, 100%) for 1 minute and kept in 3 separate xylols for 5 minutes. Finally, sections extracted from xylol were closed with entellan.

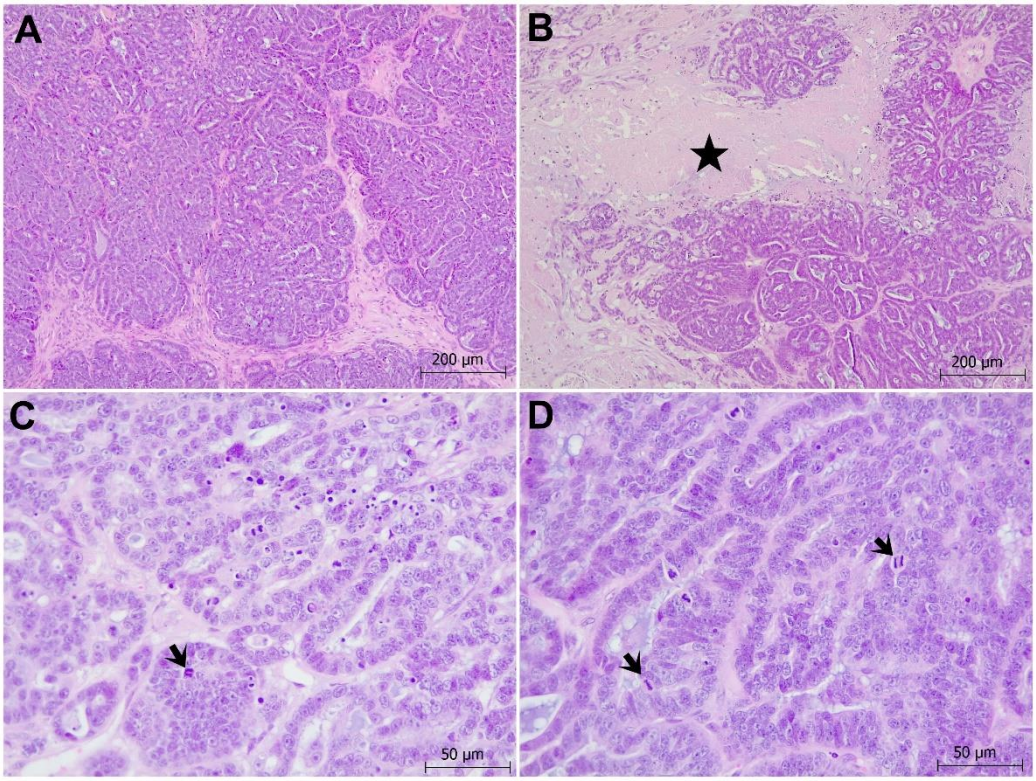

Figure 1. A. Ductal carcinoma, mammary gland, cat. H&E.Bar: 200µm**. B.** Ductal carcinoma ve nekroz (yıldız), mammary gland, cat. H&E.Bar: 200µm**.C-D.** Anisokaryosis, aniostosis, plomorphism in the ductus epithelium, mitotic figure (black arrow), mammary gland, cat. H&E.Bar:50µm.

RESULTS and DISCUSSION

Mammary tumors are the most commonly diagnosed feline neoplasm, with the vast majority (unlike dogs) malignant (Thomas 2015). The biological behavior of mammary tumors is different from that of the dog and is often aggressive, with reported malignancy rates close to 90% (Hayes and Mooney 1985). Mammary tumors usually occur in older female cats (mean age 10–12 years) (Moulton 1990). Mammary tumors have also been reported in male cats (mean age 12.8) (Weijer et al., 1972), but are rare and account for 1-5% of mammary tumors. The mean age of cats with ductal or intraductal papillary neoplasms has been reported to be 11 and 12, respectively (Zappulli et al., 2013). In the case report, ductal carcinoma was detected in a 9-year-old female cat and it is thought that older cats should be examined for breast cancer.

The main mammary tumor in the cat is simple adenocarcinoma, derived from the luminal epithelium of the mammary ducts and alveoli (Morris 2013). Ductal carcinomas are much more malignant and much more aggressive than the adenocarcinoma group (Benjamin et al., 1999). In ductal carcinoma, histopathologically, it is arranged into cords and tubules surrounding the slit-like lumen, often lined with a bilayer of epithelial cells that exhibit significant anisokaryosis and anisocytosis, and there are also numerous mitotic figures (Goldschmidt et al., 2011; Goldschmidt et al., 2016). In the case report, microscopically, multiple anisocytosis, anisokaryosis, and mitotic figures were found in ductal epithelial cells, and hyperchromatic nuclei, increased nucleoli, and giant nuclei formations were observed. Additionally, foci of necrosis were determined. When these findings were evaluated, a tabby cat was also found to have ductal carcinoma.

Cats have four pairs of mammary glands and nipples, arranged in two parallel rows from the ventral chest wall to the groin, with the right and left rows quite clearly separated from each other. According to location, there are anterior (T1 or M1) and posterior thoracic (T2 or M2), anterior (A1 or M3) and posterior abdominal (A2 or M4) mammary glands (Dyulger et al., 2020; Papadopoulou et al., 2009). Tumors located in the caudal mammary glands were detected in 16 (69%) cats, and tumors located in the cranial mammary glands in seven (31%) cats (Borrego et al., 2009). In the study, ductal carcinoma was found in the third left mammary lobe in a Tabby cat.

CONCLUSION

Atypical cell formations were detected in feline mammary gland ductus epithelial cells and evaluated as ductal carcinoma. It is thought that tumor biomarkers should be investigated by molecular methods in feline breast cancers.

Abstract
Salmon fish is regarded as a high quality protein source for human consumption and high in essential amino acids and high Omega-3 fatty acids. In this study, the drying kinetics of salmon (*Salmo salar*) were determined using freeze drying method. Properly sampled salmon slices were blanched with processing times of 1 min and 5 min, respectively. Also a non-blanched sample were prepared for control sample. For the control sample, 1 min and 5 min blanched samples, the moisture contents, which were respectively 2.2646, 1.6048 and 1.2160 kg water/kg dry matter, were reduced to 0.0642, 0.1619 and 0.1573 kg water/kg dry matter × min after freeze drying. As a result of the calculations made in the equations developed according to Fick's second diffusion law, the effective moisture diffusion (D_{eff}) values were found as 3.61×10^{-10}, 4.27×10^{-10}, 5.11×10^{-10} m^2/s for the control sample, 1 min blanched and 5 min blanched samples, respectively.
Keywords: drying kinetics, effective diffusivity, freeze drying, *salmo salar*, salmon.

INTRODUCTION

Atlantic salmon, *Salmo salar*, is a very valuable fish species. Salmon is preferred by most countries in the world. Salmo salar is an important source of beneficial food for human consumption. They contain high-value protein and high levels of omega-3 fatty acids such as EPA (eicosapentaenoic acid) and DHA (docosahexaenoic acid) that are beneficial to human health (Calder, 2014; Cao et al., 2018; Covington, 2004).

After hatching in early summer, salmon fry usually spend 1-5 years in rivers before migrating to the sea where most of the growth occurs (smolt stage). Later, the adults return to their natal rivers to spawn in the fall. While the salmon weighs 50 g or less, it increases to 1-25 kg (45-135 cm overall length) over the years at sea, and some individuals may weigh more than 30 kg when they return to spawn. The Atlantic salmon is embodied in more than 2000 genetically diverse populations distributed in waterways flowing into the North Atlantic Ocean (Forseth et al., 2017; Einum, 2011).

High moisture content facilitates the growth of bacteria and fungi in foodstuffs. Drying reduces the moisture content, thus helping to reduce the growth of bacteria and fungi (EL-Mesery et al., 2022). The deterioration of fish meat can show itself in terms of color, consistency, smell and taste, reduce the quality of the fish and completely eliminate the possibility of consumption afterwards. In general, deterioration in fish meat can be manifested by autolysis, oxidation, bacterial spoilage and the combined activity of these factors (Cetinkaya and Ceylan, 2019).

Drying of foods is one of the oldest preservation methods applied since ancient times. Various food preservation methods have been developed to extend the storage period and to take precautions against spoilage. The preservation methods applied in the food industry include heat treatment, freezing, drying, acid treatment, storage in a gaseous environment, irradiation and preservative addition, among which drying is the most widely used. The purpose of the drying process; is to make the product microbiological, enzymatic and chemically resistant by reducing the water activity (aw) of the environment (Karabacak et al., 2015).

Dried products have become more economical as their small volume allows them to save on packaging, transportation, storage and at the same time have sufficient nutrient concentration. During drying, it is very important to preserve the original physico-chemical properties of the sample as well as other quality parameters. Conventional drying methods have many disadvantages, including prolonged drying times, uneven temperature exposure, and hardening of food materials (Daghooghi-Mobarakeh et al., 2022). Among the many drying techniques, freeze drying (FD) (also known as lyophilization) has become one of the most effective food preservation techniques. It is a method of dehydration based on sublimation that is widely used to increase

the shelf life of food products. In the FD technique, the temperature of the product is lowered below the freezing point and the water is removed by sublimating into water vapor at a pressure lower than the triple point of water. Freeze-dried foods have high porosity, low color, taste, aroma and nutritional degradation as well as good rehydration properties. On the other hand, freeze drying requires a very long drying time and consumes a lot of energy. Therefore, it has been considered the most expensive drying method due to its high operating costs compared to other drying techniques such as hot air drying. Consequently, in order to produce high quality products at lower cost, the foodstuff needs to undergo some pre-treatment prior to the freeze dryer (Waghmarea et al., 2022; Cao et al., 2018 ; Chu et al., 2021). In a study by Crapo et al. (2010), the kinetics of dehydration and processing efficiency were investigated in order to minimize the freeze-drying time of freeze-dried boneless skinless salmon cubes. The physical properties of the final product including bulk density, shrinkage, hardness, color and rehydration kinetics were determined. In conclusion, it has been shown that freeze-dried salmon cubes from each of the 3 Pacific salmon species can be produced with less than 10% moisture content and less than 4% water activity with a freeze-drying time of 9 hours. In a study by Martinez and Labuza (2006), the rates of various degradation reactions, including lipid oxidation, loss of astacene pigment, were investigated in freeze-dried salmon at various relative humidity. In a study was examined the drying characteristics of blanched and unblanched sardine during indoor and open sun drying processes. High drying rates were obtained in all samples at the start of drying and then decreased with increasing drying time. The highest drying rate and effective moisture diffusivity (D_{eff}) were observed in blanched sardine during open sun drying. Blanching treatment adversely affected the color and sensory properties. Indoor drying produced a quality stable product with less lipid oxidation and the desired moisture content, higher polyunsaturated fatty acids and sensory properties (Cyprian et al., 2017).

Although there are various studies on food drying methods in the literature, drying of salmon has rarely been reported. In this study, freeze drying behavior of salmon was investigated and dried using a freeze dryer with and without blanching pretreatment, effective diffusivity values and drying rate were calculated.

MATERIALS AND METHODS

Sample Preparation

Fresh salmon was sourced from a local market in Istanbul, Turkey in 2022. The samples were cut at 32 mm × 32 mm in length and 8 mm in thickness. Each sample was weighed 10 ± 0.05 g with Radwag AS 220.R2 digital balance (Radwag, Radom, Poland). Moisture content was determined using an KH-45 hot air drying oven (Kenton, Guangzhou, China) at 105 °C. Moisture contents were calculated as 69.37%, 61.61% and 54.87% for the samples control sample, blanched for 1 min and blanched for 5 min, respectively. For dry basis, it corresponds to 2.2646, 1.6048 and 1.2160 kg water/kg dry matter, respectively. Experiments were repeated three times for each treatment, and the average of the results obtained was given.

Prepared samples were freeze-dried in Labart LFD-10N model freeze dryer (ART Laborteknik, Istanbul, Turkey). The weight of each sample was recorded every 60 minutes during the experiments. Experiments were terminated when the moisture content fell below 10%. Dried salmon samples are shown in Figure 1. After drying, the samples were sealed in polyethylene bags and stored in a desiccator to prevent moisture absorption.

a. b. c.

Figure 1. Sample images a. control, b. blanched for 1 min and c. blanched for 5 min.

Drying Rates

As the drying process progressed, the moisture content of the sample decreased. During the falling velocity period, moisture diffuses from the inside to the surface by diffusion. This results in mass transfer of moisture by evaporation into the surrounding environment of the product.

The moisture content (M), drying rate (DR) and moisture ratio were calculated via excel during the experiments. And those are calculated according to these equations that are given in (1), (2) and (3) (Kipcak, 2017):

$$M = \frac{m_w}{m_d} \tag{1}$$

$$DR = \frac{M_{t+dt} - M_t}{dt} \tag{2}$$

where M represents moisture content (kg water/kg dry matter), m_w represents water content (kg) and m_d represents dry matter content (kg). DR represents drying rate (kg water/kg dry matter × min), M_{t+dt} represents moisture content at t+dt (kg water/kg dry matter), t represents the time (min).

$$MR = \frac{M_t - M_e}{M_0 - M_e} \tag{3}$$

where MR represents the moisture ratio which is a dimensionless number. M_t represents moisture content at any time, M_e represents equilibrium moisture content and M_0 represents initial moisture content, respectively. In the calculations, M_e is neglected because it is a small amount (Nag and Dash, 2016).

Determination of Effective Diffusivity

The drying of foods occurs as a function of diffusion and in most cases diffusion occurs in the falling rate period (Ozyalcin and Kipcak, 2020). There are a few mathematical models that have been used to describe Fick's second law during the falling rate period and it is shown in the following Equation (4) (Kipcak et al., 2015):

$$\frac{\partial M}{\partial t} = \nabla\left[D_{eff}(\nabla M)\right] \tag{4}$$

Fick's second law of unsteady-state diffusion equation can be used as a way to find moisture ratio. With an assumption of mass transfer is done by the diffusion only, the diffusion coefficient is constant and shrinkage is negligible, therefore drying process in unsteady thin layer diffusion can be given as shown in the following Equation (5) (Yagcioglu et al., 2007):

$$MR = \frac{8}{\pi^2}\sum_{n=1}^{\infty}\frac{1}{(2n+1)^2}e^{\left(-\frac{(2n+1)^2\pi^2 D_{eff}t}{4L^2}\right)} \tag{5}$$

In those equations D_{eff} represents effective moisture diffusivity (m^2/s), t represents time (s), L represents the half-thickness of samples (m) and n represents a positive integer. This complex equation can be simplified for longer drying periods without much affecting the results, thus accuracy and this equation can be given as shown in Equation (6):

$$MR = \frac{8}{\pi^2}e^{\left(-\frac{\pi^2 D_{eff}t}{4L^2}\right)} \tag{6}$$

When Equation (6) is rearranged by taking the logarithm, then it can be expressed as a linear function. This linear function is given as shown in Equation (7):

$$ln(MR) = ln\left(\frac{8}{\pi^2}\right) - (-\frac{\pi^2 D_{eff} t}{4L^2}) \quad (7)$$

From the slope of the ln(MR) versus t, D_{eff} can be calculated.

RESULTS AND DISCUSSION

Drying Curves

Initial moisture contents were 2.2646, 1.6048 and 1.2160 for control sample, blanched for 1 min and blanched for 5 min, respectively. Samples were dried to the point of 0.0642, 0.1619 and 0.1573 kg water/kg dry matter for the control sample, 1 min blanched and 5 min blanched samples, respectively. The drying process was completed in 540, 300 and 240 minutes for control sample, blanched for 1 min and blanched for 5 min, respectively. The variation of moisture content over time is given in Figure 2. The drying rate-moisture content plot of the freeze drying method is given in Figure 3. It is observed that the drying rate increases with increasing blanching time. Maximum drying rates in freeze-drying are 0.0015, 0.0020 and 0.0022 kg water/kg dry matter×min for control sample, 1 min blanched and 5 min blanched samples, respectively. The falling rate period behavior of drying samples can be easily observed from the drying rate versus moisture content plot.

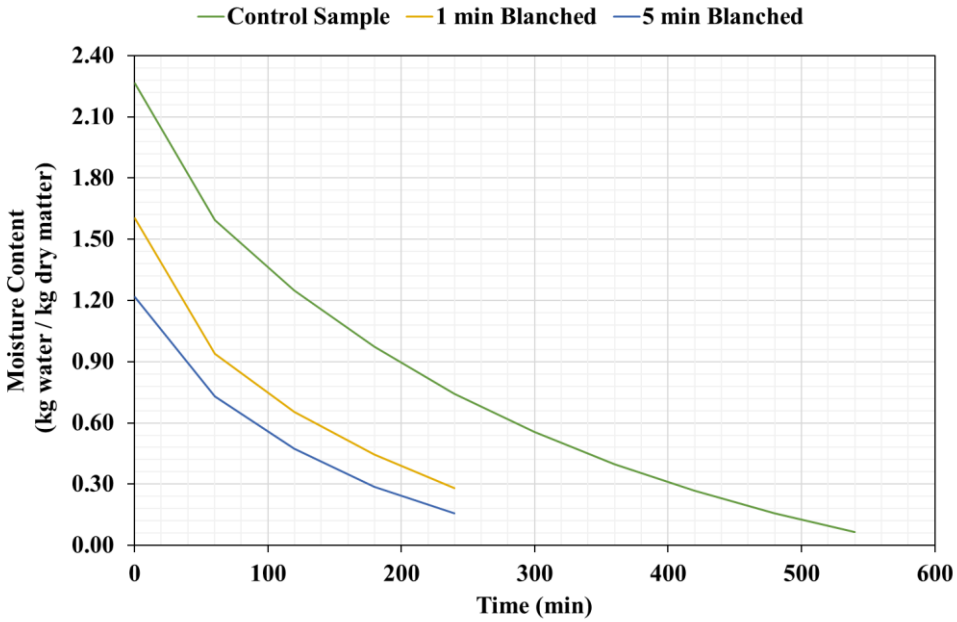

Figure 2. Moisture content versus time graph of freeze dried salmon

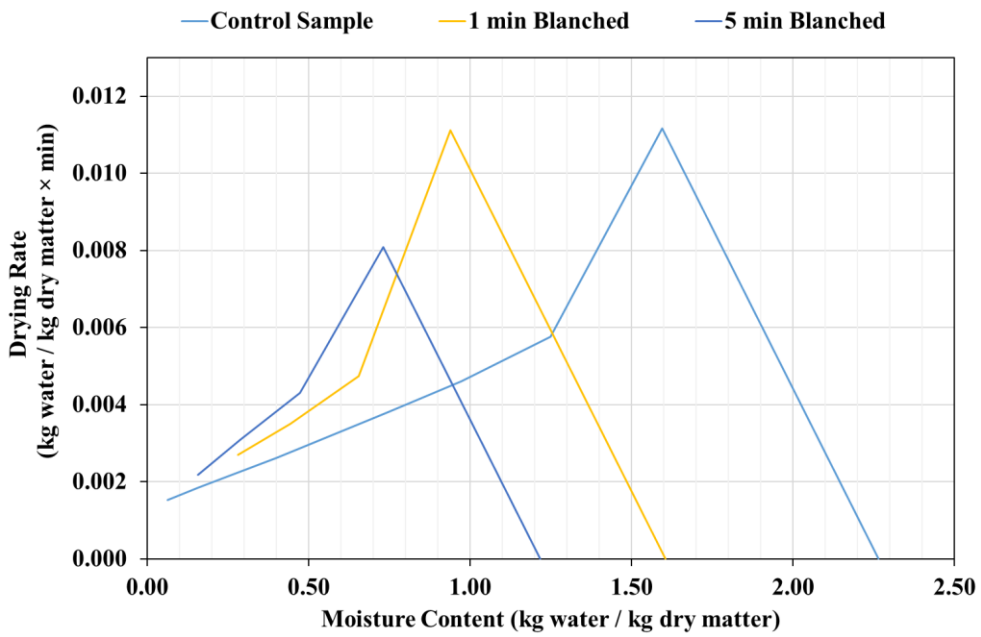

Figure 3. Drying rate curves of freeze dried salmon

Effective Diffusivity Values

From Equation (7) it is known that slope of ln(MR) versus t curve is needed to be able to calculate D_{eff} values. For the freeze dryer, D_{eff} values are 3.61×10^{-10}, 4.27×10^{-10}, 5.11×10^{-10} m^2/s for samples control sample, blanched for 1 min and blanched for 5 min, respectively. The result shows that effective diffusion increases with increasing bleaching time, as seen in Figure 4.

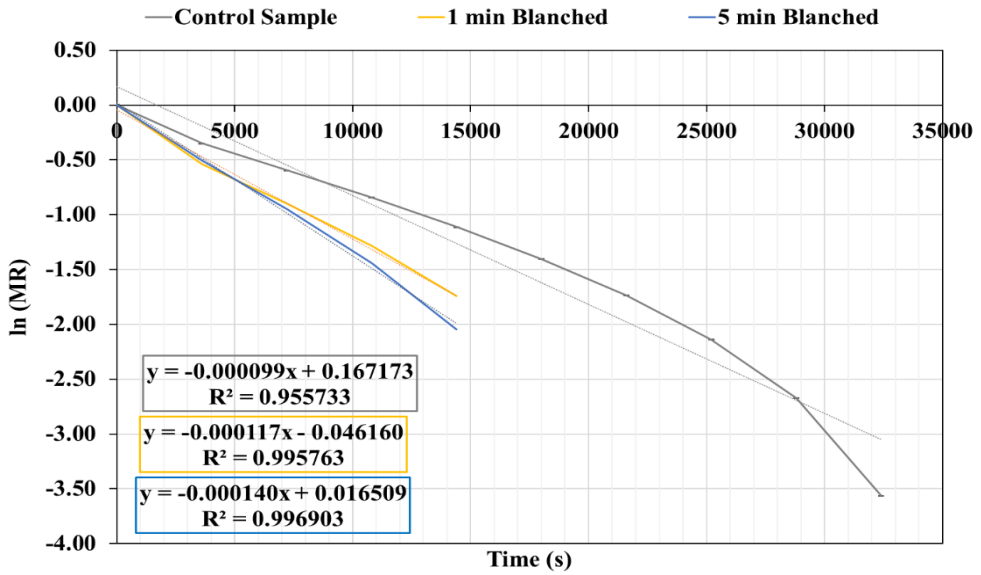

Figure 4. ln(MR) vs time (s) graph of freeze dried salmon

CONCLUSION

In this study, the drying behavior of salmon in the freeze dryer was investigated. Drying kinetics of salmon samples were investigated using experimental data. Drying experiments with freeze dryer were carried out for the samples without blanching, blanched for 1 min and blanched for 5 min. Initial moisture contents of the samples were initially recorded as 2.2646, 1.6048 and 1.2160 kg water/kg dry matter. Moisture contents were noted and drying was carried out until the values were 0.0642, 0.1619 and 0.1573 kg water/kg dry matter for the control sample, 1 min blanched and 5 min blanched samples, respectively. These values were obtained at 540, 300 and 240 minutes for control sample, 1 min blanched and 5 min blanched samples, respectively. As

expected, 5 min blanching was found to be the fastest drying method. It can be concluded that the increased blanching time causes a shortening of the drying time. Effective moisture diffusion values were calculated for the drying processes by using Fick's second law for drying the salmon samples. Effective moisture diffusivities were found to be 3.61×10^{-10}, 4.27×10^{-10}, 5.11×10^{-10} m^2/s for control sample, 1 min blanched and 5 min blanched samples, respectively. The results show that the effective moisture diffusion also increased with the blanching time.

Abstract

Herein, the platinum nanoparticles (Pt NPs) were deposited on graphene nanosheets (G), and the material (Pt NPs/G) was studied in terms of peroxidase-like activity for the first time. The peroxidase-like activity of Pt NPs/G was investigated spectrophotometrically by using the oxidation of chromogenic substrate 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid (ABTS) in the presence of hydrogen peroxide and the green color formation of oxidized ABTS was easily observed by the eyes. Thus, it can be concluded that the manufactured material displayed satisfying peroxidase-like activity, probably owing to the decent nanozyme activity of Pt NPs and the large surface area of graphene, which hosts abundant metal NPs. Also, according to the absorbance spectrum, bare graphene has revealed peroxidase-mimicking activity to some extent, implying active sites on the surface. The fabricated material can be a promising substitute for peroxidase without intricate preparation procedures.

Keywords: Pt NPs, Graphene, Spectrophotometric analysis, Peroxidase-mimicking activity, Sustainability

INTRODUCTION

Enzymes have been widely used for the catalytic reactions due to their efficient and specific catalytic activity for various substances under mild conditions (Çakıroğlu et al., 2020; Gross et al., 2017). On the other hand, expensive purification procedures, relatively poor storage stability, susceptibility to pH, temperature, ionic strength are the main shortcoming for their usage (Wang et al., 2021). Nowadays, effective artificial enzymes "nanozymes" with intrinsic enzyme-mimicking activities have been a hot topic since the breakthrough discovery of Fe_3O_4 MNPs showing peroxidase-like activity (Mou et al., 2020; Wang et al., 2018). Nanozymes have been at the forefront as a viable replacement to aid in analyte detection due to their great benefits (Jiang et al., 2019; Ren et al., 2022). These feature satisfactory catalytic activity, excellent medium resistance, simple and low cost production, facile surface modification (Chen et al., 2019; Liang and Yan, 2019). The main disadvantage is that the nanozymes do not selectively catalyze the reactions (Jiang et al., 2019). Surface area expansion and preferential exposure of catalytically active facets have led to exposing more active sites and thus increased catalytic activity (Liang and Yan, 2019). Also, surface defects have increased nanozyme activity (Singh et al., 2017).

MATERIALS AND METHODS

Graphene nanosheets (G), chloroplatinic acid (H_2PtCl_6) and sodium borohydride ($NaBH_4$) were purchased from Sigma-Aldrich. 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid (ABTS) was purchased from Roche Diagnostics (Germany). Hydrogen peroxide solution (30%) was purchased from Merck. Acetate buffer solution (ABS) was prepared using glacial acetic acid (Merck) and sodium acetate (Sigma-Aldrich). Deionized water (DW) was obtained from a Labconco Water Pro BT purification system.

Preparation of Pt NPs/G

1200 µL of 10 mM H_2PtCl_6 was added into 1.2 mL of graphene solution (5 mg mL^{-1}). Then, 600 µL $NaBH_4$ solution (5 mg mL^{-1}) was added into the mixture and magnetically stirred for one hour. Finally, the product was centrifuged and washed twice with DW. Pt NPs/G was dispersed in DW before use.

Peroxidase-mimicking Activity Measurements

3 mL of 0.4 mM ABTS solutions were prepared in 100 mM ABS pH 3.8 and the 75 µL of Pt NPs/G solution (1 mg/mL) coated substrate was immersed in the solution. 15 µL of hydrogen peroxide (30%) was added into the above mixture and incubated for 10 min at room temperature. Then, nanozyme coated substrate was removed from the reaction medium, and the absorbance spectra were recorded. UV-visible (UV-Vis) absorbance spectra were recorded using a Shimadzu UV-2600 spectrophotometer at 200-800 nm.

RESULTS and DISCUSSION

The UV-vis spectrum of Pt NPs/G revealed an intense band at 254 nm, which implies the pure graphene sheets (Figure 1). According to the literature, carbonaceous materials have demonstrated satisfying peroxidase-like activity due to the active sites on the carbon surfaces (Das et al., 2019).

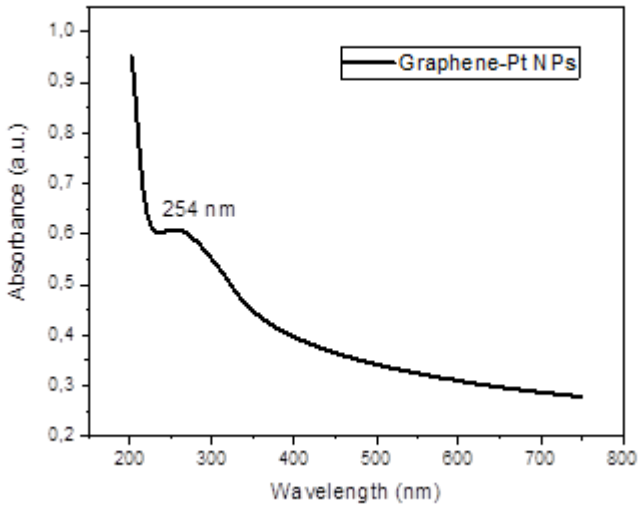

Figure 1. UV-Vis absorbance spectrum of Pt NPs/G

Graphene demonstrated peroxidase-like nanozymes to some extent probably due to surface defects (Figure 2A). After Pt NPs deposition, the colour development increased implying that Pt NPs play a crucial role in catalytic oxidation of chromogenic substrates in the presence of hydrogen peroxide (Figure 2B).

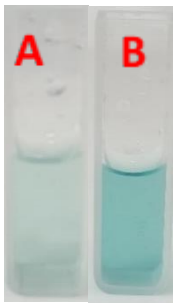

Figure 2. The color development of ABTS after the nanozyme activity of G (A) and Pt NPs/G (B)

The UV vis spectrum of oxidized ABTS after catalytic reaction was taken (Figure 3). Bare graphene displayed some absorbance; however, Pt NPs are the main component for the nanozyme activity as can be seen from the absorbance spectra. Herein, graphene is a good platform to get the NPs together along with some synergistic effect on nanozyme activity.

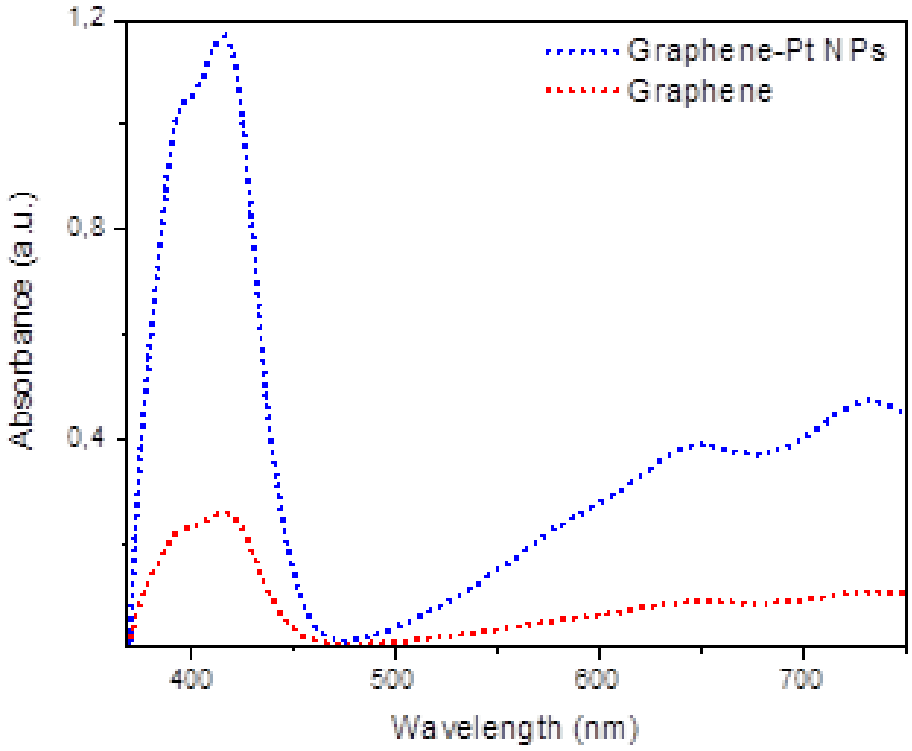

Figure 3. Absorbance Spectrum of Oxidized ABTS Generated by Pt NPs/G and graphene

CONCLUSION

In this study, Pt NPs deposited graphene sheets was reported for peroxidase substitute. Its peroxidase-mimicking activity was studied in the presence of a chromogenic substrate ABTS. The large surface area of graphene leads to the abundant catalytically active sites and Pt NPs deposition, which acts a major role in the nanozyme activity. The suggested material can be used in the sensor area as peroxidase nanozyme during hydrogen peroxide determination.

Abstract
In optimization problems, the aim is to reach the best. For this reason, many new methods have developed in solution processes. Metaheuristic methods are one of these methods. These algorithms reach the optimum solution faster by performing efficient search operations in the solution space. With the increasing use of metaheuristic methods, many new algorithms have proposed. The number of hybrid algorithms developed to improve algorithms is increasing. In this study, a new algorithm is proposed by refinement of the firefly algorithm (RFA). This algorithm is compared with the recently proposed Aquila algorithm (AO) and the algorithm developed by working together with hybrid Aquila and Harris Hawks algorithm (IHAOHHO). In this comparison, the design problems of speed reducer, spring design, I-beam design, which are engineering benchmark problems are discussed. In the results, it is seen that the improved algorithm gives better results than the firefly algorithm and other new algorithms.

Keywords: Metaheuristic, Refinement Firefly Algorithm, Benchmark Comparison.

INTRODUCTION

Metaheuristic algorithms are one of the solution methods of optimization problems. These algorithms are non-derivative techniques and have simplicity, elasticity, and the capability to avoid local optima (Mirjalili, Mirjalili, and Lewis 2014). One of the important steps in solving metaheuristic problems is the definition of the problem. Metaheuristic algorithms start by generating random solutions in the solution space. Metaheuristic algorithms do not require the calculation of the derivative of the search space as in gradient search techniques. Thus, they offer a different solution technique than mathematical optimization methods. (Abderazek, Sait, and Yildiz 2019).
Metaheuristic algorithms are easy to implement because of their ability to obtain quick and simple solutions. Algorithms can be adapted to the problem under study. Algorithms explore the search space efficiently, avoiding the local optimum, thanks to the random distribution they make in the search space (Lin and Gen 2009; Olorunda and Engelbrecht 2008). They are used in a variety of engineering and science problems because of their ability to suit problems. (Abderazek et al. 2019; Karagöz and Yıldız 2017). Metaheuristic algorithms consist of three categories. These; Evolutionary algorithms, physics based algorithms and swarm intelligence based algorithms. (Gupta et al. 2021). Genetic algorithm (GA) (Koupaei, Hosseini, and Ghaini 2016), evolutionary strategies (ES) (Hansen, Müller, and Koumoutsakos 2003), differential evolution (DE) (Storn and Price 1997) are some of the evolutionary algorithms. Gravitational search algorithm (GSA) (Rashedi, Nezamabadi-Pour, and Saryazdi 2009), ray optimization (RO) (Kaveh and Khayatazad 2013), big-bang big-crunch (BBBC) (Erol and Eksin 2006) are some of the physics-based algorithms. Algorithms developed based on swarm intelligence such as ants, bees and birds are based on swarm intelligence. These algorithms are inspired by the foraging behavior of herd animals. Creatures share information among themselves about the best places they visit in search of food. Inspired by this behavior, algorithms are developed by researchers. Particle Swarm optimization (PSO) (Kennedy and Eberhart 1995), Whale optimization (WOA) (Mirjalili and Lewis 2016), Firefly algorithm (FA) (Yang and He 2013), Cuckoo Search (CS) (Mareli and Twala 2018) Aquila optimization (AO) (Abualigah et al. 2021) Harris Hawks optimization (HHO) (Heidari et al. 2019), Hybrid algorithm (IHAOHHO) (Wang, Jia, Liu, et al. 2021).

The second part of this study gives brief information about metaheuristic algorithms. A new improved algorithm is introduced. Then, the design problems and their solutions are explained. Finally, the comparison of algorithms with engineering problems is given as a result

METAHURISTIC OPTIMIZATION METHODS

In this section, a brief description of the metaheuristic algorithms is given. Refinement firefly algorithm, aquila algorithm, and hybrid Aquila and Harris Hawk's algorithm are mentioned.

2.1. Refined Firefly Algorithm

Firefly algorithm optimization is one of the heuristic methods based on the swarm technique. The movements of fireflies depend on certain parameters. The fireflies' positions are updated using Equation (7). In the refinement firefly algorithm (Hasançebi et al. 2010) owing to the added parameter, the updated positions are added in a way that allows the fireflies to move randomly in certain directions in the near environment of their current position.

$$x_i(t+1) = x_i(t) + \beta_0 e^{-\gamma r^2}\left(x_i - x_j\right) + \alpha\varepsilon_i + h_i r_1 \frac{N_s}{\Delta t} \tag{1}$$

$$h_i = \begin{cases} 1 & if \;\; r_2 \le \dfrac{1}{2N_d} \\ 0 & if \;\; r_2 > \dfrac{1}{2N_d} \end{cases} \tag{2}$$

where, r_1 [0,1], N_s is referred to as the maximum value of the design variables. $h_i$is 0-1 weight function applied by sampling a random number r_2 between 0 and 1. N_d is the number of dimensions of each firefly. Equation (1) indicates that the term design variable is allowed to replace its position with a new one. This allows the fireflies to continue their search for the optimum. Through the reformulated equation, it was observed that the technique increased its effectiveness. Advances in the technique are illustrated with solved numerical examples

2.2. Aquila Algorithm

Living in the Northern Hemisphere, the Aquila is one of the most popular birds of prey (Wang, Jia, Liu, et al. 2021). Aquila's hunting methods can be expressed in four steps. In Equation 1, (X) indicates the candidate solution population start.

$$X_{ij} = \text{rand} \times \left(UB_j - LB_j\right) + LB_j, i = 1,2, \ldots, Nj = 1,2, \ldots, \text{Dim} \tag{3}$$

X_{ij} represents decision values (positions). N N stands for the total number of candidate solutions. and Dim, indicates the dimension of the problem.

$$X = \begin{bmatrix} x_{1,1} & \cdots & x_{1,j} & x_{1,\text{ Dim-1}} & x_{1,\text{ Dim}} \\ x_{2,1} & \cdots & x_{2,j} & \cdots & x_{2,\text{ Dim}} \\ \cdots & \cdots & x_{i,j} & \cdots & \cdots \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ x_{N-1,1} & \cdots & x_{N-1,j} & \cdots & x_{N-1,Dim} \\ x_{N,1} & \cdots & x_{N,j} & x_{N,Dim-1} & x_{N,Dim} \end{bmatrix} \tag{4}$$

Here X stands for a randomly generated set of available candidate solutions.
High Soar with A Vertical Stoop, It is used to hunt birds in flight, where the aquila rises from the ground. This behavior is represented mathematically as follows.

$$X_1(t+1) = X_{\text{best}}(t) \times \left(1 - \frac{t}{T}\right) + \left(X_M(t) - X_{best}(t)^* \text{ rand }\right) \tag{5}$$

$$X_M(t) = \frac{1}{N}\sum_{i=1}^{N} X_i(t), \forall j = 1,2,\dots,\text{Dim} \quad (6)$$

Contour Flight With Short Glide Attack, this is the method the Aquila uses to approach its prey. This behavior is represented mathematically as follows.

$$X_2(t+1) = X_{best}(t) \times \text{Levy}\,(D) + X_R(t) + (y - x) * \text{rand} \quad (7)$$

$$\text{Levy}\,(D) = s \times \frac{u \times \sigma}{|v|^{\frac{1}{\beta}}} \quad (8)$$

where $X_2(t+1)$, second search method, s 0.01 fixed value, u and v random numbers between 0 and 1.

$$\sigma = \frac{r(1+\beta) * sine\left(\frac{\pi\beta}{2}\right)}{r\left(\frac{1+\beta}{2}\right) * \beta * 2^{\left(\frac{\beta-1}{2}\right)}} \quad (9)$$

σ =1.5fixed value, and y and x are used to calculate the spiral shape in calling functions. The mathematical representation is as follows.

$$\begin{gathered} y = r * \cos(\theta) \\ x = r * \sin(\theta) \\ r = r_1 + U * D_1 \\ \theta = -w * D_1 + \theta_1 \\ \theta_1 = \frac{3 * \pi}{2} \end{gathered} \quad (10)$$

r_1 takes a value between 1 and 20 for the number of constant search cycles and they are integers from $U = 0.1$ to the length of the search space (Dim) and are a small value fixed at 0.005.

Low Flight with A Slow Descent Attack, Aquila descends to the ground and gradually attacks its prey.

$$X_3(t+1) = \left(X_{best}(t) - X_M(t)\right) * \alpha - rand + \left((UB - LB) * rand + LB\right) * \delta \quad (11)$$

$X_3(t+1)$, t iteration solution, $X_{best}(t)$ best position of prey in the ith iteration, $X_M(t)$ Indicates the average value of the current solution.

Walking And Grab Prey, walking and hunting. It is used to remove the young of large prey (such as deer or sheep) from the area.

$$X_4(t+1) = QF * X_{best}(t) - (G_1 * X(t) * rand) - G_2 * Levy(D) + rand * G_1 \quad (12)$$

$X_4(t+1)$, solve the t th iteration, QF , Specifies a quality function used to balance search strategies. G_1 denotes the various movements of the AO used to track prey during escape. G_2 presents values descending from 2 to 0 indicating the flight gradient of the AO used to track prey during escape from the initial position (1) to the final position (t).

$$QF(t) = t^{\frac{2*rand-1}{(1-T)^2}} \quad (13)$$

$$G_1 = 2 * rand - 1 \quad (14)$$

$$G_2 = 2 * \left(1 - \frac{t}{T}\right) \quad (15)$$

$QF(t)$ quality function value at the t th iteration and rand is a random value between 0 and 1. t and T represent the current iteration and the maximum iteration count, respectively. $Levy(D)$ is the calculated tax flight distribution function.

2.3. Hybrid Aquila Optimizer and Harris Hawks Algorithm

This algorithm is an extended algorithm by taking the good features of Aquila and Harris Hawks algorithms. The pseudocode is encoded in the published algorithm. (Wang, Jia, Abualigah, et al. 2021; Wang, Jia, Liu, et al. 2021). Two algorithm has its own good and bad aspects. This algorithm, which works better and faster, has been developed by taking advantage of the algorithms. Looking at the comparisons of the algorithms.
Aquila algorithm has strong randomness and fast convergence speed in the global discovery phase. However, it is easy to fall into the local optimum in the local usage phase since it does not perform an exhaustive search of the search space. The effect of Levy flight is relatively weak.
In Harris Hawks (HHO), the transition from global to local search is dependent on the energy of the prey being reduced. In the first iterations in the exploratory phase, population diversity is insufficient, and the rate of convergence is slow. As the number of iterations increases, the energy of the prey decreases and the algorithm enters the local exploitation phase. Four different hunting strategies are adopted in light of the energy of the prey and the possibility of escape. The term Levy flight is added in the usage phase. Whether the Levy flight will be used to update the positions is decided according to the suitability values. So the algorithm can jump from the local optimum to a certain degree. It combined the global exploration phase of AO and the local use phase of HHO.

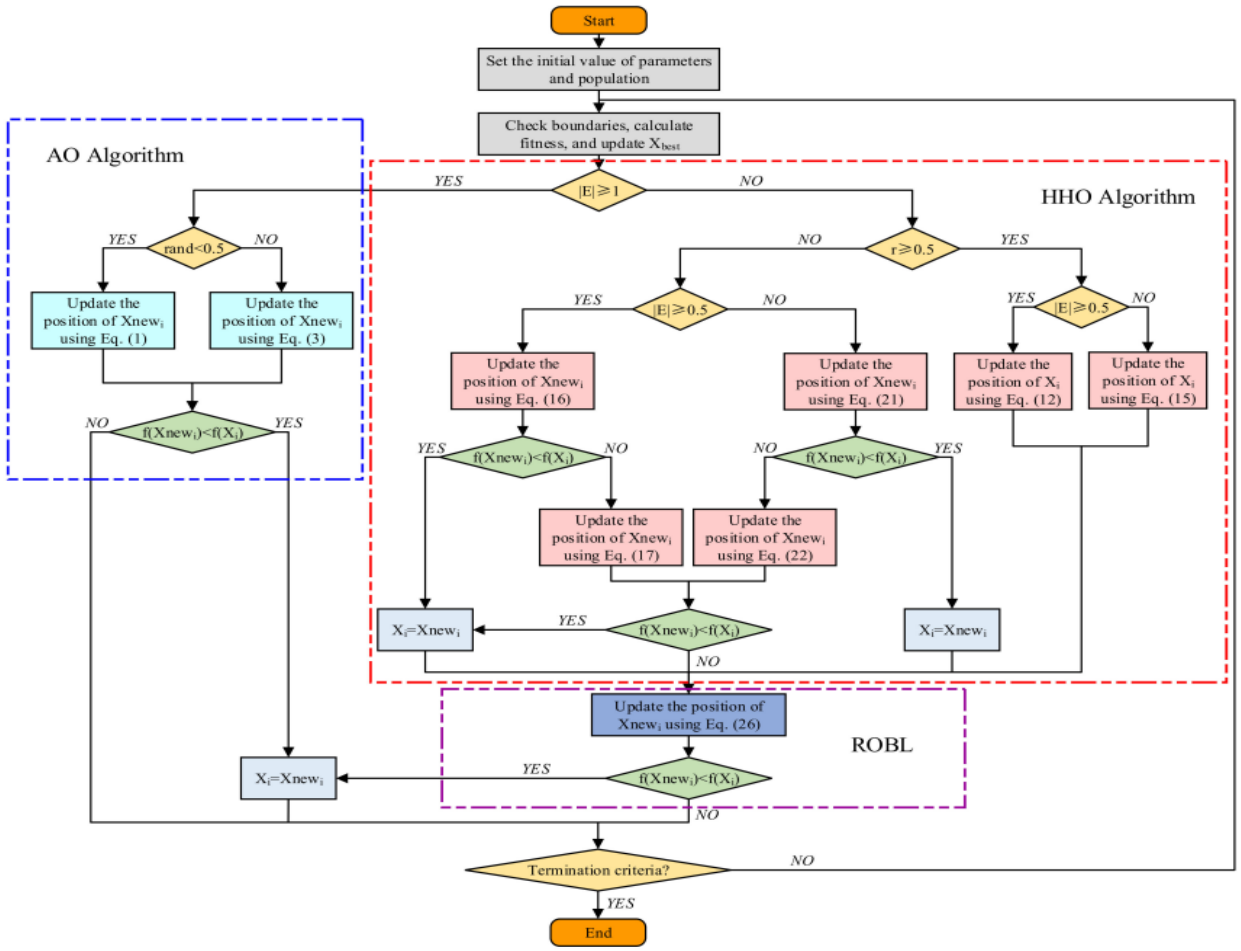

Figure 1. Hybrid Algorithm flowchart (Wang, Jia, Abualigah, et al. 2021)

3. ENGINEERING DESIGN PROBLEM AND RESULTS

Benchmark problems are used to compare the solution capabilities of metaheuristic algorithms. Among these problems, spring design, speed reducer and I beam design problems are discussed.

3.1. Speed Reducer Design Problem

The purpose of this problem is to obtain the minimum weight of the speed reducer. Here, x_1 is the surface width, x_2 the teeth modulus, x_3 is a separate design variable for the teeth on the pinion, $x_4$is the length of the first shaft thread between the bearings, x_5 is the length of the second shaft between the bearings, x_6 is the diameters of the first shaft and x_7 is the diameters of the second shaft. Figure 1 shows the image of the speed reducer (Arora 1989).

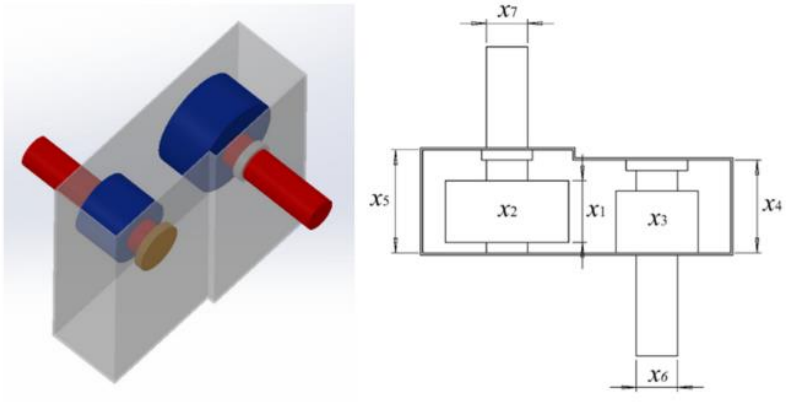

Figure 2. Speed reducer design (Wang, Jia, Abualigah, et al. 2021)

Mathematical Model;

$$f(\vec{x}) = 0.7854x_1x_2^2(3.3333x_3^2 + 14.9334x_3 - 43.0934) \\ -1.508x_1(x_6^2 + x_7^2) + 7.4777(x_6^3 + x_7^3) \quad (16)$$

Subjected to;

$$g_1(x) = \frac{27}{x_1x_2^2x_3} - 1 \leqslant 0 \quad (17)$$

$$g_2(x) = \frac{397.5}{x_1x_2^2x_3^2} - 1 \leqslant 0 \quad (18)$$

$$g_3(x) = \frac{1.93x_4^3}{x_2x_6^4x_3} - 1 \leqslant 0 \quad (19)$$

$$g_4(x) = \frac{1.93x_5^3}{x_2x_7^4x_3} - 1 \leqslant 0 \quad (20)$$

$$g_5(x) = \frac{\left[\left(\frac{745x_4}{x_2x_3}\right)^2 + 16.9 \times 10^6\right]^{\frac{1}{2}}}{110x_6^3} - 1 \leqslant 0 \quad (21)$$

$$g_6(x) = \frac{\left[\left(\frac{745x_5}{x_2x_3}\right)^2 + 157.5 \times 10^6\right]^{\frac{1}{2}}}{85x_7^3} - 1 \leqslant 0 \quad (22)$$

$$g_7(x) = \frac{x_2 x_3}{40} - 1 \leqslant 0 \quad (23)$$

$$g_8(x) = \frac{5x_2}{x_1} - 1 \leqslant 0 \quad (24)$$

$$g_9(x) = \frac{x_1}{12x_2} - 1 \leqslant 0 \quad (25)$$

$$g_{10}(x) = \frac{1.5x_6 + 1.9}{x_4} - 1 \leqslant 0 \quad (26)$$

$$g_{11}(x) = \frac{1.1x_7 + 1.9}{x_5} - 1 \leqslant 0 \quad (27)$$

where,

$$2.6 \leqslant x_1 \leqslant 3.6, \quad 0.7 \leqslant x_2 \leqslant 0.8, \quad 17 \leqslant x_3 \leqslant 28, \quad 7.3 \leqslant x_4 \leqslant 8.3, \quad 7.3 \leqslant x_5 \leqslant 8.3,$$

$$2.9 \leqslant x_6 \leqslant 3.9, \qquad 5.0 \leqslant x_7 \leqslant 5.5$$

Table 1. Speed reducer design optimum values

Optimum values								
Algorithm	x_1	x_2	x_3	x_4	x_5	x_6	x_7	**Optimum weight**

3.2. Spring Design Optimization

The purpose of the tension-compression spring problem is to achieve minimum weight. The problem has three design variables. These variables are d is the wire diameter, D is the average coil diameter, and N is the number of active coils. The tension/compression spring design function is given in Equation 2. The engineering design problem has three design variables and four constraints (Arora 1989).

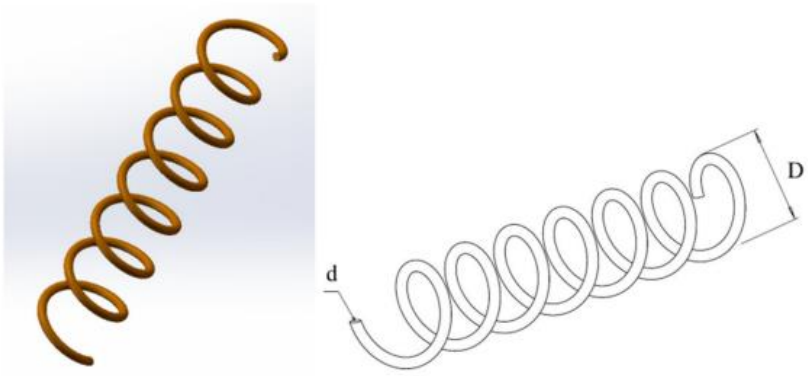

Figure 3. Spring Design Optimization (Wang, Jia, Abualigah, et al. 2021)

The problem definition and constraints are as follows;

$$f(x) = (x_3 + 2)x_2{x_1}^2 \tag{28}$$

Subject to;

$$g_1(x) = 1 - \frac{{x_2}^3 x_3}{71785{x_1}^4} \leq 0 \tag{29}$$

$$g_2(x) = \frac{4x_2^2 - x_1x_2}{12566(x_2{x_1}^3 - {x_1}^4)} + \frac{1}{5108{x_1}^2} - 1 \leq 0 \tag{30}$$

$$g_3(x) = 1 - \frac{140.45x_1}{x_2^2x_3} \leq 0 \tag{31}$$

$$g_4(x) = \frac{x_1 + x_2}{1.5} - 1 \leq 0 \tag{32}$$

and side constraints;

$0.05 \leq x_1 \leq 2, \quad 0.25 \leq x_2 \leq 1.3, \quad 2 \leq x_3 \leq 15$

The results of the algorithms for solving the problem are given in Table 2.
In this problem, x_1 variable (d) represents wire diameter, x_2 variable (D) average coil diameter, x_3 variable (N) active coil number.

Table 2. Spring design optimum value

Optimum values

3.2.1. I beam design

Finally, the beam design problem is discussed. This problem has four variables, two constraints (Cheng and Prayogo 2014). It should be provided under the given loads under cross-sectional area and stress constraints. The aim of this study is to minimize the vertical deflection of $\boldsymbol{f(x) = PL^3/48EI}$ when the beam length is **5200** $\boldsymbol{cm}$ and the modulus of elasticity is **523.104** $\boldsymbol{kN/cm^2}$

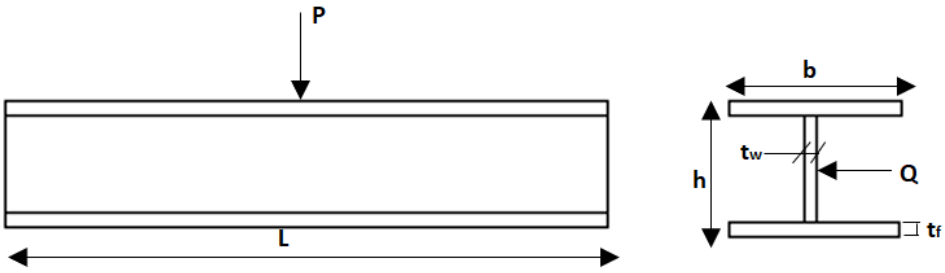

Figure 2. I-beam design

The objective function of the problem is;

$$f(b,h,t_w,t_f)=\frac{5000}{\frac{t_w(h-2t_f)}{12}+\frac{bt_f^3}{6}+2bt_f\left(\frac{h-t_f}{2}\right)^2} \tag{33}$$

Subject to:

$$g_1=2bt_w+t_w(h-2t_f)\leqslant 300 \tag{34}$$

$$g_2=\frac{18h\times 10^4}{t_w(h-2t_f)^3+2bt_w\left(4t_f^2+3h(h-2t_f)\right)}+\frac{15b\times 10^3}{(h-2t_f)t_w^3+2t_wb^3}\leqslant 56 \tag{35}$$

where initial design range;

$$10\leqslant b\leqslant 50\,,\quad 10\leqslant h\leqslant 80,\quad 0.9\leqslant t_w\leqslant 5,\ \text{and}\ 0.9\leqslant t_f\leqslant 5$$

Table 3. I beam design optimum value

CONCLUSION

Problems are solved using the solution capabilities of metaheuristic algorithms. Although the problem-solving capabilities of these algorithms have been proven by many studies, the solution capabilities for each problem may differ. In this study, three different algorithms are discussed. Three of the most well-known engineering design problems are discussed to compare these algorithms. These are speed reducer; spring design and I beam design algorithms. Between these algorithms, the firefly algorithm is developed and presented as a new algorithm. When the results are examined, a comparison of the refinement firefly algorithm with the firefly algorithm has also been made and it is seen that the refinement algorithm gives better results in all problems. While selecting the algorithms, current and hybrid algorithms are chosen as the comparison problem. Thus,

the capabilities of current algorithms are also observed. In addition, when these problems are examined, it is seen that the aquila algorithm, which is one of the current algorithms, gives better results than the hybrid algorithm. In future studies, the capabilities of the algorithms can be observed by studying the comparison of these algorithms on different problems.

Abstract

One of the purposes of the design problem is to calculate the minimum weight. The process of obtaining the most suitable solution to the problem is called optimization. One of the solution methods of these optimization problems is metaheuristic algorithms. These algorithms are inspired by foraging behavior within the swarm. Among various algorithms, whale algorithm, particle swarm and bat algorithms are discussed. The performances of these algorithms are compared with one of the benchmark problems. The welded beam design and cellular beam design examples are considered as design examples. LRFD-AISC (Load and Resistance Factor Design - American Institute of Steel Construction) specification is used in cellular beam design. The results of the algorithms are compared considering the simple beam model. In addition, it is seen that the algorithms give different results as the problems change.

Keywords: welded beam, cellular beam, metaheuristic algorithm.

INTRODUCTION

One of the most fundamental goals of engineering studies is to achieve the best balance among technological challenges (Gupta et al. 2021). Metaheuristic algorithms are independent of the deterministic properties of the problems. Algorithms are grouped into three different categories. It evaluates only the objective function in decision variables. evolutionary algorithms, physics-based algorithms and swarm-based algorithms. Evolutionary Algorithms are the application of changes in nature to computer algorithms. Genetic algorithm (GA) (Santarelli et al. 2006), evolution strategies (ES) (Bäck 1995), differential evolution (DE) (Storn and Price 1997), and biogeraphy-based optimization (BBO)(Simon 2008) are belong to this category. Physics-based algorithms are algorithms inspired by physics events that occur in nature. Water Cycle Algorithm (WCA)(Eskandar et al. 2012), Electromagnetic Field Optimization (EFO)(Abedinpourshotorban et al. 2016), Big Bang-Big Contraction Algorithm (BBBC)(Erol and Eksin 2006), Gravity Search Algorithm (GSA)(Rashedi, Nezamabadi-Pour, and Saryazdi 2009) are among these algorithms. Finally, algorithms based on swarm intelligence are inspired by swarm movements. In addition, one of the most important advantages of these algorithms is that global results can be achieved without getting stuck at local optimum points (Gendreau et al. 2006). Living things seek food sources. During this quest, they share information about the best place they found among themselves. The foraging behaviors of living things are handled by researchers and used in solving problems. Particle swarm optimization (PSO) (Kennedy and Eberhart 1995; Poli, Kennedy, and Blackwell 2007), ant colony optimization (ACO) (Dorigo, Birattari, and Stutzle 2006), artificial bee colony (ABC)(Bansal, Sharma, and Jadon 2013), cuckoo search (CS) (Mareli and Twala 2018) algorithm, whale optimization algorithm (WOA) (Mirjalili and Lewis 2016). Metaheuristic optimization methods are frequently used and improved to solve structural design problems.

These methods are used to find suitable solutions to problems in many fields such as mechanical systems, automotive systems and industry. Various problems are developed to compare the problem-solving capabilities of metaheuristic algorithms. The main purpose of optimization problems is to obtain minimum or maximum values. In other words, it's trying to find the best solution. In addition to the robustness of the profiles used in structural problems, it is desired to stay on the reliable side in terms of economy. For this reason, it is given importance to design with minimum weight within the safety limits. Sections used in structural elements such as column beams are determined by algorithms and dimensioned with minimum weight.

In this study, the welded beam design problem, which is one of the engineering design problems, and the cellular beam problem, which is one of the civil engineering structural elements, are discussed. In the cellular beam problem, the number of holes and the minimum weighted section of the beam are determined by algorithms. In order to determine the minimum weight, a solution is made with the whale algorithm, particle swarm algorithm, bat algorithm from metaheuristic methods. In the remainder of the study, chapter 2 briefly mentions the metaheuristic algorithms used in the study. In Chapter 3, an example of engineering benchmark design problems and the cellular beam problem, which is one of the structural elements of civil engineering, is introduced. Finally, the conclusion part is given.

METAHEURISTIC METHODS

Optimization studies inspired by the foraging behavior of animals began to be used in the 1980s. WOA, PSO and BA algorithms from metaheuristic methods are discussed.

Whale Optimization Algorithm (WOA)

It is an algorithm inspired by the movements of humpback whales during hunting. Whales recognize the location of their prey and surround them. The WOA algorithm assumes that the best candidate solution is close to the optimum. Once the best position has been determined, others will try to update their positions according to the best. The whale optimization algorithm consists of three parts: encircling around the prey, Bubble-net-attacking method, and search for prey (Mirjalili and Lewis 2016).

Encircling Prey,

$$\vec{D} = \left|\vec{C} \cdot \overrightarrow{X^*}(t) - \vec{X}(t)\right| \qquad (1)$$
$$\vec{X}(t+1) = \overrightarrow{X^*}(t) - \vec{A} \cdot \vec{D}$$

t represents the current iteration, A and C are the coefficient vectors, X^* is the position vector of the best solution so far, $\vec{X}$ is the position vector. If there is a better solution, X^* will be updated with each iteration.

$$\vec{A} = 2\vec{a} \cdot \vec{r} - \vec{a} \qquad (2)$$
$$\vec{C} = 2 \cdot \vec{r}$$

Here a is linearly reduced from 2 to 0 over iterations and r is the random vector between 0 and 1.

Bubble-net-attacking method, the movement of the whale towards the prey consists of two parts. It is possible by narrowing the circle around the prey and decreasing the value of a. The balloon net behavior of humpback whales is mathematically updated in two stages. This behavior is achieved by decreasing its value. a decrease linearly from 2 to 0 in iterations.

$$\vec{X}(t+1) = \overrightarrow{D'} \cdot e^{bl} \cdot \cos(2\pi l) + \overrightarrow{X^*}(t) \qquad (3)$$
$$\overrightarrow{D'} = \left|\overrightarrow{X^*}(t) - \vec{X}(t)\right|$$

D' represents the distance of the ith whale to its prey, b is a constant describing the shape of the logarithmic spiral, l is a random number in [-1,1]. Humpback whales swim in a narrow circle around the prey and along the spiral path. It assumes a 50% probability that the whales will choose to update their location during optimization. p is a random number between 0 and 1.

$$\vec{X}(t+1) = \begin{cases} \vec{X}(t) - \vec{A} \cdot \vec{D} & \text{if } p < 0.5 \\ \overrightarrow{D'}.e^{bl} \cdot \cos(2\pi l) + \overrightarrow{X^*}(t) & \text{if } p \geq 0.5 \end{cases} \qquad (4)$$

Search for prey, Vector A is used for hunting prey. Humpback whales search for random positions relative to each other are shown in (5).

$$\overrightarrow{D'} = \left|\vec{C} \cdot \overrightarrow{X_{\text{rand}}} - \vec{X}\right| \quad (5)$$
$$\vec{X}(t+1) = \overrightarrow{X_{\text{rand}}} - \vec{A} \cdot \vec{D}$$

$\overrightarrow{X_{\text{rand}}}$ is a random position vector selected from the current population. The value of vector A decides whether to perform global or local searches. Cases where $A > 1$ or $A < 1$ are considered global search. Finally, the WOA algorithm terminates when the termination criterion is met.

Particle Swarm Optimization (PSO)

Particle swarm algorithm, which is one of the foundations of metaheuristic algorithms, was developed by Eberhart and Kennedy. This method emerged when herd animals tried to use the shortest path while foraging. The algorithm starts by searching for random solutions from the population and updates their positions and velocities to look for the optimal solution. The search for food by birds in space is likened to seeking a solution to a problem. Birds search for food by following the bird closest to the food. Each particle has its own position and flight speed. In the PSO algorithm, each particle is first placed in random positions (Poli et al. 2007).

$$X_o^i = X_{min} + r(X_{\max} - X_{min}) \quad (6)$$

$$v_\circ^i = \left[\left(X_{min} + r(X_{\max} - X_{min})\right)/\Delta t\right] \quad (7)$$

Here, the expression r is a random number between [0;1], and $X_{\max}$and $X_{\min}$ indicate the upper and lower bounds for the design variables, respectively. For each x_k^i position value in the design space, $f(x_k^i)$ objective function values are determined. The best position p_k^i obtained and the position of the global optimum particle p_k^g are updated up to the iteration step k for particle i.

$$x_{k+1}^i = x_k^i + v_{k+1}^i \Delta t \quad (8)$$

Here, the expression x_{k+1}^i indicates the position at the $k+1$ step for the ith particle, the expression v_{k+1}^i indicates the speed, and the expression Δt indicates the time elapsed in the step. The velocity vector of each particle is updated considering the current position of that particle, its best position, and the best position of the swarm.

$$v_{k+1}^i = w v_k^i + c_1 r_1 \frac{\left(p_k^i - x_k^i\right)}{\Delta t} + c_2 r_2 \frac{\left(p_k^g - x_k^i\right)}{\Delta t} \quad (9)$$

Bat Algorithm

BA was developed by Xin-She Yang(Yang and He 2013) , inspired by the echolocation behavior of bats. Echolocation means positioning by sound. The sound intensity and signal propagation rates produced by bats by echolocation need to be updated as the iteration progresses and approaches the desired target. In the search process, artificial bats are used, which are like real bats with their natural pulse loudness and emission rate. These artificial bats search by imitating real bat. The mathematical model of the bat algorithm is as follows(Fister et al. 2014):

$$f_i = f_{min} + (f_{max} - f_{min})\beta \quad (10)$$

$$v_i^t = v_i^{t-1} + \left(x_i^{t-1} - x_*\right) f_i \quad (11)$$

$$x_i^t = x_i^{t-1} + v_i^t \quad (12)$$

where $\beta \in [0,1]$ is a random vector. The following equations can be used to change the sound intensity and pulse emission rates:

$$A_i^{t+1} = \alpha A_i^t \quad (13)$$

$$r_i^{t+1} = r_i^0[1 - \exp(-\gamma t)] \quad (14)$$

where α is a random number between 0 and 1 and $\gamma > 0$ is a constant First, the algorithm parameters are initialized, generated, and evaluated by the initial population, and then the best solution x_{best} in the population is determined. Then a new solution is generated. Here, virtual bats are moved relative to the search space to update the rules of the bat algorithm. The best solution is developed using random walks. The new solution is evaluated. The best solution is conditionally saved. In the last step: the best solution is found and the best available solution is updated.

DESIGN EXAMPLES AND RESULTS

3.1. Welded Beam Design

The design of the welded beam problem, which is one of the engineering design problems, is discussed. The aim of design is to achieve minimum weight. The design consists of four variables and seven constraints.

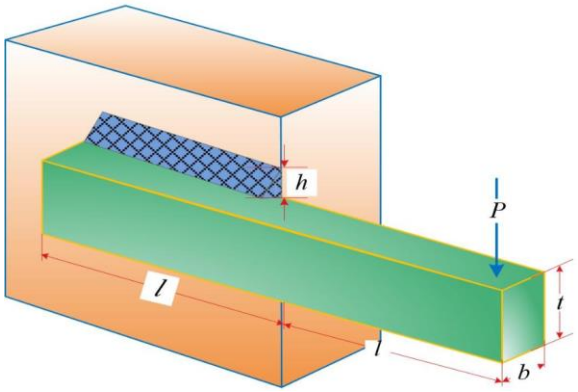

Figure 1. Design of Welded beam

The design of welded beam is made of steel and supports 6000 pound-force. The modulus of elasticity (E) is 30×10^6psi, shear modulus (G) is 12×10^6psi, beam length (L) is 14 in shear stress value is (τ_{max}) 30,000 psi and normal stress value(σ_{max}) is 30,000 psi (Mirjalili, Mirjalili, and Lewis 2014). The problem has four variables: weld thickness (h), weld length (l), beam width (t), and beam thickness (b).

Minimize:

$$f(x) = 1.10471x_1^2x_2 + 0.04811x_3x_4(14.0 + x_2) \quad (15)$$

Subject to:

$$g_1(x) = \tau(x) - \tau_{max} \leq 0(14.0 + x_2) \quad (16)$$
$$g_2(x) = \sigma(x) - \sigma_{max} \leq 0 \quad (17)$$
$$g_3(x) = \delta(x) - \delta_{max} \leq 0 \quad (18)$$
$$g_4(x) = x_1 - x_4 \leq 0 \quad (19)$$
$$g_5(x) = P - P_c(x) \leq 0 \quad (20)$$
$$g_6(x) = 0.125 - x_1 \leq 0 \quad (21)$$
$$g_7(x) = 1.10471x_1^2 + 0.04811x_3x_4(14.0 + x_2) - 5.0 \leq 0 \quad (22)$$

Variable ranges,

$$0.1 \leq x_1 \leq 2\,,\quad 0.1 \leq x_2 \leq 10,\quad 0.1 \leq x_2 \leq 10\,,\quad 0.1 \leq x_3 \leq 10,\quad 0.1 \leq x_4 \leq 2 \quad (23)$$

where,

$$\tau(x) = \sqrt{(\tau')^2 + 2\tau'\tau''\frac{x_2}{2R} + (\tau'')^2} \quad (24)$$

$$\tau' = \frac{P}{\sqrt{2x_1x_2}}, \tau'' = \frac{MR}{J}, M = P\left(L + \frac{x_2}{2}\right) \quad (25)$$

$$R = \sqrt{\frac{x_2^2}{4} + \left(\frac{x_1 + x_3}{2}\right)^2} \quad (26)$$

$$J = 2\left\{\sqrt{2}x_1x_2\left[\frac{x_2^2}{12} + \left(\frac{x_1 + x_3}{2}\right)^2\right]\right\} \quad (27)$$

$$P_c(x) = \frac{4.013E\sqrt{\frac{x_3^2x_4^6}{36}}}{L^2}\left(1 - \frac{x_3}{2L}\sqrt{\frac{E}{4G}}\right) \quad (27)$$

Table 5. Optimum designs of welded beam results

Algorithm	x_1	x_2	x_3	x_4	Optimum weight
WOA	0.205396	3.484293	9.037426	0.206276	**1.730499**
PSO	0.24348	3.04932	8.30663	0.24348	**1.85862**
BA	0.21986	3.50224	8.58467	0.23372	**1.87647**

As seen in Table 1, WOA algorithm gives better results than other algorithms for the welded beam design problem.

3.2. Cellular Beam Design

The goal is to find the minimum weight of the cellular beam. The optimum design problem of cellular beams can be expressed as follows(Dogan and Ozyuksel Ciftcioglu 2020).

$$W = \rho_C AL - \rho_C\left(\pi\left(\frac{D_0}{2}\right)^2 N_b\right) \quad (28)$$

W is the cellular beam weight and $\rho_C$is the density of the steel. A, L, D_0 and N_b represent the total cross-sectional area of the steel profile, the cellular beam length, the body diameter, and the total number of hole Designs are performed according to the LRFD-AISC (Load and Resistance Factor Design - American Institute of Steel Construction) specification.

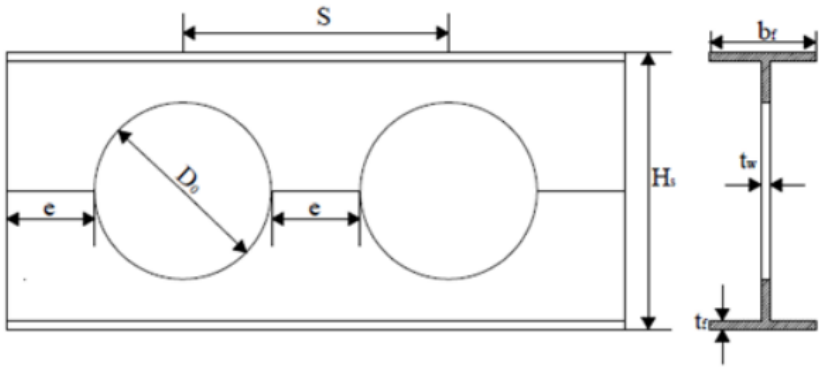

Figure 2. Design of the cellular beam

The constraints of the LRFD-AISC arrangement are used when solving the cellular beams by the optimization method. The beam member profiles are selected from 64 UB sections, starting with the UB 254×102×28 section and ending with the UB 914×419×388 section. The hole diameter is chosen from among 421 values increasing by 1 mm from 180 mm to 600 mm, and the number of holes is selected from 39 values increasing by 1 from 2 to 40 (LRFD-AISC and Design 1999).

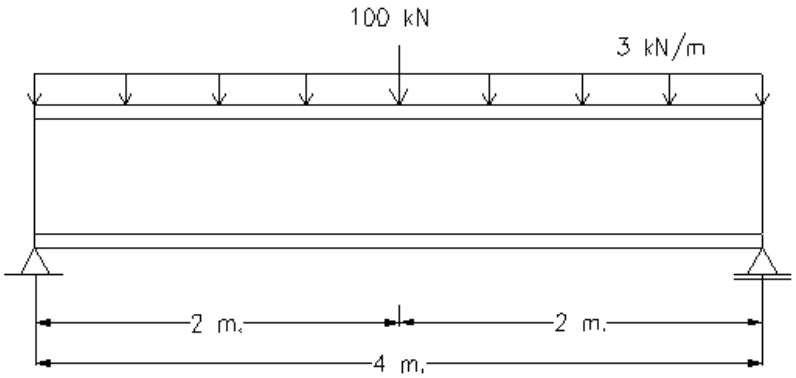

Figure 3. 4m beam si

A simple beam with a length of 4 m is considered. A uniform distributed load of 3 kN/m is applied on the beam and a single load of 100 kN is applied to its midpoint. For this beam to have minimum weight, a solution is made with WOA, PSO, and BA algorithms. The number of holes and the hole diameter is determined in a beam of 4 m in length, considering the limiters.

Table 2. Design of the cellular beam results

Algorithm	Section	Hole Diameter	Number of holes
WOA	UB-305x102x25	405	9
PSO	UB-305x102x25	405	9
BA	UB-305x102x25	405	9

According to Table 2, beam dimensions that can carry loads with minimum cross-section are determined. As a result of the design, it is seen that all 3 algorithms have the same cross-section.

CONCLUSION

The solution is made using metaheuristic algorithms. The benchmark design problem and the cellular beam problem, which is a structural element, are discussed. The goal is to achieve the minimum weight using metaheuristic algorithms. Among many metaheuristic algorithms, the whale algorithm, particle swarm, and bat algorithm are discussed.

First, one of the engineering problems, the welded beam design problem, is solved for these algorithms. The welded beam design problem has four variables and seven constraints. In the problem solved within these limits, the aim is to obtain the minimum weight. When the results are examined, it is observed that the WOA gives better results than PSO and BA. In our other engineering example, it is the cellular beam, which is often used in structures. These beams are highly preferred as they have minimum weight thanks to their cellular structure. When an optimization study is performed for a simple beam of 4 m in length, the section with the minimum weight is determined. The number of gaps to be formed in the beam and the gap diameter is determined. The most suitable one is selected among the 64 sections in the LRFD specification. Looking at the results, it is seen that all algorithms show the same performance.

Özet
Boru içi denetleme robotu, 12” ve 16” inchlik çaplara sahip çelik doğal gaz borularındaki anomalileri tespit etmek için tasarlanacak olup proje kapsamında toplam 5 modelden oluşmaktadır. Tasarımın detayları bir önceki bildiride ayrıntılı olarak ele alınmıştır. Bu çalışmada, 12”-16” çelik doğalgaz dağıtım boru hatlarının ILI (In Line Inspection) yöntemi ile incelenmesinde kullanılacak boru içi denetleme robotunun (BİDR), 3. modeline ait mekanik tasarımında yapılan geliştirmeler, hedeflenen şekil bozukluğu ölçüm sensörü, manyetik akı kaçağı (MFL) ölçüm modeli, veri linki çalışmalarına dair yapılan ilerlemeler ele alınacaktır. MFL sensörü, boruların çeperlerindeki oyuk, tamir yamaları, vana ve kaynak dikişi gibi her türlü anomaliyi tespit edebilir. MFL ve kameralardan alınan veriler, görüntü işleme ve çeşitli yapay zeka teknikleri kullanılarak işlenecek ve korozyonun konumu tespit edilebilecektir.
Anahtar Kelimeler: Boru içi denetleme robotu, manyetik akı kaçağı (MFL), doğalgaz boru hattı.

I. GİRİŞ

Boru hattı ağları, modern yaşamımızın vazgeçilmez bir parçasıdır. Uzun vadede, doğal gaz boru hatları korozyon, kaynak yapma kusurları, üçüncü şahıslardan kaynaklanan hasarlar ve diğer nedenlerden dolayı arızalanırlar. Uzun mesafeli basınçlı doğal gaz borularında meydana gelebilecek sızıntı, çevreye ve insana zarar verebilir. Yanıcı veya patlayıcı maddeler kolayca civardaki çevre üzerinde önemli ölçüde olumsuz etkilere yol açar ve hasarlı boru hatlarından sızıntı meydana gelmesi yakınlarda ikamet eden insanların can kayıplarına veya ekonomik kayıplar yaşamasına neden olabilir. Dolaysıyla boru hatlarını aktif izleme, sık denetim, boru hatlarının güvenli ve verimli bir şekilde işlevlerini sağlayabilmesi, kritik öneme sahiptir. Diğer taraftan boru hatlarını izlemek ve bakımlarını yapmak maliyetli ve zor bir iştir. Çünkü boru hatları oldukça geniş bir alana yayılmıştır ve bir çoğu tehlikeli ortamlarda bulunuyor olabilirler.

Meydana gelebilecek hertürlü olumsuz etkilerin önüne geçmek için boru hatlarının durumunu denetlemek gerekir. Bu iş için yaygın olarak akıllı pigler kullanılır. Bu pigler, genellikle tek bir teknolojiyi kullanarak belirli bir kusur türünü tespit edecek şekilde tasarlanmışlardır. Piglerin çoğu, duvar kalınlığı ölçümleri için bir manyetik akı kaçağı (MFL) sensörü veya bir ultrasonik sensör kullanır. Boruların durumunu denetlemek için gelişmekte olan diğer bir teknoloji boru denetleme robotlarıdır. Boru içi denetleme robotu borununun içindeki tıkanıklık, hasar, bozulma ve korozyon olup olmadığını kontrol eder. PIG’ler pasif olmalarından dolayı robotlara kıyasla daha dezavantajlıdırlar. Gerek PIG’ler gerek robotlar borulardaki sorunları tespit etmek için farklı teknolojileri kullanırlar. (Adegboye ve ark., 2019) makalesinde boru içi denetleme teknolojileri ele alınmıştır. Bunlar, akustik emisyon, fiber optik sensör, yer penetrasyon radarı, negatif basınç dalgası, basınç nokta analizi, dinamik modelleme, buhar örneklemesi, kızılötesi termografi, dijital sinyal işleme ve kütle-hacim dengesi gibi teknolijilerdir. Bu teknolojiler birçok araştırmacılar tarafından donanımsal, yazılımsal veya iç, dış gibi farklı şekilde sınıflandırılmaktadır. Bu teknolojiler (Lu ve ark., 2019) makalesinde de ayrıntılı olarak ele alınmıştır. (Gomes ve ark., 2019) makalesinde, araştırmacılar, gaz algılama teknolojileri konusunda en son teknolojinin derinlemesine bir incelemesini yapmaktadırlar. Ayrıca dönüştürücülerin fırsatlarını ve ana özelliklerini, Nesnelerin İnterneti (IoT) aracılığıyla entegrasyonlarını araştırmaktadırlar. (Al-Okby ve ark., 2021) makalesinde, özellikle laboratuvar ortamında toksik, tehlikeli gazlar ve uçucu kimyasallar için mevcut mobil algılama ve alarm sistemleri araştırılmıştır. Ocak 2010'dan Ağustos 2021'e kadar olan ve kullanılan en yeni sensör teknolojilerini ve sistem bileşenlerini ele alan makaleler derlenmiştir. Aalsalem ve diğerleri (Aalsalem ve ark., 2018), petrol ve gaz endüstrisinin üç sektöründe (yukarı akış, orta akış, aşağı akış) ortaya çıkan çeşitli anormal olayları izlemek için geliştirilen en son sistemlerin veya

tekniklerin kapsamlı bir araştırmasını yapmaktadırlar. Ayrıca, petrol ve gaz endüstrisinde kullanılacak kablosuz sensör ağlarının gereksinimlerini de açıklamaktadırlar.

Ghazali ve diğerleri, (Ghazali ve ark., 2012) makalesinde gaz boru hatlarındaki sızıntı, mikrokontrol temelli bir mobil robot ile tespit etmeye çalışmaktadırlar. (Sharma, 2021)'de bir robot, vektör destek makinaları (SVM) sınıflandırıcısı ve görüntü işleme tekniği kullanarak borulardaki hasarlar tespit edilmeye çalışılmıştır. Kim ve diğerleri (Kim ve ark. 2015), boru hatlarını izlemek, faydalı, doğru veriler elde etmek, onarım ve hassas coğrafi konum bilgisi için robotik, algılama ve Radyo Frekansı Tanımlama (RFID) teknolojilerini birleştiren yeni bir Otonom Bakım sistemi önermektedirler. Zhu ve diğerleri (Zhu ve ark., 2017), boru hatlarında sızıntıdan kaynaklanan negatif basınç dalgasından faydalanarak, kurşun zirkonat titanat sensörleri ile boru hattı sızıntısının hızlı tespiti ve yerinin belirlenmesi için yenilikçi bir yöntem önermektedirler. (Doshmanziari ve ark., 2019) makalesinde, boru hattı boyunca sızıntıyı tespit etmek ve yerini belirlemek için Genişletilmiş Kalman Filtresine dayanan model tabanlı bir yaklaşım önerilmiştir. (Liu ve ark., 2018)'de, dinamik basınç sensörleri kullanılarak, dinamik basınç dalgaları (akustik dalgaların) bilgisayar ortamına alınıp sinyal işleme teknikleri ile sızıntının olup olmadığı ve konumu tespit edilir. Bu teknik şu ilekeye dayanır; boru hattında bir sızıntı meydana geldiğinde, gaz içinde yayılan bir akustik dalgan üretilir. (Latif ve ark., 2020) makalesinde, beyaz zeminde siyah bir çizgiyi takip ederek ilerleyebilen bir robot tasarlanmıştır. Bu robotta , ATmega32A mikrokontroller kullanılmıştır. Robotun ilerleme hızı 150 rpm ile sınırlıdır.(Alshammari ve Chughtai, 2020)'da, IoT kullanan bir endüstriyel izleme sistemi tasarımı sunulmuştur. Gaz sensörü (MQ-5) tarafından yakalanan bilgiler cloud'a gönderilir. Sensör, çok farklı atmosfer koşullarında bile gaz sızıntısını algılayabilmektedir. Tüm bileşenler, kurulumda merkezi işlemci birimi görevi gören bir Arduino (UNO-1) tarafından kontrol edilir. (Aung ve ark., 2019) makalesinde, metal boru boyunca hareket eden, böcek benzeri bir robot, tespit ettiği gaz kaçağını WiFi üzerinden bilgisayara göndermektedir.

Türkiye' de tüketilen doğal gazın %37' sini dağıtan İGDAŞ' ın sahip olduğu çelik boru hatlarının (%25) yaklaşık 400 km'lik kısmı 12'' ve 16'' borulardan oluşmaktadır (2017 İGDAŞ haberler). 12'' ve 16'' çaplarındaki boru hatları içerisinde dolaşarak, üzerinde yer alan özel sensörler ile boru hattındaki bozulmaları hedeflenen performans parametreleri için belli doğruluk (certanity) ve tolerans (belli güven düzeyinde) ile tespit edecek, modüler ve yılansı yapıdaki bir robot kullanımı gerekmektedir. (Tetik ve ark., 2021)'de, geliştirmekte olduğumuz Boru içi Denetleme Robotunun tasarımı ayrıntılı olarak anlatıldı. Bu çalışmada model 3'te yapılan geliştirmeler anlatılacaktır. Bizim çalışmamıza benzer olarak (Li ve ark., 2020) makalesinde de petrol boru hatları için tasarlanmış bir robot için yapılan iyileştirmeler ele alınmıştır. Bu kapsamda bu bildiride BIDR'ın 3. modeline ait mekanik tasarımında yapılan geliştirmeler, hedeflenen şekil bozukluğu ölçüm sensörü, MFL ölçüm modeli, veri linki çalışmalarına dair yapılan ilerlemeler ele alınacaktır.

MEKANİK GELİŞTİRMELER

Model-3 Şekil'de görüldüğü gibi tam mekanik boya sahip olup kamera, sürücü, yönlendirme ve MFL modül tiplerinde toplam 9 modülden oluşmaktadır. Toplamda yaklaşık 135 kg ağırlığında ve 3.2 m uzunluğunda olup, sahip olduğu modüllere ait detaylar

Tablo 1'de verilmiştir.

Şekil 1: BIDR Model-3

Tablo 1: Model-3 fonksiyon tablosu

Yeni Notasyon	Önceki Notasyon	MODEL 3
Sürücü Modülü	Tahrik	• 16" ile 12" borular arası redüksiyon geçişi
	Destek	
Yönlendirme Modülü	Yönlendirme	• 45, 90 derece dirsek geçişi • mitered dirsek geçişi
	Güç Modülü	
Kamera Modülü	Haberleşme	
	Görüntüleme ve Aydınlatma Modülü	• Video görüntü kaydı
	Acil Durum Konumlandırma Modülü	• Modül için uygun yapının belirlenmesi • Modül için uygun olan alıcının belirlenmesi
	İşlemci Modülü	• Robota enerji verilmesi ve enerjisinin kesilmesi işlemlerinin yapılması • Yüksek kalitede video görüntülerinin kaydedilmesi
	XYZ Haritalandırma Modülü	• Mekanin yapının oluşturulması
	Şekil Bozukluğu Ölçüm Modülü	• Mekanik yapının oluşturulması •Geometri sensör tasarımı
	Tahrik Modülü	• 16" ile 12" borular arası redüksiyon geçişin yapılması
Kumanda Birimi	Uzaktan Kontrol Birimi	• Robot ikincil sensör verilerinin (basınç, sıcaklık, nem) yansıtılması
MFL		• MFL Kol açma/ kapama • MFL Sensör verilerinin okunması • MFL Sensör verilerinin filtrelenmesi
Veri İşleme ve Raporlama Birimi		• Robottan operatöre iletilen kamera ve sensör verilerinin kaydedilmesi
Launcher / Receiver		•Launcher/Receiver biriminin taslak modelinin oluşturulması • Launcher/Receiver birimi için operasyon prosedürü oluşturulması

Mekanik tasarım

Mekanik tasarımlar bilgisayar destekli tasarım programında üç boyutlu olarak gerçekleştirilmiştir. Tasarlanan parçaların üretiminde şasi için alüminyum malzeme diğer parçalar için çeşitli malzemelerden (alüminyum, PLA, çelik) hibrid bir yapı kullanılmıştır. Tekerlekler poliüretan malzeme ile kaplanmıştır. Bir önceki Model-2'ye göre mekanik yapıda değişiklikler yapılmış olup yapılan iyileştirme çalışmaları aşağıdaki gibi listelenmiştir;

- Hareket mekanizmaları içerisinde kayış yerine dişli kullanılarak tork artışı sağlanmıştır.
- Robot kollarında bulunan süspansiyon yayları bağımsız hale getirilerek, robotun ilerleme hareketi boyunca stabilizasyon iyileştirilmiştir.
- Yüksek basınç testlerini geçen, motor, enkoder ve kuvvet sensörü gibi bazı elektronik ekipmanlar muhafaza içerisinden basınçlı ortama çıkarılmıştır.
- Sürücü tekerleklerindeki poliüretan yüzey boruya dik basabilecek şekilde tasarlanmıştır. Bu sayede tekerleklerin temas yüzeyi arttırılarak çekiş sistemi iyileştirilmiştir.
- Kamera modülü kollarındaki tekerlekler çift sıralı yapılarak modülün merkezlemesi ve stabilitesi iyileştirilmiştir. Bu sayede kameranın ve lazerin görüntülerindeki titreşim azaltılmıştır.
- Sürücü modülü kollarına destek tekerlekleri eklendi. Bu sayede modülün dirsek geçişi sırasındaki dengelenmesi iyileştirilmiştir.
- Modül çapları arttırılarak iç hacimde kablolamaya ayrılan hacim genişletilmiştir.
- Toplam modül ağırlıklarının artması sonucu kullanılan motor tiplerinde güç mertebesi arttırılmıştır.
- Kuvvet sensörleri ile kol açma mekanizması eksenel olarak yataklanarak ölçülen kuvvet değerleri daha stabil hale getirilmiştir.
- Muhafazalar içerisinde soğutma sıvısı koyulacak şekilde tasarımlar yenilenmiştir. Bu sayede soğutma kapasitesi arttırılmış ve ATEX standartları kapsamında gerekli tedbirler sağlanmıştır.
- Muhafaza çıkışlarına uygun şekilde hermetik rakorlar tasarlanarak yerleşimleri gerçekleştirilmiştir.

- Döndürme mekanizması sürücü modüllerinden kamera modülüne taşınmıştır. Böylece sürücü modülü içerisindeki yoğunluk azaltılmıştır.
- Odometre konik dişlileri daha düşük modüllü olacak şekilde üretilerek okuma hassasiyetinin arttırılması amaçlanmıştır.
- Robot dış yüzeyleri eloksal kaplı alüminyum sac ile kapatılarak bakım kolaylığı sağlamıştır.
- MFL sensör modülü mockup tasarımı içerisindeki yataklamalarda hareket sırasında görülen takılmaların giderilmesi için yataklar genişletilmiş ve sabitleme millerinin konumu yenilenmiştir.
- MFL sensör modülü üzerindeki yay malzemesi değiştirilmiş ve yaylar daha dayanıklı hale getirilmiştir.

Kinematik Benzetim:

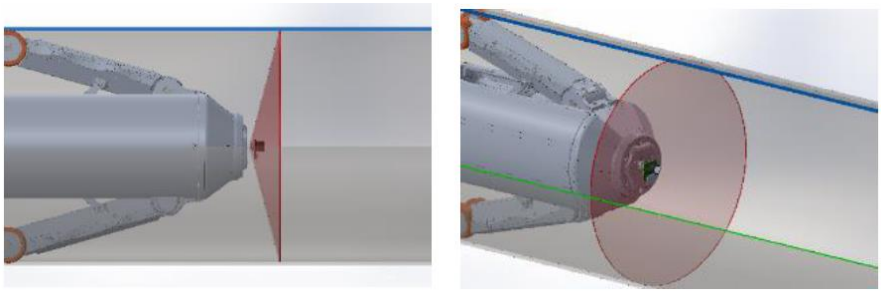
- Simülasyon yazılımı üzerinde boru içi denetleme robotunun yeni mekanik modeli oluşturulmuştur.
- Modele kuvvet sensörü, odometre, kamera, mesafe ve ovalite sensörleri eklenmiştir.
- Robotun yeni mekaniksel tasarımı ile hareket kabiliyeti ve kontrolü CoppeliaSim simülasyon ortamında çalışılmıştır.
- MATLAB ile simülasyon ortamı haberleştirilmiş, robot temel fonksiyonları (kol açma/kapama, ileri/geri hareket, yönlendirme, döndürme) kontrol edilmiştir.
- 90 derece yatay ve dikey dirsek geçiş kontrolü sağlanmıştır.

III. BİDR ÖLÇÜM SENSÖRLERİNDE YAPILAN GELİŞTİRMELER

Bu bölümde Boru içi denetleme robotunun ölçüm sensörleri ve haberleşmesinde sağlanan ilerlemeler anlatılmıştır.

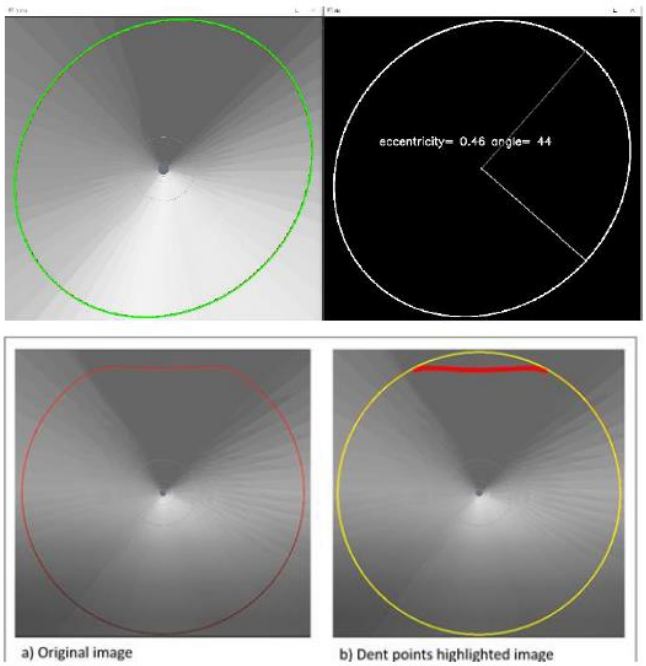
Şekil Bozukluğu Ölçüm Sensörü

Şekil bozukluğunun ölçülmesinde; yüzeye temas ederek ölçüm alan kaliper sensörü, lazer profil sensörü ve robotun merkezinden lazer yansıtarak görüntü işleme ile ölçüm yapıldığı farklı teknolojiler bulunmaktır. Proje kapsamında görüntü işleme ile ölçüm yapılması tercih edilmiştir. Görüntü işlemede kullanılacak lazer ünitesi temin edilmiş, uygun konik ayna tasarımı ve temin çalışmaları devam etmektedir. Üç boyutlu ortamda Şekil' de verildiği gibi lazer projeksiyonu benzetim çalışmaları yapılmıştır.



Şekil 2: Lazer projeksiyon benzetim çalışması.

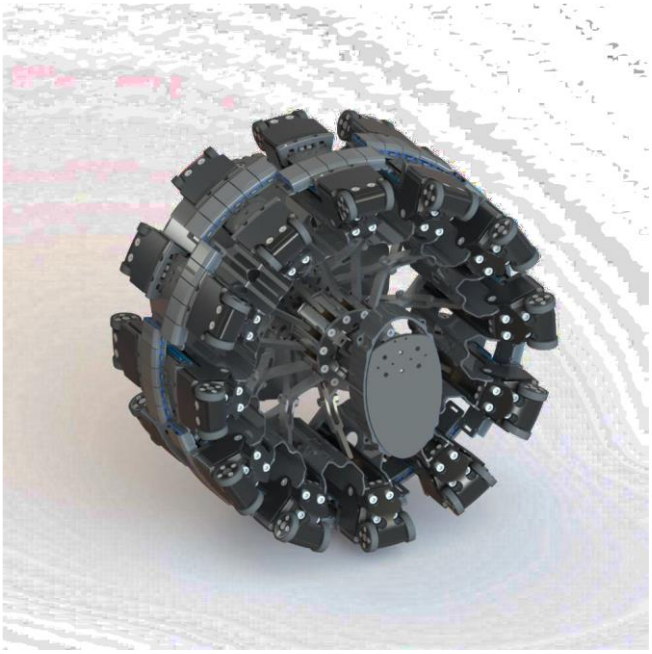
Benzetim çalışmalarından elde edilen videolar sinyal işleme çalışmalarında kullanılmış, Şekil'de belirtildiği gibi örnek ovalite bozuklukları ve göçükler (dentler) tespit edilmiştir.



Şekil 3: Ovalite ve göçük tespiti.

MFL ölçüm modülü

MFL modülünün mekanik tasarımı yapılan testler sonrasında iyileştirilmiş, boyunduruk yapısı ve MFL modülü Şekil'teki gibi tekrar tasarlanmıştır.



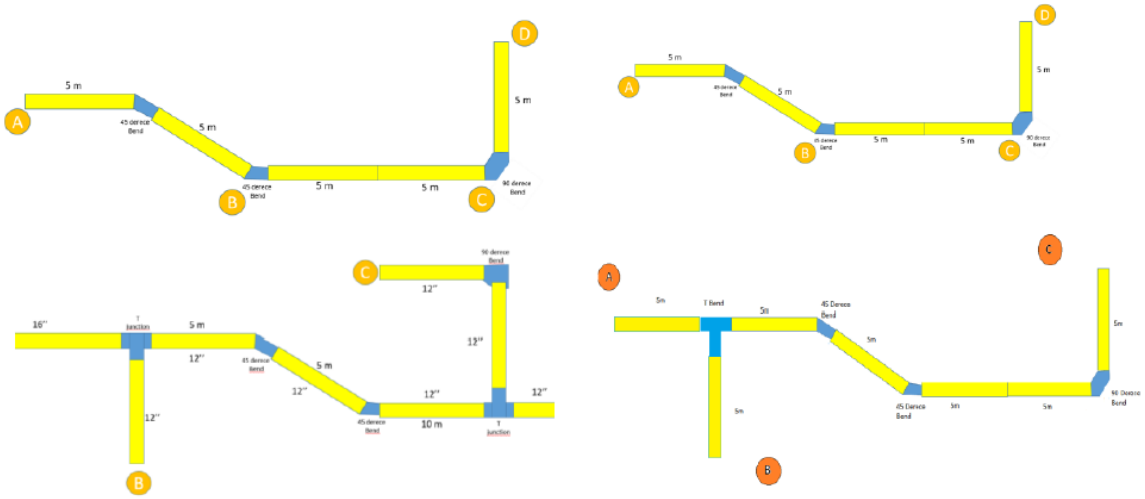
Şekil 4: MFL Modülü

MFL modülü kol açma-kapama fonksiyonunu yerine getirecek donanım ve yazılım tamamlanmıştır. MFL üzerindeki alan etkili sensörler ile veri okuma çalışmaları gerçekleştirilmiştir. MFL sensörünün ölçüm kabiliyeti çeyrek borular üzerinde oluşturulmuş standart dâhilindeki hataların ölçümleri ile test edilmiştir. MFL test düzeneği ile üzerinde metal kayıpları bulunan çeyrek borular teste tabi tutulmuştur. Testler sonucunda, MFL mıknatıslarının boruyu doyurabildiği ve hasarların yüksek doğruluk ile ölçülebildiği gözlemlenmiştir.

Veri Linki

Daha önce frekans baremi belirlenmişti. Bu modülde deneysel testler yapılmış seçilen frekans aralığının doğrulanması ve anten tiplerinin test edilmesi çalışmaları gerçekleştirilmiştir. Laboratuvar ortamında,

Şekil'de çizimleri verildiği gibi çeşitli boru hattı örnekleri oluşturularak veri linki testleri gerçekleştirilmiştir.



Şekil 5: Haberleşme testlerinde kullanılan test boru hatları.

Labratuvar ortamında oluşturulan boru hattında yapılan haberleşme testleri 868 Mhz ile 930 Mhz bant aralığında gerçekleştirilmiştir. Yapılan testlerde T bağlantıların iletişim kayıplarına yol açabildiği bu durumun önlenebilmesi için reflektör kullanımının değerlendirilmesi gerektiği görülmüştür. Gerçek sahada testler (bkz. Şekil) için yeni döşenen 12'' Deliklikaya çelik boru hattı kullanılmıştır. Yaklaşık 2.4 km uzunluğundaki boru hattı 42 adet dirsek ve 3 adet özel geçiş (dere, tren yolu) içermektedir. 2.4km lik saha testinde seçilen frekans aralığında görüntü aktarımı başarı ile sağlanmıştır.

Şekil 6: MFL Deliklikaya hattında test antenleri yerleşimleri ve alınan anlık video görüntüsü.

IV. SONUÇ

Bu çalışmada, gaz akışında kesintiye yol açmadan boru hatının haritalanmasını ve denetlenmesini sağlayan boru içi denetleme robotunda sağlanan gelişmeler ele alınmıştır. Modül-3'te Robot kollarında bulunan süspansiyon yayları bağımsız hale getirilerek, robotun ilerleme hareketi boyunca stabilizasyon iyileştirilmiştir. Yüksek basınç testlerini geçen, motor, enkoder ve kuvvet sensörü gibi bazı elektronik ekipmanlar muhafaza içerisinden basınçlı ortama çıkarılmıştır. Kamera modülü kollarındaki tekerlekler çift sıralı yapılarak modülün merkezlemesi ve stabilitesi iyileştirilmiştir. Muhafazalar içerisinde soğutma sıvısı koyulacak şekilde tasarımlar yenilenmiştir. Döndürme mekanizması sürücü modüllerinden kamera modülüne taşınmıştır. Böylece sürücü modülü içerisindeki yoğunluk azaltılmıştır. Odometre konik dişlileri daha düşük modüllü olacak şekilde üretilerek okuma hassasiyetinin arttırılması amaçlanmıştır.

TEŞEKKÜR

Bu çalışma, TUBITAK-RUTE de yürütülen Boru İçi Denetleme Robotu Geliştirme Projesi kapsamında gerçekleştirilmiştir. Katkılarından dolayı kendilerine teşekkürü bir borç biliyoruz.

Abstract
Servo motors are widely used in industrial areas for precise position movements. For this reason, determining the most suitable gain parameters for the system during the sensitive motion control process gains a special importance. In this study; Precise control is provided for the servo motor model by using Proportional-Integral (PI), Proportional-Integral-Derivative (PID) and Fractional-Order Proportional-Integral-Derivative (FOPID) controllers. PI controller consists of two parameters, PID controller consists of three parameters, and FOPID controller consists of five parameters. As the parameters of these controllers increase, it enables precise control and complicates the optimization process of the controller. Since controller optimization is difficult to calculate with traditional mathematical methods, Salp Swarm Algorithm (SSA), Atom Search Optimization (ASO), Fire-Moth Optimization (MFO) and Coronavirus Herd Immunity Optimization (CHIO) algorithms, which are nature-inspired (meta-heuristic) optimization algorithms were used. The system output response curves were examined by testing these four optimization algorithms separately with PI controller, PID controller and FOPID controller on the servo motor model. Evaluation was made by comparing the rise time and percent overshoot of the system response curves. According to this evaluation, it has better system response curve performance than other controllers and algorithms, as it is seen that it has the shortest rise to steady state and the least percentage overshoot with the Salp Swarm Algorithm (SSA) optimized with FOPID controller.
Keywords: Servo motor, PI Controller, PID Controller, FOPID Controller, Optimization Algorithm

Özet
Servo motorlar endüstriyel alanlarda hassas pozisyon hareketleri için yaygın olarak kullanılmaktadır. Bu nedenle hassas hareket kontrol işlemi sırasında sistem için en uygun kazanç parametrelerinin belirlenmesi ayrı bir önem kazanmaktadır. Bu çalışmada; Oransal-İntegral (PI), Oransal-İntegral-Türev (PID) ve Kesir Dereceli Oransal-İntegral-Türev (FOPID) kontrolörlerden faydalanılarak servo motor modeli için hassas denetim kontrolü sağlanmıştır. PI kontrolör iki parametreden, PID kontrolör üç parametreden, FOPID kontrolör ise beş parametreden oluşmaktadır. Bu kontrolörlerin parametreleri arttıkça hassas denetim yapmasını sağlarken kontrolörün optimizasyon işlemini zorlaştırır. Kontrolör optimizasyonunun geleneksel matematiksel yöntemlerle hesaplanması zor olduğu için doğadan esinlenilen (meta-sezgisel) optimizasyon algoritmalardan olan Salp Sürüsü Algoritması (SSA), Atom Arama Optimizasyonu (ASO), Ateş-Güve Optimizasyonu (MFO) ve Koronavirüs Sürü Bağışıklığı Optimizasyonu (CHIO) algoritmaları kullanılmıştır. Kullanılan bu dört optimizasyon algoritmaları, servo motor modeline PI kontrolör, PID kontrolör ve FOPID kontrolör ile ayrı ayrı denenerek sistem çıkış cevap eğrileri incelenmiştir. Sistem cevap eğrilerinin yükselme süresi ve yüzde aşım miktarı karşılaştırılarak değerlendirme yapılmıştır. Bu değerlendirmeye göre FOPID kontrolörü ile optimize edilen Salp Sürüsü Algoritması (SSA) ile kararlı hale en kısa yükseldiği ve en az yüzde aşım miktarına sahip olduğu görülerek diğer kontrolör ve algoritmalara göre daha iyi sistem cevap eğrisi performansına sahip olduğuna karar verilmiştir.
Anahtar Kelimeler: Servo motor, PI Kontrolör, PID Kontrolör, FOPID Kontrolör, Optimizasyon Algoritması.

INTRODUCTION

Servo motors have long been widely used in the control field because of their many good properties. For example; such as high starting torque characteristic, high response performance, precise position control. With the development of servo motor systems, great developments have been achieved in robotics, aviation and industry. In servo motor systems, the desired speed-position control is controlled by the controller with the mechanical speed information received from the encoder. The gain values of these controllers are very important to minimize the error parameter. Many nature-inspired meta-heuristic search algorithms have been developed today to find the gain values.

Today, many meta-heuristic algorithms inspired by nature have become increasingly important (Tzanetos and Dounias, 2021). Inspired by the interatomic repulsion and pull forces, he developed the Atom Search Algorithm (ASO) (Zhao et al., 2018). Inspired by the movements of moth butterflies around the fire source, the Fire-Moth Optimization (MFO) algorithm was developed (Mirjalili, 2015). Salp Swarm Algorithm (SSA) was developed by deriving the mathematical model of the herd hunting technique of Salp (Mirjalili, 2017). The Coronavirus Herd Immunity Optimization (CHIO) algorithm was developed by examining the contagion movement of the Covid-19 Coronavirus pandemic, which started in Wuhan, China in 2019 and spread to the world (Al-Betar et al., 2021). In their study in 2021, Arıkuşu and Bayhan examined the PID Controller design based on the Coronavirus Herd Immunity Optimization Algorithm for the Automatic Voltage Regulator (AVR) and gave successful results compared to other control methods (Arıkuşu and Bayhan, 2021). Podlubny has shown that derivative and integral powers in PID Controllers can be used in a larger search space by using fractional order mathematics (Podlubny, 2003). Göktürk's study in 2009; Fraction order PIDs (FOPID) with 5 parameters gave more successful results than classical PID controllers with 3 parameters (Göktürk, 2009). In Sezer's study, Fractional Order PID and Gas Turbine Power Plant system were examined with meta-heuristic algorithms and successful results were obtained with Artificial Bee Colony (ABC) algorithm and Gray Wolf Optimization (GWO) algorithm (Sezer, 2021).

In this study, the servo motor system was controlled with MATLAB Simulink simulation PI/PID/FOPID Controllers, inspired by nature, Salp Swarm Algorithm (SSA), Atom Search Optimization (ASO), Fire-Moth Optimization (MFO) and Coronavirus Herd Immunity Optimization (CHIO). Gain values of PI/PID/FOPID Controllers were compared with algorithms.

SERVO MOTOR SYSTEM

Servo motors; Also known as permanent magnet synchronous motor. Basically, there are two types as Alternating Current (AC) and Direct Current (DC) Servo Motor. Alternating Current Servo motor control system is shown in Figure 1.

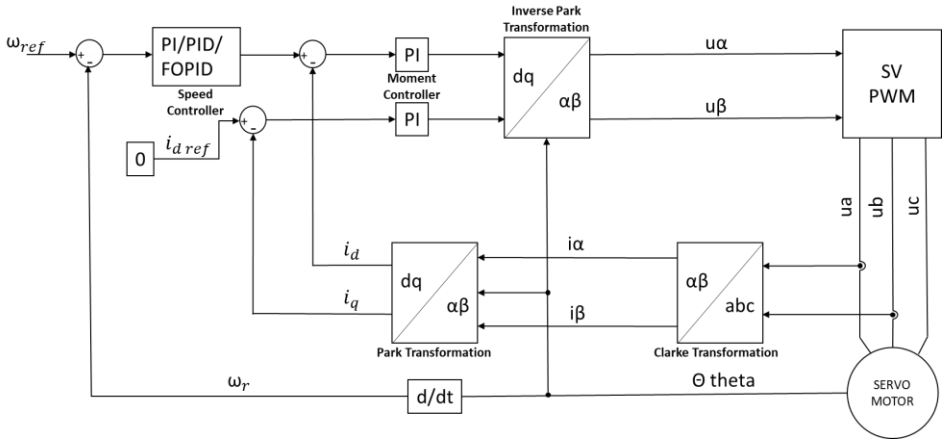

Figure 1. Servo motor controller system model

Motor dynamic equations can be solved in conversions between phase planes used in system modeling of three-phase alternating current servo motors. Generally, three-phase fixed plane to two-phase fixed plane with Clarke transform, two-phase fixed plane to three-phase fixed plane with Inverse Clarke transform, two- or three-phase fixed plane to two-phase rotor plane with Park transform, and two-phase rotor plane to two-phase with Reverse Park transform. It is also performed as a three-phase fixed plane transformation. The electrical and mechanical equations of the servo motor in the rotor reference (d-q) frame are summarized as follows.

$$u_d = R_s i_d + \frac{d\phi_d}{dt} - \omega_e \phi_d \quad (1)$$

$$u_q = R_s i_q + \frac{d\phi_d}{dt} - \omega_e \phi_d \quad (2)$$

$$\phi_d = L_d i_d + \phi_r \quad (3)$$

$$\phi_q = L_q i_q \quad (4)$$

In this context, u_d, u_q and i_d, i_q are d_q frame stator voltages and currents, respectively. L_d and L_q, d_q are axis inductances. ϕ_d and ϕ_q are d_q stator flux connections. ϕ_r, R_s and ω_e are rotor flux coupling, stator resistance and electric angle velocity, respectively. It is expressed in equation (5) for motor dynamics.

$$\frac{d\omega_r}{dt} = \frac{1}{J}(T_e - T_m - B\omega_r) \tag{5}$$

The corresponding electric torque is expressed in equation (6).

$$T_e = \frac{3}{2}P_n\left[\phi_r i_q + \left(L_d - L_q\right)i_d i_q\right] \tag{6}$$

In this context J, B, ω_r and P_n are inertia, coefficient of friction, mechanical angle velocity and number of pole pairs, respectively (Kürüm and Akın, 2017). Servo motor parameter values are given in Table 1. Servo motor controller MATLAB Simulink model is given in Figure 2.

Table 1. Servo Motor Parameter Values

PARAMETER NAME	VALUE
Stator Resistance	0.266Ω
Stator Inductance d-axis	3.488 µH
Stator Inductance q-axis	3.488 µH
Rated Speed	330 dev/dk
Rated Torque	145.67Nm
Moment of Inertia	0.4224 kgm^2
Number of Pole Pairs	17

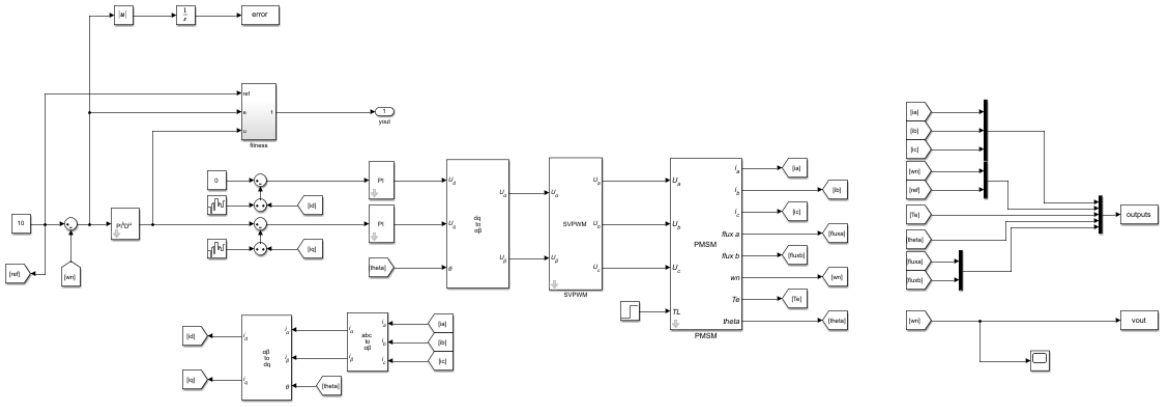

Figure 2. Servo motor controller MATLAB Simulink model

The MATLAB Simülink simulation of the servo motor controller system model given in Figure 1. is given in Figure 2. According to this model, the first two of the phase currents of the Motor (i_a, i_b) are measured, where i_c is calculated with $i_a + i_b + i_c = 0$. i_a and i_b currents are found by transforming to 3-axis 2 dimensional coordinate system formed by 3 phase currents with Clark transform, the angle between i_a and i_b is 90° degrees. Here, 2-axis stator currents are converted to 2-axis orthogonal coordinate system with rotor flux with Park transform. As a result, i_d and i_q are obtained using the rotor angle i_a, i_b and θ (theta). The angle between these two currents is 90° degrees. At steady state these currents remain constant. Here i_d produces the magnetizing flux of the rotor, i_q produces the output of the motor. These currents are regulated by PI Controllers and give U_d and U_q output voltages. Using the Inverse Park Transform, the voltages U_d and U_q are transformed into U_α and U_β with θ (theta). U_α and U_β voltages are converted to U_a, U_b and U_c in the 3-phase coordinate system with the Space vector modulation (PWM) algorithm. (Erünlü 2014) It is aimed to minimize the error by adding PI/PID/FOPID as speed controller for the desired reference angular at the beginning of this closed loop.

PI, PID AND FRACTIONAL ORDER PID (FOPID) CONTROLLER

Controllers provide stable operation of the system by calculating the error in industrial control systems, that is, the difference between the intended system state and the current system state, and minimizing the error in feedback control systems. Classical PID controllers have 3 parameters: Proportional Gain (Kp), Integral Gain (Ki) and Derivative Gain (Kd). Proportional Gain (Kp) provides the desired value to be reached quickly, but it causes overshoot. Integral Gain (Ki) is used to reduce steady state error. The Derivative Gain (Kd) will temporarily shorten the system response time and reduce the overshoot, but can cause oscillations if high values are applied. In addition, fractional order PID Controllers have the power of integral and derivative terms with fractional numbers. With $\lambda \in \mathbb{R}$, "λ" is the integral power, and $\mu \in \mathbb{R}$ is the derivative power. Figure 3. FOPID λ and μ parameter graphs are given.

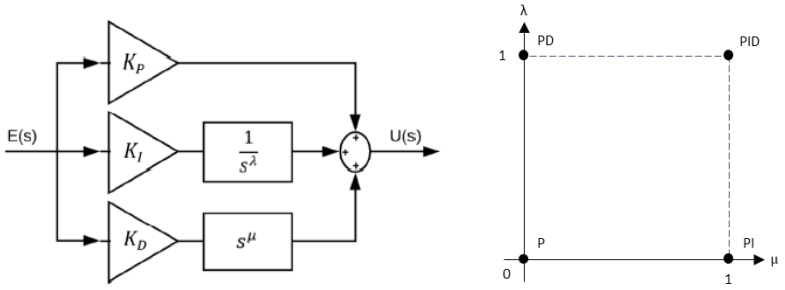

Figure 3. FOPID λ μ parameter graph

FOPID controllers consist of 5 parameters, K_p, K_i, K_d, λ and μ parameters. When λ=1 and μ=1, it becomes a classical PID controller, and when λ=1 and μ=0, it becomes a PI controller. Since the number of parameters is higher in FOPID controllers, it provides the opportunity to make more precise gain adjustment in a wide search space. However, the increase in the number of parameters makes it difficult to determine and optimize the parameters. Equations of PI, PID and FOPID Controllers in t time and s-plane are shown below.

PI Controller;

$$u(t) = K_p e(t) + K_i \int_0^t e(t)dt \tag{7}$$

Laplace transform;

$$u(s) = K_p + K_i \frac{1}{s} \tag{8}$$

PID Controller;

$$u(t) = K_p\, e(t) + K_i \int_0^t e(t)dt + K_d \frac{de(t)}{dt} \tag{9}$$

Laplace transform;

$$u(s) = K_p + K_i \frac{1}{s} + K_d s \tag{10}$$

FOPID Controller;

$$u(t) = K_p e(t) + K_i \int_0^t e(t)dt^{\lambda} + Kd\, \frac{de(t)^{\mu}}{dt} \tag{11}$$

Laplace transform;

$$u(s) = Kp + Ki\, \frac{1}{s^\lambda} + Kd\, s^\mu \tag{12}$$

METAHEURISTIC OPTIMIZATION ALGORITHMS

Metaheuristic optimization algorithms are alternative methods used to reach the desired result in an acceptable time with mathematical models inspired by the structures in nature of algorithms that are difficult to calculate with traditional classical methods today. In metaheuristic algorithms, the aim is to find the optimum solution according to the objective function in the search space. In the literature, there is a certain objective function according to the approach method (Almabrok et al., 2018). The aim of this study; Since it has the shortest settling time and the least amount of overshoot, an optimization search was made with the Integral of the Absolute Value of Error (ITAE) objective function given in Equation(13).

$$ITAE = \int_0^T t|e|\,dt \tag{13}$$

In this study, ASO, MFO, SSA and CHIO algorithms were applied in the servo motor model and the controller gain parameters were compared. Salp Swarm Algorithm (SSA) proposed in this study is described below.

Proposed Method: Salp Swarm Algorithm (SSA)

Salps are sea-like creatures to the colorless jellyfish as in Figure 4(a). Salps living in flocks form a chain by clinging to each other while hunting, as in Figure 4(b). In this way, they hunt by scanning a large area. As in Figure 4(c), the salp swarm directs the leading flock; the leader is pure, the others are followers. (Mircalili, 2015)

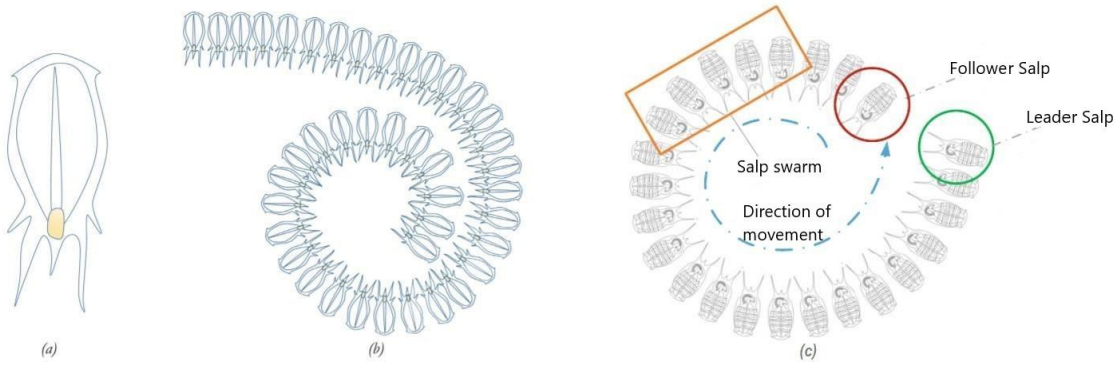

Figure 4. (a) Salp, (b) Salp swarm, (c) Salp swarm hunting hierarchy

Salp swarm algorithm was created by making use of this hunting behavior to find food. At the beginning of the algorithm, swarm individuals are randomly distributed, and fitness values are calculated according to the objective function. The salp with the best fit position value is the leading raft, the other salps follow it without breaking the chain. This process is repeated for the number of iterations in the algorithm. The mathematical model of the leader salpin displacement movement is given in equation (14).

$$X^{1(leader)} = \begin{cases} X_{food} + c_1.((ub - lb).c_2 + lb), & c_3 \geq 0 \\ X_{food} - c_1.((ub - lb).c_2 + lb), & c_3 < 0 \end{cases} \tag{14}$$

In equation(14), $X^{1(leader)}$ represents the leader salpin position and X_{food} represents the food position. Here, c_2 and c_3 are random numbers in the range of [0,1] and are calculated with $c_1 = 2e^{-(4l/L)}$. In Equation (15), movements of other follower salps other than the leader salp are given. X_{new} indicates the updated positions of the salps.

$$X_{new}^{i} = \frac{X^{i} + X^{i-1}}{2} \tag{15}$$

The algorithm is repeated as many as the number of iterations. At the end of the iterative process, the location with the best fitness value is assigned as the output of the algorithm.

RESULTS and DISCUSSION

Servo motor MATLAB Simulink model is shown in Figure 2. In this study, the simulation angular velocity was applied as a reference value of 10 rad/sec. PI/PID/FOPID Controller gain parameter optimization is done with each ASO, MFO, SSA and CHIO algorithms in order to minimize the error parameter with ITAE objective function. Controller gain parameter values are given in Table 2.

Table 2. Controller Gain Parameter Values

ALGORITHM-CONTROLLER	K_P	K_I	K_D	λ	μ
ASO-FOPID	3.9479	2.6795	4.2691	0.2259	0.9859
MFO-FOPID	3.6755	18.6319	18.8301	0.6159	0.0010
SSA-FOPID	3.9136	11.7055	9.8750	0.8036	0.4522
CHIO-FOPID	1.3932	4.8530	2.1094	0.0724	1.4865
ASO-PID	3.9283	4.7553	5.3331	1	1
MFO-PID	3.8651	6.4837	4.9198	1	1
SSA-PID	3.8393	13.1312	5.0159	1	1
CHIO-PID	5.2243	12.8019	13.0443	1	1
ASO-PI	6.0332	9.9172	0	1	1
MFO-PI	6.2544	20.000	0	1	1
SSA-PI	6.1507	10.7241	0	1	1
CHIO-PI	4.0767	1.8734	0	1	1

The optimization graph of the controller gain parameters is shown in Figure 5. In order to compare the optimized algorithms and controllers, 0-100% and 10%-90% rise time, 2% and 5% settling time and overrun amounts accepted in the literature are given in Table 3 (Ogata, 2010).

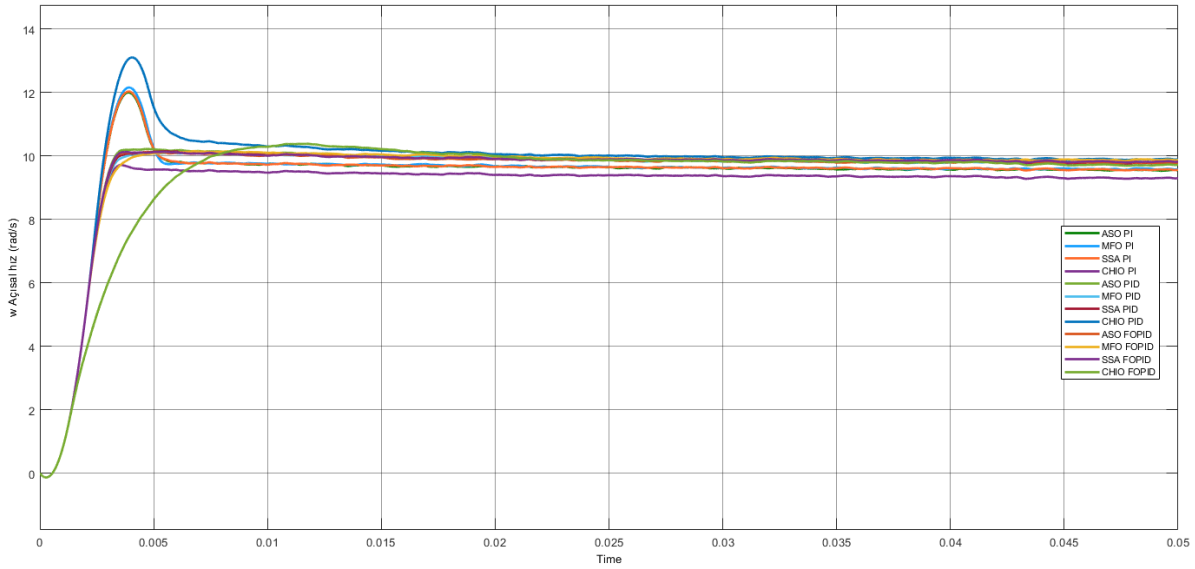

Figure 5. PI/PID/FOPID Controllers vs. ASO, MFO, SSA and CHIO optimization graph

Tablo 3. Algorithm-Controller Transient Criteria and Values

ALGORITHM-CONTROLLER	Rise time (ms) 0%-100%	Rise time (ms) 10%-90%	Settlement time (ms) 5%	Settlement time (ms) 2%	Maximum overshoot
ASO-FOPID	3.401	1.785	3.061	3.226	%1.3
MFO-FOPID	4.264	1.890	3.285	3.692	%1.5
SSA-FOPID	**3.369**	**1.880**	**3.052**	**2.221**	**%1.3**
CHIO-FOPID	7.596	4.371	6.281	7.031	%3.8
ASO-PID	3.319	1.769	3.035	3.244	%2.2
MFO-PID	3.848	1.817	3.119	3.339	%1
SSA-PID	3.498	1.796	3.081	3.260	%1.5
CHIO-PID	2.822	1.559	6.474	13.309	%31.1
ASO-PI	2.902	1.500	4.830	-	%20
MFO-PI	2.888	1.593	4.882	-	%21.6
SSA-PI	2.899	1.598	4.843	-	%10.3
CHIO-PI	-	1.861	-	-	-

If Figure 5 and Table 3 are examined, it is seen that although the rise times of the algorithms optimized with the PI Controller are less than the algorithms optimized with PID and FOPID, the percentage overrun amounts are higher. At the same time, it is seen that the algorithms optimized with the PI controller cannot settle in the 2% settlement area. As a result of the PID Controller and the CHIO algorithm, it is seen that the rise time is low, but the percentage overrun amount and settling time are high. If the percentages of overruns are checked, it is seen that the ASO-FOPID, MFO-FOPID, SSA-FOPID, MFO-PID and SSA-PID Controller algorithms do not exceed the 2% excess.

CONCLUSIONS

While the system output curves of the controller gain parameters for the servo motor are examined; The PID controller provided better system performance than the PI Controller, while the FOPID Controller provided the best system performance compared to PI and PID controllers. As a result of algorithm optimizations with PI/PID/FOPID Controllers, it is showed that the SSA-FOPID controller algorithm has the shortest rise time among the controller algorithms that do not exceed 2% overshoot. For this reason, optimization of the FOPID controller and the Salp Swarm Algorithm for the servo motor gives the best system performance.

* rdogan@eskisehir.edu.tr

Özet
Bu çalışmada İspanya'nın Sevilla kentindeki bir tarım alanına ait elde edilen Sentinel -2 uydu görüntülerinden Random Forest algoritması yardımıyla denetimli sınıflandırma yapılarak tarımsal ürünler haritalanmıştır.2017 yılına ait Sentinel-2 uydu görüntüleri https://scihub.copernicus.eu/dhus/#/home sitesinden temin edilmiş olup, Random Forest algoritmasıyla yapılacak sınıflandırmada kullanılan bölgeye ait eğitim dataları ve vektör verileri ise ESA (Avrupa Uzay Ajansı) platformundan https://eo4society.esa.int elde edilmiştir. Çalışma alanı buğday, mısır, pamuk, pirinç, yonca, şeker pancarı, ayçiçeği, domates ekili alanlar, boş araziler, suyla kaplı alanlar, yapılar ve verisi olmayan alanlar olmak üzere toplam 12 sınıfa ayrılarak haritalanmıştır.
Anahtar Kelimeler: Sentinel-2 uydu görüntüsü, Random Forest algoritması, tarımsal ürün haritalama.

Agricultural Product Mapping With Random Forest Algorithm From Sentinel-2 Satellite Image

Abstract
In this study, agricultural products were mapped by supervised classification with the help of Random Forest algorithm from Sentinel-2 satellite images obtained from an agricultural field in Seville, Spain.Sentinel-2 satellite images of 2017 were obtained from https://scihub.copernicus.eu/dhus/#/home .The training data and vector data of the region used in the classification to be made with the Random Forest algorithm were obtained from the ESA (European Space Agency) platform https://eo4society.esa.int . The study area was mapped by dividing into 12 classes in total: wheat, corn, cotton, rice, lucerne, sugar beet, sunflower, tomato planted areas, vacant lands, water-covered areas, structures and areas with no data.

Keywords: Sentinel-2 satellite image, Random Forest algorithm, agricultural crop mapping

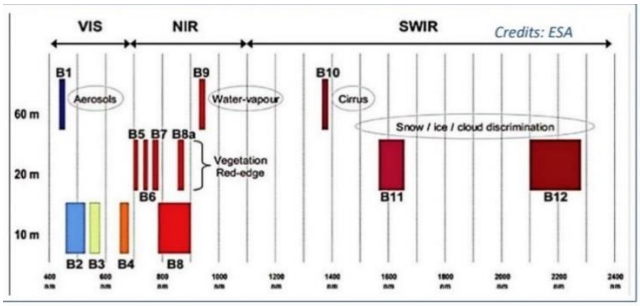
1. GİRİŞ

[1] Tarımsal yönetimi iyileştirmek ve bu faaliyetlerin çevresel faktörlerden daha az etkilenmesini ve sürdürülebilir gıda güvenliğini sağlamak için mahsuller hakkında güvenilir bilgi edinmek gereklidir. Bu bilgiyi toplamak için günümüzde çok farklı yöntemler kullanılabilmektedir. Ancak uydu yer gözlem teknikleri, sağlanan verilerin çeşitliliği ve kapsamının genişliği bakımında oldukça uygun seçenekler sunmaktadır. Sentinel uydularından alınan görüntü verileri tarımsal izleme için yeni bir yaklaşım sağlamakta olup, ilgili analizlerle birlikte bunların zamansal, uzaysal ve spektral çözünürlüklerinin kombinasyonu, karar verme sürecinin iyileştirilmesine oldukça fazla katkı sağlamaktadır.
[2] Buğday, pirinç, pamuk, şeker pancarı, ayçiçeği gibi tarımsal ürünlerin insanların yaşamında temel ihtiyaç maddelerini sağlaması sebebiyle dünya üzerinde oldukça geniş alanlarda ekimi yapılmaktadır. İklim değişikliği, doğal afetler ve savaşlar gibi birçok etkenler ise bu ürünlerin üretim aşamalarında zararlara sebep olmakta, dünyadaki arz miktarının dalgalı seyretmesine yol açmaktadır. Bu ise birçok ülkenin sağlıklı bir şekilde gıdaya ulaşamamasına ya da kısıtlı bir şekilde yüksek maliyetlerle ulaşmasına sebep olmaktadır. Bu tür sebeplerden dolayı tarımsal üretimin geniş ölçekte planlanması, tüm aşamalarında gözlemlenmesi gelecekteki senaryolara karşı tahminler yapılarak gerekli tedbirlerin alınmasına katkı sağlayacaktır. Bu çalışmada alandaki ürün desenini belirleyerek bu tür bir katkı sağlamak amacıyla Sentinel-2 uydu görüntüsü kullanılarak Random Forest algoritması yardımıyla tarımsal alandaki ürünlerin sınıflandırılması İspanya'nın Seville şehri örneğinde gerçekleştirilmiştir.
[3]

MATERYAL VE METOD

Sentinel-2 Uydu görüntüsü

Sentinel-2 görüntüleri, elektromanyetik spektrumun görünürden (VIS) Kısa Dalga Kızılötesi (SWIR) kısmına kadar üç farklı uzamsal çözünürlüğe (10, 20 ve 60 metre piksel boyutu) sahip 13 spektral bant içermektedir. Bant aralıkları aşağıda Şekil 1'de verilmiştir.



Şekil 1. Sentinel-2 uydu görüntüsü bant aralıkları (ESA, 2015)

Genel olarak bu uydu sensörlerinin işlevlerinden bir tanesi de arazi örtüsü ve kullanımına ilişkin haritalama işlemleridir. Son yıllarda Sentinel-2A MSI (Multispectral Instrument) uydu sensörlerinin yeterliliğini ve potansiyelini göstermek amacıyla farklı çalışmaların yapıldığı görülmüştür(Dereli, 2019).Tarım alanlarında ekili ürünlerin belirlenmesi ve verimliliği hakkında ki doğru bilgi, tarımla ve tarıma dayalı üretimle ilişkili olan diğer alanlarda yapılacak planlama ve yatırımlarda sağlıklı karar verilmesine yarar sağlamaktadır. Planlama ve yatırım yapılırken ele alınan önemli konulardan birisi bölgede yatırım yapılması planlanan ürünün üretimi ve verimliliği istenilen düzeyde olmasıdır (Narin vd., 2018).

Verilerin Temini

İspanya Seville bölgesini içeren 01 Haziran 2017 tarihine ait Sentinel-2 uydu görüntüsü https://scihub.copernicus.eu/ sitesinden temin edilmiştir. Bölgeye ait eğitim dataları ve vektör verileri ise ESA (Avrupa Uzay Ajansı) platformundan https://eo4society.esa.int elde edilmiştir. https://rus-copernicus.eu platformundan ise görüntülerin elde edilmesi, işlenmesi ve kullanılan yazılımlar olmak üzere ücretsiz olarak sunulan birçok bilgilendirici eğitim dökümanına ulaşılarak yararlanılmıştır. Belirtilen websitelerine kayıt olunarak başta gerekli verilerin ve yazılımların temini olmak üzere sanal makine ve eğitim gibi bazı hizmetlerden de faydalanılabilmektedir.
Gerekli veri ve yazılımlar:

- Sentinel-2 uydu verisi (S2A_MSIL2A_20170601T110651_N0205_R137_T30STG_20170601T111225)
- Yerel olarak depolanan önceden işlenmiş vektör veriler (LAND01_CropMapping_Seville\LAND01_CropMapping_Seville\AuxData cotton.shp, wheat.shp, vb.)
- İnternet tarayıcısı, SNAP + Sentinel-2 Araç Kutusu + QGIS

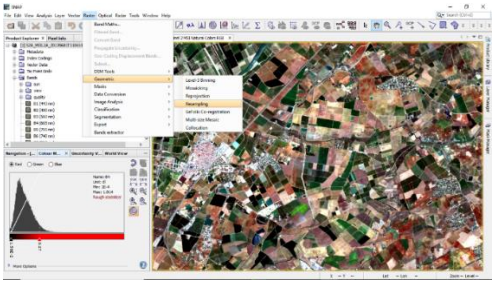
Uydu görüntüsü işleme ve sınıflandırma işlem basamakları

Bu bölümde uydu görüntüsünün elde edilmesi, işlenmesi ve sınıflandırılmasına yönelik tüm aşamalar ve görseller aşağıda verilmiştir.

- https://scihub.copernicus.eu/ sitesinden çalışma alanının seçilerek Sentinel-2 uydu görüntüsünün temin edilmesi
- https://step.esa.int/main/download/snap-download/ sitesinden indirilen Sentinel uydu görüntülerinin işlenmesi ve görüntülenmesini sağlayan SNAP yazılımında görüntünün açılması
- Elde edilen görüntünün SNAP yazılımda 4-3-2 (RGB) bant sıralamasının seçilmesi
- Bant sıralaması seçili görüntünün 4-3-2 (RGB) şeklinde görüntülenmiş hali

Uydu görüntüsünün yeniden örneklenmesi

Sentinel-2 uydu görüntüleri spektral banda bağlı olarak farklı piksel boyutlarına sahip olduğundan ürünü yeniden örneklemek ve farklı uzamsal çözünürlükleri eşitlemek daha sonraki işlemleri yapabilmek açısından gerekmektedir. Bu nedenle görüntüde bant seçimi yapılarak yeniden örneklenmiştir.

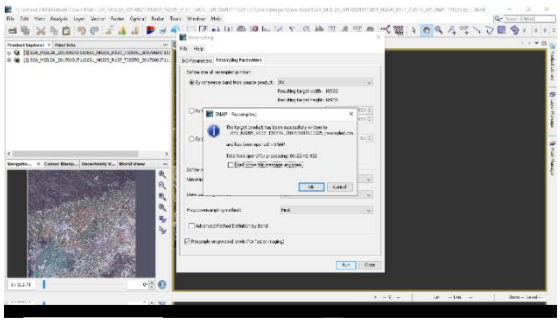


Şekil 2. Yeniden örnekleme ekranı

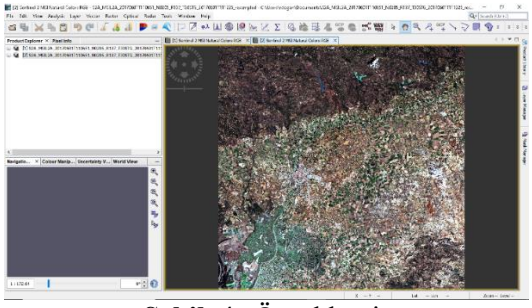
- Yeniden örnekleme menüsünden örneklenecek görüntünün ve kayıt klasörünün seçilmesi

Yeniden örnekleme parametreleri sekmesine gidilerek, kaynak seçiminden referans bandı olarak B2'yi seçilmiştir. Diğer tüm ayarlar varsayılan değerlere ayarlı şekilde bırakılarak, işlem çalıştırılmıştır.

- Yeniden örnekleme menüsünden B2 bant seçimi ve parametrelerin seçilmesi,



Şekil 3. Yeniden örnekleme işlem sonuç ekranı



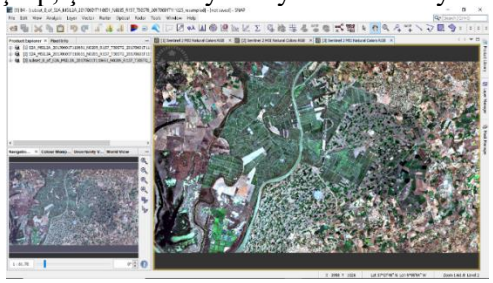
Şekil 4. Örneklemiş görüntünün RGB olarak görüntülenmesi

Mevcut uydu görüntüsünden yeni görüntü alt kümesinin oluşturulması

İlgi alanımız oldukça küçük olduğundan ve tüm görüntüyü işlemeye gerek olmadığından, görüntüyü daha yönetilebilir bir alt boyuta ayarlayarak sonraki adımlarda işlem süresini azaltmak amaçlanmıştır. Üst kısımdaki gezgin araç çubuğundan Raster -> Alt Küme'ye gidilerek yeniden örneklenen ikinci ürünü seçilmiştir.

- Görüntü alt küme belirleme ekranı
- Oluşturulacak görüntü alt kümesinin koordinat aralığının belirlenmesi

Alt küme menüsünden, kapsam alanı başlangıcı X: 0, Y: 7651, sonu X: 5689, Y: 10978 olacak şekilde piksel koordinatları ayarlanmıştır. Daha sonra devam etmeden önce, hataları önlemek için alt küme ürününe (indeks [3]) sağ tıklayıp, ürünü Kaydet seçilip, çıktı klasör yolu ayarlanarak kaydedilmiştir.



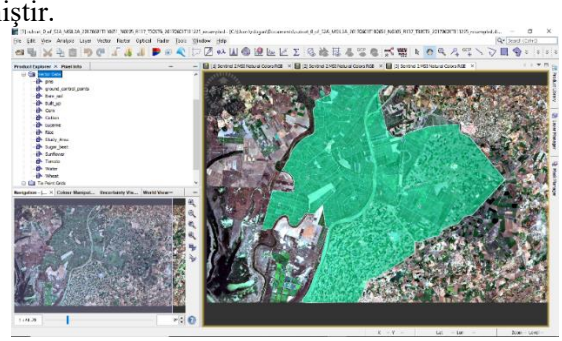
Şekil 5. Oluşturulan alt görüntünün RGB olarak görüntülenmiş hali

Sınıflandırılmada kullanılacak vektör verilerinin içeri aktarılması

Verileri sınıflandırmaya hazırlamak için çalışma alanı ve eğitim alanlarının şekil dosyaları oluşturulmalıdır. Bu çalışmada ESA platformundan çalışma alanına ait tarımsal ürünlerle ilgili vektör dosyalar ve şekil dosyaları temin edilmiştir. Vektör -> İçe Aktar -> ESRI Şekil Dosyası'na tıklanarak daha önceden ESA platformundan indirilen shape dosyaları ilgili klasörden seçilmiştir.Tüm Geometriyi İçe Aktar iletişim kutusunda ise Hayır'a tıklanarak işleme devam edilmiştir.

- Shape dosyası ekleme
- Shape dosyası klasörünün seçimi
- Shape dosyası klasöründen sınıflandırılacak nitelik dosyalarının seçimi

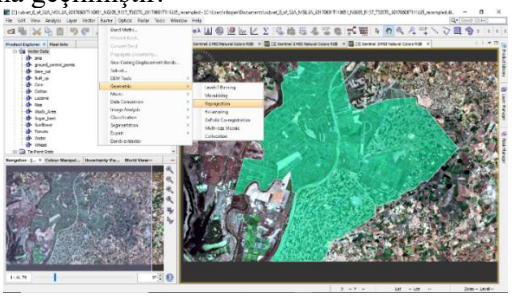
Vektör verileri içe aktarıldıktan sonra değişiklikler alt küme ürününe (indeks [3]) sağ tıklanıp ve Ürünü Kaydet'e tıklanarak kaydedilmiştir.



Şekil 6. Shape dosyalarının eklenmiş hali

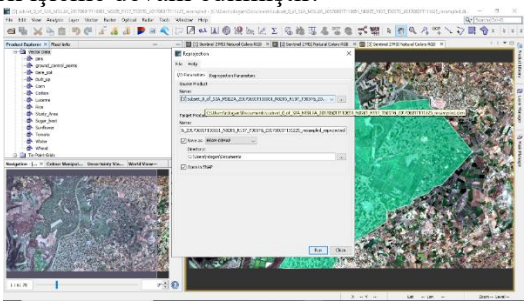
Yeniden projeksiyon oluşturma

Sınıflandırma yapılmadan önce, yazılım gereksinimleri nedeniyle ürünü yeniden projelendirilmek gerekmektedir. Bu nedenle Raster üzerinden -> Geometrik İşlemler -> Yeniden Projeksiyon'a tıklanarak projeksiyon oluşturma aşamalarına geçilmiştir.



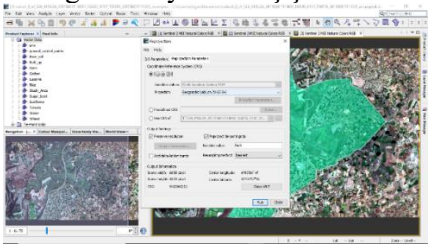
Şekil 7. Yeni Projeksiyon oluşturma ekranı

Girdi/Çıktı parametreleri sekmesinde, kaynak ürün olarak oluşturulan en son alt küme ürünümüz (indeks[3]) seçilmiştir. Çıktı klasörü seçilerek işleme devam edilmiştir.

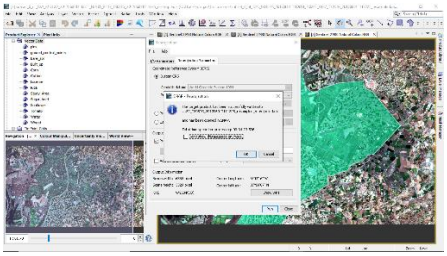


Şekil 8. Yeniden projeksiyon oluşturma ekranından Girdi/Çıktı parametrelerinin seçimi

Yeniden projeksiyon ekranından "Özel CRS" seçildikten sonra, koordinat sistemi olarak UTM / WGS 84 belirlenip, diğer tüm ayarlar varsayılan değerlere ayarlanmış şekilde bırakılarak işleme devam edilmiştir.



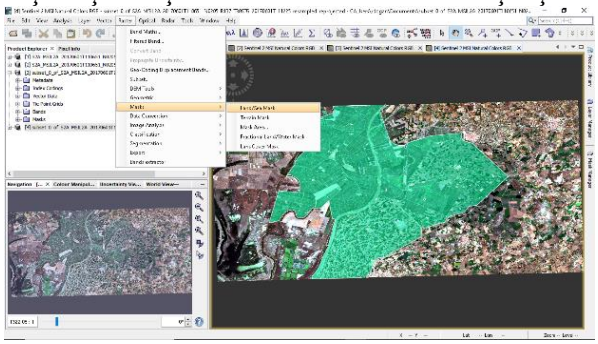
Şekil 9. Yeniden projeksiyon oluşturma ekranından koordinat sistemi ve projesiyon parametrelerinin belirlenmesi



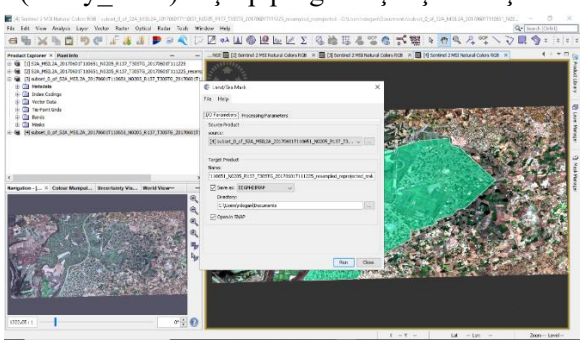
Şekil 10. Yeniden projeksiyon oluşturma işlem sonucu

Piksel maskeleme

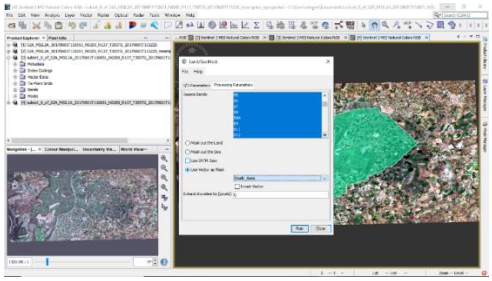
Sınıflandırmayı çalıştırmadan önceki son adım, çalışma alanı içinde olmayan pikselleri maskelemek olacaktır. Bu işlemi gerçekleştirmek için Raster -> Mask -> Kara/Deniz Maskesi'ne tıklanıp. Girdi olarak yansıtılan ürünün (indeks [4] seçildiğinden emin olunduktan sonra çıktı klasörü seçilmiştir. Daha sonra İşleme Parametreleri sekmesine gidilip, kaynak bantları olarak B1'den B12'ye kadar tüm bantlar seçilmiştir. Daha sonra ise "SRTM 3 kullan" seçeneğinin işaretini kaldırılıp ve Vektörü Maske Olarak Kullan seçeneği seçilmiştir. Açılır menüden maske olarak çalışma alanı(Study_Area) seçilip program çalıştırılmıştır.



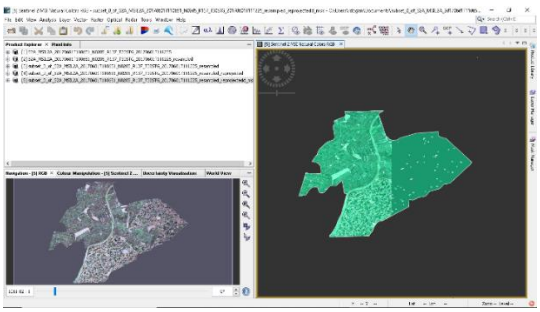
Şekil 11. Maskeleme ekranının görüntülenmesi



Şekil 12. Girdi/Çıktı parametrelerinin seçimi



Şekil 13. Maskeleme ekranından bantların ve maske olarak kullanılacak çalışma alanı vektörünün seçimi



Şekil 14.Çalışma alanı maskelenmiş hali

Random Forest Sınıflandırması

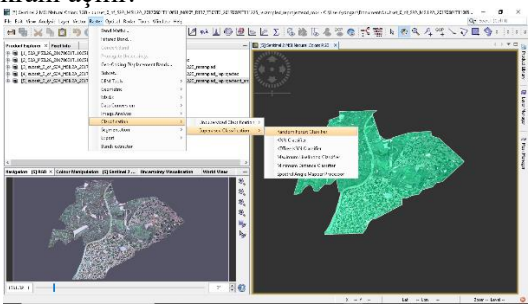
Random Forest Sınıflandırma algoritması, sınıflandırma veya regresyon için kullanılabilen bir makine öğrenme tekniğidir. Parametrik sınıflandırıcılara karşı (örneğin, Maksimum Olabilirlik), makine öğrenimi yaklaşımı bir veri modeli ile başlamaz, bunun yerine eğitim ve yanıt veri seti arasındaki ilişkiyi öğrenir. Random Forest Sınıflandırma algoritması, yanıt değişkenini hesaplamak için farklı modellerden (ağaçlardan) gelen çıktıları kullandığı anlamına gelen toplu bir modeldir.Numune sayısı ve değişken sayısı m olan bir eğitim seti verildiğinde, değiştirme (torbalama yaklaşımı) ile rastgele bir numune alt kümesi seçilir ve bir ağaç

oluşturmak için kullanılır. Ağacın her düğümünde, rastgele bir değişken seçimi m kullanılır ve bu değişkenlerden yalnızca en iyi bölünmeyi sağlayan, iki alt düğüm oluşturmak için kullanılır. ağaçları birleştirerek orman oluşur. Bir uydu görüntüsünün her pikseli, ormanın tüm ağaçları tarafından sınıflandırılır ve ağaç sayısı kadar sınıflandırma üretilir. Her ağaç bir sınıf üyeliği için oy kullanır ve ardından en fazla oyu alan sınıf son sınıf olarak seçilir (Breiman, L. (2001).

Random Forest algoritması özetle şu dört adımda çalışır;

1. Belirli bir veri kümesinden rastgele örnekler seçilir.
2. Her örnek için bir karar ağacı oluşturulur ve her karar ağacından bir tahmin sonucu alınır.
3. Tahmin edilen her sonuç için bir oylama yapılır.
4. Tahmin sonucu, son tahmin olarak en çok oy kullanılarak seçilir.(Kazan & Karakoca, 2019)

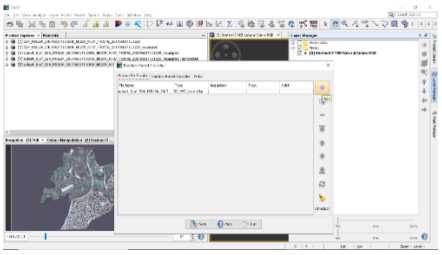
SNAP programı üzerinden Raster -> Sınıflandırma -> Denetimli Sınıflandırma ->Random Forest Sınıflandırıcısı seçilerek işlem ekranı açılır.



Şekil 15. Random Forest Sınıflandırıcı penceresinin açılması

Ürünü daha sonra düzgün bir şekilde görselleştirmek için Layer -> Layer Manager'a gidilip, VectorData'nın seçili olmadığından emin olunmalıdır. Daha sonra sağ üst köşede yer alan + sekmesine tıklanarak önceki aşamada oluşturduğumuz maske dosyası ilgili klasörden seçilmiştir. Oluşturulan maske dosyası ve uzantısı örnekteki gibidir:

"suset_0_of_S2A_MSIL2A_20170601T110651_N025_R137_T30STG_20170601T111225_resampled_reprojected_msk.dim"



Şekil 16.Sınıflandırmada kullanılacak maske dosyasının seçimi

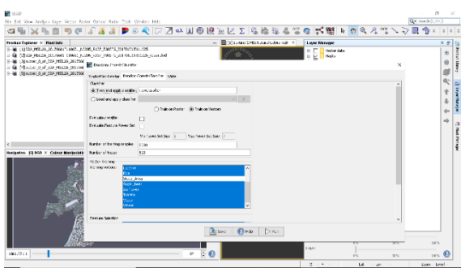
Daha sonra Random-Forest-Classifier sekmesine geçilip, aşağıdaki şekilde parametreler ayarlanmıştır:

-Sınıflandırıcı Değerlerini Değerlendir seçeneğinin işaretini kaldırılmış,

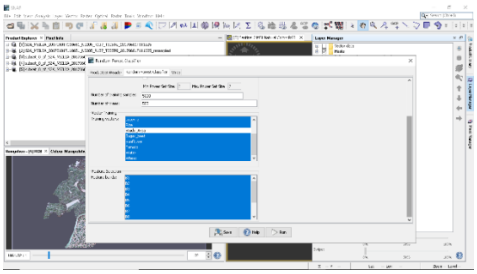
-Ağaç sayısını 500 olarak ayarlanmış,

-Çalışma alanı (Study_Area) dışında eğitim vektörleri olarak tüm shape dosyaları seçilmiş,

-Özellik grupları olarak tüm bantları (B1-B12) seçilmiştir.

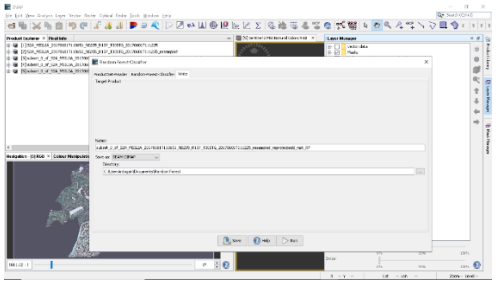


Şekil 17.Sınıflandırma için parametrelerin belirlenmesi

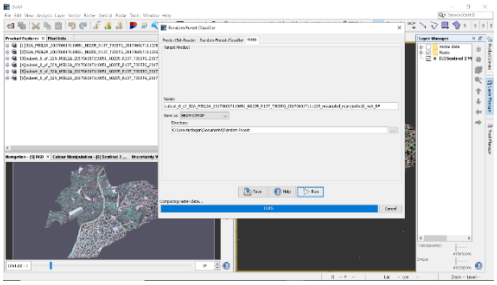


Şekil 18. Bant ve eğitim vektörlerinin seçimi

Daha sonra ise Yazma sekmesine geçilip, Çıkış klasörünü ve yolu ayarlanmıştır. Henüz oluşturulmamış olduğu için RandoForest klasörü oluşturulmuştur. Kullanılan giriş görüntülerinin sayısına göre çıkış dosyası örnekteki gibi varsayılan olarak adlandırılmıştır: RF_1_images.

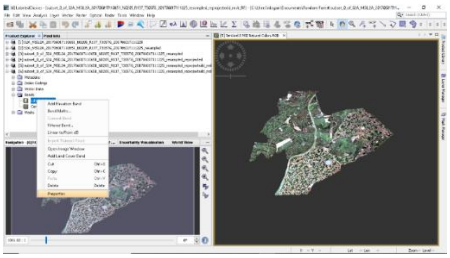


Şekil 19. Sınıflandırma çıktı yolunun belirlenmesi

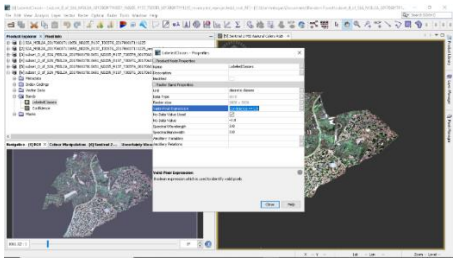


Şekil 20. Sınıflandırma işlem tamamlanma sonucu

Sınıflandırılmış çıktıyı görselleştirmeden önce, geçerli piksel ifadesi değiştirilmelidir. Varsayılan olarak, yalnızca 0.5 'in üzerinde güven eşiği olan pikseller görüntülenmektedir. Bu parametreyi değiştirmek için oluşturulan Random Forest ürününü (dizin [6]) genişletilip, Bantlar klasörü açılıp, LabeledClasses dosyasının üzerinde sağ tıklanıp Özellikler (Properties) penceresi açılmıştır. Açılan pencerede Confidence > = 0.5 ifadesi silinip kapatılmıştır.



Şekil 21. Sınıflandırılmış çıktıyı görselleştirmek amacıyla bant özellik penceresinin görüntülenmesi



Şekil 22.Sınıflandırılmış çıktıda görüntülenecek piksel eşiğinin belirlenmesi

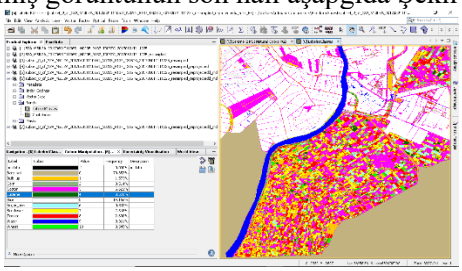
Sınıflandırma görüntüsünü açmak için LabeledClasses dosyasını çift tıklanıp, sol alt köşedeki önizleme ekranından Renk İşleme (Colour Manipulation) sekmesine tıklanarak ya da Görünüm-> Araç Pencereleri-> Renk İşleme (Colour Manipulation) sekmesinden renkler değiştirebilmektedir. Buradan kendi renklerimizi seçebilir ya da "Renk paletini içe aktar" simgesinine tıklanarak dosyadan renk belirlenebilir. Örnek dosya uzantısı ve yolu aşağıdaki gibidir.
Yol: /shared/Training/LAND01_CropMapping_Seville/AuxData/Cour_Palette/ Cour_Palette_SNAP.cpd

- Sınıflandırılan görüntü için dosyadan renk belirleme

Yeni ürünü uygun bir şekilde görselleştirmek için, sağ üst köşedeki Katman-> Layer Manager 'a gidilip, Vector verileri kutucuğunun seçilmediğinden emin olunmalıdır.

- Görüntü renk belirleme

Sınıflandırılmış ve renkleri belrlenmiş görüntünün son hali aşapğıda Şekil 36'da verilmiştir.



Şekil 23. Sınıflandırılmış görüntü son hali

TARTIŞMA

Sınıflandırma sonucunu daha da iyileştirmek için kullanılan giriş görüntülerinin sayısı artırılabilir. Böylece algoritma daha fazla bilgiye sahip olacak ve daha iyi çıktılar üretebilecektir. İstenirse, Dosya-> Dışa Aktar-> GeoTIFF menüsünden çıktı dosyası GeoTIFF biçimde kaydedilerek QGIS gibi coğrafi bilgi sistemleri yazılımlarında görüntülenebilir. Sonuç görüntülerinin, QGIS yazılımında rastgele üretilmiş test noktaları, farklı görüntüler ve yer gözlemleriyle doğruluk değerlendirmeleri yapılabilir.

SONUÇ

Çalışma sonucunda 2017 yılına ait Sentinel-2 uydu görüntüleri ve ESA (Avrupa Uzay Ajansı) platformundan alınan vektör verilerinden yararlanılarak Random Forest algoritmasıyla sınıflandırmada yapılmıştır. Çalışma alanı buğday, mısır, pamuk, pirinç, yonca, şeker pancarı, ayçiçeği, domates ekili alanlar, boş araziler, suyla kaplı alanlar, yapılar ve verisi olmayan alanlar olmak üzere toplam 12 sınıfa ayrılarak başarılı bir şekilde haritalanmıştır.
Ok vd., tarafından yapılan başka benzer bir çalışmada ürünlere ait sınıflandırma doğrulukları incelendiğinde en belirgin karışmanın mera-mısır, pirinç-şeker pancarı, domates şeker pancarı ve mısır-şeker pancarı sınıfları arasında olduğu gözlenmiştir. Başlıca karışma nedenleri arasında sınıflar arasındaki spektral benzerlikler ve görüntülere ait spektral çözünürlüğün sınırlı olması (mavi, yeşil, kırmızı ve yakın kızılötesi) sayılabilir. Daha fazla örnek alan toplamak veya ek spektral bant kullanımı ile nesnelere ilişkin ek özelliklerinin bütünleştirilmesi ile bu eksikliğin belli bir oranda giderilebileceği öngörülmüştür.

TEŞEKKÜR

Çalışmamda eğitici yönlendirmeleri ve bilgileriyle katkı sağlayan Eskişehir Teknik Üniversitesi hocalarıma ve eğitim verilerinin temininde katkı sağlayan ESA topluluk platformuna teşekkür ederim.

İdyopatik Epilepsi ile İyon ve Non-İyon Kanal Genlerindeki Mutasyonların İlişkisi

Berrin Tuğrul* (*https://orcid.org/0000-0003-0844-7766)*

*Manisa Celal Bayar Üniversitesi, Fen Edebiyat Fakültesi, Biyoloji Bölümü, Moleküler Biyoloji AD, Manisa, Türkiye

*berrin.tugrul@yahoo.com

Özet

Son yıllarda idyopatik epilepsilerin altında yatan genetik kökenin non iyon ve iyon kanal genlerindeki mutasyonlardan kaynaklandığına yönelik çalışmalara ilgi artmıştır. İdyopatik epilepsi için ilk gen 1995 yılında keşfedildiği tarihten beri devam eden moleküler genetik araştırmalarla, bu kompleks hastalığın moleküler temelinin çözümlenmesine çalışılmaktadır. Non iyon kanal genlerinden HP, ACP1, ME2, LGI4, OPRM1, GRIK1, BRD2, EFHC1, ve EFHC2 genleri çeşitli metabolik yolaklarda önemli rol oynayan enzimleri kodlarlarken, KCNJ10, KCNJ3, KCNQ2/KCNQ3, CLCN2, GABRG2, GABRA1, SCN1B, ve SCN1A genleri merkezi sinir sistemindeki iyon kanallarını kodlar. İdyopatik epilepsinin genetik temelinde merkezi sinir sistemi için önemli olan proteinleri kodlayan iyon kanalları ve non iyon kanal genlerindeki mutasyonların rolü olabileceği ileri sürülmektedir. Genotipik ve fenotipik heterojenite gösteren bu kompleks hastalığın oluşumunda rol oynayan genetik etkenlerle ilgili yapılacak yeni çalışmaların, epilepsinin patofizyolojisinin aydınlatılması ve yeni tedavi yöntemlerinin geliştirilmesine katkısı olacaktır.

Anahtar Kelimeler: İdyopatik epilepsi, iyon kanal genleri, non iyon kanal genleri

The Relationship between Idiopathic Epilepsy and Mutations in Ion and Non-Ion Channel Genes

Abstract

In recent years, the interest in studies that the underlying the genetic origin of idiopathic epilepsies has been due to the mutations in the non-ion and ion channel genes has increased. With the ongoing molecular genetic research since the discovery of the first gene for idiopathic epilepsy in 1995, people have been trying to resolve the molecular basis of this complex disease. While the non-ion channel genes of the HP, ACP1, ME2, LGI4, OPRM1, GRIK1, BRD2, EFHC1, and EFHC2 encode the enzymes that play an important role in various metabolic pathways, KCNJ10, KCNJ3, KCNQ2/KCNQ3, CLCN2, GABRG2, GABRA1, SCN1B, and SCN1A genes code the ion channels in central nervous system. It has been suggested that mutations in ion channels and non-ion channel genes that encode proteins important for the central nervous system may play a role in the genetic basis of idiopathic epilepsy. New studies on the genetic factors that play a role in the formation of this complex disease with genotypic and phenotypic heterogeneity will contribute to the elucidation of the pathophysiology of epilepsy and the development of new treatment methods.

Key words: Idiopathic epilepsy, ion channel genes, non-ion channel genes

GİRİŞ

Bu çalışmada, literatür araştırması ışığında idyopatik epilepsi (IE) tanımı, idyopatik epilepsi alt tiplerinde etkili olan hastalıkla ilişkili bazı iyon kanallarını kodlayan ve çeşitli metabolik yolaklarda kritik öneme sahip proteinleri kodlayan genlerdeki mutasyonlara örnekler verilerek IE gelişmesinde etkisi olabilecek genetik kökene ilişkin bilgiler verilmesi amaçlanmıştır. Ayrıca voltaj kapılı ve ligand kapılı iyon kanallarının yapısı ve kanalı oluşturan alt ünitelerin görevlerine de değinilerek, bu kanalların yapısının bozulmasına neden olan mutasyonların etkisi ile epilepsi gelişimine katkılarına da yer verilmektedir.

Epilepsiler, hareket, duyusal, bilişsel, ruhsal ya da otonomik bozukluklara yol açan tekrarlayan nöbetlerle karakterize edilen bir hastalıktır (Steilein, 2004).

Epilepsinin epidemiyolojisi ile ilgili sınırlı sayıda çalışmalar yapılmıştır. Gelişmiş ülkelerde hastalığın insidansı yılda 0.05%, prevalansı 0.4%-1.0%'dır. Epilepsili hastaların %30'unda, kafa travması, inme, tümör ya da doğuştan var olan bir lezyon gibi bilinen bir sebepten hastalık görülmektedir. Olguların %70'ini ise, genetik faktörlerin rol oynadığı idyopatik epilepsiler oluşturmaktadır (Heron ve ark., 2007a).

Normal bir beyinde uyarıcı ve baskılayıcı mekanizmalar arasındaki dengenin bozulmasıyla, en azından nöronal uyarılabilirlikte meydana gelen bir artış sonucunda epilepsi oluşumuna yol açan mekanizmalar tetiklenebilir.

Son yıllarda yapılan çalışmalar, İdyopatik epilepsinin altında yatan nedenin iyon kanalları ve non iyon kanalları ile ilişkili genlerdeki mutasyonların olduğunu göstermektedir.

1.Aşırı Nöronal Uyarılma; Epileptogenez

Bir nöronun elektrofizyolojik uyarılmasında ve nöronlar arasındaki iletişimde iki temel mekanizma vardır. Birincisi aksonal iletimle aksiyon potansiyelinin oluşması ve ikinci mekanizma olan sinaptik aktarımla bir hücreden diğer hücreye sinyalin iletilmesidir. İyon kanalları bu işlemler için zemin hazırladığından, herhangi bir mutasyonla bozulan kanal fonksiyonu beyin uyarılabilirliğini değiştirebilir ve epileptik nöbetlere yol açabilir (Lerche, 2001).

Aksiyon potansiyeli sırasında depolarizasyon ve repolarizasyon süreci voltaja bağlı Na+ ve K+ kanallarının açılıp kapanmasıyla yürütülür. Sodyumun hücre içine akımıyla aktivasyon depolarizasyona yol açar, oysaki Na+ kanallarının hızlı inaktivasyonu ve K+'un dışarıya doğru akımıyla aktivasyon membram repolarizasyonundan sorumludur. Sonuç olarak hızlı Na+ kanal inaktivasyonunda aksama ya da K+ geçirgenliğindeki azalma yavaşlamaya yol açar ya da hücre membranında tamamlanmamış repolarizasyon aşırı uyarılmayla sonuçlanır. Aşırı uyarılmaya neden olan bu durumlar kanal hastalıklarının (kanalopati) altında yatan en yaygın mekanizmadır (Lerche, 2001).

Beyin nöronlarındaki iyon kanallarını kodlayan genlerdeki mutasyonlar çeşitli epilepsi sendromlarında belirlenmiştir. Nöronal ağda, baskılayıcı iletimde iş gören kanalın fonksiyon kaybetmesi nöronal baskılama sistemini bozarken, uyarıcı sinirsel iletimde (nörotransmisyon) rolü olan kanalın fonksiyon kazanması aşırı uyarılmaya (hiper-eksitasyon) neden olur ve her iki durumda epilepsiye yol açabilir (Hirose, 2006).

2.İdyopatik Epilepsi ve Genetik

ILAE'nın (International League Against Epilepsy) 2001 epilepsi sınıflama önerisine göre, "idyopatik epilepsi (IE) sendromu; altında yapısal bir beyin lezyonu veya başka nörolojik belirti ve bulgular olmaksızın sadece epilepsinin olduğu bir sendromdur ve bulguların genetik kökenli olduğu öngörülmektedir ve yaşa bağımlıdır" olarak belirtilmektedir." (Engel, 2001).

Nöbetlerin başlıca klinik bulgu olduğu idyopatik epilepsilerde genetik ve fenotipik heterojeniteye ilave olarak çevresel faktörlerle etkileşen pek çok genin etkisinden dolayı hastalığın genetiği tam olarak aydınlatılamamıştır (Bebek ve Baykan, 2006).

Kompleks kalıtım gösteren idyopatik epilepsilerde birden fazla gen ve çevresel faktörlerin etkisi söz konusudur. Basit kalıtım özelliği olan IE'lerde ise hastalıkla ilişkili olan tek bir gendeki mutasyonlar hastalığın ortaya çıkmasında etkili olmaktadır (Heron ve ark., 2007a).

2.1.İdyopatik Epilepsi Sendromlarında Belirlenen Genler

İdyopatik epilepsi için ilk gen 1995 yılında keşfedildiği (Steinlein, 1995) tarihten beri devam eden moleküler genetik araştırmalarla, bu kompleks hastalığın moleküler temelinin çözümlenmesine çalışılmaktadır (Reid, 2009).

Epilepsinin genetik temelinde merkezi sinir sistemi için önemli bazı iyon kanallarını kodlayan ve çeşitli metabolik yolaklarda kritik öneme sahip proteinleri kodlayan genlerdeki mutasyonların rolü olduğu belirtilmektedir. Bu genlerden; HP, ACP1, ME2, LGI4, OPRM1, GRIK1, BRD2, EFHC1, ve EFHC2 genleri çeşitli metabolik yolaklarda önemli rol oynayan enzimleri kodlarlarken, KCNJ10, KCNJ3, KCNQ2/KCNQ3, CLCN2, GABRG2, GABRA1, SCN1B, ve SCN1A genleri merkezi sinir sistemindeki iyon kanallarını kodlar (Lucarini ve ark., 2007).

Nöronal voltaj kapılı ve ligand kapılı iyon kanallarının alt ünitelerini kodlayan genlerdeki mutasyonlarla idyopatik epilepsiler arasındaki ilişkiden dolayı onlar kanalopatiler (iyon kanal hastalıkları) sınıfında değerlendirilmektedir (Heron, 2007).

2.2.İyon Kanalları

İyon kanalları beyin ve elektriksel olarak uyarılabilen diğer dokularda önemli bir fonksiyona sahiptir. İyon kanalları sodyum (Na+), potasyum (K+), klorid (Cl-) ya da kalsiyum (Ca2+) iyonlarının seçici olarak geçişine izin veren membrandaki porlardır. Temel olarak voltaj kapılı iyon kanalları ve ligand kapılı iyon kanalları olmak üzere iki tiptedirler (Vidaurre ve ark., 2009).

Membran uyarılabilirliği (excitability) ve nörotransmitter salınımı ile direkt olarak ilişkili olan yapılardır. İdyopatik epilepsi gelişmesinde katkısı olan kanallardan, ligand kapılı iyon kanalları ise sinaptik aktarımda (transmission) iş görmektedir (Steinlein, 2004).

2.2.1.Voltaj Kapılı İyon Kanalları

Voltaj kapılı iyon kanalları aksiyon potansiyelinin başlaması, çoğalması ya da nörotransmitter salınımı için gereklidir. Çoğunlukla nöronların akson ve akson uçlarında bulunur (Forehand, 2009).

Membran potansiyelindeki değişikliklerle açılıp kapanan voltaj kapılı Na+, K+, Cl- ve Ca2+ kanalları birkaç alt üniteden oluşur. Membranda por oluşumunu sağlayan α-alt ünitesi ve bir ya da daha fazla sayıda olabilen, kanalın işlevini değiştiren daha küçük eklenti alt ünitelerden (β, γ, δ gibi) meydana gelirler (Lerche ve ark., 2001). Voltaj kapılı iyon kanalları membranda aksiyon potansiyelinin oluşumu ve kontrolünde iş görmektedir (Steinlein, 2004).

2.2.1.1.Voltaj Kapılı Na+ Kanalları

Voltaj kapılı Na+ kanallarının temel görevi nöronal uyarılma için aksiyon potansiyelini başlatmak ve yayılmasını sağlamaktır. Kanalın dört adet α-alt ünitesini dokuz gen ve iki adet β alt ünitesini dört gen kodlamaktadır (Catterall ve ark., 2005). Her iki alt ünitenin de kodlayan genlerindeki bazı mutasyonların idyopatik epilepsi sendromlarının çeşitli tipleri ile bağlantılı olduğu bulunmuştur.

2.2.1.1.1.SCN1A (Nöronal Voltaj Kapılı Sodyum Kanal A1 Altünitesi) Gen Mutasyonları

Nöronal sodyum kanalının α1 altünitesini kodlayan gen SCN1A genidir. SCN1A geni 2. kromozomun q24 bölgesinde SCN2A ve SCN3A genlerinin de bulunduğu gen kümesi içinde yer almaktadır. SCN1A geni 26 exon içerir ve 6030 bç'lik mRNA kodlar. SCN1A mRNA'sından alternatif kesip-çıkarma (splicing) mekanizması sonucu, aralarında 11 aminoasitlik farkın olduğu iki izoform ürün elde edilir (Schaller ve ark., 1992).

Şu ana kadar SCN1A geninde 100'den fazla mutasyon belirlenmiştir (Reid 2009). Teklif edilen isimlendirme değişikliğine göre febril nöbet artı genetik epilepsi olarak isimlendirilen GEFS+ (Scheffer ve ark.,2008) epilepsi tipinde genetik kökenin SCN1A genindeki yanlış anlamlı (missense) mutasyonlardan kaynaklandığı belirtilmektedir (Harkin ve ark., 2001; Wallace ve ark., 2001a; Abou-Khalil ve ark., 2001; Sugawara ve ark., 2001a; Annesi ve ark., 2003; Lossin ve ark., 2003). GEFS+'daki Na+ kanal genlerinden SCN1A'daki mutasyonların her biri farklı biyofiziksel etkilere yol açar. Kanala fonksiyon kazandıranlar R1648H (Spampanato ve ark., 2004a), W1204R (Spampanato ve ark., 2004a), D188V (Cossette et. Al., 2003), D1866Y (Spampanato ve ark., 2004b) mutasyonlarıdır ve aşırı uyarılmaya (hyperexcitability) neden olurlar. GEFS+ ile ilişkili bulunan A1685V, V1353L (Lossin ve ark., 2003) ve R859C (Barele ve ark., 2006) mutasyonları ise kanal fonksiyonu kaybına neden olmakta ve aşırı uyarılmaya yol açmaktadır. Kanal aktivitesindeki hem azalma, hem de artma GEFS+'ya neden olan nöronal aşırı uyarılmanın altında yatan sorumlu mekanizma olabilir (Reid, 2009).

SCN1A genindeki de novo mutasyonlar Dravet Sendromu (DS) ile ilişkili bulunmuştur (Claes ve ark., 2001; Sun ve ark., 2008). De novo mutasyonlar hem yanlış anlamlı, hem de budanmış (truncated) mutasyonları içermektedir (Reid, 2009). Mulley ve arkadaşları, de novo mutasyonların dışında Dravet sendromlu hastaların %15'inde sadece ekson delesyonlarının olduğunu belirlemişlerdir (Mulley ve ark., 2006).

2.2.1.1.2.SCN2A (Nöronal Voltaj Kapılı Sodyum Kanal A Altünitesi Tip II) Geni Mutasyonları
SCN2A geni, 2. kromozomun q23-q24 bölgesinde haritalanmıştır (Ahmed ve ark., 1992).

SCN2A genindeki yanlış anlamlı mutasyonlar idyopatik epilepsi tiplerinden BFIC, tip 3 (BFIC3) ve GEFS+ tip 7 (Genetic Epilepsy with Febrile Seizures Plus, type 7 (GEFSP7)) ile ilişkilendirilmektedir. Gendeki ARG188TRP aminoasit değişiminin GEFSP7 ile (Sugawara ve ark., 2001b), LEU1330PHE, LEU1563VAL değişiminin BFIC3 ile (Heron ve ark., 2002), VAL892ILEU ARG223GLN, ARG1319GLN, LEU1003ILE allelik varyantların BFIC3 ile (Berkovic ve ark., 2004) bağlantılı olduğu bulunmuştur. Yanlış anlamlı mutasyonlar sonucunda oluşan epilepsilerde orta derecede bir fenotip görülmektedir.

Gende R102X aminoasit değişimine neden olan de novo anlamsız mutasyon çok daha ciddi bir fenotipe yol açmaktadır (Kamiya ve ark., 2004). Ogiwara ve arkadaşları (Ogiwara ve ark., 2009) SCN2A geninde bulunan E1211K, -I1473M, and -R102X aminosit değişimine neden olan de novo mutasyonların epilepsilerin etiyolojisini anlamaya yardımcı olacağını belirtmektedirler. Hastalar arasındaki fenotipik çeşitliliğin mutant kanallardaki farklı elektrofizyolojik özelliklerden dolayı olabileceği düşünülmektedir (Ogiwara ve ark., 2009).

Dravet Sendromunda SCN1A geninde yüzlerce mutasyon bulunmasına karşın, SCN2A geninde üç mutasyon tesbit edilmiştir. Bu üç mutasyondan ikisi yanlış anlamlı, biri R1312T de novo mutasyonudur ve mutasyonların Dravet Sendromuna sebep olduğu bildirilmektedir (Shi ve ark., 2009).

2.2.1.1.3.SCN1B (Nöronal Voltaj Kapılı Sodyum Kanalı B Tip I Altünitesi) Geni Mutasyonları
Voltaj kapılı sodyum kanallarının, kanalın işlevini değiştiren daha küçük eklenti alt ünitelerinden β tip 1 alt ünitesini kodlayan gen SCN1B genidir. Genin kromozomal yerleşimi 19. kromozomun (McClatchey ve ark. (1993) q13.1 bölgesindedir (Wallace ve ark., 1998). Membran uyarılabilirliğini etkileyen kalıtsal hastalıklarla ilgili olan SCN1B geni, 5 exon (72 -749 bp büyüklüğünde) ve 4 intron (90 bp - 5.5 kb büyüklüğünde) içerir (Makita ve ark., 1994).

Bu gendeki C121W mutasyonu, sodyum kanalının β tip I alt ünitesinin fonksiyonunu yitirmesine, bu da kanalın α alt ünitesinin inaktive edilmesinin azalmasına, böylece artan sodyum akımıyla membranın daha fazla depolarizasyonuna ve aşırı uyarılmaya yol açar. C121W yanlış anlamlı mutasyon GEFS+'li Avustralya'lı bir ailede bulunmuştur (Wallace ve ark., 1998).

Audenaert ve arkadaşlarının çalışmasında, sodyum kanalının beta tip I alt ünitesi geni splice bölgesindeki Adeninin Sitozine değişiminin 5 aminoasitlik bir delesyona sebep olduğu ve bu mutasyonun absans nöbeti olan hastalarda ateşi önlediği belirtilmektedir (Audenaert ve ark., 2003).

SCN1B geninde bulunan iki yeni mutasyon R85C ve R85H mutasyonlarıdır (Scheffer ve ark., 2007).

2.2.1.2. Voltaj Kapılı Potasyum (K+) Kanalları
Potasyum kanalları en farklı iyon kanal grubudur. Voltaj kapılı K+ kanalının (Kv), İçeri doğru düzeltici (inward rectifier) K+ kanalı (Kir), Kalsiyum'la aktive edilen K+ kanalı gibi farklı tipleri bulunur.

Voltaj kapılı K+ kanalları ana alt ünite olarak dört homolog α-alt ünitesinden ve sitoplazmik Kvβ ya da sitoplazmik kalsiyum bağlayan protein ailesinden olan KchIP ve DPP benzeri (transmembran dipeptidil peptidaz benzeri protein) eklenti alt ünitelerden oluşur. Her bir α alt ünitesindeki 6 transmembran alandan (S1-S6 olarak adlandırılır), S1-S4 transmembran segmentleri voltaj duyarlı kısmı, S5-S6 transmembran segmentleri kanalın iyonik geçirgenlik yolunu (por) oluşturan kısmıdır. Her bir α alt ünitesindeki dördüncü transmembran segmenti (S4), alt ünitenin voltaj duyarlı ana parçasıdır (Vacher ve ark., 2008).

Voltaj kapılı K+ kanallarının daha küçük eklenti alt üniteleri ya sitoplazmik, ya da tek-çift ya da dörtlü span transmembran polipeptidleridir. Bu eklenti alt üniteleri, ana kanal kompleksinden faklıdır ve kanal fonksiyonunu, hücre içi trafiği (intracellular traficking), translasyon sonrası değişimleri, kararlılığı ve lokalizasyonu önemli ölçüde etkileyen kısımdır (Vacher ve ark., 2008).

Voltaj kapılı K+ kanalları farklı gen ailesinin üyeleridir. Kvα alt ünitesini kodlayan gen ailesi KCN olarak isimlendirilir. KCN ailesindeki dört orijinal alt aileyi kodlayan genler Kv1-Kv4 ya da KCNA-KCND harfleri ile ve Kv isimlendirmesini takip eden özel gen numaraları (örneğin; Kv1.1 = KCNA1, Kv1.4 = KCNA4, Kv2.1

= KCNB1 vb.) ile belirtilir. Kv5-Kv12 alt aileleri KCNF (Kv5), KCNG (Kv6), KCNQ (Kv7), KCNV (Kv8), KCNS (Kv9) ve KCNH (Kv10-12) şeklinde belirtilir (Vacher ve ark., 2008).

2.2.1.2.1.KCNQ2 (Potassium Channel, Voltage-Gated, Kqt-Like Subfamily, Member 2) ve KCNQ3 (Potassium Channel, Voltage-Gated, Kqt-Like Subfamily, Member 3) Geni Mutasyonları
KCNQ2 geni 20q13.3 kromozom bölgesinde yer alır, en az 18 ekzonu bulunur ve 50kb uzunluğundadır. Kesip çıkarma işlemi sonucu farklı varyantlarının olduğu bulunmuştur (Biervert and Steinlein, 1999). KCNQ3 geni 8q24 kromozom bölgesinde haritalanmıştır (Charlier ve ark., 1998).

KCNQ2 ve KCNQ3 genleri beyin uyarılabilirliğinde anahtar rolü oynayan voltaj kapılı potasyum kanal ailesinin bir üyesidir. KCNQ2 (Singh ve ark., 1998) ve KCNQ3 (Charlier ve ark., 1998) genlerindeki mutasyonların idyopatik jeneralize epilepsi tiplerinden biri olan BFNC'nin altında yatan genetik neden olduğu 1998 yılında bulunmuştur.

KCNQ2'de yanlış anlamlı mutasyonlardan Tyr284Cys (Singh ve ark., 1998a), Ala306Thr (Singh ve ark., 1998b), Arg214Trp (del Guidice ve ark., 2000), Arg207Trp (Dedek ve ark., 2001), Ser247Trp ((Dedek ve ark., 2003), Lys526Asn (Borgatti ve ark., 2004), V589X veT359K (Volkers ve ark., 2009) BFNC'li hastalarda belirlenmiştir. Gendeki delesyonlar (Rett and Teubel, 1964; Zimprich ve ark., 2006; Goldberg-Stern ve ark., 2009), insersiyonlar (Bievert ve ark., 1998), aynı gende hem insersiyonun hem de delesyonun olması sonucu S4 kısmı eksik protein eldesine neden olan mutasyonlar (Bassi ve ark., 2005) BFCN1 ile ilişkilendirilmiştir.

KCNQ3 geninde Gly263Val (Charlier ve ark., 1998) aminoasit değişimine neden olan yanlış anlamlı mutasyonların BFNC2'nin altında yatan genetik neden olduğu saptanmıştır.

2.2.1.2.2.K+ Kanallarındaki Diğer Mutasyonlar
KCNJ10 içeri doğru düzeltici (inward rectifier) K+ kanalıdır (Kir) ve hücre dışı potasyum konsantrasyonunu düzenlemekte rol oynar. KCNJ10 Arg271Cys yanlış anlamlı mutasyonunun idyopatik jeneralize epilepsi sendromlarında nöbete yatkınlık üzerine etkisi olduğu belirlenmiştir (Bueno ve ark., 2004; Lenzen ve ark., 2005a).

2.2.1.3.Voltaj Kapılı Ca2+ Kanalları
Voltaj kapılı Ca2+ kanalları membran depolarizasyonuna cevap olarak sinir hücrelerinde kalsiyumun içeriye doğru akışına aracılık ederler. Bu kanallar, hücredeki fizyolojik olaylar için nöronal plazma membranda elektriksel sinyalin birleştirilmesinde önemli bir role sahiptir. Her biri çeşitli genlerden kodlanan, por oluşturan büyük bir α1 alt ünitesi ile α1 alt ünitesinin fonksiyonunu etkileyen birçok eklenti alt ünitelerden (Cavα2δ, Cavβ ve Cavγ) oluşur. Voltaj kapılı kalsiyum kanalları Cav1 (L-tipi), Cav2 (P/Q-, N- ve R-tipi) ve Cav3 (T-tipi) ailesi olmak üzere üç sınıfa ayrılır. Cav1 (L-tipi) ailesi, memeli merkezi sinir sistemi hücrelerinde somatodendritik kalsiyum akımında kritik öneme sahiptir. Cav2 (P/Q-, N- ve R-tipi) ailesi somatodendritik kalsiyum akımında ve memeli merkezi sinir sistemindeki birçok hücrede presinaptik uçlardan nörotransmitter salınımının düzenlenmesinde iş görür. Cav3 (T-tipi) ailesi membran potansiyelini alt eşik değere getiren kısa süreli akımın temelini oluşturur (Vacher ve ark., 2008).

2.2.1.3.1.CACNA1A (Voltaj Kapılı P/Q Tipi Kalsiyum Kanalı Alfa 1A Alt Ünitesi) Geni Mutasyonları
CACNA1A geni 19p13 kromozomal bölgesinde bulunur ve 47 ekzon içerir (Ophoff ve ark., 1996). IJE ilişkisinin araştırıldığı bir çalışmada, genin 8. ekzonundaki tek nükleotid polimorfizmlerinin IJE ile bağlantılı olabileceği belirtilmiştir (Chioza ve ark., 2001). Genin 6 ile 9'uncu ekzonları arasındaki bölgeye yakın olan bir ya da iki intronik fonksiyonel olarak önemli varyantın (FVS) IJE'ye yatkınlık oluşturabileceği rapor edilmiştir (Chioza ve ark., 2002).

2.2.1.3.2.CACNB4 (Voltaj Kapılı Kalsiyum Kanalı Beta-4 Alt Ünitesi) Geni Mutasyonları
CACNB4 geni 2q22-q23 kromozomal bölgesinde yer alır (Taviaux ve ark., 1997). Gen 13 exon içermektedir (Escayg ve ark., 1998). Kalsiyum kanalı α1 alt ünitesinin içerdiği domainlerin bütünlüğünü sağlamada fonksiyonel öneme sahiptir (Chen ve ark., 2004).

Escayg ve arkadaşları, bu gendeki R482X mutasyonunun idyopatik jeneralize epilepsi tiplerinden JME ile, C104F yanlış anlamlı mutasyonun IJE ile ilişkilendirilebileceğini belirtmektedirler (Escasy ve ark., 2000).

2.2.1.3.3.CACNA1H (Voltaj Kapılı T Tipi Kalsiyum Kanalı Alfa-1H Alt Ünitesi) Geni Mutasyonları
16p13.3 kromozom bölgesinde bulunan (Cribss ve ark., 1998) CACNA1H geni 27 ekzon içerir (Jagannathan ve ark., 2002). CACNA1H geni, soma ve proksimal dendritlerde bulunan T tipi kalsiyum kanalının Cav3.2 alt ünitesini (α alt ünitesi tipi) kodlar. Gendeki F161L (Chen ve ark., 2003; Khosravani ve ark., 2004), E282K (Chen ve ark., 2003; Khosravani ve ark., 2004), V831M (Chen ve ark., 2003; Khosravani ve ark., 2004), R788C (Chen ve ark., 2003) yanlış anlamlı mutasyonları çocukluk çağı absans epilepsisi (CAE) olan hastalarda, P618L mutasyonu (Heron ve ark., 2004) ve A876T mutasyonu (Heron ve ark., 2007b) IJE grubunda belirlenmiştir.

Vitko ve arkadaşları CACNA1H geninde aynı anlamlı olmayan 12 tek nükleotid mutasyonunun yalnızca CAE'li hastalarda olduğunu bildirmişlerdir. Bu mutasyonlardan G773D–R788C mutasyonlarının birlikte bulunması farklı davranışlara yol açmaktadır. CACNA1H genindeki varyantların epilepsi nöbet tipine yatkınlık oluşturabilecek gen olduğu düşünülmektedir (Vitko 2005).

2.2.1.3.4. Voltaj Kapılı Klorid (Cl-) Kanalları
Klorid kanalları açılıp kapanma mekanizmalarına göre sınıflandırılmaktadır. Membran elektrik potansiyelindeki değişikliklerle açılıp kapananlara voltaj kapılı klorid kanalları (CIC), protein kinaz aktivasyonu ile aktive olanlara kistik fibroz transmembran iletken düzenleyici (CTFR) Cl- kanalları, Ca2+ ile aktive olan Cl+ kanalları (CaCC), ve glisin ya da aminobutirik asid (GABA) ile aktive olan Cl+ kanalları olmak üzere dört gruba ayrılır. Nöron ve kas hücresi plazma membranındaki klorid kanalları, membran potansiyelindeki değişikliklerle açılır ve elektriksel uyarının engellenmesini, böylece membran potansiyelinin negatif değere dönmesini sağlarlar. Hatalı klorid kanalları aşırı uyarılmaya yol açarlar (Puljack and Kilic, 2006).

2.2.1.3.4.1. CLCN2 (Klorid Kanal 2) Geni Mutasyonları
Voltaj kapılı klorid kanalı 2 geni 3q26 kromozomal bölgesinde yer alır (Sander ve ark., 2000). CLCN2 geninin epilepsi ile ilişkisi bakımından tartışmalı çalışmalar bulunmaktadır. Bu konuda yapılmış çalışmalarda gendeki bazı mutasyonların idyopatik jeneralize epilepsi ile ilişki olduğunu belirtmesine (Haug ve ark., 2003; Kleefuss-Lie ve ark.,20099) karşın, Niemeyer ve arkadaşları bu mutasyonların epilepsi ile bağlantılı olmadığını ileri sürmüşlerdir (Niemeyer ve ark., 2010).

2.2.1.4.HCN (Hiperpolarizasyonla Aktive Edilen Siklik Nükleotid Kapılı) Kanalları
HCN kanalları kendine özgü biyolojik özellikleri olan voltaj kapılı iyon kanallarıdır. H-kanalı adı da verilmektedir. Diğer voltaj kapılı iyon kanallarından farklı özelliklere sahiptirler. Yapısal olarak K+ kanallarına benzemekle birlikte Na+ akışına geçirgendirler, bu nedenle nöronal membran potansiyelini depolarize ederler. Kanalın aktivasyonu hem voltaja hem de ikinci mesajcılara (cAMP) bağlıdır. Kanalın açılması diğer iyon kanallarına göre yavaştır ve diğer voltaj kapılı kanallar membran depolarizasyonu ile açılırken H-kanalları hiperpolarizasyona cevap sonucu açılır (Poolos, 2005).

HCN kanalları dört ayrı gen (HCN1-4) tarafından kodlanmaktadır. HCN alt tipleri arasındaki biyofizyolojik farklar bulundukları beyin bölgesinde çeşitli fonksiyonel rolleri üstlenmelerine yol açar. H-kanal aktivitesinin kaybı iç nöronal aşırı uyarılabilirliğe neden olur (Poolos, 2005).

HCN kanallarındaki kaybın epilepsiye neden olabileceğine ilişkin kesin bir kanıt henüz elde edilememiştir. Tang ve arkadaşlarının yaptıkları hasta-kontrol çalışmasında, HCN1 geninde A881T amino asit değişimi 510 kontrol grubunda gözlenmemesine karşın IJE grubunda bir hastada gözlenmiştir. HCN1 ve HCN2 gen varyantlarının IJE'ye katkısına ilişkin daha fazla çalışma yapılması gerektiği vurgulanmıştır (Tang ve ark., 2008).

2.2.2. Ligand Kapılı İyon Kanalları
Hızlı sinaptik iletişime katılan Ligand kapılı iyon kanalları nikotinik asetil kolin (nAChR), 5-hidroksitriptamin3 (5-HT3), g-aminobutirik asitA (GABAA), glisin, iyonotrofik glutamat ve p2X reseptör ailelerinden oluşur (Collingridge ve ark., 2009).

Bu kanalları aktive eden nörotransmitterler ya uyarıcı (örn; ACh, glutamat) ya da engelleyici (örn; GABA, glisin) etkiye sahiptirler (Vidaurre et al; 2009). Ligand kapılı kanallarda kapalı, açık ve uyarıya karşı duyarsız olmak üzere üç ana yapısal durum söz konusudur (Lerche ve ark., 2001). Uyarıcı nörotransmitterler (glutamat,

ACh, seratonin ve ATP) ligand-kapılı iyon kanallarını açarak öncelikle Na+ ve Ca+2 geçişine izin verirler ve hücre daha kolay uyarılabilir hale gelir. İnhibitör hızlı nörotransmitterler (GABA ve glisin) ise klor (Cl-) geçişine izin vererek hücre içindeki negatif yükü arttırır ve hücrenin daha az uyarılabilir olmasına yol açar. Ligand kapılı kanallar transmitterin bağlanması ile açılır ve transmitter uzaklaşana kadar yeni uyarıya karşı duyarsızlaşır. Transmitter uzaklaştıktan sonra kanal kapanır, böylece bir sonraki uyarana karşı duyarlı hale gelir (Vidaurre et al; 2009).

Ligand kapılı kanallar birkaç alt üniteden oluşur. 2-4 transmembran segmenti (M1-4) içeren alt üniteler birbirine benzer yapıdadır. Her bir alt ünitedeki M2 segmenti iyon iletimini sağlayan merkezi poru oluşturan kısımdır (Lerche ve ark., 2001).

2.2.2.1. Nöronal Nikotinik Asetil Kolin Reseptörü (nAChR)
Nöronal nikotinik ACh reseptörleri iki α ve üç β alt üniteli pentamerik yapıda ligand kapılı kanallardır. Beyinde sekiz α-(α2-9) ve üç β-(β2-4) alt ünite izoformları eksprese edilmektedir. Beyinde en bol olarak bulunanları CHRNA4 geni ürünü olan α4 ve CHRNB2 geni tarafından kodlanan β2 alt üniteleridir (Dani, 2015).

2.2.2.1.1.CHRNA4 (Nöronal Asetil Kolin Reseptörü Alfa 4 Alt Ünitesi) Geni Mutasyonları
CHRNA4 geni 20. kromozomun (Anand and Lindstrom, 1992) q13.2-q13.3 bölgesinde bulunur (Steinlein ve ark., 1994) ve 6 ekzon içerir (Steinlein ve ark., 1996).

İdyopatik fokal epilepsi tiplerinden ADNFLE'li Avustralyalı geniş bir ailede yapılan çalışmalarda, genin 5. ekzonundaki Ser248Phe mutasyonunun reseptör fonksiyonunu azalttığı bulunmuştur (Phillips ve ark., 1995, Steinlein ve ark., 1995).

ADNFLE'li Norveçli bir ailede genin 776. pozisyonundaki nükleotidin bulunduğu kısma üç bp'lik (GCT) katılımın (insersiyon), kalsiyum geçirgenliğini düşürdüğü ve reseptör fonksiyon kaybından sorumlu olabileceği bildirilmiştir (Steinlein ve ark., 1997).

Genin 5. ekzonundaki Ser252Leu amino asit değişimine neden olan 755. pozisyondaki C'inin T bazına değişimi ADNFLE'den etkilenmiş kişilerde belirlenmiştir (Hirose ve ark., 1999; Cho ve ark.,2003). Bu değişim kanal fonksiyonunu bozmaktadır.

2.2.2.1.2.CHRNB2 (Nöronal Asetil Kolin Reseptörü β2 Alt Ünitesi) geni mutasyonları
CHRNB2 geni 1q21 kromozomal bölgesinde bulunur (Lueders ve ark., 1999) ve 6 ekzon (Rempel ve ark., 1998) içerir. Gendeki mutasyonlar reseptörün asetil koline duyarlılığını arttırıcı etki yapmaktadır (Hoda et al:, 2008).

Nikotinik asetil kolin reseptörünün β2 alt ünitesindeki, M2 domainini etkileyen V287M (Phillips ve ark., 2001) ve genin 5. ekzonundaki V287L (De Fusco ve ark., 2000) aminoasit değişiminin ADNFLE ile bağlantılı olduğu bulunmuştur.

Manfredi ve arkadaşları, nöronal nikotinik reseptörü beta 2 alt ünitesinde V287L mutasyonu taşıyan tip III ADNFLE'li farelerle yaptıkları çalışmada, mutant nikotinik reseptörün beyin gelişiminde nöronal ağdaki anormal oluşumdan sorumlu olduğunu, bunun da epilepsiye yol açtığını belirtmektedirler (Manfredi ve ark., 2009).

2.2.2.2.Gamma-aminobutirik Asid (GABA) Reseptörü
GABA santral sinir sistemindeki en önemli nörotransmitter engelleyicidir ve iyonotrofik GABAA ve GABAC reseptörleri ve metabotropik GABAB reseptörlerinde rol oynar. Şu ana kadar yapılan çalışmalarda epilepsi ile ilişkili GABA mutasyonlarının GABAA'da olduğu bulunmuştur (Reid ve ark., 2009).

2.2.2.2.1.GABAA Reseptörü
GABAA reseptörü, ligand kapılı iyon kanallarının Cys-loop ailesinin bir üyesidir. Pentamerik yapıda proteinler olan bu reseptörler, Cl- geçişine izin veren porlar içerir. GABAA reseptörü, α, β, γ, ε, δ ve θ alt ünitelerinin çeşitli kombinasyonları sonucu pentamerik yapı oluşturması ile oluşur. Beyindeki en yaygın GABAA reseptörü α1β2γ2 kompleksidir (Reid ve ark., 2009).

IJE ile ilişkili GABAA reseptörü mutasyonları ve varyantları α1, β3, γ2 ve δ alt ünitelerinde bulunmaktadır. Bu mutasyonların tipleri; yanlış anlamlı, anlamsız, kodlayıcı dizilerde çerçeve kayması ve genin kodlamayan dizilerindeki mutasyonlardan oluşmaktadır. Bu mutasyonlar, reseptör fonksiyonunun ya da reseptör alt ünite mRNA kararlılığının, reseptör alt ünite protein katlanması ve kararlılığının, reseptör alt ünitelerinin bir araya toplanmasının ve reseptör trafiğinin bozulmasına yol açmaktadır (Macdonald and Kang, 2009).

2.2.2.2.1.1.GABRA1 (Gamma-Aminobutirik Asid Reseptörü A1 Alt Ünitesi) Geni Mutasyonları
GABAA reseptörünün α1 alt ünitesini kodlayan gen GABRA1'dir. Bu gen genomda 5q34-q35 kromozomal bölgesine haritalanmıştır (Buckle ve ark., 1989).

Ala322Asp amino asit değişimine neden olan mutasyon JME (Cosette ve ark., 2002) ile, genin 975. nükleotidi olan C'inin delesyonu (975delC) sonucu oluşan çerçeve kayması mutasyonu çocukluk çağı absans epilepsi (CAE) (Maljevic ve ark., 2006) ile bağlantılı bulunmuştur.

2.2.2.2.1.2.GABRG2 (Gamma-aminobutirik Asid Reseptörü Gamma2 Alt Ünitesi) Geni Mutasyonları
GABRG2 geni GABAA reseptörünün γ2 (gamma2) alt ünitesini kodlamaktadır. Gen 5q31.1-q33.1 kromozomal bölgesinde yerleşiktir (Wilcox ve ark., 1992) ve 9 ekzon içerir (Harkin ve ark., 2002).

Gendeki Lys289Met yerdeğişimine neden olan yanlış anlamlı mutasyon GEFS+'de,, Arg43Gln (R43Q) mutasyonu hem CAE hem de febril nöbet (FS)'de etkili olmaktadır (Wallace ve ark., 2001b). R139G mutasyonu FS ile ilişkilendirilmiştir (Audenaert ve ark., 2006).

2.2.2.2.1.3.GABRD (Gamma-aminobutirik Asid Reseptörü Delta Alt Ünitesi) Geni Mutasyonları
GABRD geni GABAA reseptörünün delta alt ünitesini kodlar. Bu gen 1. kromozomun p36.3 kromozomal bölgesinde bulunmaktadır (Emberger ve ark., 2000). İnsan GABRD geni 1A ve 1B varyantları 9 ekzon, 1C varyantı 8 ekzon içermektedir (Windpassinger ve ark., 2002).

Gendeki Glu177Ala mutasyonu, Arg220His amino asit yerdeğişimine neden olan yanlış anlamlı mutasyon GEFS+'lı ailelerde bulunmuştur (Dibbens ve ark., 2004).

2.3.İdyopatik Epilepsilerle İlişkili Diğer Genler
İdyopatik epilepsilerin kanal hastalığı olarak isimlendirilmelerine neden olan iyon kanal genlerindeki mutasyonların hastalığa etkisi dışında, epilepsi ile ilişkili non iyon kanal genlerindeki mutasyonların da hastalığın ortaya çıkmasında katkısının olduğu belirtilmektedir. Bu genler arasında, LGI1 (Leucine-rich glioma, inactivated gene 1), LGI4 (Leucine-rich glioma, inactivated gene 4), ME2 (Malik enzim 2), SLC1A3 (uyarıcı aminoasit transporter 1 (EAAT1), EFHC1 (EF-hand domain (C-terminal) containing 1, MASS1 (monogenic, audiogenic seizure susceptibility 1 homolog), EFHC2 (EF-hand domain (C-terminal) containing 2) bulunmaktadır.

2.3.1.LGI1 (Leucine-Rich Glioma, Inactivated Gene 1) geni mutasyonları
LGI1 geni 10q24 kromozom bölgesinde bulunur (Chernova ve ark., 1998) ve genin 8. ekzonunun alternatif kesip çıkarma işlemi sonucunda beyin ve iskelet kasında farklı ürünleri oluşmaktadır (Morante-Redolat ve ark., 2002).

LGI1 genindeki çeşitli mutasyonlar işitsel özellikli otozomal dominant parsiyal epilepsi (ADPEAF)'ye sebep olmaktadır. Gendeki Glu383Ala, 1-bp del, 835C, IVS3AS, C-A, -3 ((Kalachikov ve ark., 2002), Cys46Arg (Gu ve ark., 2002a), 1320C-T (Morante-Redolat ve ark., 2002), Phe318Cys (Fertig ve ark., 2003), Leu232Pro (Chabrol ve ark., 2007), Arg136Trp (Michelucci ve ark., 2007), Ile122Lys (Striano ve ark., 2008) mutasyonları ADPEAF ile ilişkili bulunan mutasyonlardandır.

2.3.2.LGI4 (Leucine-Rich Glioma, Inactivated Gene 4) geni mutasyonları
LGI4 geni 19q13.11 kromozomal bölgede yerleşiktir ve 9 ekzon içerir (Gu ve ark., 2002b). LGI4 geni BFIC ve IJE ile bağlantılı bölgede bulunmaktadır. CAE hastalarında c.1914GC>AT polimorfizminin hastalıkla bağlantılı olabileceği belirtilmektedir (Gu ve ark., 2004).

2.3.3.ME2 (Malik Enzim 2) Geni Mutasyonları

Malik enzim 2, nöronlarda GABA sentezi için gerekli olan piruvatı malata çeviren mitokondrial bir enzimdir (Reid ve ark., 2009).

ME2 geni 18q21 kromozomal bölgesine haritalanmış ve 16 ekzon içerdiği belirlenmiştir (Yanaihara ve ark., 2001).

Linkaj ve asosiasyon analizleriyle ortaya konan 9 SNP haplotipi'nin IJE'li hasta populasyonunda arttığı belirlenmiştir (Greenberg ve ark., 2005). Bir diğer benzer çalışmada ise bu gendeki mutasyonların IJE üzerinde etkisinin olmadığı bildirilmiştir (Lenzen ve ark., 2005b).

2.3.4.MASS1 (Monogenic, Audiogenic Seizure Susceptibility 1 Homolog) Geni Mutasyonları

G Protein-Coupled Receptor 98 (GPR98) olarak da isimlendirilen MASS1 geni ürünü G proteinle bağlantılı çok büyük reseptörün bir kısmını oluşturur. Bu reseptör gelişme sırasında önemli bir role sahiptir (Reid, 2009).

MASS1 geni 5q14 kromozom bölgesinde bulunur (Nikkila ve ark., 2000) ve 90 ekzon içerir (McMillan ve ark., 2002). Gendeki Ser2652Ter anlamsız mutasyon sonucu C ucunda 126 aminoasitlik kısmın kaybolmasına yol açan bu mutasyon febril ve afebril nöbetli bir ailede saptanmıştır (Nakayama ve ark., 2002).

2.3.5.EFHC1 ve EFHC2 Geni Mutasyonları

EF-el yapısı Ca2+ bağlayan motif 1 (EFHC1) ve 2 (EFHC2) genleri iyon kanalları ile ilişkilendirilen non iyon kanal genlerindendir. EFHC1 geninin insan genomundaki paraloğu EFHC2 genidir. EFHC1 ve EFHC 2 genleri beyinde nöronlarda ifade edilir (Gu ve ark., 2005).

2.3.5.1.EFHC1 Geni Mutasyonları

EFHC1 geni 6p12-p11 kromozomal bölgede bulunur ve 11 ekzon içerir. EFHC1 geni 640 aminoasitlik EF-el motifli bir protein kodlar. Protein, üç DM-10 domaini ve bir EF-el yapısına sahip kalsiyum bağlayan motif içerir (Suzuki ve ark., 2004).

Suzuki ve arkadaşları, fare hipokampal primer kültüründe EFHC1'in aşırı ifadesinin (overexpression) nöronları apopitozise teşvik ettiğini gösterdiler. Aynı çalışmada fare beyninde EFHC1 ve Cav2.3 (R tipi kalsiyum kanalı)'ün immüno materyallerinde Cav2.3 C ucu ile EFHC1'in birlikte immunopresipite olduğunu belirlediler. Patch-clamp analizinde de EFHC1'in Cav2.3 kanalı aracılığıyla Ca2+ akımını arttırmakta, JME'li EFHC1 geni mutasyonu taşıyanlarda bu durum kısmi olarak tersine çevrilmektedir (Suzuki ve ark., 2004).

İnsanlardaki EFHC1 geni ortoloğu olan myoklonin 1 geni (mRib72-1) bakımından mutant farelerle yapılan bir diğer çalışmada, heterozigot değil de null mutant olan farelerde beyin ventriküllerinin aşırı genişlediği belirlenmiştir. Yetişkin farelerde, hem heterozigotlarda hem de null mutantlarda sıklıkla kendiliğinden myoklonik nöbetlerin geliştiği görülmüştür. Myoklonin1'in fonksiyon kaybı ya da azalması EFHC1 mutasyonlarının sebep olduğu epilepsilerin altında yatan moleküler temel olabilir (Suzuki ve ark., 2009).

EFHC1 genindeki Arg182His, Phe229Leu (Suzuki ve ark., 2004), Asp210Asn, Pro77Thr, Arg221His (Bai ve ark., 2002; Suzuki ve ark., 2004) ve Gln277Ter (Medina ve ark., 2008) mutasyonları JME ile ilişkilendirilmektedir. Ile174Val ve Cys259Tyr yanlış anlamlı mutasyonlar JAE'li hastalarda belirlenmiştir (Stogman ve ark., 2006).

2.3.5.2.EFHC2 Geni Mutasyonları

EFHC2 geni Xp11.3 kromozomal bölgesinde bulunur, 15 ekzon içerir ve 749 amino asitlik bir protein kodlar. Protein, üç DM-10 domaini ve üç olduğu varsayılan EF-el yapısına sahip kalsiyum bağlayan motif içerir (Gu ve ark., 2005). EFHC1 geninin paroloğu olan EFHC2 geni ürününün fonksiyonu hakkında herhangi bir bilgi yoktur.

Gu ve arkadaşlarının Alman populasyonunda yaptıkları bir çalışmada 654 IJE hastası ve 662 kontrol grubundaki örneklerde EFHC2 geninde polimorfizmler belirlemişlerdir. IJE alt gruplarından absans nöbeti olmayan 81 klasik JME'si olan hastalarda bu polimorfizmlerden S430Y (rs2208592) yanlış anlamlı mutasyonun hastalıkla zayıf bir ilişkisi olduğu bildirilmiştir (Gu ve ark., 2005).

SONUÇ

Altında yapısal bir beyin lezyonu veya başka nörolojik belirti ve bulgular olmaksızın sadece epilepsinin olduğu idyopatik epilepsilerde non iyon ve iyon kanallarını kodlayan genlerdeki mutasyonlar hastalıkla ilişkilidir. Yapılan çalışmalar, IE'lerde bir genin birden fazla hastalık alt tipleri üzerinde etkili olduğu ya da birden fazla genin de aynı IE tipinde etkili olduğunu göstermektedir. Bazı mutasyonların hastalıkla ilişkisine yönelik birbirine zıt bulguların olduğu da görülmektedir. Bu durum, hastalıkla ilişkilendirilen genin etnik kökenine bağlı olarak hastalık üzerinde etkisini gösteriyor olmasından kaynaklanabilir. Genotipik ve fenotipik heterojenitenin söz konusu olduğu bu kompleks hastalığın oluşumunda rol oynayan genetik etkenlerle ilgili yapılacak yeni çalışmaların, epilepsinin patofizyolojisinin aydınlatılması ve yeni tedavi yöntemlerinin geliştirilmesine katkısı olacaktır.

Abstract

In this work, the surface of paper was coated with starch mixed with styrene acrylate copolymer and and polyethylene glycol (PEG) and effects were evaluated in terms of mechanical and physical properties of paper. In addition to this, the effects of PEG on starch coating formulas were characterized by FTIR spectroscopy. The results showed that water absorption values (Cobb 60) decreased to approximately at rate of 31% comparing with reference coating solution coated papers, which contained only styrene acrylate copolymer. With this newly formulated surface sizing application, tensile strength of papers increased about 15% compared with reference.

Keywords: starch, coating, surface sizing

INTRODUCTION

Cellulosic materials such as paper are generally hydrophilic and its fibers have a strong tendency to absorb water. Surface sizing is done to ensure hydrophobicity and reduce water absorption during paper production. Surface sizing is carried out with a special unit in the drying section of the paper machine. Here, the already formed and dried paper sheet is treated with a formulation of hydrophobizing agents and starch, in an application device often called a sizing press, which provides not only hydrophobicity but also surface strength due to the polymeric nature of starch and sizing agents. Sizing generally limits a surface region of the paper that acts as a protective layer that prevents water from entering the hydrophilic interior of the sheet (Bung et al., 2004).

The most commonly preferred sizing materials are resin, starch, chitosan, polyvinyl alcohol, carboxy methyl cellulose, and styrene acrylate emulsions (Özdemir et al., 2017). Latexes such as butadiene-styrene copolymer latexes and styrene acrylate copolymer latexes are widely used in the paper industry to coat paper surfaces. (Duan et al., 1999; Kopacic et al., 2018).

Starch is a biopolymer used in the manufacture of paper and cardboard. The preference of starch is due to its abundance, price, renewability, and suitability for contact with food. In the rapid development of the paper coating industry, starch, modified starch is widely used as adhesive or coating material for paper. However, it has many disadvantages such as poor fluidity, poor water resistance and brittleness of starch films (Zhang et al., 2019). Starch film is fragile due to large molecules and intermolecular interactions between starch chains (Laohakunjit et al., 2004). In surface sizing, starch is applied to the paper surface, where it bonds the fibers to the paper surface and forms a more or less continuous film on the paper surface. Generally oxidized starches are the main type of modified starch used for surface sizing as they show excellent resistance to retrogradation and good fiber binding ability but the oxidized starch solution tends to penetrate the paper structure and there is less starch film on the paper surface. To improve the spreading of starch as film, plasticizers or cationic polymers are used (Cushing, 1979). Such substances have the potential not only to affect the quality of a starch-based film, but they also may affect its hydrophobic nature after drying (Bildik Dal et al., 2021). In addition, paper fibers are negatively charged, so cationic polymers are used to improve surface properties (Seo et al.,

2006). Especially, cationic surface sizing polymers such as cationic styrene acrylate copolymers are used for this purpose (Cushing, 1979 and Lee et al., 2002).

To overcome the fragility of the starch film, it is necessary to add plasticizer. The addition of plasticizers can change the brittleness and improve the flexibility and extensibility of the starch film. An ideal plasticizer should reduce the intermolecular strength and recrystallization of starch, increase the mobility of starch chains, reduce moisture absorption, and be compatible with starch (Laohakunjit et al., 2004). Plasticizers are usually small molecules such as polyol-like sorbitol, polyethylene glycol, interspersed and intervening between polymer chains, breaking the hydrogen bond and increasing flexibility by separating the chains from each other (Gontard et al., 1993).

Polyethylene glycol is often used in renewable biofilm production to reduce the brittleness of the starch film (Kim et al., 2000). The plasticizer property of PEG varies depending on its molecular weight, and as the molecular weight increases, its plasticizing effect decreases (Roz et al., 2006). PEG200 was used as a plasticizer in the study and its effects were investigated by using it together with styrene acrylate copolymer in the surface sizing process. The reason for the usage of polyaluminium chloride hydroxide (PAC) is its synergetic effect with polystyrene acrylate copolymer. Cationic styrene acrylate emulsion products are popular, often used with alum or polyaluminium chloride (Anderson 1997).

In the literature researches, the use of PEG with starch is generally aimed at obtaining a thermoplastic starch film or modify starch (Bourtoom et al., 2008; İbrahim et al., 2019). No studies were found on the use of polyethylene glycol together with cationic styrene acrylate copolymer in surface sizing.

MATERIALS AND METHODS

Materials

In the study, the oxidized corn starch was obtained from TAT Nişasta company with the trade name of Levosize 250.The hydrophobic polymer with the trade name Perglutin (PERG), which is a styrene acrylate copolymer, was purchased from Kurita. Polyaluminium chloride hydroxide (PAC) and polyethylene glycol 200 (PEG) were purchased from Akkim and Ataman chemical companies, respectively. Base papers used for surface treatment were fluting paper procured from Ankutsan Company and %100 recycled papers without any surface treatment.

Methods

Surface Sizing

Oxidized starch weigh was prepared in a beaker at 9.5 % (w/w) concentration. Then, heating and mixing processes were performed. Heating process was continued to reach 85 °C and at this temperature, mixing process continued for 5 minutes. When gelatinization was observed, the solution was cooled to 70 °C and then styrene acrylate copolymer, polyaluminium chloride hydroxide, and PEG 200 were added at different rates. The prepared mixture was applied on the pre-heated paper at 105 °C by coating roller. Base papers were preheated to have good impregnation of coating solution through the paper surfaces. After surface coating, papers were dried at 105 °C for 15 minutes. The mixture formulas and constituents were shown in Table 1. The coat weight (grammage increasement) of the coated paper was determined gravimetrically as the weight difference between coated and uncoated papers of the same area after conditioning at 23 °C and 50% RH for at least 24 h. Measurements were made in triplicate.

Table.1. Constituents of Coatings Formules

Coating Formule Codes	Constituents of Coating Formules
F0	Base paper
F1	0.9% PERG + 1.3% PAC
F2	0.9% PERG + 1.3% PAC + 0.9% PEG
F3	0.9% PERG + 1.3% PAC + 1.7% PEG

Paper Tests

Base paper and paper samples sized with the above-described coating formulations were conditioned for 48h at 23 ± 1 °C and 50% ± 3% RH. All measurements were performed according to the standardized methods listed in Table 2.

Table 2. Property and Methods Used for Characterization of Raw Paper and Sized Paper

Property	Standard
Grammage	EN ISO 536
Cobb 60	EN ISO 535
Tensile strength	EN ISO 1924-2
RCT (Ring Crush Test)	EN ISO 12192

FT-IR (Fourier Transform Infrared) Analysis

FT-IR spectrums of coating formules and papers sized were studied with Bruker alpha II FT-IR spectrophotometer with the ATR-IR. The spectrum was obtained in the range of 4000 to 400 cm^{-1} wavelength, at a resolution of 4 cm^{-1}.

RESULTS and DISCUSSION

Mechanical and Physical Tests Results

To evaluate the effect of coatings on the paper, RCT, Tensile strengths and water resistance tests were carried out according to related standards. Test results were the average values of three coated paper samples. Test results and the amount of coatings applied on the surface can be seen at below Table 3.

Table 3. Mechanical and physical test results and grammage differences

Coating Formula Codes	Physical and Mechanical Tests			Grammage increment of Paper Samples (g/m^2)
	$Cobb_{60}$ (g/m^2)	RCT (kN/m)	Dry Tensile Strength (k.Nm/kg)	
F0	135	1.19	31.82	0
F1	65	1.20	37.64	10.80
F2	45	1.23	41.48	9.31
F3	50	1.26	43.31	9.08

It is shown as in the Table 3 that adding with the PEG on to the reference coating formulation (F1) affected the water resistance (COBB) of flute papers on the positive way. Just by using oxidized starch and styrene acrylate copolymer as Formule 1 decreased the Cobb 60 values as approximately 52% comparing with the base paper. This situation is caused by the hydrophobicity of PERG and oxidized starch film forming properties on the base paper. COBB results were determined decreasing to 30.8% and 23.1%, respectively, with increasing concentration of PEG comparing with the reference Formule 1 (Figure 1). In the similar way Park and co-workers detected the increasing concentration of PEG in protein based films decreased the water vapor permeability (Park et al., 1994). Saputri et al. detected the application of PEG-400 and starch mixture on the paper surfaces decreased the water vapor transmission rate comparing with the base paper but when PEG compared with the just starch film, increasing in the water vapor transmission rate have been observed with 6.7% (Saputri et al., 2017).

Tarique et al. detected that the starch films plasticized absorbs less water (Tarique et al., 2021) and Sanyang et al reported that the water absorption of plasticized films decreased with increasing plasticizer concentration (Sanyang et al., 2016). This effect have been explained by the fact that glycerol formed a stronger hydrogen bond with arrowroot starch, preventing the water molecule from combining with the plasticizer or starch (Tarique et al., 2021).

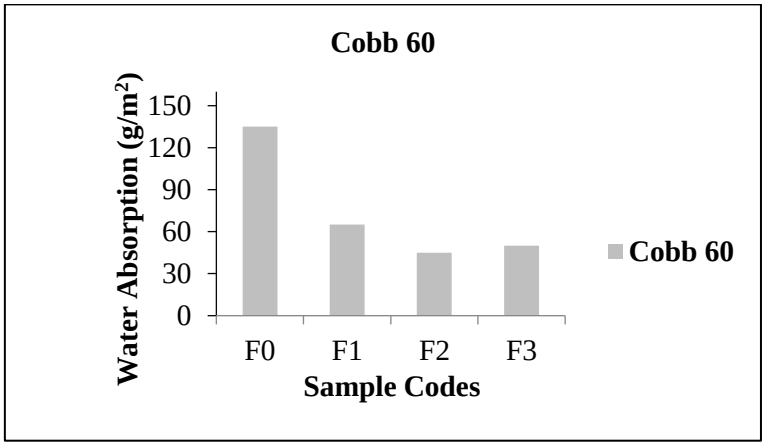

Figure 1. The change of water absorption properties of base and coated papers

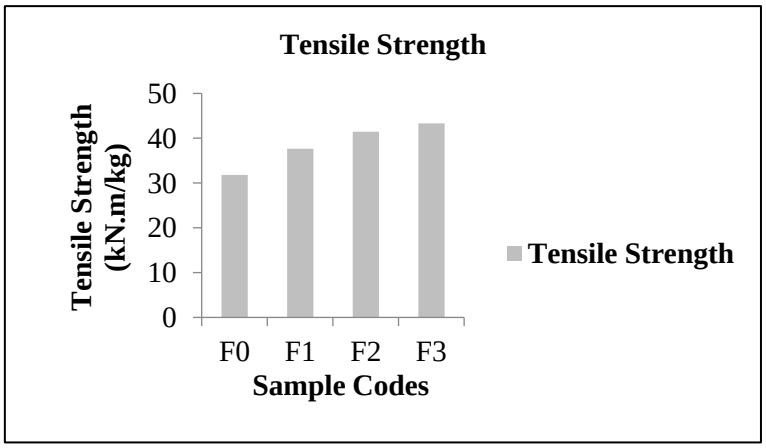

Figure 2. The change of tensile strength of base and coated papers

Tensile strength of the base and coated papers were examined, adding PEG in to the formula 1 system increased the tensile strength at rates 10.2% and %15.1, for F2 and F3, respectively (Figure 2). In the literature increasing the concentration of the plasticizer from 20% to 60% decreased the tensile strength of starch films (Bourtoom et al., 2008). In this work usage of plasticizers with low percentage have been affected the tensile strength in positive way. It can be caused from the usage of hydrophobic styrene acrylate copolymer have dominant effect

on the paper strength and plasticizers that provides good spreading of starch film with the cationic styrene acrylate copolymers (Cushing, 1979).

When the RCT (Ring Crush Test) was examined, it is clearly seen that adding the PEG in to the F1 mixture increased the RCT values of the papers increased as 2.5% and 5% for F2 and F3, respectively (Figure 3). In the research of Rhim et al., There was no significant difference in ring crush force between control groups and biopolymer-coated groups after coating (Rhim et al, 2006). This difference can be caused by the paper quality and grammage comparing with in this study.

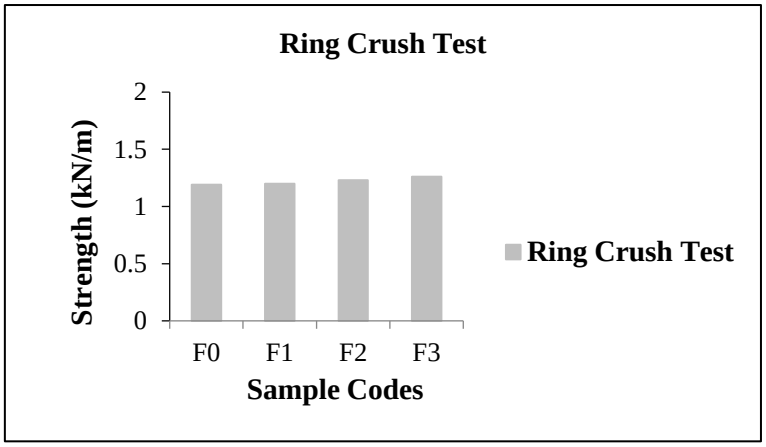

Figure 3. The change of crush strength of base and coated papers

FT-IR Analysis

FT-IR Analysis of paper surfaces

In the present work, three surface sizing formulations were applied to base paper sheets, and their penetration was evaluated by FT-IR-ATR analysis of the top surface layer. F1 coating formula was chosen as reference coating formula. And effects of polyethylene glycol on the reference coating formula have been investigated. FT-IR spectrums of base and coated papers were investigated in 600-1800 cm^{-1} wavenumber. As seen in the figure 4, FTIR spectra curves were similar because the elemental composition of the starch films occurred on the surface of base paper was dominating other materials. The strong bands arising from the antisymmetric bridge stretching of C-O-C groups at 1156 cm^{-1} and C-O stretching in cellulose/hemicellulose molecules at 1101 and 1020 cm^{-1} are observed (Ferreira et al., 2009). However in the study of the Bhardwaj et al, The peaks found at 1150 cm^{-1}, 1080 cm^{-1} and 1010 cm^{-1} represent the stretching mode of C-O-C linkages of the starch and small shoulder peak at 1734 cm^{-1} refers to carboxyl carbonyl groups of oxidized starch (Bhardwaj et al, 2019).This peak is not existed in the spectrum of base paper by proofing the starch film occurrence on the top surface of paper.

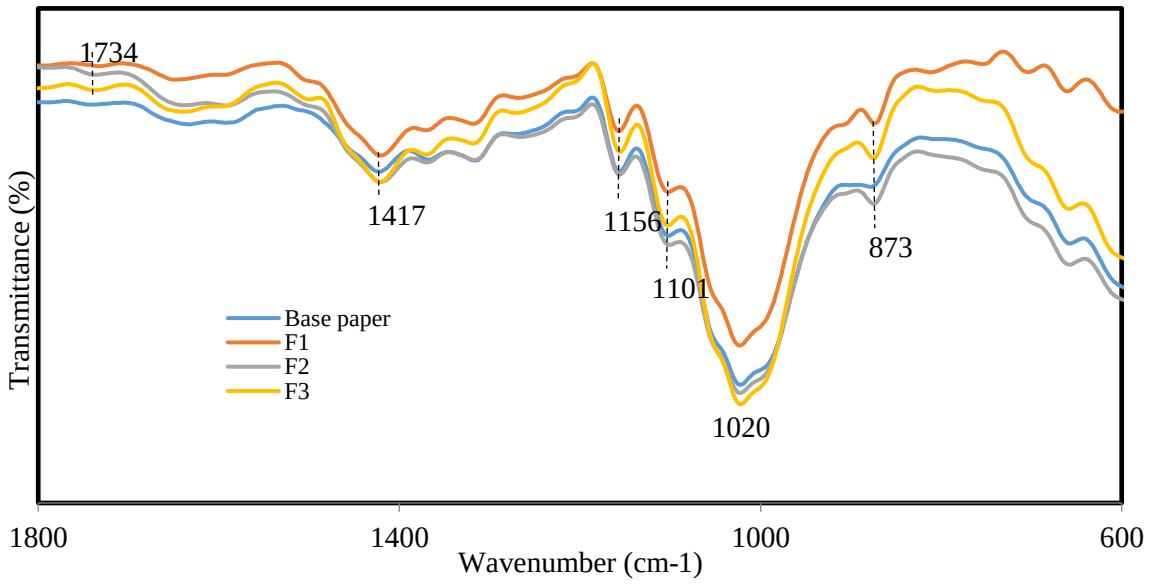

Figure 4. FT-IR spectra of the paper surface without sizing (base paper) and FT-IR spectra of corresponding formulations used in paper sizing

FT-IR Analysis of starch films

Three coating formulations has been prepared with using oxidized starch. The effect of PEG on the reference coating formula has been investigated by means of FT-IR and spectrums are shown in the Figure 5.

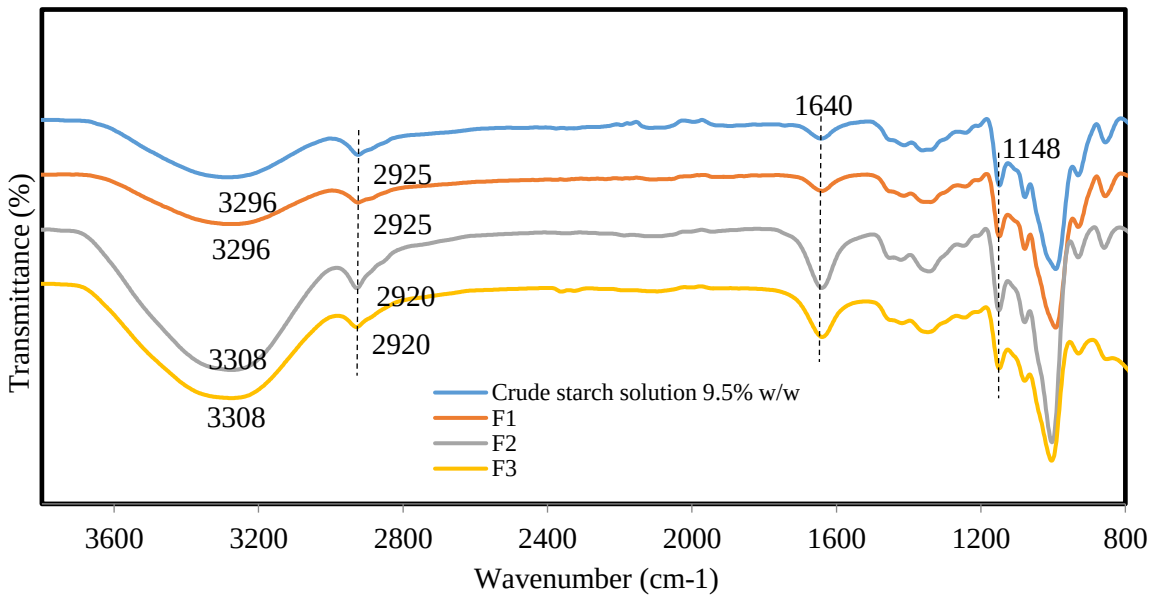

Figure 5. FT-IR spectra of the starch solution and sizing formulations

The FT-IR spectrum of crude starch solution and starch solution containing PEG and styrene acrylate copolymer (PERGLUTİN) were very similar. Addition of PEG in the reference coating solution (F1) changed the increase of –OH band intensities with higher wavenumber. The incorporation of PEG200 into reference coating shifted the band position of O-H from 3296 cm^{-1} in to 3308 cm^{-1} indicating there is interaction between starch and PEG. The peak at 2925 cm^{-1} refers to the –C-H stretching of methylene and shift to lower wavenumber 2920 cm^{-1} containing PEG can be deduced to interaction between starch and PEG molecules

(Saputri et al., 2017). Peak observed at 1640 cm^{-1} was originated from the bending vibration of H_2O absorbed in the starch molecule (Bhardwaj et al., 2019). The peak at 1148 cm^{-1} assigned to C-O-C stretching of starch films (Kim et al., 2000).

CONCLUSION

PEG addition in to the starch based coating formulation that containing styrene acrylate copolymer emulsion changed the water absorption values of base paper. This effect explained by the plasticizer formed stronger hydrogen bond with starch, preventing the water molecule from interact with the plasticizer or starch. In addition to hydrophobic copolymers, many size pres formulations have been prepared with additives that might be called plasticizers. Such substances have the potential not only to affect the quality of a starch-based film, but they also may affect its hydrophobic nature after drying. In this study ıt can be deduced the PEG have synergetic effect on the increased the hydrophobicity of starch films with styrene acrylate copolymer. In addition, PEG addition in to reference coating solution increased the tensile strength and ring crush strength of papers.

Özet

Dünyadaki nüfus artış hızı ve teknolojinin gelişimi her geçen gün enerji ihtiyacını artırmaktadır. Artan sanayi, kentleşme, nüfus ve tüketim azalan kaynaklar ile birlikte insanoğlunu günden güne alternatif enerji arayışları içine sokmuştur. Artan enerji ihtiyacına paralel olarak fosil kaynakların azalmasının yanında çevreye olan etkiler de farklı enerji alternatiflerinin önemini ortaya koymuştur. Bu çalışmada, yenilenebilir enerji kaynakları arasında yer alan biyogaz enerjisinin gelişime açık bir enerji çeşidi olduğunu, biyogaz enerjisinin potansiyeli ve kullanım olanaklarını Şırnak'ın tarihsel sürecinden de bahsederek avantajları ve dezavantajlarından, birçok şirketinin ilgisini çeken enerji potansiyeline kadar kapsamlı bir şekilde ele alınacaktır. Fiziksel ve coğrafi şartları baz alındığında hayvancılığa ve tarıma uygun olması göz önüne alınarak Şırnak biyogaz açısından önemlidir. Kentin biyogaz potansiyeli bir yıllık atık su arıtma tesisi, kanalizasyon atıkları, katı atık bertaraf alanları, vahşi atık bertaraf alanları, büyükbaş - küçükbaş - kümes hayvanları, yağlı tohum - yeşil yapraklı bitkiler - yumru bitkisel - şekerli bitkilerin yıllık atıklarından elde edilebilecek gaz miktarının hesaplanması ve değerlendirilmesi ile ortaya çıkartılacaktır. Sonuç olarak artan nüfus, şehrin sosyal yapısındaki değişimler ve şehri enerji açısından bir miktar daha bağımsız kılacak olan biyogazın potansiyelinin Şırnak açısından ortaya çıkartılması hem ekonomik hem de gelecek nesiller için önemlidir. Bu sonuçlar dahilinde Şırnak için yaklaşık olarak 1.234.110 GJ biyogaz potansiyeli olduğu hesaplanmıştır.

Anahtar Kelimeler: Biyogaz, Yenilenebilir Enerji, Şırnak, Sürdürülebilirlik

Determination of Biogas Potential of Şırnak Province

Abstract

The rate of population growth in the world and the development of technology increase the need for energy day by day. Increasing industry, urbanization, population and consumption have led human beings to seek alternative energy day by day, along with decreasing resources. In addition to the decrease in fossil resources in parallel with the increasing energy need, the effects on the environment have also revealed the importance of different energy alternatives. In this study, biogas energy, which is among the renewable energy sources, is a type of energy that is open to development, the potential and usage possibilities of biogas energy will be discussed in a comprehensive way, from the advantages and disadvantages to the energy potential that attracts the attention of many companies, by also mentioning the historical process of Şırnak. Considering its physical and geographical conditions, it is suitable for animal husbandry and agriculture, and Şırnak is important in terms of biogas. Calculating the amount of gas that can be obtained from the annual waste water treatment plant, sewage wastes, solid waste disposal areas, wild waste disposal areas, cattle - ovine - poultry, oilseed - green leafy plants - tuber plant - sugary plants of the city's biogas potential, and will be revealed by the evaluation. As a result, the increasing population, changes in the social structure of the city, and revealing the potential of biogas, which will make the city more independent in terms of energy, are important both for the economy and for future generations. Within these results, it has been calculated that there is approximately 1.234.110 GJ biogas potential for Şırnak.

Keywords: Biogas, Renewable Energy, Şirnak City, Sustainability

GİRİŞ

Dünya nüfusunun hızlı artışı ve aynı zamanda gerçekleşen sanayi gelişimi enerjiye olan ihtiyacı arttırmakla birlikte, enerji arz-talep dengesinin birbirini karşılayamaması enerji fiyatını her geçen gün arttırmaktadır. Buda her geçen gün enerjiye olan ihtiyacın yükselmesi anlamına gelmektedir. Sosyo-ekonomik yapı değiştikçe bununla birlikte üretim ve tüketim çeşitliliği artmış, alışkanlıklarımızda her geçen gün değişmiştir. Enerji sürekli form değiştirip dönüşüm yaşaması sonucu günümüz değişiyle modern toplumlar şekillenip iş yapabilme gücünde de artış yaşanmıştır. Enerji ihtiyacının karşılanabilmesi için fosil yakıtların çok hızlı tüketilmesiyle birlikte sera gazı, çevresel etkilerin azaltılması ve fosil yakıtların yakın gelecekte tarihin tozlu raflarında yer alacağı öngörüldüğünden alternatif yeni enerji kaynaklarına ihtiyaç duyulmuştur (Kalpuhan, 2014) (Gültekin, 2021) (Yağlı & Koç, 2019).

Organik içerikli çeşitli atıkların anaerobik mikroorganizmalar sayesinde oluşturduğu yoğun olarak metan gazı içeren bir gaz karışımıdır (Saamer , ve diğerleri, 2021). Biyogazın içeriği metan doğalgaz için ciddi öneme sahiptir (Yılmaz , Ünvar, Koca , & Koçer, 2018). Biyogazın içeriğindeki ana bileşenler oranlarıyla birlikte aşağıdaki tabloda görüntülenmektedir (Sethi, 2018).

Tablo1 1 Biyogazın ana bileşenleri (Sethi, 2018)

Biyogaz Bileşeni	Ağırlık Yüzdesi
Metan	% 50-75
Karbondioksit	% 25-50
Nitrojen	% 0-10
Hidrojen Sülfür	% 0-3
Hidrojen	% 0-1
Oksijen	% 0.5
Su	% 5-6

Tablo1 2 Biyogazın Genel Özellikleri (Kızmaz, 2019)

Özellikler	Değerler
Koku	Çürük Yumurta
Yakıt Eşdeğeri	0,60-0,65 L petrol/m biyogaz
Yanma Değerleri	% 6 - 12 havadaki miktarı
Yanma Sıcaklığı	650-750 G
Enerji İçeriği	6,0-6,5 kWh/m
Molar Kütle	16.043 kg/kmol
Yoğunluk	1.2 kg/m
Kritik Sıcaklık	-82,5
Kritik Basınç	75-89 Bar

Biyogaz üretiminin avantajlarını şöyle sıralayabiliriz:

-Bertarafına ihtiyaç olan atıklardan yenilenebilir enerji üretimi yapıldığı için çevreyi korur.

-Kendi sınıfına göre düşük emisyon sağlar.

-Yaşam döngüsü var olduğu sürece devam edeceğinden dolayı yenilenebilir ve tükenmeyen bir enerjidir (Fredriksson, 2006).

-Kentsel ortamlarda katı atıkların düzenli depolama sahalarının doğru işletilmesi için iyi bir alternatiftir.

-Atıkları anaerobik sindirim sağlayıp kalori değeri yüksek yakıt üretimi sağlanması bununla birlikte üretilen gazdan akalan atığında kaliteli gübre olarak tekrar doğaya kazandırılabilmesi (Wang, Di, & Hu, 2007).

Gelişmekte olan ülkelerin hem maliyet tasarrufu hem de ekolojik sanitasyonu gelişimi için iyi bir yöntemdir

-Biyogaz üretiminin dezavantajları da şu şekildedir:

-Çürütme ve ayrıştırma sürecinin hızlandırılmaya ihtiyacı vardır.
-Ham biyogaz içerisindeki nem, karbondioksit, kükürt ve diğer aşındırıcılardan arındırılması kullanılan ekipmanların kullanım süresini ve güvenilirliğini kısalttığı için bunun üzerinde çalışılması gerekir (Neves, Converti, & Penna , 2009).
-Unutulmamalıdır ki biyogazın sera etkisi üzerindeki etkisi büyüktür, biyogaz üretildikten sonra atmosfer ile herhangi bir temastan olmamalı ve depolanmasının yapılması gerekmektedir (Fredriksson, 2006).
-Aslında kırsal alanlar için çok avantajlı görünse de ilk yatırım maliyeti bir an önce üzerinden çalışılması gereken bir dezavantajdır (Fredriksson, 2006) (Neves, Converti, & Penna , 2009) ..

MATERYAL VE METOD

Şırnak, Doğu Anadolu ile Güneydoğu Anadolu arasındaki geçiş bölgesinde olup şehrin nüfus yoğunluklu kısmı Güneydoğu Anadolu Bölgesindeyken, Şırnak il olarak Doğu Anadolu Bölgesindedir. Doğuda Hakkâri, batıda Mardin, kuzeyde Siirt ve Van illeri güneyde ise Suriye ve Irak'a komşudur. 1350 m deniz seviyesinden yüksekte olup, yüzölçümü de 6904 km^2'dir. Yaklaşık nüfusu 546.000 olan şehrin Ankara'ya 1200 km, İstanbul'a 1636 km ve İzmir' 1609 km uzaklıktadır (Şırnak Valiliği, 2022).

Tablo2.1. Yıllara Göre Şırnak Nüfusu

TARTIŞMA

Şırnak İl'i Evsel Atıklardan Biyogaz Üretim Potansiyeli**:**

Detaylı olarak bahsettiğimiz Şırnak evsel katı atık verilerini inceleyip bu veriler ışığında Şırnak İl'i evsel katı atık biyogaz potansiyelini hesaplayabiliriz. Şırnak İl'inde 2020 yılında 211.676 ton atığın oluştuğu ve yapılan karakterizasyon sonucuna göre bu atıkların ancak %45'i biyometanizasyon için uygundur. Bu da yaklaşık olarak 95.254 ton etmektedir. Bu atıkların büyük bir çoğunluğunu mutfak atıkları oluşturmaktadır.

95. 254 * 0,87 = 82.870 ton KM
82.870 * 0,971 = 80.466 ton OKM
80.466 * 650,5 * 0,528 = 27.637.174 m^3 CH^4

$$\frac{27637174 * 0{,}72 * 50000}{1000000}$$

= 994.938 GJ

Şırnak İl'i Bitkisel Ürün Atık Biyogaz Potansiyelinin Hesaplanması
Aynı formül kullanılarak hesaplama yaptığımızda 5102 GJ sonucuna ulaşılır.

Şırnak İl'i Hayvansal Atık Biyogaz Potansiyeli
Aynı formül kullanılarak hesaplama yaptığımızda 300123 GJ sonucuna ulaşılır.

Şırnak Atıksu Artıma Tesisi Biyogaz Potansiyeli
Şırnak İl'i için ilk atıksu artıma tesisinin temeli 2018 yılında atılmış olup 2022 mayıs olan teslim tarihinde henüz kullanıma başlamadığı için Şırnak'ta ki tek atıksu artıma tesisinden herhangi bir atıksu artıma çamuru eldesi edilmemekte ve hesabı yapılamamaktadır.
Yenilenebilir enerji kaynakları her geçen gün daha fazla ihtiyacımızın olduğunu hissettiğimiz alternatif enerji kaynaklarındandır. Günlük yaşam kriterlerine bağlı olarak insanoğlu hatta yaşam var oldukça biyokütle hiçbir zaman bitmeyecek bir enerji kaynağıdır. Elbette ki elde edilen biyokütlelerin tamamını yakma vb… diğer yöntemlerle elektrik enerjisine dönüştürsek de biyogaz eldesi büyük bir oran içerisindedir. Organik veya diğer atıkların kendi aralarında ayrıştırılıp hem sıfır atık konusunda bilinçlendirilmiş bir toplum hem de bu ayrıştırma sonucunda kalan atıkların çevremize aslında kendimize daha az zararla ekonomik olarak faydalanabileceğimiz bir şekilde kullanabileceğimiz yöntemlerden biridir biyogaz eldesidir.

Çalışmamızda Şırnak ilindeki atıkların belirlenmesi ve biyogaz potansiyelinin hesaplamasını yaptık. Şırnak gerek iklimi gerek yeryüzü şekilleriyle tarım ve hayvancılık için uygun bir şehirdir. Şehrin toplam yüzölçümünün % 21' i tarım arazisinden oluşmaktadır. Şehrin örtü altı tarım arazisi yaklaşık ‰ 3 oranındadır. Şırnak genelinde bitkisel biyogaz potansiyeli 5102 GJ'dir.

Hayvancılık faaliyetlerinin de yoğun olarak yapıldığı Şırnak'ta, il geneli büyükbaş sayısı 83159 adet, kümes hayvanları 143.387 adettir. Biyogaz üretimi için en uygun verimin hayvansal atıklardan elde edildiği bilinmektedir. Diğer hayvan adetlerine oranla en az nüfus büyükbaşlarda olsa da en fazla biyogaz verimi büyükbaş hayvanlardan elde edilir. Böyle bir ters orantı da adeti en fazla olsa da kümes hayvanlarından da en az biyogaz verimi elde edildiği söylenebilir. Şırnak genelinde 1297647 adet olarak çok yoğun miktarda küçükbaş hayvancılık yapılsa da yayla hayvancılığı yapıldığı için küçükbaş hayvan atıklarının hesaplamada hiçbir etkisi olmamaktadır. Mandıracılık ve besi hayvancılığının genellikle yapılmamaktadır. Şırnak genelinde hayvansal atık kaynaklı biyogaz potansiyeli
Şırnak genelinde evsel atıklardan biyogaz potansiyelini hesaplamak istesek de ne yazık ki şimdilik teoriden öteye gidemeyeceğimizi bile bile bu durumu gerçekleştirmiş olduk, Şırnak genelindeki yaklaşık 20 belediyeden tümünde vahşi atık depolama sahası mevcuttur. Bununla beraber yaklaşık olarak 994.938 GJ enerji elde etmek mümkündür.

Şehirde yalnızca atıksu artıma tesisi bulunmakta ve bununda henüz tamamlanamamasından dolayı atıksu artıma çamurundan biyogaz potansiyeli ile ilgili herhangi bir sonuca ulaşamamaktayız. Bu durumun yaklaşık 500.000 nüfuslu bir kentte yaşanması tabi ki durumun vahametini ve getireceği çevresel sorunlarla beraber ekonomik olarak büyük kayıpları da unutmamak gerekir.
Şırnak genelinde toplam biyogaz potansiyeli 1.234.110 GJ'dür. Benzer bir çalışmada Muğla İl'i Biyogaz Potansiyelini 5.598.874 GJ olarak hesaplanmıştır. Bu potansiyelin Şırnak şehri için hesaplanan potansiyelin yaklaşık 5 katı olduğu gözden kaçmamaktadır. Bu farkın ana sebeplerinden biri nüfus atık arıtma tesisi oranına göre Şırnak'ta sadece 1 tane atıksu artıma tesisinin olması küçükbaş hayvancılık konusunda hayvan adedi oranı olarak yüksek bir değere sahip olsa da besi hayvancılığının yapılmaması ve sadece yayla hayvancılığının yapılmasını ilk akla gelen durumlardır.

TEŞEKKÜR
Çalışmalarım esnasında bana desteğini esirgemeyen Dr. Muhammed Hasan Toper'e teşekkür ederim.

Tıbbi Bitki Ekstraktlarının Sağlık Ve Biyoteknolojik Alanda Kullanımı

Ercan KARABULUT[1], Tuğba Raika KIRAN[2], Önder OTLU[2], Aysun Bay KARABULUT[3]

[1] Ankara Yıldırım Beyazıt Üniversitesi Tıp Fakültesi, Farmakoloji Anabilim Dalı, Ankara, Türkiye.
[2] Malatya Turgut Özal Üniversitesi Tıp Fakültesi, Tıbbi Biyokimya Anabilim Dalı, Malatya, Türkiye.
[3] Ankara Yıldırım Beyazıt Üniversitesi Tıp Fakültesi, Tıbbi Biyokimya Anabilim Dalı, Ankara, Türkiye.

Özet
Hem Doğu hem de Batı kültürlerinde yüzlerce yıldır tıbbi bitkiler ve ikincil metabolitleri terapötik veya profilaktik olarak kullanılmaktadır. Dünya Sağlık Örgütü'ne göre yaklaşık 21.000 bitki türünün tıbbi bitki kategorisinde kullanılma potansiyeli vardır. Tıbbi bitkilerden aktif bileşenlerin ekstraksiyonu için çeşitli teknolojiler mevcuttur. Tıbbi bitkilerden potent biyoaktif moleküllerin elde edilmesi uygun çözücü seçimi, ekstraksiyon yöntemleri, fitokimyasal tarama prosesleri, doğru fraksiyonlama yöntemleri ve iyi tanımlama teknikleri ile mümkün olmaktadır. Tıbbi bitki metabolitleri, karbonhidratlar, proteinler, lipidler, nükleik asitler gibi büyüme ve gelişme için gerekli birincil/temel metabolitler ile alkaloidler, fenolikler, steroller, steroidler, uçucu yağlar, glikozitler, ligninler, terpenoidler gibi ikincil/spesifik metabolitler şeklinde sınıflandırılabilir. Tıbbi bitkilerden toplamın %10'unu karşıladığı belirtilen yaklaşık 12.000 biyoaktif bileşik izole edilmiştir. Fenolik bileşikler, flavonoidler, antosiyanidinler, flavanlar, tananler gibi polifenoller yüksek konsantrasyonda ve ticari değeri yüksek biyoaktif bileşenler arasındadır. Günümüze kadar birçok tıbbi bitki ekstraktları ve biyoaktif moleküllerinin antimikrobiyal, antiviral, antiinflamatuar, antioksidant, antitumor, antikoagulator, antihelmintik, antidiyabetik, antiaterosklerоz ve diüretik aktiviteleri üzerine yayınlanmış çalışmalar mevcuttur. İlaç potansiyeli olan biyoaktif moleküller ayrıca gen tedavisi, rejenaratif tıp, antibakteriyal yara örtüleri formu ile yara yanık bakımı, doku mühendisliği gibi çeşitli alanlarda da katkılar sunmaktadır.

Usage of Medicinal Plant Extracts in Health and Biotechnology

Abstract
Medicinal plants and their secondary metabolites have been used therapeutically or prophylactically for hundreds of years in both Eastern and Western cultures. According to the World Health Organization, approximately 21,000 plant species have the potential to be used as a medicinal plant. Various technologies are available for the extraction of active ingredients from medicinal plants. Obtaining potent bioactive molecules from medicinal plants is possible with appropriate solvent selection, extraction methods, phytochemical screening processes, correct fractionation methods and good identification techniques. Medicinal plant metabolites can be classified as primary/essential metabolites required for growth and development such as carbohydrates, proteins, lipids, nucleic acids, and secondary/specific metabolites such as alkaloids, phenolics, sterols, steroids, essential oils, glycosides, lignins, terpenoids. Approximately 12,000 bioactive compounds have been isolated from medicinal plants, which are stated to account for 10% of the total. Polyphenols such as phenolic compounds, flavonoids, anthocyanidins, flavans, tannins are among the bioactive components with high concentration and commercial value. Today, there are studies published on the antimicrobial, antiviral, anti-inflammatory, antioxidant, antitumor, anticoagulant, anthelmintic, antidiabetic, antiatherosclerosis and diuretic activities of many medicinal plant extracts and bioactive molecules. Bioactive molecules with drug potential also make contributions in various fields such as gene therapy, regenerative medicine, antibacterial wound dressings and wound care, tissue engineering.
Keywords: Medicinal plant, Phytochemicals, Extraction, Biotechnology

GİRİŞ

Antik çağlardan bu zamana kadar hastalıkların tedavisi için insanlar şifalandırıcı tertiplerin/ ilaçların hazırlanması amacı ile doğadaki bitkileri araştırmışlardır. Bu vesile ile bu zaman kadar iyileştirici etkiye sahip çok sayıda tıbbi bitki tanımlanmış ve biyoaktif moleküllerin özellikleri literatürlerde yayınlanmıştır (1,2). Hem Doğu hem de Batı kültürlerinde yüzlerce yıldır tıbbi bitkiler ve ikincil metabolitleri terapötik veya profilaktik olarak kullanılmaktadır. Dünya Sağlık Örgütü'ne göre yaklaşık 21.000 bitki türünün tıbbi bitki kategorisinde kullanılma potansiyeli vardır (3).Yüksek değerli bitkiler birincil ve ikincil metabolitler olarak isimlendirilen çok sayıda kimyasal bileşik grubu içermektedir. (4). İkincil metabolitler ise bitki hücresi tarafından metabolik yollar aracılığı ile üretilen kimyasal bileşiklerdir. (5). Tıbbi bitkilerden toplamın %10'unu karşıladığı belirtilen yaklaşık 12.000 biyoaktif bileşik izole edilmiştir (6,7). Bitkilerde ekstraksiyon prosesi, seçili çözücüler kullanılarak tıbbi olarak aktif kısımlarının aktif olmayan veya inert bileşenlerden ayrılması şeklinde tanımlanabilir (8). Ekstraksiyon ile elde edilen ürünler, nispeten saf olmayan sıvı, yarı katı veya sadece oral veya harici kullanıma yönelik tozlar olabilir. (9). Böylelikle elde edilen ekstraktlar, tentür ve sıvı ekstraktlar şeklinde tıbbi ajan olarak kullanıma hazır olabilir. (10).

Tıbbi Bitkilerin Genel Ekstraksiyon Yöntemleri

Maserasyon, Bu işlemde, kaba formda veya toz haline getirilmiş bitki materyalinin, çözücüyle birlikte kapalı bir kapta ±25°C'de en az 3 günlük bir süre boyunca sallamak sureti ile bekletilme işlemi yapılır. (11). ***İnfüzyon.*** Taze infüzyonlar, ham ilacın soğuk veya kaynar su ile kısa bir süre için maserasyonuyla hazırlanır. Bunlar, ham ilaçların kolayca çözünen bileşenlerinin seyreltik çözeltileridir. infüzyon için maserasyon süresi daha kısadır ve numuneler belirli su hacimlerinde belirli zaman aralığı boyunca kaynatılır (12). ***Dijestiyon:*** İşlemde hafif ısının kullanıldığı maserasyon şeklidir. Orta derecede yüksek sıcaklık (40-60°C) sakıncalı olmadığında kullanılır. Böylece mestruum çözücü etkinliği artmış olur (11). ***Dekoksiyon:*** Bu işlemde ham bitki belli hacim ve belli süre kaynatılır, soğutulduktan sonra süzülür. Proses ısıya dayanıklı aktif bileşenlerin çıkarılması için uygundur. Hacim ekstraksiyonla başlangıç hacminin dörtte birine düşürülür (12,13).

Perkolasyon Katı bileşenler nemlendirme amaçlı öncelikle uygun miktardaki seçili mestruum ile yaklaşık 4 saat beklemeye bırakılır. Perkolatörün musluğu açılarak damlatma süresi ayarlanarak sıvı akışına izin verilir. Karıştırılan sıvı süzülür (12,14).***Soxhlet Ekstraksiyonu:*** eklenen solventin ısıtılması ile yoğunlaşması ve örneğe damlaması şeklinde sıcak solventin birkaç kere örnek içerisinde sirküle olması esasına dayanır. Soxhlet ekstraksiyonunda sürekli olarak taze solvent ile temas halinde olduğundan matriksten analitin uzaklaştırılması da artar (12, 15).***Ultrases destekli ekstraksiyon*** 20 kHz ila 2000 kHz arasında değişen frekanslarla ultrason kullanımını içerir, ultrases örneğin hücre geçirgenliğini arttırır ve kavitasyon üretir. Ekstraksiyon verimi solvent türü, sıcaklık ve sonikasyon genliği, sonikasyon zamanı, partikül boyutu, örnek miktarı etkilemektedir (15,16). ***Süperkritik Akışkan Ekstraksiyonu:***Süper kritik sıvı ekstraksiyonu, daha az organik çözücü kullanımı ve artan numune verimi gibi avantajlar sağlayan alternatif bir numune hazırlama yöntemidir. Süperkritik akışkan üretimi, basınç, sıcaklık ve akış hızı kontrolü sağlayan cihazla gerçekleştirilmektedir. (15). ***Mikrodalga-Destekli Solvent Ekstraksiyonu***: 300-300000 MHz yüksek frekanslı elektromanyetik dalgalar olan mikrodalga enerjisinin kullanılarak, iyonların iletimi ve dipol rotasyonuyla molekül üzerine enerjinin direkt etkisi söz konusudur. İyon akışı ile basınç oluşturarak ısı oluştumaktadır. Ekstraksiyon verimini solvent türü, ekstrakt uyumu önemlidir (15). Uygun ekstraksiyon yöntemi belirlenerek tıbbi bitki yaprakları, çiçekleri, tohum, meyve, kök gibi bölgelerinden alkaloidler, steroidler, reçineler, fenoller, flavonoidler, tanenler, glikozitler, uçucu yağlar gibi yüksek değerli biyoaktif bileşenlerin ekstraksiyonu gerçekleştirilmektedir (16). Alkaloidler, analjezi, lokal anestezi, kardiyak stimülasyon, solunum stimülasyonu ve gevşemesi, vazokonstriksiyon, kas gevşemesinin yanı sıra antineoplastik, hipertansif ve hipotansif özellikleri de içeren çeşitli farmakolojik eylemlere sahiptir (17,18,19). Karbonhidrat, triterpenoid ya da steroid aglikon parçalarından oluşan amfifilik molekül olan saponinler, fungicidal, antimikrobiyal, antiviral, antiinflamatuar, antikanser, antioksidan ve immünomodülatör biyolojik aktiviteleri ile doğal ürün türevli ilaç gelişiminde farmakoloji alanında dikkat çekmektedir (20). Terpenlerin anti-inflamatuar, antitümör, antibakteriyel, antioksidan, analjezik, hepatoprotektif özelliklere sahip olduğunu gösteren birçok farmakolojik çalışma mevcuttur (21)Esansiyel yağların antiseptik, antimikrobiyal, analjezik, sedatif, antiinflamatuar, spazmolitik ve lokal anestezik ilaçlar gibi birçok ve önemli tıbbi kullanım alanları vardır (22).

SONUÇ: Medikal bitkiler yaşamı tehdit eden birçok hastalığı önlemekle kalmayıp aynı zamanda tedavi eden doğal ilaç kaynaklarıdır. Biyoaktif bileşenlerin diğer gıda bileşenlerine etkisi ve bu etkileşimin biyoaktif bileşenlerin ilaç gibi davranma etkinliği üzerindeki etkilerinin araştırılması gerekmektedir. Ayrıca bitki kaynaklı terapötik moleküllere yönelik artan talep, biyoteknolojik üretimi ve yüksek değerli biyoaktif bileşenlerin eldesi için sürdürülebilir, çevre dostu ve yenilikçi ekstraksiyon tekniklerinin geliştirilmesi desteklenmelidir. Ayrıca, biyoaktif bileşiklerin izolasyonu için alternatif tekniklerin geliştirilmesi ve optimizasyonu ile ilgili ileri çalışmalara ihtiyaç vardır.

Özet

İnsan vücudu çeşitli organik ve inorganik bileşenler içerir. Bu bileşenler vücudun yapısını ve işlevlerini desteklerken, bunların yokluğu veya aşırı üretimi bir takım anormalliklere yol açar. Hayati olaylar vücutta iyonların ve bazı inorganik elementlerin varlığını gerektirmektedir. Canlı organizmaların temel işlevlerini sürdürebilmeleri için beslenmeye ek olarak minerallere de ihtiyaçları vardır. Magnezyumun, gelişmiş glikoz ve insülin regülasyonu, anti-hipertansif, anti-aritmik, anti-inflamatuar, antikoagülan, antiplatelet özellikleri, gelişmiş lipid metabolizması, azalmış vasküler kontraktilite ve artan endotel bağımlı vazodilatasyon dahil olmak üzere birçok temel sağlık faydası vardır.
Magnezyum, kalp ritminin kontrolü, trombosit aktivasyonundan sonra trombüs oluşumu, kalsiyum ve potasyumun transmembran taşınması dahil olmak üzere çeşitli kimyasal işlemler için çok önemli bir katyondur. İnsan vücudundaki magnezyumun %50-60'ı kemikte, %20'si iskelet kasında, %19'u vücutta bulunur. Diğer dokularda ve hücre dışı sıvılarda ise %1'den az bulunur.

Anahtar Kelimeler: Magnezyum, gliserofosfat, disolüsyon.

Abstract

The substances of natural origin and more particularly the essential oils of the plants represent currently an alternative solution of fight against mosquitoes.
This study aims to test the effect of essential oils at different concentration of *Trigonella foenum graecum* (600 et 800 mg/l) and *Ocimum basilicum* (300 et 600 mg/l) with respect to L3 larvae of *Culex pipiens.*The resultats in the laboratory conditions showed that both plants are larvicids of interest to larvae *Culex pipiens.* In *Trigonella foenum graecum* after 24h (LC_{50}=31g/l), after 48h (LC_{50}=15.43g/l), and after 72h (LC_{50}=39.69g/l), in *Ocimum basilicum* after 24h (LC_{50}=23.59g/l), after 48h (LC_{50}=39.01g/l), and after 72h (LC_{50}=36.14g/l). The comparison showed that the oil of *Ocimum basilicum* more efficient of the oil of *Trigonella foenum graecum.* Our results suggest that the oil of *Ocimum basilicum* prossesses a potential as biocide against the larvae of mosquito.

Keywords: *Ocimum basilicum, Trigonella foenum graecum*-L, *Culex pipiens* and mosquito.

Abstract

In this study, we present what kind of results we have achieved by using the WiFi signal technology, which is widely used in the world and can be used easily in every environment in the Closer project we have been working on, and what problems we aim to solve in the field of home healthcare technologies. By doing extensive research about WiFi signals and WiFi signal data called Channel State Information (CSI) in the literature, we discovered common techniques on healthcare technologies. We studied on the applicability of these techniques, including the use of WiFi signal technology, in the CLOSER project. In the field of healthcare, we have successfully implemented sensor-independent ambient mobility detection on WiFi signals in the CLOSER project. We have detailed how we solved an important challenge within the scope of the project objectives with the help of CSI data obtained from WiFi signals, by measuring the mobility rate of individuals living alone at home, which we think is an important measurement for healthcare technologies.

Keywords: Channel State Information, Healthcare technologies, Motion detection, Device free, WiFi sensing.

E-mail: rftsyr@gmail.com

Özet

Enerji tüketimindeki artış sonucu yaşanan petrol rezervlerindeki azalmanın hızlanması, fosil yakıtların yanma egzozu, çevre kirliliği ve sera etkisi sorunları dünya çapında büyük endişeler yaratmış ve bunun sonucu olarak yenilenebilir enerji ve yeşil enerjinin geliştirilmesi noktasında önemli ölçüde teşvikler sunulmuştur. Son yıllarda, güneş pili araştırmalarında, güvenli, düşük maliyetli, yüksek verimli, güvenilir ve işlenmesi kolay malzemelerin elde edilebilirliği oldukça önemli bir çalışma alanıdır. Bu kapsamda, boya duyarlı güneş hücreleri (DSSC) üçüncü nesil güneş pilleri olarak ortaya konmuştur. DSSC sistemi ilk olarak O'regan ve Grätzel tarafından 1991'de rapor edilmiş [1] ve bu, çeşitli boyaların, malzemelerin morfolojisinin ve düşük kaliteli yarı iletken tabanlı güneş pilleriyle karşılaştırılabilir foto-enerji dönüşüm verimliliği gösteren hücre tasarımlarının keşfedilmesine yol açmıştır. DSSC'nin foto-enerji dönüşüm verimliliği %12 civarındadır [2].

Organik boyarmaddeler, molekül yapılarındaki çeşitliliğin fazla olması, foton soğurma katsayılarının yüksek olmasının yanı sıra sentez basamaklarının daha basit ve ucuz olması nedeniyle soy metal komplekslerine göre daha avantajlıdır. Diğer taraftan, organik boyaların özellikleri, moleküle farklı gruplar bağlayarak değiştirilebilmektedir. Doğru bir tasarım ile boyanın dalga boyunu, absorpsiyon katsayısını ve enerji seviyelerini değiştirerek DSSC hücrelerinde verimi geliştirme çalışmaları yapılabilmektedir. Bu bilgiler ışığında, bu çalışmada, daha önce literatürde bulunmayan, DSSC adayı olabilecek yeni organik boyarmaddelerin tasarlanması ve bunların literatüre kazandırılması hedeflenmektedir. Bu hedef doğrultusunda, tasarlanan bileşiklerin DSSC sistemlerinde kullanılabilirliği teorik hesaplamalar sonucunda ayrıntılı olarak ortaya konacaktır.

Tasarlanan bileşiklerin taban durum geometrilerini elde etmek için ilk olarak, potansiyel enerji yüzeyi (PES) hesaplamaları, gerçekleştirilecektir. Bu işlem sonunda elde edilen minimum enerjili konfigürasyon veya konfigürasyonlar DFT hesaplamaları çerçevesinde uygun bir metot (B3LYP, M06 vs.) ve temel set seçilerek yeniden optimize edilerek taban durum geometrileri elde edilecektir. Bileşiklerin spektroskobik özellikleri zamana-bağlı DFT hesaplamaları (TD-DFT) ile belirlenecektir. Hesaplamalarda Gaussian 09 paket programı [3] kullanılacaktır. Çözücü içinde yapılan tüm hesaplamalarda Polarize Süreklilik Modeli (Polarizable Continum Model (PCM)) metodu [4,5] kullanılacaktır. Taban durum geometrileri belirlenen tüm bileşikler için DSSC parametreleri elde edilecektir. İlgili parametrelerde, sübstitüent ve çözücü etkileri araştırılacaktır.

Anahtar Kelimeler: enerji, dssc, gaussian, boyarmadde.

Prevalence and epidemiology of dog babesiosis in the Belgrade area during 2020

Ivan Pavlovic[1*] (*ORCID: https://orcid.org/0000-0003-4751-6760*)

[*1] Institute of Veterinary Medicine of Serbia, Belgrade, Serbia

*Corresponding author e-mail: dripavlovic58@mail.com

Abstract

Dog babesiosis is caused by haemoprotozoan parasites of the genus *Babesia (Piroplasmidae: Apicomplexa).* Two species of genus *Babesia - B.canis* and *B. gibsoni* are of great importance owing to wide range of infected animals in *Canidae* familly. Dog babesiosis is a tick-borne disease and in Europe, the principal vector of is *R. sanguineus* and tick species of the genus *Dermacentor- D. marginatus* and *D. reticulatus.* During 2020 (from January until the end of December) we examined prevalence of babesia infection of pet dogs and faunistic study of tick which were found at dogs in the Belgrade area. From 270 suspected dogs, with common clinical manifestation of disease (anemia, haemoglobinuria, fever, pale of mucous membranes etc.) or infested with ticks, we used capillary blood to examination. Ticks were collected from dogs by means lightly sprung forceps and ticks of suspected genus (*Rhipicephalus* and *Dermacentor* species) were examined to presence of babesia. Used blood films were air-dried, fixed in absolute methanol for 1 minute and stained in 10% Giemsa stain. Identification of ticks and babesia were performed by morphometric characteristic. During examination, infection with *B. canis* was found in 54.11% and with B.gibsoni in 11.21% of examined dogs. Infection is found throughout the year but increase in incidence commenced in the interval March-April. May was the month of infection maximum, decreasing gradually until July. The autumn infection peak occurred in September, disappearing completely in December. Ticks were found on 29.39% of examined dogs. Relative abundance analysis revealed that the species *I. ricinus* was absolutely dominant and found at 51.01%, followed by *R. sanguineus* (39.74%), *D. marginatus* (9.84%) and *D. reticulatus* (2.01%). *Babesia canis* was detected in 64,10% *R. sanguineus*, 41,40% *D. reticulatus* and 11,70% *D. marginatus.* The appearance of babesiosis was directly correlated with the dynamics of the population of ticks found.

Keywords: babesiosis, ticks, dogs, Belgrade.

Abstract

This investigation concerns the formulation of a stabilized compressed earth block (BTCS) for the masonry of walls in arid and semi-arid regions.
The materials used for this are clay soil, dune sand and natural alfa or Halfa plant fibers without prior treatment. Different combinations of clay soil – dune sand at different percentages were tested.
In the first phase; an optimal mixture is obtained from compression tests carried out for different percentages of clay soil - dune sand in steps of 10%. The mixture corresponds to proportions of 80% clay soil and 20% dune sand (A80S20) is the optimal mixture obtained.
In the second phase; the optimal mixture is treated with a percentage of lime previously fixed at 12%. Cylindrical samples 50mm in diameter compacted by double piston are subjected to compression tests at 28 days. An average compressive strength reached is around 3.95MPa. For the same mixture, the cubic samples stabilized with the same percentage of lime lead to a compressive strength of around 3.47MPa.
The third step; consists in carrying out mechanical tests on cubic samples in compression and parallelepipedic samples in tension by bending reinforced with different percentages (1.2 and 3%) and different lengths (25mm and 50mm) of natural cellulosic fibers. Despite the drop in the compressive strength at 28 days which reaches the value of 3.18 MPa; this drop in resistance is of the order of 12-17%. A significant increase in tensile strength by bending which reaches a value of 0.6Mpa, this increase is about 60%
The optimal combination obtained remains an economical solution with regard to the regulations in force in Algeria and an industrial outcome for the manufacture of an eco-material for homes that respect the environment at low cost.

Keywords: clay soil, dune sand, fibers, eco-materials, arid and semi-arid regions.

Abstract

This investigation aims to formulate a low-cost eco-material, usable for masonry in arid and semi-arid regions. The materials used for the manufacture of compressed earth blocks stabilized with lime (BTCS), are clayey earth, dune sand. Different combinations of clay soil – dune sand at different percentages were tested.
In the first phase; an optimal mixture is obtained from compression tests carried out for different percentages of clay soil - dune sand in steps of 10%. The mixture corresponds to proportions of 80% clay soil and 20% dune sand ($A_{80}S_{20}$) is the optimal mixture obtained.
In the second phase; the optimal mixture is treated with a percentage of lime previously fixed at 12%. Cylindrical samples 50mm in diameter compacted by double piston are subjected to compression tests at 28 days. An average compressive strength reached is around 3.95MPa. For the same mixture, the cubic samples stabilized with the same percentage of lime lead to a compressive strength of around 3.47MPa.
The third step consists in carrying out tensile tests by bending on parallelepipedic blocks; the result obtained for 12% lime is acceptable for the shear strength of masonry joints whether parallel or vertical in accordance with British Standard BS 5628 part 1 of Masonry Walls.
The optimal combination obtained remains an economical solution with regard to the regulations in force in Algeria and an industrial outcome for the manufacture of an eco-material for homes that respect the environment at low cost.

Abstract

Strawberry is a fruit that is consumed very frequently, especially in summer. It stands out not only with its nutritional value and palatability, but also as a relevant source of bioactive compounds. For this reason, the drying process in the pre-treatments applied is important in protecting these valuable components (Gamboa-Santos, et.al., 2014). The reason for choosing the pulsed electric field (PEF) technology as a pre-treatment for strawberries in this study is to reduce the infusion time. With this technology, it has a great advantage to provide high quality food to consumers (Syed, Q. Abbas, et al., 2017). PEF technology is a technology used for many purposes such as microbial inactivation, increasing extraction efficiency, shortening drying time in liquid and solid foods. As a result of PEF application, the pores in the cells are opened for a short time and the cell membrane permeability increases. Thus, the transfer of molecules from the outside into the cell is facilitated (Bilek 2010).IQF strawberries were dipped in apple juice concentrate solution. After the applied process, it was dried at 60°C until the water activity was measured below 0.6 in the tray dryer. While this period is 24 hours for strawberries without PEF, the total infusion time is 21 hours for strawberries with PEF. Drying time for both groups is 7 hours. Thanks to the delivery of PEF, the semi-permeability of the cell membrane increases reversibly (Ağçam, AKYILDIZ et al. 2014). In our study, the infusion procedure time was shorter in strawberry treated with PEF.

Keywords: PEF technology, strawberry infusion, drying time.

Özet

Tıbbi bitkilerin insanlık tarihinin başlangıcından bugüne kadar olan süreçte başta sağlık ve kozmetik olmak üzere birden çok alanda büyük role sahip olduğu bilinmektedir. Bu çalışmada, sağlık faydası için kullanılan 9 farklı uçucu yağ (lavanta, biberiye, nane, kekik, portakal, defne, ylang ylang, melisa ve gül) içerisindeki ağır metal (Cd, Pb ve Hg) miktarlarının derişimleri ICP-MS yardımıyla analiz edilmiştir. Kişisel bakım ve kozmetik ürünleri olarak kullanılan söz konusu uçucu yağların Cd, Pb ve Hg analizleri sonucunda istatistiki verileri oluşturulup değerlendirilmiştir. Çalışma sonucunda elde edilen bulgular analizi gerçekleştirilen bu uçucu yağlar içerisinde ihtiva eden Cd, Hg ve Pb değerlerinin Avrupa Farmakopesi'nce tayin edilen sınır değerlerin altında kalmaktadır. Söz konusu 9 farklı tür tıbbi bitkisel yağın olarak tüketilmeye uygun olduğunu göstermektedir.

Anahtar Kelimeler: İndüktif plazma kütle spektroskopisi, ICP-MS, bitkisel yağlar, tıbbi yağlar.

Abstract

Nickel-based superalloys are used in many production processes, especially in aviation engines and high temperature furnaces, due to their high corrosion resistance, high creep strength, resistance to fatigue crack propagation. Although many advanced melting and casting techniques have been developed for nickel-based superalloys, related problems such as macro-separation and freckle formation in large ingots have not been completely avoided [Rao, Rao et al., 2003]. The demand for the advanced jet engine industry has led to the production of nickel-based superalloys with higher mechanical properties and desired microstructure at lower costs. In this study, the effect of yttrium aluminum garnet (YAG) additive on sintering and microstructure of Inconel 718 (IN718), which is a nickel-based superalloy, which has many application areas from aviation engines to electrodes, high temperature furnaces was investigated. For the study, 3% (wt.) YAG was added to IN718. The powdered IN and YAG alloy was mixed with Turbula for 30 minutes and then the powder was bound by adding liquid paraffin. The bonded powders were pressed with 110 MPa and then sintered at 1300°C for 6 hours in an Argon gas atmosphere.

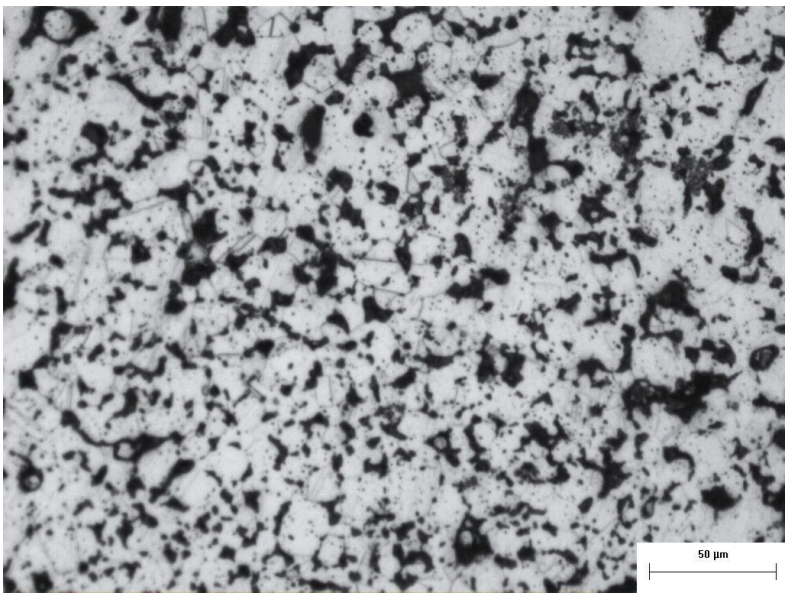

Figure 1: Microstructure image of 3% YAG added IN718 alloy

The microstructure of Inconel 718 to which 3% YAG was added was polished with 1µm,0.25 µm alumina, respectively, after sanding with 2500 grit sandpaper to examine the microstructure with an optical microscope. Inconel Etchant was used for etching. As seen in Figure 1, annealing twins were formed in the microstructure. This situation, which may cause a decrease in mechanical properties, can be eliminated by applying thermal secondary treatments. In this study, the sinterability of IN and YAG alloy at 1300°C and the formation of different phases were observed and it was seen that IN718 and YAG could be sintered homogeneously. It was also observed that the addition of 3% YAG reduced the density of IN718 by 5.07%.

Abstract

Face recognition is an important research problem most suitable for the purpose of the field of image analysis, covering many fields and disciplines, including security applications and commercial applications. The fact that face recognition applications are subject to different disciplines increases the interest in the studies that have been done and will be done in this field. In this study, new structure of deep convolutional neural network presented for real time face recognition. The proposed structure uses low number of layers to perform the real time face recognition. The proposed application presented best results than previous studies that are uses transfer learning techniques.

Keywords: Face recognition, convolutional neural network, transfer learning.

Özet

Bu çalışma ile marine hindi göğüs eti üretiminde %0.5 ve %1 oranlarında sarımsak (0.5SA, 1SA), kimyon (0.5KİM, 1KİM) ve muskat (0.5MUS, 1MUS) oleoresinleri kullanımının ürünün bazı fiziksel ve kimyasal özellikleri üzerine etkilerinin belirlenmesi amaçlanmıştır. Bu amaçla yerel bir firmadan temin edilen hindi göğüs etleri kuşbaşı büyüklüğünde doğrandıktan sonra +4°C' de 12 sa süreyle marine edilmiş ve buzdolabı koşullarında depolamanın 0., 3., 5., 7. ve 10. günlerinde tüm grupların (Kontrol, 05SA, 1SA, 05KİM, 1KİM, 05MUS, 1MUS) pH, titrasyon asitliği (TA), su aktivitesi (a_w), tiyobarbitürik asit (TBA) ve pişirme kaybı (PK) değerleri belirlenmiştir. Depolama başlangıcında (0. gün) pH ve TA değerleri sırasıyla 5.85-5.95 ve %1.15-%1.20 laktik asit aralığında değişmiş olup depolama sonunda (10.gün) en düşük pH değerinin 0.5MUS grubuna ($p<0.05$) ve en düşük TA değerinin ise 0.5SA grubuna ($p<0.05$) ait olduğu gözlenmiştir. Depolama başlangıcında (0.gün) PK değerlerinin sırasıyla %10.60-12.81 aralığında olduğu tespit edilmiştir. Depolama sonunda (10.gün) PK değerlerinin %6.99-9.05 aralığında olduğu ve en düşük PK değerinin Kontrol grubuna ait olduğu belirlenmiştir ($p<0.05$). Depolamanın 0. ve 10.günlerinde marine hindi göğüs etlerinin a_w değerlerinin sırasıyla 0.977-0.979 ve 0.978-0.981 aralığında olduğu tespit edilmiştir ($p>0.05$). Depolama başlangıcında en yüksek TBA değeri Kontrol grubuna (1.59 mg MA/kg) aitken en düşük TBA değerinin 0.5MUS ve 1MUS (0.28 mg MA/kg) gruplarına ait olduğu gözlenmiştir. Depolama süresince 0.5MUS ve 1MUS gruplarının TBA değerlerinde önemli bir yükselme gözlenmezken diğer grupların TBA değerleri istatistiki açıdan önemli düzeyde yükselmiştir ($p<0.05$). Depolamanın 10. gününde en yüksek TBA değeri 1SA grubunda 2.44 mg MA/kg olarak ve en düşük TBA değeri 1MUS grubunda 0.30 mg MA/kg olarak ölçülmüştür ($p<0.05$). Çalışmada 10 günlük soğuk muhafaza süresince elde edilen veriler göz önünde bulundurulduğunda marinasyonda %0.5 ve %1 oranıda muskat oleoresini kullanımının lipid oksidasyonunu önlemede daha etkili olduğu belirlenmiştir.

Anahtar Kelimeler: marinasyon, oleoresin, muskat, kimyon, TBA.

handebelkiran@gmail.com

Özet

Petrokimya endüstrisinde yakıt olarak kullanılmayan kimyasal yan ürünlerin yaklaşık %80'lik kısmı kimya-polimer üretiminde kullanılmaktadır . Günümüzde petrol ve petrolden elde edilen ham maddelerin tedariği ve sürdürülebilirliği konusunda ciddi problemler yaşanması biyo esaslı doğal malzemelere yönelimi arttırmıştır. Kökeni petrol olan kimyasallar çevreye zararlı olup karbon ayak izini dolaylı yoldan etkilerken biyo bazlı malzemeler fosil yakıtların daha az kullanılmasını ve bu sayede karbon ayak izinin ve sera gazı salınımının azaltılmasını sağlarlar. Doğada bulunan selüloz, lignin, bitkisel yağlar, mısır nişastası, bezelye nişastası, patates nişastası, şeker kamışı, avokado, yosun gibi biyo bazlı kaynaklardan farklı yöntemlerle çeşitli kimyasallar sentezlenebilmektedir. Reçine ve fosilleşmiş bitkilerden fermantasyon yöntemi içeren özel bir proses ile elde edilen süksinik asit de bu doğal kaynaklardan biri olup son yıllarda kullanımı artan bir biyo bazlı malzemedir. Yurt dışından ithalat yolu ile temin edilen süksinik asit kimya sektöründe özellikle poliüretan çalışmaları için tercih edilmektedir.
Bu çalışmada petrol türevli adipik asit ve alternatifi olan biyo bazlı süksinik asit kullanılarak yarı mamül polyester polyol sentezlenmiştir. Sentezlenen polyester polyoller poliüretan sistemlerinden olan ayakkabı tabanı şeklinde basılarak işlenebilirlik özellikleri karşılaştırılmıştır. Sentezlenen polyolün yapı karakterizasyonu Fourier dönüşümlü kızıl ötesi spektrometresi (FTIR) ve diferansiyel taramalı kalorimetre (DSC) ile analiz edilmiştir. Taban olarak basılan malzemelerin yoğunluk, çekme, kopma direnci gibi fiziksel ve mekanik özellikleri belirlenmiştir.

Anahtar Kelimeler: Süksinik asit, biyobazlı, polyester polyol, PU.

Abstract

This paper has been conducted to investigate the effect of using artificial Fly Ash and Slag aggregate, steel fiber, on the mechanical properties of Geopolymer concrete. In order to reduce energy consumption and provide a positive environmental impact, the cold-bonded process was used to manufacture artificial aggregate. At first, the production of an aggregate of Fly Ash and Slag was conducted by pelletizing a dry powder of two types: the first type (90% Slag and 10% Portland cement) After that, artificial fly ash aggregate, and/or natural coarse aggregate in the mixes was used with sodium hydroxide and Alkali to produce three mixtures of lightweight geopolymer concrete, two mixes without steel fiber, and other with 0.5 and 1 % steel fiber). To achieve the objectives of this study, concrete properties such as Splitting Tensile Strength, Compressive strength, and flexural strength were investigated. The strength properties were examined through compressive strength, and splitting tensile strength. Test results revealed that the utilization of steel fiber crucially enhanced the structural performance of lightweight geopolymer concrete. The lightweight geopolymer concrete incorporated fly ash and Slag aggregate can be produced with compressive strength as high as 40.50 MPa and a Splitting tensile strength as high as 2.66 MPa. Moreover, the incorporation of 0.5 and 1% steel fiber volume fraction were the most significant parameters that caused a remarkable improvement of investigated properties.
For 0.5 % steel fiber, the compressive strength is 45.97 MPa and for 0.5 % steel fiber the Splitting tensile strength is 3.51 MPa.
For 1 % steel fiber, the compressive strength is 51.21 MPa and for 1 % steel fiber the Splitting tensile strength is 5.14 MPa.

ce.amjad1@gmail.com

Abstract

Scholars all over the world are becoming increasingly interested in the production of lightweight building materials through the utilization of wastes and by-products. The present research focused on the production of artificial lightweight aggregate (ALWA) and its mechanical, physical properties. Also presents the effect of using artificial aggregate on the properties of alkali-activated slag/fly ash concrete cured with ambient temperature. the cold-bonded process was used to manufacture artificial aggregate. At first, the production two type of aggregate was conducted by pelletizing a dry powder of type1 (40% fly ash 40% slag and 20% Portland cement), type 2 (90% slag and 10% Portland cement). Thereafter, All the natural coarse aggregate replaced by the artificial aggregate were used to produce 3 mixtures of geopolymer concrete with sodium hydroxide concentration of 12 M. To attain the objectives of this study, The strength properties were investigated through compressive strength, density, water absorption and the (SEM) of the artificial aggregate. Moreover, the strength properties through compressive strength, splitting tensile strength of the geopolymer concrete. Test results revealed that the compressive strength of the geopolymer concrete incorporated 80% of type 1 and 20% of type 2 aggregate can be produced with compressive strength as high as 50.70 MPa and 2.91 MPa as splitting strength.

Keywords: (Geopolymer concrete, ground granulated blast furnace slag, ordinary Portland cement.)

*Sorumlu yazar e-mail: guneygunseli@gmail.com

Özet

Gelişmekte olan teknoloji beraberinde uygulama alanlarında kullanılabilecek olan yeni kimyasal malzemelere ve bunların özelliklerinin incelenmesine ihtiyaç duyulmaktadır. Son yirmi yıl içerisinde hem akademik hem de endüstriyel düzeyde kesintisiz bir gelişme göstermiş ve avantajları ile ön plana çıkmakta olan metal organik kafes yapılar (MOF) veya gözenekli koordinasyon polimerleri bulunmaktadır (1). MOF'lar organik bağlayıcı ve metal iyonlarının birleşmesi ile oluşan yüksek gözenekliliğe sahip organik-inorganik hibrit yapılardır. Yapısal çeşitlilik, geniş spesifik yüzey alanı, kontrol edilebilir gözenek boyutu/geometrisi, yapısal kararlılık çok düşük yoğunluk, esneklik ve güçlü önemli Van der Waals etkileşimleri gibi kayda değer özellikleri bulunmaktadır (2). Bu özellikleri sebebi ile gaz depolama/ayırma, saflaştırma, kataliz, sensör, ilaç depolama gibi birden çok uygulama alanında kullanımı mevcuttur (3). Gözeneklileri sayesinde moleküler eleme etkisi nedeniyle çeşitli analitlere karşı yüksek hassasiyet ve seçiciliğe sahip MOF tabanlı gaz sensörlerin oluşturulmasında ilerleme kaydedilmiştir. Tıbbi teşhis, gıda tazeliği, endüstriyel gaz kaçağı konularında artan endişe, mükemmel hassasiyet, düşük güç tüketimi, maliyet ve uzun kullanım ömrüne sahip minyatürize edilmiş gaz sensörleri gerektirmektedir. SAW (yüzey akustik dalga) sensörleri kütleye duyarlı minyatürize edilmiş gaz sensörlerindendir ve cihaz yüzeyindeki mekanik değişiklikleri tespit eden ve bu değişikliği elektriksel sinyale dönüştüren cihazlardır. SAW cihazlarında transdüser kısımları (IDT) arasında bulunan alanda belirli bir kimyasala duyarlı bir katman oluşturularak analitin bu alana bağlanmasına izin verilir, bu bağlanma doğrultusunda analitin neden olduğu kütle artışı ile rezonans frekansındaki kayma sonucu oluşan sinyal ile algılama malzemesinin analite karşı duyarlılığı analiz edilir (4).
Bu çalışma kapsamında, kararlı yapıya sahip karboksilik asit türevi içeren MOF bileşiğin sentezi ve çeşitli yöntemler kullanılarak karakterizasyonu gerçekleştirilmiştir. Sentezlenen MOF yapısının SAW sensör yüzeyine kaplanması sonucu uçucu organik bileşik gazlarına karşı etkileşimleri incelenmiştir. Uçucu organik bileşiklerin belirli oranlarda nem ile karışması sonucu SAW sensör ölçümleride alınmış olan MOF yapısının duyarlılık ve seçicilik analizleri gerçekleştirilmiştir. Yapılan analizler MOF bileşiğinin gaz algılama özelliklerine sahip olduğunu ortaya koymuştur.

Anahtar Kelimeler: Metal Organik Kafes Yapılar, SAW Sensör, Gaz Algılama, Uçucu Organik Bileşik

Abstract

Impact loads can make a significant damage to concrete slabs, many researchers study to improve concrete resistance to impact forces. This study aims study the effectiveness of using hybrid concrete on slabs resistance to impact loads comparing to normal concrete NC slabs. A free drop mass impact experiment setup will be utilized to find the impact Response of hybrid concrete slabs reinforced with steel bars comparing to NC slabs. In this investigational study, one hybrid concrete slab and one NC slab were experienced for free drop impact. A full scale (1550×1550 mm) slabs were used, the hybrid concrete slab containing 50% reactive powder concrete (RPC) with a reinforcements ratio 0.006 having a grid of eight steel bars and the control specimen casted with 100% NC slab with a reinforcements ratio of 0.00448 reinforced with six steel bars have been made and subjected to 7 m free drop mass. The outcome from present research demonstrate that slab casted with RPC made a significant enhancement for enduring impact loads with much less dispersed fragments comparing to the NC slab, also slab casted with RPC gave low deflection comparing to the NC slabs.

Keywords: free drop weight impact; impact test; steel; RPC and NC.

Abstract

Slabs are subject to many forces and one of the forces that slabs usually fail to resist is impact loads, steel bars reinforced concrete is extensively used in structural members. The aim of the current research is to investigate the effects of using hybrid concrete on impact resistance comparing to normal concrete NC. A free drop weight impact test setup will be used to investigate the impact behaviour of hybrid concrete slabs reinforced with steel bars. In this experimental study, one hybrid concrete slab and one NC slab used as control specimen were tested for impact. One (1550×1550 mm) hybrid concrete slab containing 50% reactive powder concrete (RPC) and normal concrete (NC) and one normal concrete, both slabs have a reinforcements ratio of 0.00448 have been made and subjected to 7 m free drop weight. The results from current study shows that slab containing RPC are better in resisting and enduring impact loads also less scattered pieces comparing to the NC slab, furthermore slab containing RPC giving low deflection comparing to the NC slabs.

Keywords: free drop weight impact; impact test; steel; RPC and NC.

Özet

Raylı taşıtlar diğer ulaşım türleriyle kıyaslandığında, yüksek yolcu ve yük kapasitesine, yüksek çalışma hızına, düşük işletme maliyetine ve yüksek güvenlik katsayısına sahiptir. Hızla gelişmekte ve büyümekte olan bu ulaşım türüne tüm dünyada yoğun ilgi duyulmaktadır. Özellikle son yıllarda raylı taşıt kullanımının artması, bu taşıtlarda kullanılan fren sistemlerinin teminine olan ihtiyacı da arttırmıştır. Aynı zamanda otomotiv sektöründeki gelişmeler yüksek performans gerektiren frenleride beraberinde getirmiştir. Bu nedenle raylı taşıtlarda ve otomotiv sektöründe kullanılan balataların üretim maliyetlerinin düşürülerek performansının artırılması son derece önemlidir. Polimer matrisli kompozit fren balatalarında kullanılan bileşenlerin her birinin frenleme esnasında farklı bir görevi vardır. Genel olarak bu bileşenler; yağlayıcılar, aşındırıcılar, bağlayıcılar, yapısal malzemeler ve dolgu malzemeleri olarak sınıflandırılmaktadır.Bu çalışma kapsamında ağırlıkça %20 yapısal malzeme, %20 yağlayıcı, %31 aşındırıcı, %29 dolgu malzemesi oranları sabit tutulup karışımın toplam yüzdesine göre değişen bağlacıyı oranlarında bileşimler hazırlanarak reçine miktarının etkisi incelenmiştir. Hazırlanan karışımlar 255 MPa basınç altında 150 °C'de 5 dakika boyunca standart atmosfer altında sinterlenmiştir. Numunelerin aşınma deneyleri özel olarak tasarlanmış balata test cihazında 8 m/s hız, 1 MPa yük kullanılarak toplam disk devir sayısı 5000 olana kadar gerçekleştirilmiştir. Deneyler esnasında karşı cisim olarak dökme demir disk kullanılmıştır. Bağlayıcı oranındaki değişimin balatanın tribolojik performansını önemli ölçüde değiştirdiği gözlemlenmiştir. Bağlayıcı oranının artmasıyla beraber sürtünme katsayısında azalma, balatanın aşınma miktarında ise artış olduğu gözlemlenmiştir. %20 reçine miktarına sahip olan numune ile en yüksek sürtünme katsayısı (0,36-0,5), en az aşınma miktarı (2,51 mm^3) ve en stabil sürtünme katsayı elde edilmiştir. Bağlayıcı miktarının %8'den az, %30'dan fazla olduğu durumlarda standartlar sağlanamamıştır.

Anahtar Kelimeler: Polimer matris kompozit; raylı taşıtlar; otomotiv; balata; reçine.

Özet

Titanyum (Ti) malzemelerin yüzey özellikleri başarısını etkileyen en önemli faktörlerin başında gelmektedir. Konak yapı ve biyomalzeme arasındaki ilk temas malzemelerin yüzeylerinde gerçekleşmektedir. Dolayısıyla hücrelerin temas ettikleri yüzeylerin kimyası, fiziksel ve mekanik özellikleri oldukça önemlidir. Bu çalışma kapsamında Ti malzemelerin lokal salım yapabilecek polimerik bir kaplama sistemi geliştirilecektir. Yüzey pürüzlülüğünün hücre davranışını etkilediği bilindiğinden kaplamalar farklı büyüklükte nanopartiküller ile hazırlanacak ve yüzeylerin pürüzlülükleri tespit edilip bu pürüzlülüğün hücreler üzerine etkileri çalışılacaktır. Bu amaçla öncelikle kitosandan sonikasyon yöntemi ile kitosan nanopartiküller üretilmiş, çapraz bağlayıcı olarak TPP kullanılmıştır. 4 mg/ml'lik kitosan çözeltisi 4 mg/ml'lik TPP çözeltisi ile 5 dk ve 80 watt ile sonikasyon işlemine maruz bırakıldığında ortalama 143 nm, 4 mg/ml'lik kitosan çözeltisi 2 mg/ml'lik TPP çözeltisi ile 10 saniye 10 Watt ile sonikasyona maruz bırakıldığında ise ortalama 600 nm boyutlarında nanopartiküller elde edilmiştir. Üretilen nanopartiküllerin zeta potansiyelleri ve boyutları zeta sizer ile analiz edilmiştir. Nanopartiküllerin ilaç yükleme ve salım profillerinin tespiti için model ilaç olarak ciproflaxin tercih edilmiş olup nanopartiküllerin enkapsülasyon yöntemi ile yüklemeleri yapılmış olup salım çalışmaları devam etmektedir. Partiküllerin ilaç salım profilleri çıkarıldıktan sonra partiküller sırasıyla Ti yüzeylere tutuklanacak, yüzeylerin pürüzlülükleri tespit edilecek ve fibroblast hücreleri ile hücre kültürü çalışmaları yapılacaktır. Çalışmanın sonunda polimerik partiküllerin oluşturduğu pürüzlülüğün hücreler üzerine etkisi ortaya çıkmış olacaktır.

Anahtar Kelimeler: Kitosan, ilaç salımı, MTT, yüzey pürüzlülüğü.

Abstract

Water is an indispensable natural resource for life and economy. With the development of the industry, the use of water in the industry is increasing due to the use of it for providing hygiene and for consumption as a drinking water. With the increasing population, water pollution increases at the same rate. Water pollutant sources used for color purposes in wide areas such as textile, paper, rubber, plastic, leather, cosmetics, food and pharmaceutical industries. Wastewater containing dyes causes toxicological damage to the environment and also human health. Many methods are used to remove dyes from wastewater, but adsorption is superior to other methods because of its simple design, easy process operation, inexpensive and intensive against pollutants. The most commonly used among the adsorbents is activated carbon, but it is expensive. This high cost required orientation towards alternative adsorbent sources. One of these alternatives is agricultural waste or industry residues.
Therefore, in this study, it was aimed to investigate the potential of wastewater removal by using date seeds to remove Reactive Red 195 dye from aqueous solutions. Various parameters such as pH, adsorbent amount and temperature were studied using Box-Behnken experimental design and adsorption mechanisms were determined. According to the results, date seed has found as an appropriate and environmentally friendly alternative for the clean-up of dye-polluted aqueous as a new natural sorbent with desirable absorption capacity.

Keywords: Adsorption, Reactive Red 195, Date Seeds, Optimization.

Abstract

The industrial activity of the aromatic and medicinal plant sector generates thousands of tonnes of waste. The high volume of essential oil extraction residues poses a real environmental and economic problem. However, the recovery of these by-products is an opportunity to obtain benefits in a sustainable way, particularly in terms of obtaining bioactive compounds with undeniable pharmaceutical interests. The objective of the study is to recover a by-product obtained from essential oils of *Salvia officinalis L*. The effect (main and interactive) of extraction conditions on total phenolic and flavonoid content were studied using Box–Behnken design (three factors at three levels). The influence of extraction time (60-360 min), solid–liquid ratio (1:10–1:30 g/ml) and concentration of ethanol (40- 80%) on the extraction yield were investigated. Total phenolic compounds (TCP) and flavonoids (TCF) contents were estimated by Folin - Ciocalteu and aluminum chloride methods, respectively. Antioxidant activity was measured by 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging assay. The results obtained showed that the extraction yield of bioactive compounds from sage residues as well as the antioxidant activity were affected by the extraction parameters, a time of 4 hours, an ethanol/residue ratio of 20 and an ethanol concentration of 60% revealed a maximum content of 26,95 mg EAG/g in TCP and a maximum content of 6,3 mg EQ/g in TCF. Under these conditions, the highest IC50 value (0,66 mg/mL) is recorded. In addition, the results showed that the contribution of the quadratic model was significant for all the responses. Second-order mathematical regression models were developed and were found to fit well with observed data. This study leads to confirm the possibility to valorize bioactive molecules present in the residues of sage which are a potential source of bioactive compounds.

Abstract

Since seed germination and early seedling development period constitute the most important stage of a plant's development, it is very important to determine the effects of environmental factors at these stages. This study was carried out to determine the effects of exogenous Epibrassinolide (EBr) application on germination and early seedling growth of wheat (*Triticum aestivum* L.) seeds under the influence of Cypermethrin (CP) insecticide. The seeds were sterilized with 5% sodium hypochlorite for 15 minutes before applications. The following applications were made in the controlled climate cabinet with 20 seeds in each petri dish: 0 (no application), 25 ppm CP, 50 ppm CP, 100 ppm CP, 25 ppm CP+10^{-5} M EBr, 50 ppm CP+10^{-5} M EBr, 100 ppm CP+10^{-5} M EBr. The seeds were checked daily and germination numbers were recorded. The effect of EBr applications on germination was not found to reduce the effects of CP. Similar findings were also found in total phenolic contents. In contrast, non-protein sulfhydryl group contents were found to increase relative to control. In addition, the fact that the highest hydrogen peroxide and malondialdehyde contents were determined in individual CP applications compared to CP+EBr applications.

Keywords: Epibrassinolide, Cypermethrin, wheat, germination, physiological effect

Abstract

Cancer is the second deathly disease in the world after cardiovascular disorders. In last two decades, the chemotherapy drugs became a very attractive area of research in cancer therapy. Angiogenesis (the formation of new vessels from existing vessels) and its role in tumor growth and metastasis is a clear target for new antiangiogenic agents and inhibition of this pathway would be a very successful strategy in cancer therapy. Various studies in the literature indicate the vital role of protein tyrosine kinases on the angiogenesis pathway and this superfamily of kinases known as promising drug targets for the development of novel and potent lead molecules with anti-cancer activity. Protein tyrosine kinases are important regulators of cellular processes such as proliferation, survival, apoptosis, metabolism, transcription, differentiation, and their role in many diseases such as cancer are well recognized. Vascular endothelial growth factor receptors (VEGFRs) are very important member of receptor tyrosine kinase superfamily. VEGFR-1 and 2 are known with their crucial role in physiology and pathology of angiogenesis, while VEGFR-3 involves in embryogenesis and lymphangiogenesis. Sorafenib, a very important and successful member of small molecule kinase inhibitors, approved by FDA for the treatment of renal cell carcinoma in 2005. Chemically sorafenib possess a diaryl urea and it is the first urea derivative developed as small molecule kinase inhibitors. In this study in order to develop new and potent VEGFR-2 inhibitors six urea derivatives bearing 1,3,4-thiadizole moiety have synthesized and have characterized by FT-IR, ^{1}H-NMR, and ^{13}C-NMR spectrums. A radiometric protein kinase assay (33PanQinase® Activity Assay) was used for measuring the kinase activity in the presence of tested compounds or standart inhibitor. Results show that synthesized compounds have moderate VEGFR-2 inhibitory activity and could be used as lead compounds for developing more potent drog candidates. This study supported by Marmara University BAP FEN-C-DRP-170419-0127 grant.

Abstract

Yogurt is well known for its health-promoting properties, and in combination with fruits may provide many health benefits. Moreover, producers are seeking always new alternatives to satisfy the potential consumers' expectations and fulfil their needs. This study aims to evaluate the beneficial effects of fruits in combination with cow milk yogurt, in terms of nutritional and sensory properties, and antioxidant activity. This study used cow milk yogurt plain, produced in the laboratory, which served as a control sample and in combination with fruits, strawberries, and peaches. The quality characteristics of the samples were determined and compared with six different commercial yogurts, collected during 2022 in the region of Tirana, Albania. The physico-chemical characteristics evaluated for all samples were: moisture, soluble solids, total acidity, pH, fat, protein, carbohydrates, colour, water activity, and vitamin C. For the determination of polyphenols, flavonoids, and antioxidant activity with two tests (DPPH and ABTS) were prepared extracts with MeOH 80% alcoholic solvent. The results of the study showed that the physico-chemical parameters are in the order of the values specified for this category of products, and were following similar studies. It was noted that the addition of strawberry compared to peach fruit, had a better impact on the quality of the product. Also, the addition of fruits resulted in higher values for antioxidant activity and this was stable using two tests used, also from positive correlations with the content of total polyphenols and total flavonoids in the product containing strawberry and peach fruits. Compared with plain yogurt, fruits contribute to the antioxidant activity value by increasing it more than 2-fold. All gained results consistently emphasize the benefits of adding fruits to cow milk yogurt. From the study, we may suggest the consumption of yogurt with fruits, toward the promotion of a healthy diet. Their combinations, not only may offer product profile diversification, but also the provision and guarantee of the consumer with products that are healthy and with better acceptability by consumers of all age groups.

Keywords: Antioxidant activity, Healthy diet, Peach, Quality, Strawberry, Yogurt.

INTRODUCTION

Yogurt is a traditional fermented food, recognised for its high nutritional value and as healthy food. Even an acid-coagulated milk product by fermentation, compared to milk is more nutritious, possessing protein, Ca, P, Mg, Zn and riboflavin, thiamine, vitamin B12, folate, and niacin (Granato et al., 2010). The beneficial effect of consuming yogurt is linked with the presence of probiotics and lactose-fermenting bacteria with a beneficial effect on intestinal function. Also, it is reported to provide many health benefits, such as suitability for consumption by lactose intolerant people without causing adverse effects (de Vrese et al., 2015), able to ameliorate intestinal disorders and chronic diseases, reduce blood pressure, decrease cholesterol absorption, etc. (Sanders, 1999). Another benefit of consuming yogurt is linked with the slight reduction in stomach pH effect as it is a fermented food, and thus may reduce the risk of pathogen transit and ameliorates the effects of low gastric juice secretion (O'Connell and Fox, 2001).

In the market, there are several commercial brands, which offer diverse yogurt products supplemented by adding natural ingredients or synthetic additives (Coïsson et al., 2005). Fruit yogurt is among the most common fermented dairy products consumed around the world (Saint-Eve et al., 2006). An interesting application in the dairy sector is the addition of fruits, in the forms of fruit juices, pulp, jam, powders, and extracts (Wallace and Giusti, 2008). The enrichment of yogurt with different types of plant materials added as functional ingredients can provide many benefits, serving as natural colorants, enhancing the flavor, and offering sources of bioactive compounds with antioxidant properties (Kim et al., 2009; Oh and Kang, 2015). The purpose of

the inclusion of fruit (natural additives) in yogurt aims to increase its antioxidant activity and functionality (Pereira et al., 2013).

To increase the functionality and antioxidant capacity of these dairy products, food ingredients such as strawberry fruit is commonly added (Coïsson et al., 2005; Trigueros, et al., 2011). Strawberries fruit have unique sensory properties, rich in phenolic compounds and anthocyanins as a source of antioxidants, have the scent of bright red colour (Ahouagi et al., 2021; Yang et al., 2021; Rahman et al., 2021), and are rich in vitamins and essential elements (Mousavi et al., 2021). Peaches are rich in polyphenols and carotenoids (Fernandes et al., 2012; Flis et al., 2012; Martínez et al., 2012; Barros et al., 2010).

There are few studies on yogurt, and even reports on the antioxidant activity of different fruits yogurt available in the market are scarce. This study aims to evaluate the beneficial effects of fruits in combination with cow milk yogurt, in terms of nutritional and sensory properties, and antioxidant activity.

MATERIALS AND METHODS

This study used cow milk yogurt plain, produced in the laboratory, which served as a control sample and in combination with fruits, strawberries and peaches. The cow milk for making yogurt plain and with fruits strawberry (*Fragaria × ananassa Duch.*) and peach (*Prunus persica (L.) Batsch 'Diamond Princess'*), also six commercial yogurts with fruits (strawberry, peach) from different brands collected during 2022 in the region of Tirana, Albania. In this study and all ingredients (sweeteners, starch, thickeners, acidifying substances, fruit preservative, milk proteins, lactic ferments) were collected from the domestic market in Albania. For the production of yogurt in laboratory conditions, milk was pasteurized at 90°C for 10 minutes in a water bath for general purposes and c tooled at 42°C before use. A traditional homemade yogurt sample was prepared too. The yogurt starter culture was inoculated by direct addition with an appropriate amount applied to treated milk, preserved in glass packaging, and incubated in a conventional oven at 42°C until coagulation occurred (pH reached 4.5), as well was transferred to the refrigerator for cooling and stored at 5 ± 1 °C for further analysis.

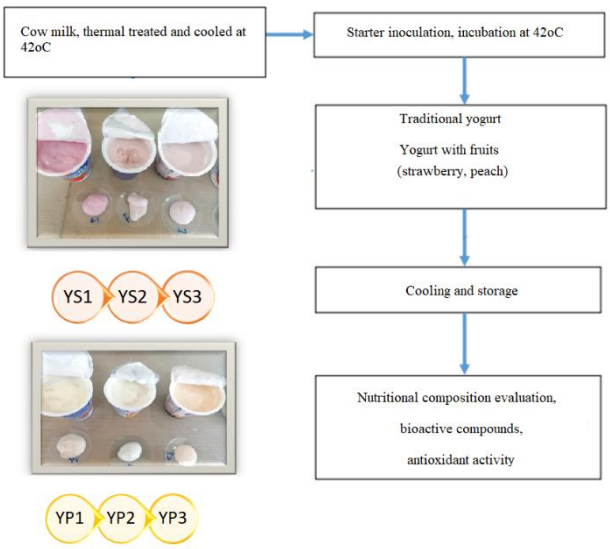

Figure 1. Study samples and general flow diagram followed for yogurt preparation

The samples were coded Yt (traditional yogurt), Y (plain yogurt), YS1, YS2, YS3 (yogurt with strawberry fruit, from 3 different brands), YP1, YP2, YP3 (yogurt with peach fruit, from 3 different brands).

All chemicals and reagents used in this study were ACS (Committee on Analytical Reagent grade). Analyses were performed at the Food Research Centre, Agricultural University of Tirana.

The total content of protein, fat, ash, total acidity (TA, result expressed % lactic acid), and vitamin C was determined according to AOAC (2016), and all the results were expressed as g/100 g. Energy values were calculated using Atwater factor of 4 Kcal/g for protein and carbohydrate and 9 Kcal/g for fat. Moisture content was determined using an advanced moisture analyser Ohaus, where 1.0±0.002 g of sample was uniformly distributed on an aluminum plate. The measurement of pH was performed with a Benchtop pH meter, having an accuracy of 0.001 pH and previously calibrated with 4.00 and 7.00 pH buffer solutions. The carbohydrates were calculated by difference: [100 - (protein + fat + ash + water)]. The water activity (aw) was measured at

25°C using a water activity meter Retronic. The colour value was determined using a portable colorimeter NH310 with CIE parameters L*, a*, and b*.

Extracts were prepared according to Shori and Baba (2013), with modifications using MeOH 80% alcoholic solvent. The supernatants were collected and kept in the refrigerator (4 °C). The determination of total polyphenols was done according to Shetty et al., (1995). Yogurt extracts (1.0 ml) were mixed with 1.0 ml absolute ethanol and 5 ml dH2O, then 0.5 ml Folin–Ciocalteu reagent (diluted 10 times) was added to each sample, followed by the addition of 1.0 ml Na2CO3 5%, and let to stand in dark for 60 min at room temperature. The absorbance was measured at 760 nm using UV-VIS spectrophotometer (Libra S22, Bichrom, UK). The results were expressed as mg of gallic acid equivalents (GAE) per 100 g of fresh weight (fw) of the sample.

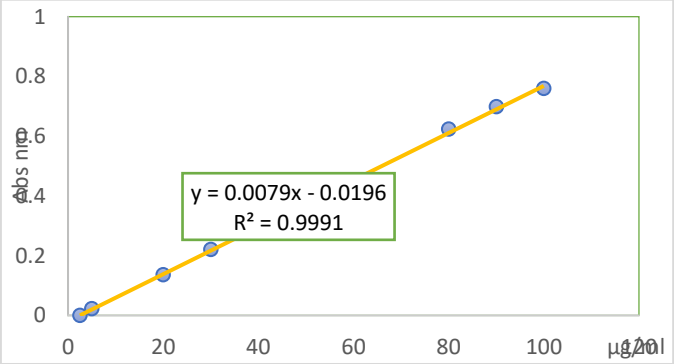

Figure 2. Standard gallic acid curve

The flavonoids were determined by the aluminum chloride colorimetric method, the absorbance was read in triplicate against blank at 510 nm, and the results were expressed as mg of catechin equivalents (CE) per 100 g of fresh weight (fw) of the sample. The antioxidant activity assessed with ABTS (2,2′-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) test according to Giao et al., (2007), and with DPPH (2,2-diphenyl-1-picrylhydrazyl) test according to Shetty et al., (1995), the results were calculated according to Apostolidis et al., (2007) and were expressed as % of inhibition.

All measurements were performed at least in triplicate and were reported as mean and standard deviation.

RESULTS and DISCUSSION

The results of yogurt samples are presented in Table 1 and the Figure 2 to 6. The energy value for yogurt resulted in 269-469 kJ/100 or 64-111 kcal/100 g fw of the sample. From the addition of fruits, it increased by ~8% compared to traditional sample, and in commercial samples from 29 to 68% compared to yogurt made in the laboratory. The moisture content ranged from 74.5 to 87.4%, where the traditional yogurt had the highest content, while the strawberry yogurt YS2 sample had the lowest. Commercial samples had almost 29% lower moisture content compared to Yt and Y. The protein content in yogurt varied from 3.56 to 4.48 g/100 g, and no big differences were noted among the samples. The higher content was found in the commercial strawberry yogurt YS2 (4.48 g/100 g fw of the sample). The fat content was found in the range of 2.24-3.50 g/100 g fw of the sample. Slight differences were noted between samples, and the highest value had the traditional (homemade) yogurt with 3.50 g/100 g fw of the sample. Regarding carbohydrates, they were in the range of 4.35-18.07 g/100 g fw of the sample, where is notable the highest content in yogurt with fruits compared to traditional yogurt (~34% for Y), and in commercial samples, it gets higher 1.74 to 2.74-fold compared to Y sample. The total ash content was in the range of 0.65-0.89 g/100 g fw of the sample, and yogurt produced by us had the highest value (0.89).

Table 1. The nutritional composition values of yogurt (control and with fruits, results expressed per 100 g fw of sample)

Sample	Energy (kcal)	Energy (kJ)	Moisture (g)	Prot (g)	Fat (g)	Carb (g)	Ash (g)
Yt	64	269	87.4 ± 0.10	3.86 ± 0.02	3.50 ± 0.05	4.35 ± 0.10	0.89 ± 0.04
Y	66	279	86.1 ± 0.02	3.89 ± 0.01	2.72 ± 0.10	6.60 ± 0.02	0.89 ± 0.01
YS1	86	361	81.2 ± 0.05	3.68 ± 0.04	2.77 ± 0.02	11.50 ± 0.05	0.85 ± 0.02
YS2	111	468	74.5 ± 0.50	4.48 ± 0.10	2.30 ± 0.05	18.07 ± 0.03	0.65 ± 0.05
YS3	97	408	78.5 ± 0.40	4.05 ± 0.05	2.80 ± 0.50	13.87 ± 0.02	0.78 ± 0.10
YP1	88	372	80.5 ± 0.10	3.56 ± 0.04	2.70 ± 0.10	12.46 ± 0.04	0.78 ± 0.02
YP2	87	365	80.5 ± 0.05	3.89 ± 0.02	2.24 ± 0.06	12.71 ± 0.06	0.66 ± 0.04
YP3	98	411	78.4 ±0.10	4.06 ± 0.04	2.90 ± 0.10	13.80 ± 0.02	0.83 ± 0.07

In the Figure 3 are presented water activity values, which resulted higher in Yt (0.941) sample, and the addition of the fruits had a decreasing effect on aw values (till 0.838). Based on moisture content and water activity values measure, could be seen as beneficial supplementation of yogurt with fruits by decreasing the moisture to 29% and aw till ~7%, providing thus safer conditions for microorganisms growing, and extending the shelf life of products. Nevertheless, other factors and conditions should be taken into consideration.

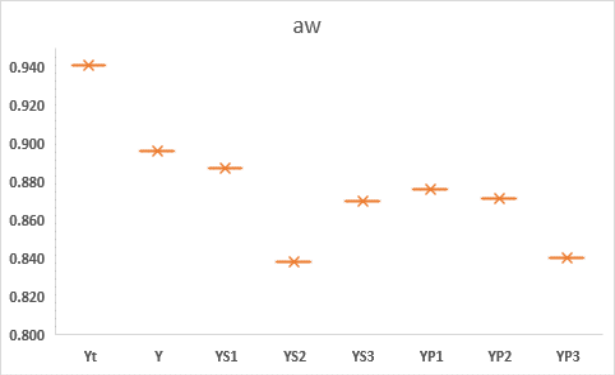

Figure 3. Water activity of yogurt samples

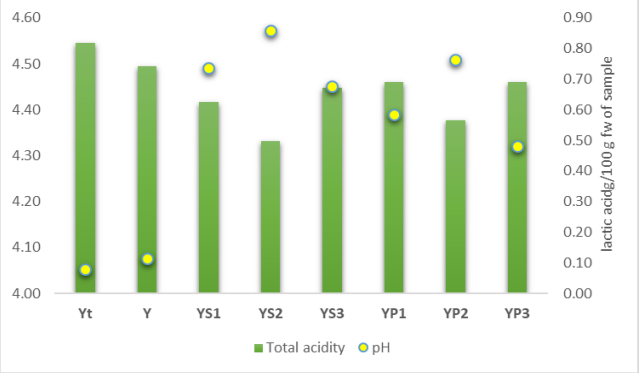

Figure 4. Total acidity and pH values of yogurt samples

Total acidity and pH values (Figure 4) ranged from 0.50 to 0.82 g lactic acid /100 g fw of sample and 4.05-4.57. The lowest value of pH and higher total acidity had the yogurt samples prepared by us, whereas the commercial samples had slight differences among them.

The total colour values CIE L*, a*, and b* are presented in Figure 5. The L* value was found in the range 86.55-99.99 representing brightness, and plain yogurt prepared without fruits had higher values (99.99), Regarding, a* values resulted higher and positive in strawberry yogurt samples (6.13-16.91), due to the presence of red pigments from strawberry fruit. The b* value resulted higher and positive in peach yogurt samples (15.84-27.83), due to the presence of yellow pigments from peach fruit.

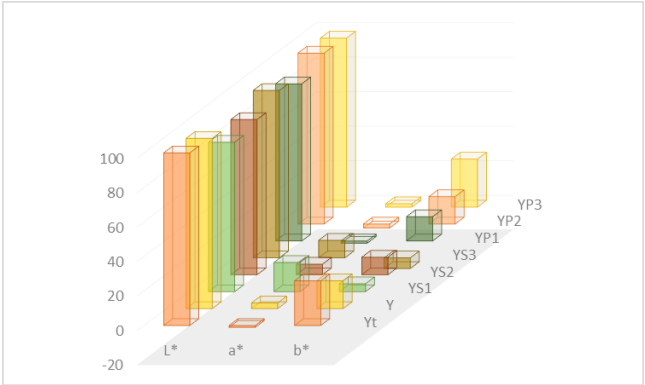

Figure 5. Colour values CIE L*a*b* of yogurt samples

In the Figure 6 are presented the values of total polyphenols, flavonoids and antioxidant activity content.

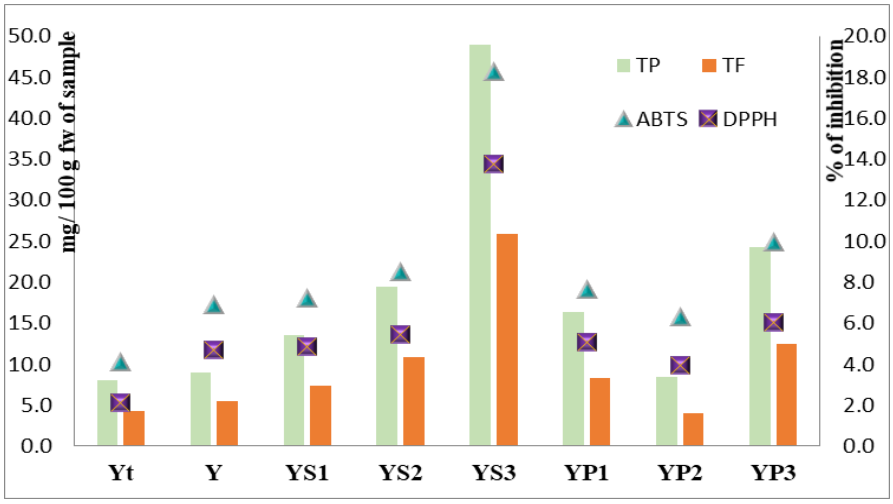

Figure 6. Total bioactive compounds and antioxidant activity of yogurt samples

Results showed that the total content of polyphenols ranged from 8.0 to 48.9 mg GAE/100 g fw of the sample, the lowest content had Yt sample and the highest YS3 sample, generally, supplementation of yogurt with fruits caused an increase of polyphenolic content (till 6-fold), and strawberry fruit served as a better source of such compound compared to the peach fruit. The flavonoid content ranged from 4.2 to 25.8 mg CE/ 100 g fw of sample and followed the same trend as polyphenols. The antioxidant activity was evaluated with two tests, and from the DPPH test values ranged 2.1-13.8 % of inhibition, while from the ABTS test values ranged 4.1-18.3 % of inhibition, both tests are in good correlation with each other and with total bioactive compounds determined. By comparison with plain yogurt, fruits contribute to the antioxidant activity value by increasing it more than 2-fold. The values resulted followed the trend Yt< YP2< Y< YS1< YP1< YS2< YP3< YS3 according to the content of total bioactive compounds and antioxidant activity.

The results of the study showed that the physico-chemical parameters and antioxidants are in the order of the values specified for this category of products. It was noted that the addition of strawberry compared to peach fruit, had a better impact on the quality of the product. Also, the study results were in accordance with other similar studies (Pereira et al., 2013; Shori and Baba, 2013; Oliveira and Pintado, 2015; Nguyen and Hwang, 2016; Supriyanti et al., 2022).

CONCLUSION

The results of the study showed that the physico-chemical parameters are in the order of the values specified for this category of products, and were under similar studies. It was noted that the addition of strawberry compared to peach fruit, had a better impact on the quality of the product. Also, the addition of fruits, resulted in higher values for antioxidant activity and this was stable employing two tests used, also from positive correlations with the content of total polyphenols and total flavonoids in the product containing strawberry and peach fruits. By comparison with plain yogurt, fruits contribute to the antioxidant activity value by increasing it more than 2-fold. All gained results consistently emphasize the benefits of adding fruits to cow milk yogurt. From the study, we may suggest the consumption of yogurt with fruits, toward the promotion of a healthy diet. Their combinations, not only may offer product profile diversification, but also the provision and guarantee of the consumer with products that are healthy and with better acceptability by consumers of all age groups. In the future exploitation should be done for other fruits application in the yogurt and dairy sector.

Abstract
Our research is to elaborate a yoghurt added with carob flour and oat flakes, in order to diversify the dairy products and to use rich natural products existing in important quantity and are ignored and not consumed in Algeria having benefits on the human health knowing that the yoghurt is an important contribution in calcium and vitamins, that the carob involves a fall of the level of total cholesterol and the bad cholesterol (LDL) in blood The tannins and fibres in carob are very rich in polyphenols and oat flakes contain high levels of iron, calcium, magnesium, phosphorus, potassium and other minerals with moisturising, soothing and skin-repairing properties. Physico-chemical and microbiological analyses gave results in conformity with the standards fixed by the Algerian Official Journal. We noted that the fat content of the mixed yoghurt increases with the carob powder at different incorporation rates and that the acidification of the yoghurt is slower with the oats, due to the decrease in water activity (aw), or the conservative effect of the oats on the activity of lactic bacteria. A tasting test for sensory analysis allowed us to interpret the tasters' feelings, who appreciated the carob yoghurt with 4% incorporation and less with the oats. The cultivation of carob remains one of the weakest activities despite the importance of this product in economic development and the contribution of foreign currency through exports, the interest of these crops must be done through the process of support and reforestation. In addition, the yogurt is enriched with oats and therefore minerals, fiber and natural sugar, which has an antioxidant capacity, is a functional food beneficial to the body.
Key words: yoghurt, carob flour, oat flakes, organoleptic characteristics, sensory analysis.

Introduction

Fermented milks are dairy products transformed by an essentially lactic fermentation that results in the acidification and gelation of milk. Historically, the aim was to improve the preservation of milk, which is a rapidly perishable raw material. Human food is increasingly varied and plays several roles in terms of nutrition and health. Indeed, the current dynamics of the food market is no longer to develop products in large quantities and satisfactory quality, but to develop a balanced food called functional of dietetic and therapeutic interest, **(Vilain, 2010).**With the technological progress made, yoghurt appears as a very digestible dairy product, which has a high nutritional value and is appreciated for its taste and texture. **(Schmidt et *al*., 1994)** Yoghurt itself, in addition to its nutritional importance, has long been identified as a healthy food due to the beneficial action of its two live bacteria (*Lactobacillus delbrueckii subspbulgaricus and Streptococcus thermophilus).* These compete with pathogenic bacteria both in the food and in the environment **(Tamime and Robinson, 1985)**.The microorganisms in the final product must be viable and abundant **(Bourlioux et *al*., 2011)**. Yoghurts and many fermented milks have health-promoting functionalities linked to the specific bacterial strains they contain. For example, they promote lactose digestion and some fermented milks improve functional intestinal disorders and others can act on the immune system **(Syndifrais, 1997)**. Carob pods, richer in sugar than sugar cane and sugar beet, are used in the food and pharmaceutical industries, particularly as an anti-diarrhoea agent, and their high fibre content gives them cholesterol-lowering and glucose-lowering properties; The phenolic compounds they contain are at the origin of their antioxidant property, carob is currently attracting a lot of interest in Algeria, particularly in Tlemcen where industrialists are vying for the international market, with a view to exporting it in the form of flour from the pulp and seeds for their agricultural cultivation. Moreover, this tree is of considerable economic importance **(Hariri et *al*., 2009)**. The carob tree has socio-economic and ecological roles which, through its multiple uses, can contribute to the rural development of certain areas, particularly in North Africa **(Benmahioul, 2011).**

Materials and methods :

Biological materials:

Oat flakes, carob powder, 0% and 26% milk powder, tap water, modified starch, sugar, lactic ferments.
Yoghurt incorporated with oatmeal at different rates (2%,4 %and 6%).
Yoghurt incorporated from carob flour at different rates (2%,4 %and 6%).
Incorporated yoghurt of carob oat mixture of different rates (2%,4 %and 6%).

Measurement equipment:

Laboratory measurement equipment, apparatus and reagents.

Methods

Sampling and preparation of samples of carob powder: The different stages of transformation of carob pulp into powder. The grinding is done by a mill (mammoulex).
Sieving: This operation aims to separate the usable fraction from the non-usable one. The sieving is carried out using sieves with different openings. The aim is to obtain a powder with a granulometry of less than 200 µm.Sterilisation of the carob powder and oats was done manually to remove impurities. Both the oats and the carob were sterilised at 60C° for 1 hour and then stored in a sterile glass box.
The milk powder sample was taken from a 25 kg bag of 26% fat and 0% fat powder, randomly selected from the storage pallet using a sterilised spoon. The collected powder is placed in a hermetically sealed sterile glass box.
Modified starch Sugar Lactic ferments: These consist of two strains: *Lactobacillus bulgaricus and streptococcus thermophilus* and Process water

physico-chemical analyses :

The purpose of physical-chemical analyses is to determine the stability and consistency of a product and its nutritional and organoleptic characteristics during storage.

Table n°01 : parameters studied in the physico-chemical analyses on the different products.

Sample Parameter	Carob powder	Oat flakes	Trial water	Milk powder 0% and 26%	Prepared milk	Finished product
Moisture	+	+	-	+	-	-
Ph	+	+	+	+	+	+
Alkalinity (TA, TAC), TH	-	-	+	-	-	-
Acidity	-	-	-	+	+	+
Fatty matter	-	-	-	+	+	-
Dry extract	-	-	-	-	-	+

(+): presence of analysis. (-): no analysis.

Trial water :

Determination of the pH :

The two probes of the pH meter are immersed in our product, and read directly the value indicated on the pH meter device.

Determination of alkalinity (TA, TAC):

The alkalinity titre or TA measures the hydroxide ion content of the water and the half concentration of carbonate ions.The complete alkalimetric titre or TAC corresponds to the free alkali content of the water, the half concentration of carbonate ions and the bicarbonate **.**

The determination of these two parameters is based on the neutralisation of a certain volume of water by a dilute mineral acid, in the presence of a coloured indicator. The procedure and the expression of the results are as follows:Add: 2 drops of phenolphthalein (C20H14O4) at1 (%) Alkalinity is measured with a strong acid standard solution in the presence of coloured PH indicators.
Titration: with the N/25 sulphuric acid solution (H2SO4).
Phenolphthalein turns from pink to colourless at a ph of 8.3

$$\mathbf{TA\ (°F) = VH2SO4\ (ml)_{x}\ 4}$$

Determination of the TAC (complete alkalimetric titre) :
Take: V water 50 (ml) of water into a 250 (ml) Add: 2 drops of methyl orange to the Erlenmeyer flask.
Alkalinity is measured using a strong acid standard solution in the presence of coloured ph indicators.
Titration: With the sulphuric acid solution (H_2SO) at N/25.
Methyl orange, turns from yellow to orange at pH 4.3 13.1 4.4).(Calculation with the same formula as above)
Determination of water hardness TH :

$$TAC = [OH] + 1/2\,[CO3^-] + [H\,HCO^{-3}]$$

The hydrometric titre (**TH**) indicates the total calcium and magnesium salt content of water, the hardness of a water is proportional to the total number of calcium and magnesium atoms it contains **(Lauze, 2002).**

$$TH = Ca2+, Mg2+$$

Take: V100 (ml) of water Add: 2 (ml) of the buffer solution of pH 10 (TK 10) to the Erlenmeyer.
Add: 2 to 4 drops of NET (CH, N, NaO, S) to the Erlenmeyer.
The NET acts as an end-of-reaction indicator. It is purple in the presence of Ca" and M ions and blue in distilled water.Titration: With EDTA-Na solution, ($C10H14N_2O$ Nay. 2 H_2O) at 0.01 (M).

$$TH\ total\ (°F) = VEDT\ (ml)$$

Determination of PH :Milk powder 0% and 26%
After diluting 2g of the sample in 20ml of distilled water, the ph was measured using a PH meter. The result was displayed on the screen of the apparatus.
Determination of the titratable acidity:
In a beaker, dilute 2g of the powder in 20 ml of distilled water and add two drops of phenolphthalein. Then, a titration is carried out with a 0.09g/l sodium solution until the colour changes from colourless to pink.
Determination of the fat content :
10 ml of sulphuric acid is introduced into the butyrometer using a dosing device, then 10 ml of distilled water is added using a pipette, allowing it to drain very slowly to avoid mixing with the acid, then 2.5 g of milk powder and 1 ml of iso-amyl alcohol are introduced.The butyrometer is then stoppered with a clean, dry stopper. The dissociated fat is less dense and collects in a clear, transparent mass, which can be read directly on the butyrometer scale. The fat content is expressed in g/l.
Determination of moisture :
It is done following the calculation of the TSE, which is done by the following method:
An aluminium dish is placed in the electronic desiccator, tared, 2g of the sample to be analysed is placed on the surface of the dish, the temperature is set to 90C°, then the analysis is started by pressing the START button on the apparatus, which will stop automatically at the end of the analysis.
The percentage of water content is given by the following formula:'

$$H\% = 100\% - EST$$

H%: water content in %.
TSE: total dry extract.
Oat flakes and carob powder:
The measurement of ph and moisture in these products is done in the same way as follows:
Determination of PH :
Were determined by the same techniques described in the section on milk powder.
Determination of moisture : With a balance, first measure the weight of the watch glass, then tare and put 1g of the sample. Place the sample in an oven at a temperature of 105 C° and after every 10 minutes measure the humidity until the value stabilizes for 1 hour. The results are expressed as a percentage.
m0: mass of the test sample (in gram).
m1: mass of the test sample after steaming (in grams)

$$Water\ content\% = \frac{(m0 - m1)}{} \times 100$$

Another analysis for oatmeal and carob powder:

According to the results of other students' studies:

Oat flakes: Determination of fat content, crude fibre content and protein content.

Carob powder: Ash content, fat content, acidity, Brix degree, polyphenols, flavonoids and protein.

Manufacturing process of stirred yoghurt incorporated with oat flakes and carob powder:

Preparation of sourdough :

A 200 unit bag of freeze-dried sourdough consisting of two strains (*Lactobacillus bulgaricus and streptococcus thermophilus)* was introduced into a one litre beaker containing 1000 ml of pasteurised skimmed milk (0% MF) and mixed well. .

Milk preparation :

Table n°02: the different milk ingredients.

Materials:	Quantity in g :
-Milk powder of 26% fat	72 g
-Milk powder 0% fat	67 g
-Sugar	67 g
-Modified starch	16 g

preheated milk

Homogenisation Add a small amount of water and mix well over low heat until the powder is dissolved in the water.in a 1 litre Erlenmeyer flask put the mixture and complete with water (one litre of prepared milk).this step affects the fat and protein of the milk, it reduces the size of the fat globules and limits the rise during incubation and gives a more uniform consistency to the yoghurt produced.

Heat treatment At a temperature of 90-94°C for 3 to 5 minutes.destruction of pathogenic germs and large parts of the common flora, promotes the growth of lactic flora.

Cooling The milk is cooled to the seeding temperature of 44°C.-Acidification of the milk, the mass of the milk, production of aroma, development of lactic bacteria.Inoculation Add 2ml of sourdough

Incubation The glass bowl was placed in the oven at 44°C for 4 hours until an acidity of 70°D was reached.

Cooling For the purpose of blocking the fermentation. At T 4°C for 30 min

Stirring Stir the yoghurt with a sterile spoon in a circular motion for 5-10 minutes until a homogeneous stirred yoghurt is obtained.

Packaging The fermented milk is put into sterile glass jars.

Addition of the sample

In this step, the oatmeal and carob powder are added and mixed together in the following percentages:

rate of incorporation of oatmeal in the yoghurt :Incorporation of 2-4-6%.

rate of the carob powder in the yoghurt :Incorporation of 2-4-6%.

rate of oatmeal and carob powder in the yoghurt "mix":1-2-3%of oatmeal and 1-2-3% of the carob powder in the yoghurt

Physical and chemical analysis of finished products:

The pH is determined using a calibrated PH meter.Homogenise the sample and pour 25 to 50 ml of sample into a beaker.

Measure the pH of the samples while shaking.Rinse the electrode thoroughly between each sample.The value is read directly on the display of the instrument.

Determination of Dornic acidity :

The purpose of this analysis is to determine the lactic acidity of the yoghurt with the NAOH soda in the presence of a coloured PH indicator.

Homogenise the contents of the yoghurt pot well, then In a beaker take 10 ml of yoghurt

Add 3 drops of phenol phthalein solution.Titrate with NAOH 0.09 g/L until the colour changes from colourless to pink.The reading will be taken directly on the acidimeter.

Determination of the fat content :

Dissolution of the milk proteins by addition of sulphuric acid by the acid-butyrometric method.

Butyrometric method. The released fat is separated by centrifugation in the presence of iso-amyl alcohol.Introduce 10 ml of sulphuric acid, 11 ml of the sample (milk or yoghurt) and 1 ml of amyl alcohol into a butyrometer.Stopper the butyrometer well and shake by turning it over until the proteins are dissolved.Centrifuge for 3 minutes.The dissociated fat is less dense, it gathers in a clear and transparent, visible for a direct reading on the butyrometer scale. The fat content is expressed in g/l.

Determination of the total dry extract (TDE):

The principle is based on the drying of the product by evaporation of the water in absorbed or adsorbed form.Weigh 2g of yoghurt and spread the sample over the entire surface of the dish with a spatula.Set the desiccator temperature to 110°C.The TSE value is displayed directly on the apparatus in percentage (% or g/l).

Microbiological analysis:

Microbiological analysis is used to guarantee the safety and wholesomeness of foodstuffs. It focuses on the detection and enumeration of pathogenic germs in the finished product. They are carried out in accordance with the directives of the Algerian official journal JORA N°39(2017) . These germs, widely found in nature, can contaminate the yoghurt and cause food poisoning or intoxication.

Table n°03: germs sought in each material and medium used.

Samples Germs	Culture media used	Process water	Milk powder	Finished product
Staphylococcus Aureus	Baird-Parker agar	+	+	+
Enterobacteriaceae	VRBG agar	-	+	+
Salmonella	FBS Hecktoen	+	+	+
Fecal and total coliforms	VRBL+ BCPL	+	-	-

(+) : Presence of analysis. (-): No analysis.

Methods of bacteriological analysis

Sample preparation, stock suspensions and decimal dilutions are carried out according to the recommendations of EN ISO 6887-1:1999. The enumeration of total aerobic mesophilic flora (TMAF) and thermotolerant coliforms (TTC) is carried out according to the recommendations of NF EN ISO 4833 (2003) and NF V08-060 (2009) respectively.

Staphylococcus aureus (SA) enumeration is performed according to the recommendations of NF EN ISO 6888-1 (2004), catalase and coagulase tests are used to confirm the species.

The conformity of the bacteriological quality of each sample for the flora sought was determined according to the microbiological criteria defined by Algerian regulations (AIM N°10/2016). Sensory analysis :

A sensory analysis aims to analyse the organoleptic properties of a product, based on the perception made by the sense organs, only those aspects related to the sensations in the mouth perceived by a panel of tasters. During the consumption of the product the aspects sought are: Taste and flavour, texture, aroma, consistency and visual appearance.

The tasting test carried out by a panel of 30 people is based on a tasting sheet. It is a question of presenting the different yogurts made to the tasters anonymously. It is necessary to rinse the mouth with water before each tasting to neutralise the taste impressions.

Physicochemical results of the finished products studied:

Product A: control yoghurt.

Product B: yoghurt incorporated in oat flakes at different rates.

Product C: yoghurt incorporated in carob powder at different rates.

Product D: yoghurt incorporated in a mixture of oat flakes and carob powder at different rates of incorporation of 2, 4 and 6%.

The TSE rate of the control yoghurt is in the conformity zone according to the norms set by the company. The TSE values of the different yoghurt products incorporated from oats, carob powder and the mixture are higher compared to that of the control yoghurt.

Table 4: Results of physico-chemical analysis of dry matter content:

Parameter%	**Product A**	**Product B**			**Product C**			**Product D**		
EST	210	2%	4%	6%	2%	4%	6%	2%	4%	6%
		230	245	248	244	241	259	223	244	250
Norms JORA	250 %									

We note that the results of the variation of pH obtained from yoghurt A and medium acid because, in the control yoghurt we observe a decrease in pH throughout the period of 15 days of conservation which varies between 4.61 and 4.32. This decrease is due to the activity of the yoghurt.

This decrease is due to the acidifying activity contained during storage and the accumulation of lactic acid from the metabolism of the two bacterial species (Hermier et al., 1986). In fact, keeping the yoghurt cold prevents bacterial multiplication, but it does not completely stop their metabolic activity, although these results remain within the norm.

From the results obtained, we observe that in yoghurt B incorporated with oats at 2 % shows a faster decrease of the pH which varies between 4.54 from the first day to 4.31 after 15 days, on the other hand, Oat yogurt (4% - 6%) shows a slow acidification compared to 2 % because it contains more amount of oats, which may be due to the lower water activity (aw) of oats, or the inhibiting effect of oats on the activity of lactic acid bacteria. The lowering of ph is due to the degradation of lactose into lactic acid by the mesophilic lactic acid bacteria. When comparing between the 3 products we note that the yoghurt C prepared with 4% and 6% carob powder is slow, then the yoghurt incorporated with 2% carob powder decreases rapidly during storage and which meets the standards (4, 45 - 4.70), so the carob yoghurt has little effect on the metabolic activity of lactic bacteria and thus the lactic acid that produces lactose which lowers the pH **(Brule ,2003 and Larpent , 1991).**

It is noticed that the pH of the finished product which is a yoghurt incorporated with (carob/oats) at different rates (2%,4%,6%) decreases during the storage period which is due to the effect of the added samples on the acidifying activity of the lactic bacteriainterpretation of the physico-chemical results of the Variation of acidity :The results obtained show that the titratable acidity of the control yoghurt increases progressively from a value of 72D° on the first day to 95D°. After 15 days, it is parallel to the decrease in pH during the entire storage period. This increase is due to the action of lactic acid bacteria, whose main function is to produce lactic acid, which acts as a coagulant and antimicrobial preservative **(Schmidt et *al.*, 1994).**

In parallel to the PH, we notice a progressive increase of the titratable acidity for the yoghurt incorporated with oats at different rates (2%, 4%, 6%), so we can say that the acidity curves represented in the previous figure have an increasing tendency during the whole analysis period. This can be explained by the slow development of the two lactic ferments and consequently no acidification.

The results presented in the figure show a progressive increase in the acidity of yoghurt incorporated with carob at different rates (2%, 4%, 6%).

This variation of acidity is close for the three percent of incorporation, which means that the carob powder is slightly affected by the action of lactic bacteria.

We notice that the acidity of our finished products, incorporated yoghurt of oats and carob at different rates (2%, 4%, 6%). it increases during storage, this may be due to the low temperature of storage at 6 ° C and the degradation of lactose in lactic acid.these values obtained for the different samples are always in accordance with the standards of **JORA**.

The results of the physico-chemical analysis of the Variation of the fat:of the yoghurt, is (18%), we notice that these values meet the normative requirements. This fat value increases when oatmeal is added (26 to 29), carob powder (30.4 to 31.9) and the mixture (28.2 to 30.45), The MG content of these products increases slightly according to the rate of carob powder and oatmeal (2% , 4%,6%), and this increase remains stable during the study from (day 1 to 15 days).

We found that the MG of yoghurt with carob powder at different levels increases rapidly during the study compared to yoghurt with oats so we can conclude that carob contains MG more than oats.

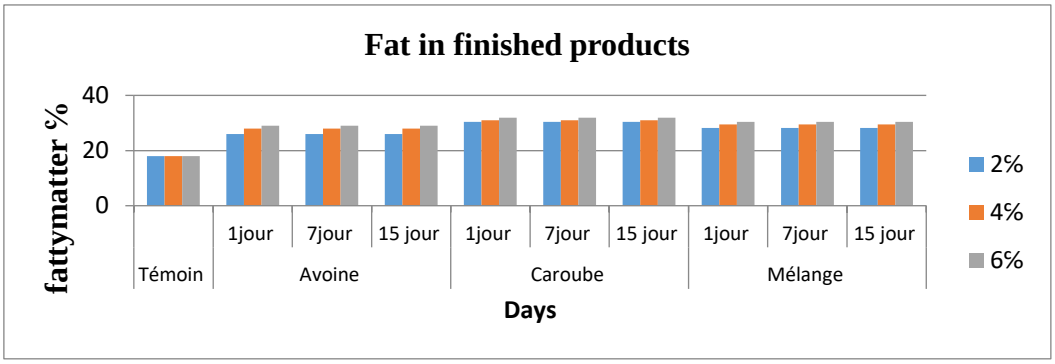

Figure 1: Results of MG measurements of finished products at different rates during storage

The results of the microbiological analyses of the process water indicate an absence of germs that indicate faecal contamination: total and faecal coliforms, staphylococcus aureus, salmonella. These results are due to the fact that the water is subjected to treatment before it reaches the tap, such as pre-chlorination, activated carbon filtration, softening, UV disinfection. The results are in accordance with the standards, so it is suitable for yoghurt production is of good bacteriological quality The results of microbiological analysis of milk

powder are negative and correspond to the standard set by national legislation of the official journal of the Algerian Republic.

The total absence of germs sought in the powders indicates that the powder is of good microbiological quality and the sampling made in the right way without forgetting the conditions of transport, conservation, storage are satisfactory.

The results of the microbiological analyses of the products (A, B, C, D)

Product A: control yoghurt
Product B: yoghurt incorporated in oat flakes.
Product C: yoghurt incorporated in carob powder.
Product D: yoghurt incorporated in carob powder.

The microbiological results of the different finished products show the total absence of the germs of alteration sought: enterobacteria, staphylococcus, salmonella. This is in accordance with the **JORA (2017)** standards.

We note that the analysed product does not present any risk for the health of the consumer, because it does not contain any pathogenic bacteria responsible for intoxication, even after the expiry date of the conservation.

The results show that the yoghurt is prepared under good hygienic conditions (good quality of the raw material, ingredients), the efficiency of heat treatment and the good conditions of cold storage at 4C°-6C° has the effect of slowing down the enzymatic and chemical reactions, and consequently also of slowing down the multiplication and metabolism of micro-organisms. **(Guiraud, 1998; Spinnler, 2004).**In case of the presence of germs any product is destroyed and considered spoiled.

Interpretation of the results of the sensory analysis: satisfaction characteristics of the three products: From the histogram it can be seen that the percentage of people who are very satisfied is higher for the carob yoghurt of 67% compared to 27% for the oat yoghurt and 34% for the mixed yoghurt.

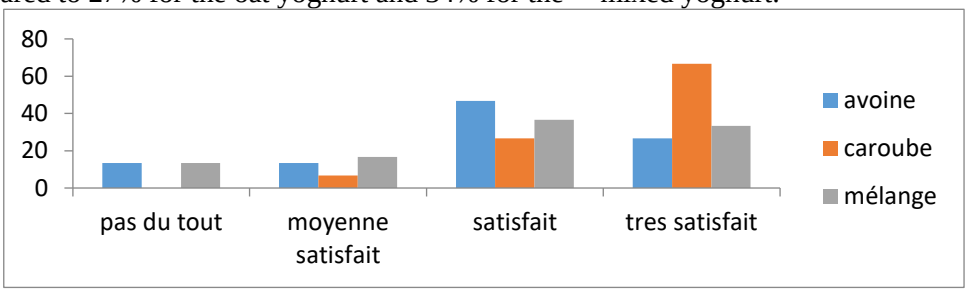

Figure N 2: the satisfaction rate for the three products.

Conclusion :

This study established the moisture and pH values of carob powder to be 7% and 5.35 respectively, and those of oat flakes to be 9% and 6.03 . The results obtained during the various quality controls carried out on the other raw materials showed that the process water intended for the reconstitution of milk and the milk powder are within the ranges set by the standards of the standard codex, AFNOR 1986.

The monitoring of the physico-chemical quality of the finished products during storage shows that the pH of the control yoghurt, yoghurt with carob powder and oat flakes and the mixture at different rates (2%, 4%, 6%) decreases slightly during the entire storage period. The acidity is therefore higher due to the action of lactic bacteria that produce lactic acid. The TSE of mixed yoghurt is higher than that of the control yoghurt and the fat content remains stable during the whole storage period.

The results obtained from the sensory analyses applied to the formulation of the finished product show that the yoghurt with 4% carob incorporated has a better consistency and the greatest acceptability, compared to the other yoghurts.At the end of this work, it appears that it is possible by associating new products to yoghurt by incorporating in this study carob flour and oat flakes, to obtain a new food product rich in nutrients and inexpensive because the raw material is a national production available poorly or little exploited.

Recommendations :

The carob sector remains one of the weakest activities in terms of dissemination and local production compared to the main sectors that dominate, despite the importance of this product in economic development and the contribution of hard currency through exports, it should be interested in these crops through the process of support and reforestation. Oats are important because of their benefits for those who practice sports, and many other advantages, and yoghurt, which is a functional food beneficial for the body, will be enriched with natural sugar, minerals, fibre and antioxidant capacity. It would be interesting if

It would be interesting to carry out further research on the functional and health qualities of carob and oats, products that are poorly exploited and little valued by Algerians, and to conduct awareness campaigns on their benefits to motivate people to consume them.

*malikaj@ubt.edu.al

Abstract

The artificial lake of Tirana is under constant influences from human and natural impacts. This lake is situated in the south part of Tirana city, near to the Zoo and the Botanical Garden. The assessment of water quality is very important in the existence of biodiversity of the lake. Thus, the diatoms species are the powerful indicators that provide changes in environmental conditions. This study aims to determine the different species of diatoms algae and to evaluate the ecological status of artificial Lake of Tirana. Diatom samples were collected in three sampling points during June 2017 and many species have been identified. The dominant taxa were: *Epithemia adnata, Epithemia sorex, Gomphonema minutum, Gomphonema olivaceum, Cyclotella ocellata, Cymbella affinis, Cymbella caespitosa, Cymbella helvetica, Denticula elegans* etc. Based in different taxa and ecological values of species, artificial Lake of Tirana belongs to meso-eutroph state.

Keywords: Artificial Lake, Diatom taxa, species diversity, ecological status

INTRODUCTION

Diatoms are more specific in their preference and tolerance of environmental conditions than most of other aquatic biota. Most diatoms are unicellular, although they can exist as colonies in the shape of filaments. The silica cells wall accumulate in the bottom of lakes, oceans and in macrophytes **(Round et.al., 1990**). Diatom communities are specific species for monitoring environmental conditions and historical pollution of ecosystems. They respond quickly to changes in environmental variables as light, moisture conditions, temperature, current velocity, salinity, pH, nutrients, thus they are commonly used in water quality studies (**Alikaj et.al, 2019**). Diatoms are more abundant in lakes, but they are living in all habitats (**Kupe et.al. 2008; Kupe et al., 2013**).

The artificial Lake of Tirana is a well known for fishing and swimming activities. Even if there are many data about evaluation of water quality in water ecosystems in Albania, using diatoms, (**Kupe at.al, 2011; Miho et.al, 2005; 2006; Kupe et.al, 2006; Alikaj et. al, 2019**), for artificial Lake of Tirana there is no study about assessment of diatoms algae, therefore our study is focused on the evaluation of diatom species of this lake.

MATERIALS AND METHODS

The artificial lake of Tirana is situated in the south part of Tirana city, covering an area of 0.55 km^2 with a depth of 4.5 m. The lake was built from local waters in 1955 on volunteer work. Sampling and monitoring of the diatoms were performed on June 2017. The samples were collected in different depth of Lake Tirana in three sampling point (Fig. 1).

Figure 1. Sampling points in Lake Tirana

The diatom communities were collected like epiphyte in different macrophytes. Collected samples in small bottles were preserved in 4% formaldehyde (**Kelly et.al., 1995; Prygiel et. al., 2002; Kupe L., 2006; Kupe et. al., 2013**). The cleaning of diatom frustules was done by boiling the material, first with HClcc and then, boiling them again with H_2SO_4cc, adding during the last procedure some crystals of KNO_3, as described by **Krammer and Lange Bertalot 2001**. Diatoms were identified using standard literature (**Krammer and Bertalot 1996-2001**). For each samples we calculated the Diversity Index (H'), (**Shannon and Weaver, 1949**), Trophic and Saprobic indices. Trophic and saprobic status of lake was defined according to **Rott et. al, 1977, 1999**.

RESULTS AND DISCUSSION

In table 1 are presented diatoms species found in Lake Tirana. There are 2 centric diatoms species and 37 pennate diatoms. The number of species varied from 19 to 22 in each station. The most commonly species are *Epithemia adnata, Epithemia sorex, Gomphonema minutum, Gomphonema olivaceum, Cyclotella ocellata, Cymbella affinis, Cymbella caespitosa, Cymbella helvetica, Denticula elegans, Rhopalodia gibba* etc. where their presence is 100% in observed samples. Most of the species like, *Gomphonema olivaceum* (TW = 2.9 - eu-polytroph; S = 2.1 - meso-eutroph); *Navicula cryptotenella* (TW = 2.3 - eutrophies; S = 1.5 - oligo-α-mesotrophy); *Epithemia adnata* (TW = 2.2 - meso- eutrophies; S = 1.2 - Oligosaprobe); *Gomphonema minutum* (TW = 2.1 - meso- eutrophies; S = 2.0 - α - mesosaprobe). While some species that grow as epiphytes on rocks live in poly-hypertrophic environments, e.g. *Fragilaria ulna* (TW = 3.5 poly-hypertroph; S = 2.7 mesosaprob); *Nitzschia palea* var. *palea* (TW = 3.3 polytroph; S = 2.8 mesosaprob) are very rarely found in the lake of Tirana.

In table 2 are shown the values of diatoms indices and trophic status of lake. The values of trophic diatoms index varied from 2 at station S3 to 2.5 at station S1. From these values, trophic status was classified from meso-eutroph to eutroph which represent moderate to heavy pollution with inorganic substances as phosphorus and nitrogen. The saprobic index in all stations was 1.4 and sabrobic classes were oligosaprob. In this situation the values of organic matters at Lake Tirana are in low level. Thus eutrophication at this lake may occur from natural and antropogenic impact, but mostly naturally.

Table 2. Diatoms indices and trophic status of lake

Period	**June 2017**		
Stations	**S1**	**S2**	**S3**
Number of species N:	22	19	22
Diversity index H':	0.92	0.94	0.88
Trophic diatoms index TI_{DIA}:	**2.5**	**2.3**	**2.0**
Trophic classes	**Eutroph**	**Eutroph**	**Meso-eutroph**
Saprobic index, SI	**1.4**	**1.4**	**1.4**
Saprobic classes	**Oligosaprob**	**Oligosaprob**	**Oligosaprob**

CONCLUSIONS

In three samples we have identified about 39 species, of which 2 are centric diatoms and others are pennate diatoms. The values of trophic and saprobic index define eutrophic status in relation with inorganic matters but oligosaprob state from organic matters. Anyhow, this lake is in eutrophy conditions. Eutrophication at this lake may occur from natural and antropogenic impact, but mostly naturally.

Abstract

Pollution of water ecosystems by heavy metals is a worldwide concern, because these metals are indestructible and most of them have toxic effects on living organisms, when they exceed a certain concentration. The present study aims the assessment of heavy metals like Cd, Cu, Cr, Fe, Mn, Ni, Pb and Zn in the sediments of Drini Bardhe River in Kosovo. The concentrations of heavy metals were analyzed by using atomic absorption spectrophotometer (AAS) method. Obtained data showed that the concentration of heavy metals in sediments were in the following order: Fe>Mn>Ni>Cr>Zn>Cu>Pb>Cd. Pollution status of sediments has been evaluated using enrichment factor and geo-accumulation index. The calculated values of enrichment factors showed moderately severe enrichment for Cd and Ni; moderate enrichment for Cu, Cr and Pb; and no enrichment for Fe, Mn and Zn. Furthermore, calculated values of the geo-accumulation index showed that the sediments were high polluted with Cd and Ni; moderate polluted with Cr; unpolluted to moderate polluted with Cu, Mn, Pb and Zn; and unpolluted with Fe.

Keywords: Water ecosystem, heavy metals, sediment, enrichment factor, geo-accumulation index

INTRODUCTION

Human activities, including metal mining, smelting, coal combustion, fossil fuel burning, draining of sewerage, dumping of Hospital wastes, recreational activities and agricultural practices have released countless tons of trace elements into the environment (**Haxhibeqiri et.al, 2015**). Also metals may occur naturally from normal geological phenomenon such as ore formation, weathering of rocks and leaching. Heavy metals in environment may accumulate to toxic levels without visible signs. The assessment of heavy metals in sediments is important for the categorization of the environmental status of the water ecosystems. Pollution of sediments by heavy metals defines the historical pollution of ecosystems because these elements cannot degrade and continuously keep on depositing in sediments (**Forster 1990**). Sediments represent one of the ultimate sinks for heavy metals discharged into the environment (**Ghrefat & Yusuf, 2006**), nevertheless by various processes sediments in aquatic environments release metals to the water column. This study aims to assess the level of heavy metals in sediments of Drini Bardhe River in Kosovo and to evaluate the degree of pollution by heavy metals at this ecosystem.

MATERIAL AND METHODS

Sediment samples

Along Drini Bardhe River in Kosovo three representative sampling sites were selected to collect sediment samples (Figure 1). Standard procedure was applied for sediment sampling. After collection, sediment samples were prepared and analyzed to determine heavy metals concentrations. For the determination of heavy metals 0.3g of sediment samples were mixed with, HNO_3cc 65% acid and H_2O_2 33%. The mixture of samples was carried in microwave for 25 minutes in 180^oC **(EPA Method 3051[a]).** The concentrations of heavy metals were determined by atomic absorption spectrophotometer (AAS).

Figure 1. Study area along Drini Bardhë River

Assessment of heavy metal contamination

Assessment of heavy metals pollution was defined using Enrichment Factor (EF) and Geo-accumulation Index (Igeo) based on the following categorization respectively: 1) Ef ≤1 no enrichment; 2) 1 < Ef ≤3 minimal enrichment; 3) 3 < Ef ≤5 moderate enrichment; 4) 5 < Ef ≤10 moderately severe enrichment; 5) 10 < Ef ≤25 severe enrichment; 6) 25 < Ef ≤50 very severe enrichment; 7) Ef > 50 extremely severe enrichment.

1) Igeo < 0 unpolluted; 2) 0 ≤ Igeo < 1 unpolluted to moderately polluted; 3) 1 ≤ Igeo < 2 moderately polluted; 4) 2 ≤ Igeo < 3 moderately to strongly polluted; 5) 3 ≤ Igeo < 4 strongly polluted; 6) 4 ≤ Igeo < 5 strongly to very strongly polluted; 7) Igeo ≥ 5 very strongly polluted.

The EF was calculated using the formula according to **Li et al., 2008** and Igeo by using the equation given by **Huu et al., 2010.** The heavy metals concentrations in the earth crust are taken from **Rudnic et.al, 2005**.

Ef= metal content in a given sediment / metal content in earth crust

Igeo= log2 (metal content in a given sediment / metal content in the earth crust *1.5)

SPSS Statistic 20 program was used for **s**tatistical analysis and **Minitab 16** for cluster analysis.

RESULTS AND DISCUSSION

In table 1 are presented the concentrations of heavy metals in sediments of river. In total were analysed 8 heavy metals and the concentrations order were: Fe>Mn>Ni>Cr>Zn>Cu>Pb>Cd.

The sediments enrichment with heavy metals and the pollution level is evaluated with Enrichment factor and Geo accumulation index (table 1). The values of enrichment factors showed moderately severe enrichment for Cd and Ni; minimal enrichment for Cu, Cr and Pb and no enrichment for Fe, Mn and Zn.

Beside this through the geo-accumulation index resulted that the sediments were much polluted with Cd and Ni; moderate polluted with Cr; unpolluted to moderate polluted with Cu, Mn, Pb and Zn, and unpolluted with Fe.

Table 1. Heavy metal concentrations in sediments of Drini Bardhe River

Heavy metals mg/kg	Sediment samples								
	S1	S2	S3	Min	Max	Average	StDev	Ef	Igeo
Cd	0.7	0.1	1.0	0.1	1.0	0.6	0.4	6.1	3.20
Cu	14.5	20.5	48.1	14.5	48.1	27.7	17.9	1.1	0.73
Cr	43.1	265.4	53.6	43.1	265.4	120.7	125.4	1.4	1.09
Fe	14515.5	24430.9	23116.3	14515.5	24430.9	20687.6	5385.4	0.6	-0.17
Mn	220.8	409.1	458.8	220.8	458.8	362.9	125.6	0.7	0.01
Ni	78.1	787.0	59.0	59.0	787.0	308.1	414.9	7.0	3.39
Pb	16.3	11.6	30.3	11.6	30.3	19.4	9.7	1.1	0.78
Zn	38.1	44.4	99.4	38.1	99.4	60.7	33.7	0.9	0.36

The high level of Cd, Cr and Ni in sediments can influence in water quality and present negative effects due to the possibility of their transfer in the food chain.

To understand the origin of heavy metals and the linkage between them we used cluster analysis Fig. 2. The cluster analysis classified the metals in the sediments in three groups; the first group, are the metals (Cd, Cu, Zn, Pb) (natural and anthropogenic origin). Even if Cu and Zn are natural elements in the earth crust, the linkage with Cd and Pb classified them with dual origin. The second group are Fe and Mn as metals with natural origin. The third group are Cr and Ni, with (anthropogenic origin).

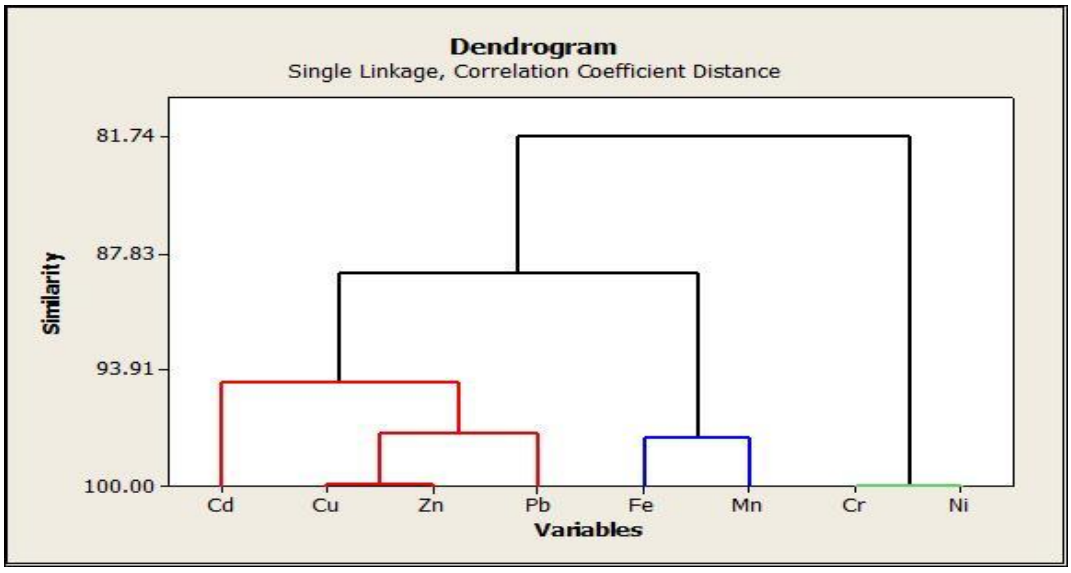

Figure 2. Dendogram of heavy metals in the sediments of Drini Bardhe River

CONCLUSION

The results clearly indicated that heavy metals concentrations were high in sediment samples. In general, the metals content in sediments is indicative of the degree of pollution and serves as a source of mobility of heavy metals to water. The highest level of heavy metals especially for Cd and Ni is the result of anthropogenic, industrial and agricultural activities. High concentration of heavy metals in sediments can affect water quality and to present negative effects due to the possibility of their transfer to food chain.

Abstract

The aim of the study was to determine the interconnection of the metabolic profile indicators with the BCS in dairy cows in various physiological states. From the current study it was found out that the interconnection of the BCS with the metabolic indicators based on the physiologicalstatus was quite strong in cows two weeks prior to calving .In the two-week period following calving this relationship remains equally strong (R^2=0.65; Fllog=4,5; P=0.0053). Whereas in the one-month period following caving the relationship becomes week and not scientifically significant. In the two-month period after calving the relationship tends to turn moderate, but otherwise statistically significant.

Key Words: BCS, metabolic profiles, multi-factor regress, physiological periods

INTRODUCTION

The metabolicprofileof cowsin herds is commonly utilized inveterinarypracticesto determine themetabolicstatusof the herdduring the reporteddifferentphysiologicalstates(Payne *etal.*, 1970), as well as in helping establish diagnosis ofmetabolicdiseasesand output-relateddiseases (Rowlands, 1973; Ingraham*etal*., 1988). The metabolicprofileis established in 7-10 cows of a given herd based on their physiological state, but in the main during the dry period length and the lactation peak as well as in the middle of the lactation period (Rowlands, 1973). Incountries beyond theUS, the definingvalue of the metabolic profile in the healthy status of the cows is much higher than that in the USA (Bogin *et al*., 1982; Ghergariu *et al*., 1984; Adams *et al*., 1978; Jones *et al*., 1982; Lee *et al*., 1978), where the diagnosing role is considered not as important. Despitethisgap in the diagnosticvalue, the metabolicprofile appears to be quite expensive. In order to analyze the samplesof a total of 7 cows between 200 - 400$ are expended. This is the case even with the utilization of the automatic analysis equipment (Adams *et al.*, 1978). In addition to the metabolicprofileapproachthere have been two other approaches including both the determination of the live weightfromonephysiologicalconditionto the other, andthe determination of BSC (bodycondition scoresin cows). The approach to determining the weight change provides someinformativeresults which are muchlowerthanthe metabolicprofile, while the determination of the BCS in various physiological conditions is much more informative with regard to the energy level in cows.

What is more, the costs involved are not quite high to perform such an exercise.BCS is widely used nowadays as a method of evaluating the energy balance in the cows. It also provides information on nutrition and health status of the cow herd (Roche *et al.*, 2000). In cows which are mainly used for meat and those used for milk the determination of BSC is recommended for evaluating and managing the nutrition status (Rae *et al*., 1996; Gillund *et al*., 2001). Determining the BSC allows one to quantify the energy reserves stored in the way of fat under the skin and in the way of muscles in cows (Houghton *et al.*, 1990). These energy reserves are not constant in all cows (Wright *et al*., 1987). The changes that happen at the level of BSC provides some

important clues as to the nutrition status of cows. In other cases when the determination of BCS is done on a more frequent basis, say 2-3 months, one can easily formulate conclusion every 2-3 months on the dynamics of the change in the energy reserves in cows. The evaluation of the metabolic deviations, the disorders in the reproduction processes and the mild output (Edmonson *et al*., 1989). Metabolicchangesareregulatedunder the action ofvarioushormones, which do supportthe new physiological state. The most important, among an entire group of factors, include, insulin, leptin, ghrelin and estrogens (Vargova *et al*., 2015). Lack of various hormonal harmonization leads to the occurrence of diseases of the puerperal periods in cows. Through this process of metabolicadaptationit is believed that cowsin themiddleof their pregnancy do store away energy reserves in the shape of fats and intensive use during the early lactation stage (Friggins, 2003; Garnswothy and Topps, 1982). The phenomenon is reflected even upon the BCS (Bernabucci *et al.*, 2005). The drawing close of calving is accompanied with a reduction of the progesterone level while the level of estrogens goes upward instead (Grummer, 1995). The high level of estrogens is believed to play quite an important role in the reduction of the uptake of dry matter from cows (Grummer, 1993). During the three months of pregnancy there is a significant rise in the needs for nutrition matter which affects the growth of fetus and the size of placenta (Bell, 1995), whereas the dry matter uptake decreases by 10-30% when compared with the dry period length (Friggens, 2003; Drackley *et al.*, 2001). Based on these data the current study was launched with the purpose of determining the BCS with the metabolic indicators through the multiple regress equations in the 2 week period prior to calving up to a period of 2 months after calving.

MATERIALS AND METHODS

The study was conducted during the period running from February 2013 to November 2013. The study focused on three cow herds in three different farms (Ndroq, Kashar and Lushnja). The determination of BCS was done on the basis of 9-scale method recommended by the Government of Alberta, Agriculture and Rural Development (1995-2012). The cows at the centre of the study were examined through 4 physiological states starting with the dry-period ending with a 2 month period after calving (Dova *et al*., 2013). In each of the farms under study, the cows were selected in such a way as to allow for a dynamic follow-up exam of the cows under the focus of the study in 4 of the physiological states (2 weeks period to calving (-14 days), 2 weeks after calving (+ 14 days), a month after calving (+ 30 days) and 2 months after calving (+ 60 days). In each of the farms 10 cows pertaining to lactation of 2-4 were selected. In each of the physiological states blood from the jugular vein was obtained in sterilized and chemically clean test-tubes. The separation of the serum from the cell-like elements of the blood was done 8-10 hours after the blood collection. The serum was stored away in refrigerators at temperatures close to + 4°C until the conclusion of the analysis. Through the blood serum one was able to determine the overall proteins through the biuret test method, the bicarbonate standard (alkaline reserves) with the titrimetric method with Tashiro indicator, inorganic phosphorus with the spectrophotometric method, glucose with the Frank Kimberger method, urea with the spectrophotometric method with diacetilmonoksim, general calcium and magnesium with the titrimetric method with Eriochrom black indicator (Xoxa *et al.*,1978). The analysis were taken to the physiology laboratory at the Faculty of Veterinary Medicine, Tirana, Albania. In each of the physiological states the body condition score was determined through the visual approach and with palpation based on the afore-mentioned approach.

Statistical evaluation of the data

The data obtained through the study was statistically tested with the ANOVA method and the multiple factor regression equation was calculated for the BCS and the metabolic indicators, where in the role of the subordinate indicator is BCS(Y), while the indicators of the metabolic profiles constituted the determining variables (X) as indicated below:

X_1=general proteins, X_2= alkaline reserves; X_3= inorganic phosphorus; X_4=glucose X_5=Urea; X_6= general calcium; X_7=Magnesium.

RESULTS AND DISCUSSION

The metabolic profile indicators do have an impact on the BSC of the cows taken up for study. This interaction is borne out by the truthfulness of the multiple regression equation for cows two weeks prior to calving. The equation embraces R^2=0.69 and P=0.00051. This truthfulness scale shows that the regression equation can be utilized to predict the level of the body condition in cows be solving this equation. The increase in the level of overall proteins in serums has affected the reduction of BCS in cows.

Table 1. The multiple regression equation data 2 weeks before calving

Multiple regression equation
$BCS=1.76 - 0.42X_1 + 0.006X_2 + 0.45X_3 + 0.049X_4 – 0.05X_5 – 0.06X_6 + 0.17X_7$
The truthfulness of the equation is: R^2=0.69, Fllog=6.36, P=0.00051

This is closely connected with the change in the protein variables of the serum. In this early stage one is able to spot a reduction of albumins in serums which extend to the minimum border of the normal value and the increase happens with the function of globulin elements (Pedron *et al.*,1993; Suzuki *et al*., 2006). The interconnection of the specific metabolic indicators in this physiological state is of various size and direction. The positive connection with the BCS is established because of the role of alkaline reserves, inorganic phosphorus, glucose and the magnesium level while the other metabolic indicators have a negative impact on the BCS score in cows. The positive impact of the alkaline reserve is connected with the status of the acid basic equilibrium of the biological liquids in the organism which is reflected in the alkaline reserve level within the 276 mg% range. The reduction or increase of this indicator brings about negative effects (Garnsworthy *et al*., 1982; Drennan *et al*., 2006). This fact alone is also endorsed by the positive role that the phosphat ions have as a component of the buffered system of phosphates and the component of the cation-anion difference of the portion (DCAD) along with the ions of magnesium (Drennan *et al*., 2006; Erfle *et al*., 1974), as well as the role of phosphate ions in glycolysis (Mane *et a.l,* 2011).
In the period of 2 weeks after calving it is easily noticed that the truthfulness of the multiple regression equation is decreased when compared with the pre-calving period. Hence, R^2=0.65, Fllog=4.5 and P=0.0053. The equation, however, is true and might be used for purposes of predictions.

Table 2. The multiple regression equation in cows 2 weeks after calving

Multiple regression equation
$BCS=-3.35 + 0.337X_1-0.002X_2 + 0.07X_3 + 0.019X_4 + 0.03X_5 + 0.22X_6 + 0.445X_7$
The truthfulness of the equation is depicted"R^2=0.65, Fllog=4,5, P=0.0053

This status shows that in the organism of the animal has started the building up of the endogen sources and in particular the intensification of lipolyses. The data on the urea level show that the production of proteolyses has not started yet, a thing which might surely increase the level of urea in blood. The operation of the significant lipase towards the adrenalin hormone and noradrenalin goes up. This affects the break-down of triglyceride of the fatty tissue accompanied with the reduction of the volume of adiposities and consequently the energy level goes down in cows and the reduction in the BSC occurs as well. This phenomenon is closely connected with the fact that the initiation of the mobilization of the endogen proteins has triggered the intensification of the biosynthesis of albumins (Gergacz *et al.,* 2008). The glucose needs in the first 21 days after calving increase anywhere from 1000 to 1100 g/days. In this period one can observe a positive impact of glycemia in BCS, but this impact appears to be much smaller when contrasted with the period prior to calving.

The level of alkaline reserve in the blood serum is negative over the BCS. This goes to show that the metabolic effect under the conditions of the mobilization of the endogen energies has affected the acid - basic equilibrium of the organism as a whole. The level of inorganic phosphorus in blood serum is much lower. This is believed to be caused by two metabolic aspects of it in liver which manifests itself in the halting of glycolysis and the promotion of gluconeogenesis and the significant discharge of phosphate ions in urine which has an influence on the maintenance of the acid-basic equilibrium.

In cows which are 1 month after calving, the multiple regression equation experiences significant changes. The truthfulness of the equation is proven statistically: R^2=0.44, Fllog=1.9 AND P=0.13. In the equation it is observed that all of the variables in the multiple regression equation have positive connection with the body condition with the exception of the magnesium level in serum which has negative connections.

Table 3. The multiple regression equation in cows 1 month after calving

Multiple regression equation
$BCS = 0.05 + 0.18X_1 + 0.0009X_2 + 0.07X_3 + 0.0007X_4 + 0.022X_5 + 0.054X_6 – 0.04X_7$
Truthfulness of equation is depicted, R^2=0.44, Fllog=1.9, P=0.13

The source of this difference remains yet to be explained satisfactorily. Lipolysis under the hormonal impact and under the strain of the parasympathetic nerve system is highlighted. The concentration of fatty acids free in the blood plasma is increased significantly (Ariete *et al.,* 2005). Ketogenesis is much more pronounced. Under this physiological state the proteolyses is intensified, mainly in the muscular tissue and the gluconeogenesis is intensified equally. The body condition goes down further (Suzuki *et al*., 2006). The urea level in blood serum is increased, hence pointing to the intensification of proteolyses accompanied by the gluconeogenesis (Gergacz *et al.,* 2007; Mouffolk *et al.,* 2011).

In the period 2 months after calving one can see that the multiple regression equation between the body condition (Y) and the indicator of the metabolic profile has a high signaling value (R^2=0.55, Fllog=3.1 dhe P=0.025). This shows that this equation might be used as a means of making predictions. The level of proteins in blood glucose has a negative impact upon the BCS.

Table 4. The multiple regression equation in cows 2 month after calving

The multiple regression equation in cows 2 months after calving
$BCS=0.62 - 0.34X_1 + 0.01X_2 - 0.2X_3 - 0.0018X_4 + 0.014X_5 + 0.27X_6 + 0.415X_7$
The truthfulness of the equation is depicted: R^2=0.55, Fllog=3.1, P=0.025

This is closely related to the fact that the reduction of BCS is accompanied with an increase of general proteins in serum. But this increase has been attributable in the main the fraction of globulins and the reduction of the albumin fraction (Santos *et al.,* 2012). The comparison of the 4 regression equations brings to light the fact that the multiple-factor regression equation are of great value when it comes to predicting the BCS in three different physiological states. Exclusion to this rule is only the multi-factor regression equation in the period one month after calving.

CONCLUSIONS

Body condition of cows (BCS) with the indicators of metabolic profile has close connections with the 3 physiological state observed under the study.BCS has no connection tested statistically for the period 1 month after calving**.** Based on our findings we recommend BCS as a tool to determine the energy level in cows.
